Ehrenbergii. Sts. erect or nearly prostrate, to 6 in. long and 1 in. diam.; ribs 6, notched, straight; spines stiff, straight; raduals 8-10, slender, to % in. long, white to yellowish; central 1, to 1 in. long; fls. purple- to violet-red, about 3 in. long, inner segms. dentate. Mex.

Émoryi: Bergerocactus Emoryi.

Engelmannii (Creus Engelmannii). In large clumps, sts. cylindric, 4-12 in. long and 2 in. or more diam.; ribs 11-14; radial spines about 10; centrals 5 or 6; fls. 2-3 in. long, widely expanding, purple. Utah, Nev., S. Calif., Aris., Mex.

emeacanthus (Cereus enneacanthus). Cespitose, sts. asoending and 3-5 in. long and 2 in. diam. more or less; ribs 7 or 8; radials mostly 8; central 1: fis. to 2½ in. long, purple. S. Tex., New Mex., Mex.

Féndleri (Cercus Fendleri). Cespitose but with few sts.

which are ascending or erect and 4-12 in. long and 2-3 in. which are ascending or erect and 4-12 in. long and 2-3 in. diam.; ribs 9-12; radials 5-10; central 1: fis. to 4 in. broad in expansion, deep purple. Utah, Ariz., Tex., Mex.

Fereirræ. Catalogue name of no known botanical standing: Mexican plant said to resemble E. Fendleri, differing in its larger brown central spines and clear pink larger fishaving clusters of white spines on the outer involucral

Fitchii. Plant-body cylindric or narrowed to top, to 4 in. high and half as thick; ribs 10-12; radials about 20: fls. pink, to nearly 3 in. long, widely spreading. Tex.

flavispinus: listed name.

Géntyi. Cespitose, sts. 2-4, procumbent to ascending, to 6 in. high and 1 in. diam.; ribs 5, indistinct, tubercles inconspicuous; spines acicular, to \(\frac{1}{10}\) in. long; radials 8-12, base bulbous, white to brownish; central 1, darker: fls. deep rose-pink within, funnelform, to 3 in. long, style exserted, stigma green, 7-9-lobed, anthers red. Mex.

glycimorphus (Cereus glycimorphus). Sts. erect or nearly prostrate, to 10 in. long and 1½ in. diam.; ribs 6-7, acute, notched, straight; radial spines 8-9, white; central spine brownish, to ½ in. long: fls. purple-red, to 3 in. long, inner segms. dentate, narrow. Cent. Mex.

gonacánthus: see E. triglochidiatus.

grándis. Sts. subcylindric, to 18 in. tall and 6 in. diam.; ribs 21-25, shallow; spines short, stiff, dull white; radials 15-25; centrals 8-12: fls. white, striped green, to 2½ in. long. Mex.

Knippelianus. About 4-8 in. high, thick, branching, deep green; ribs 5-7; spines 1-3 and weak; fls. about 1 in. long, pinkish. Mex.

Tufted, subcylindrical, to 20 in. long; ribs Lédingii straight; central usually 1, rarely 3, about 1 in long, ros usually 13-16, yellowish-green; spines yellow; radials 10-12, straight; central usually 1, rarely 3, about 1 in long, curved downwards: fis. rose-purple, to 1 3/4 in. long. Ariz.

leonénsis. Sts erect, to 10 in tall and 2 in. diam.; rbs 6-7, acute, straight; spines white; radials 7-9, to $\frac{6}{2}$ in. long; central 1, to $\frac{1}{2}$ in. long; fls. purplish-red with purple stripe down each inner segm. Mex.

leptacánthus: E. pentalophus.

Llóydii. Sts. clustered, to 10 in. high and 4 in. diam., bright green; ribs 11; radial spines 14 and ½ in. long; central spines 4-6, red: fls. reddish-purple, 3 in. long. Tex.

longisètus (Cercus longisetus). Sts. erect, to 10 in. tall and 3 m. diam.; ribs 11-14, notched; spines slender, white; radials 18-20, to \(\frac{1}{2}\) in. long; centrals 5-7, unequal, to \(\frac{1}{2}\) in. long; fls. red. Mex.

longispinus: perhaps Trichocereus strigosus var.

lûteus. Sts. cylindrical, to 10 in. tall, occasionally branching near base; ribs 8-0, remotely undulate, often somewhat purplish, thun; spines small; radials 6-8, to ½ in. long; central 1: fls. pale yellow, to 3 in. long, fragrant. Mex.

mamillatus (Cereus mamillatus). Cespitose, sts. 8-12 in. long, cylindric, 1½ in. or more diam.; ribs 20-25; radials 10-25; central spines 3 or 4; fls. not described. Lower Calif.

martimus. Forming dense clumps, sts. to 6 in. long; ribs 8-10; radial spines 10; central spines 4 and 1 in. long; fls. pale yellow, 1½ in. long. Lower Calif.

melanocéntrus: listed name.

Mérkeri. Cespitose, parts erect, to 6 in. diam., light green; ribs 8 or 9; radial spines 6-9 and white; centrals 1 or 2; fls. 2 in. or more long, purple. Mex.

mojavénsis (Cereus mojavensis). Forming great clumps, sts. globose to oblong to 8 in., pale green; rbs 8-13; radials about 10; central spine 1: fls. to nearly 3 in. long, crimson. Utah, Nev., Calif., Mex.

Múnzii (Cereus Munzii). Sts. cylindrical, erect, usually in compact clumps; ribs shallow; spines dull white; radials 10-12, to 1 in. long; centrals 2-4, unequal, to 2 in. long; fls. cerise-pink. Calif.

octacanthus (Cereus octacanthus, and C. Roemeri of some lists). Cespitose, joints or sts. ovoid to 4 in. long and nearly 3 in. diam.; ribs 7-9; radials 7 or 8; central 1: fis. 2 in. long, red. Tex., perhaps westward.

pacificus. Tufted, forming clumps to 2 ft. across, sts. to 10 in. tall and 1½ in. diam.; ribs 10-12, rounded; spines gray, often tinged reddish; radials 10-12, to ½ in. long or less; centrals 4-5, unequal, to 1 in. long: fis. deep red, to 1½ in. long. N. Lower Calif.

papillosus (E. terensis of some lists). Somewhat cespitose, dark green, sts. to 12 in. long and to 1½ in. diam.; ribs 6-10; radials about 7 and needle-like; central 1: fls. 4 in. or more broad, yellow. W. Tex. Var. giganteus is listed.

paucispinus: E. triglochidiatus.

pectinatus (Cereus pectinatus). Simple, cylindric, 4-6 in. long, 1-2 in. diam., with many interlocking spines; ribs 20-22; radials about 30; centrals several: fis. 2-3 in. long, purplish. Mex. Var. adustus: E. adustus. Var. cespitòsus:

E. Reichenbachii. Var. Paileanus is listed. Var. rigidissimus: E. rigidissimus. Var. tamaulipėnsis has more numerous white spines and larger pink fis.

pénsilis (Cerus pensilis). Sts. prostrate to pendent, to 18 in. long and 1½ in. diam.; ribs 8-10, notched; spines to ½ in. long, bulbous at base, yellow to reddish-brown; radials 8; central 1: fls. bright red, to 2½ in. long. Mex.

pentalophus (E. leptacanthus. Cereus pentalophus. C. procumbens). Procumbent, branches ascending to 5 in. and deep green; ribs 4-6; radials 4 or 5 and very short; central 1 or absent: fis. 3-5 in. long, reddish-violet. S. Tex.,

perbéllus. Simple or clustered, to 4 in.; ribs 15; spines all radial, 12-15, 14 in. long: fls. purple, 2 1/2 in. long. Tex.

phoeniceus: E. coccineus.

polyacánthus (Cercus polyacanthus). Cespitose, pale green sometimes tinged red; ribs mostly 10; radial spines about 12; centrals 4: fls. 2 in. or more long, crimson. New Mex., Ariz., Mex.

Posélgeri: Wilcoxia Poselgeri.

procumbens: E. pentalophus.

pulchéllus (Echinocactus pulchellus). Obconical, to 2 in. diam., blue-green to gray-green; ribs 11-13, notched; spines yellow to gray, usually only 3-4, to ½ in. long: fls. pink, to 1¾ in. long, unner segms. acute, dentate. Mex.

purpureus. Cylindrical, to 5 in. tall and 1¼ in. diam.; spines slender, unequal, 14-18, white with purple tips, all radial: fls. deep magenta-purple. Okla.

Reichenbachii (Cercus Reichenbachianus. C. and E. cxspitosus. C. texensis). Somewhat cespitose, sts. globose or short-cylindric, to 8 in. long and 3 in. diam.; ribs 12-19; radials 20-30; centrals 1 or 2: fs. 2-3 in. long, light purple, fragrant. Tex, Mex., perhaps Kans.

rigidissimus. RAINBOW CACTUS. Simple, erect and rigid, short-cylindric, 4-8 in. high and 4 in diam., covered with interlocking spines; ribs 18-22; radials about 16, no centrals: fls. 2-3 in. long, purple. Ariz., Mex.

Roetteri (Cereus Roetteri). Cylindrical, to 6 in. tall and 2½ in. diam., erect; ribs 11-13, notched, straight; spines acicular; radials 15-17, purplish to white, to ½ in. long; centrals 2-5, bulbous, to ½ in. long or more; fls. violetpurple, to 2½ in. long. Tex. to New Mex. and Mex.

Rösei. Forming clumps, sts. to 8 in. long and 3 in. diam.; rbbs 8-11; radial spines 10; central spines 4 and 2 in. long: fls. scarlet, to 2½ in. long. New Mex., W. Tex., N. Mex.

Sáim-Dyckiànus. Sts. ascending, to 8 in. long and 1 in. diam; ribs 7-9, straight to spiral; spines yellowish to red; radials 8-9, to 3% in. long; central 1, to 5% in. long: fls. orange, to 4 in. long. Mex.

sarissophorus. Tufted, sts. depressed-globose, to 4 in. diam.; ribs 9; spines slender; radials 7-10, to 3½ in. long; centrals 3-5, somewhat angled: fls. purplish, to 3½ in. long; fr. globular, spiny. Mex.

Scheèrii. Cylndrical, to 10 in. tall and 1½ in. diam., erect or ascending; ribs usually 7-9 formed from tubercles, dark glossy green; spines to ½ in. long, from yellowish areoles; radials 7-9, straight, whitish; centrals 3, brown with red tips: fls. pink, to 5 in. long. Mex.—Plants so listed in the trade frequently belong elsewhere.

scilrus (Cereus sciurus). Clump-forming, tufts to 2 ft. across, sts. to 8 in. tall; ribs 12-17, shallow, notched; spines slender; radials 15-18, to ½ in. long, brown-tipped; centrals usually 3-5, to about ½ in. long: fts. bright magenta-red, to 3 in. long. S. Lower Calif.

scopulorum. Sts. solitary, to 18 in. tall; ribs 13-17, notched, shallow; spines pink with black tips when young becoming gray; centrals 3-6; fls. rose to rose-purple, paler without, to 3½ in. across, fragrant. Mex.

stoloniferus (E. subterraneus of hort). Colony-forming by stolons, making clumps to 1½ (t. across; ribs 14-16, about ½ in. deep and twice as wide, remotely tubercled; spines black or red becoming white; radials 10-12, spreading; centrals 3-5 of which one is more conspicuous than others: fis. yellow: fr. red. Mex.

stramineus (Cereus stramineus). Forming mounds 1-3½ ft. high, joints to 10 in. long and 1-3 in. diam.; ribs about 13; radials 7-14; centrals 3 or 4: fls. 3-nearly 5 in. long, purple. W. Tex., New Mex., Mex.

 ${\bf subterraneus}. \ E.\ stoloniferus.$

texénsis: E. Reichenbachii, E. papillosus.

triglochidiàtus (Cereus triglochidiatus. C. gonacanthus. C. and E. paucispinus). Cespitose, sts. to 2 ft. long and 3 in. diam.; ribs 5-8; spines 3-8 and often all radial: fls. 2 in. long more or less, scarlet. W. Tex., New Mex., Colo.

tuberdsus: Wilcoxia Poselgeri.

viridiflorus (Cereus and Echinocactus viridiflorus). Small, nearly globular or cylindric, to 8 in. high; nbs 14; radials about 16; centrals 2 or 3 or wanting: fls. about 1 in. long, greenish. S. D. and Wyo. to Tex. Var. centrispinus is listed.

ECHINÓCHLOA. Graminex. Tall coarse ann. or per. grasses with broad lvs. and spikelets in spike-like racemes borne in large terminal panicles; native in warm regions and grown for forage and grain. See Grasses.

Crüs-gälli (Panicum Crus-galli. P. Crus-corvi). Barnyard-Grass. Ann. to 4 ft.: lvs. to 2 ft. long and 1 in. wide: panicles to 8 in. long, awned. Eu., but widely distributed elsewhere. Var. frumentacea (var. eduls, E. frumentacea, Panicum frumentaceum), Japanese Barnyard Millet, Billion-Dollar-Grass, has denser appressed panicles and stiffer purplish awnless spikelets.

frumentàcea: E. Crus-galli var.

ECHINOCÝSTIS (incl. Marah). Cucurbitaceæ. Ann. and per. tendril-climbing monocious vines of N. and S. Amer., with lobed or angled lvs. and small white or greenish fls., the staminate racemose or paniculate and the pistillate solitary. One ann. species, grown from seeds, is frequently planted for covering arbors and fences.

lobata (Micrampelis lobata). WILD- or MOCK-CUCUM-BER. Essentially glabrous ann., slender, to 20 ft. or more: lvs. sharply 3- to 5-lobed: staminate fls. in long prominent profuse clusters: fr. a papery puffy spiny pod to 2 in. long. N. B. to Ida. and Tex.

macrocárpa. Chilicothe. Monoccious per. from very large thick root, st. to 20 ft.: lvs. more or less circular in outline, several-lobed, to 8 in. across: fls. rotate, clear white: fr. oblong, spiny, to 4 in. long. S. Calif., and sometimes planted there.

Márah: E. oregana.

oregana (B. Marah), Man-Root. Differs from E. macrocarpa in having bell-shaped rather than rotate fls.: fr. ovate, 3½ in. or less long, tapering to ends. Coast ranges and hills, Cent. Calif. to Ore.

ECHINOFOSSULOCACTUS: Stenocactus.

ECHINOMÁSTUS. Cactaceæ. A half dozen globular or short-cylindric ribbed cacti allied to Echinocactus and with the appearance of Coryphantha; axils of scales on ovary and fr. naked, all or most of the spines needle-like; fls. purple, rose or reddish. See Cacti.

dasyacánthus. Cylindric, to 6 in. tall; ribs of compressed tubercles, spiralled, areoles oblong; spines somewhat purplish, radials 19-25, to ¾ in. long, centrals usually 4, alike; top of st. woolly: fls. purplish to nearly white. S. W. Tex. and N. Mex.

durangénsis. Simple, ovoid, about 3 in. long and broad; areoles circular, ribs 18–21; radials 15–30 and white tipped black; centrals 3–4 and 3/4 in. long, accular. Mex.

erectocentrus. Ovoid to short-cylindric, to 6 in. tall; ribs 21, comprising closely set tubercles, areoles oblong-elongate; radial spines 14, reddish, straight; centrals 1 or 2, erect, base bulbous: fls. pale pink, to 2 in. long. S. E. Ariz.

intertéxtus (Echinocactus intertextus). Simple, nearly or quite globular, to 4 in. diam.; ribs 13, arcoles elongate; radial spines 16-25 and appressed and upper ones nearly or quite white; centrals 4, one of which is very short and conical: fis. about 1 in. long, purple, the outer segmes, whitemargined. S. W. Tex, Ariz., Mex.

Johnsonii (Ferocactus and Echinocactus Johnsonii). Oblong, to 8 in. high, very spiny; ribs 17-21; radials 10-14; centrals 4-8 and longer and stouter: fls. 2-2½ in. long, deep red to pink. Utah, Nev., Arız., Calif.

Krausei (Echinocactus Krausei). St. cylindric to subconical, to 10 in. tall and 5 in. diam.; ribs 21-23, somewhat spiral, notched; spines straight, radials 14-20, to 1½ in. long, centrals 2-4, to 1½ in. long: fis. pink with white center, to 1½ in. long. Ariz.

Macdòwellii (Echinocactus Macdowellii). Simple, globular or somewhat depressed, nearly 3 in. high, more in diam.; ribs 20-25, areoles circular; radials 15-20 and white, acicular; centrals 3 or 4 and dark: fls. to 11/2 in. long, rose-purple. N. Mex.

uncinatus: Hamatocactus uncinatus.

unguispinus (Echinocactus unguispinus and Trollietii). Globular to short-cylindric, to 5 in. tall, blue-green; ribs 21, shallow, areoles circular; spines almost hiding body, radials 21-25, mostly white, to ½ in. long, centrals 4-8, stout, subulate: fis. reddish, to 1 in. long. Mex.

ECHINOPANAX: Oplopanax.

ECHÌNOPS. GLOBE THISTLE. Compositæ. Stout erect thistle-like per, and bien, herbs with coarse pinnatifid spinescent lys. tomentose or white-woolly underneath: florets each with its own involucel, all aggregated into a spherical dense head that bears a small reflexed common involucre at its base; achenes hairy; pappus either an entire cup, or a dentate or fimbriate crown comprised of more or less united parts; the bracts of the involucel and the pappus afford distinguishing marks for the identification of the species, which are confused in cult. The species of Echinops are many, distributed from Portugal and Spain to India and Cent. Asia, and also in Afr.

The globe thistles are bold plants good for striking effects in the border or in colonized clumps. The prominent stiff involucel scales are metallic-blue in the cultivated kinds, giving the head a pleasing color effect; the little corollas themselves may be blue or white. The plants are of simple culture, in open places Propagation is by seed, which gives blooming plants the following summer: but perennial kinds may be increased also by dividing the clumps and by root-cuttings. They are hardy North.

bannáticus. Per. to 3 ft. and more, the st. lightly canescent: lys. rather thin, green above and canescent underneath, lower ones petioled and lyrate or somewhat divided into large oblong segms, the margins ciliate-spinulose, upper lys. small and clasping involucel bracts 18-20, glabrous; pappus scales united at base. S. E. Eu, Asia Minor.

commutatus of lists: perhaps E. exaltatus.

dahùricus Per., st. hairy-pubescent at base and cobwebby above: lvs. smooth above, white-tomentose underneath, pinnatifid into either narrow-lanceolate or broad-lanceolate segms, margin with small spines; involuced bracts slender-acuminate and ciliate; pappus a fimbriate crown. Siberia, Mongolia.—Imperfectly known as a cult. plant.

exaltatus. Bien. to 3 or 4 ft, st. simple or nearly so, glandular-hairy and cobwebby: lvs. somewhat rough above, grayish-woolly underneath, unevenly pinnatifid and small-spined: head large, blue; involved bracts long-acuminate, short-ciliate; pappus a rim or entire cup. E. Eu., probably Russia.

giganteus. To 16 ft., cottony above: lvs. rough-hairy above, white-tomentose beneath, pinnatisect into lanceo-late deeply spiny-toothed lobes: heads to 3½ in across; involucel bracts about 15; pappus scales united at base. Nile Land.

Gmélinii: probably E. dahuricus.

humilis. Per., 3-4 ft, st. simple and 1-headed: lvs. villous-cobwebby above, white-tomentose underneath, lower ones short-petioled, sinuate-lyrate and obtuse, nearly spineless, st.-lvs. oblong-linear and spiny-toothed: involuced bracts long-culiate; pappus a fimbriate crown. Siberia. Var. cyaneus is listed.

níveus of lists: probably E. sphærocephalus. pùmilus: listed name.

Ritro. SMALL G. Per., 1-2 ft, st. glandless, terete, branched above, white-tomentose: lvs. nearly glabrous or somewhat webby above, white-tomentose underneath, much pinnatisect into narrow or linear and very spiny short lobes: involucel bracts about 20, the outer ones short and broad-triangular and dentate, the others lanceolate and ciliate; pappus scales united to about the middle. Spain to Asia Minor and Siberia.—Apparently little cult. although the name is common in the lists: see E. sphæro-stabelies.

ruthénicus: confused name; probably a form of E. Ritro is meant.

sphærocéphalus. GREAT G. Per. to 5 and 8 ft., branched st. grooved, glabrous or somewhat canescent or cobwebby on branches and more or less finely glandular or viscid: lvs. green and roughish above and with scattered viscid lvs. green and roughish above and with scattered viscid hairs, canescent underneath, pinnatified into triangular-oblong spinulose segms.: heads large, to 2 in. across; involucel bracts about 16, somewhat viscid, ciliate-pectinate; pappus united above the middle. Cent. and S. Eu., N. Afr. to Siberia.—Common in cult. and sometimes sparingly escaped; apparently sometimes passes for E. Ritro.

syriacus: E. viscosus.

viscosus (E. spriacus). Per., st. tall, branched, mostly canescent and with reddish glandular hairs: lvs. greenish or canescent above and with glandular hairs, canescent underneath, lobed or pinnate into spinose lanceolate revolute segms.; heads large; involucel bracts 20-22, glabrous or glandular; pappus united 1/4 or less its length. Medit. Isls. to Asia Minor.

ECHINÓPSIS. SEA URCHIN CACTI. Cactaceæ. Low condensed plants with ribs continuous or undulate, bearing the areoles which are felted or spiny: fls. from old areoles just above the clusters of spines, narrowly funnelform with long tube, mostly white, the ovary and fr. not spiny. S. American cacti, east of the Andes, perhaps 30 known species although many more names have been applied in the genus: many of the species have also been named in Cereus. See Cacti.

The kinds of echinopsis are often showy because of the long flowers, and although not much grown they are capable of making good window-garden and conservatory subjects.

albiffòra. Globose, to 4 in. diam., bluish-green; ribs 10-11; spines 11-16, about ½ in. long and whitish tipped brown; fls. white, greenish outside, 6 in. across and 8 in. albiflòra. long. Paraguay.

albispinbsa (E. tucumanensis). Globose, becoming columnar, to 4 in. diam., olive-green; ribs 10-12, obtuse, straight; spines subulate, straight, radials about 12, white, sometimes yellow tipped, centrals 1-4, to 1½ in. long; fls. white, to 7 in. long, tube longer than limb. Bolivia, Paraguay.

amcena: Echinocereus amcenus.

ancistróphora. Simple, nearly globose, 3 in. diam.; ribs 15-16; radial spines 3-7 and recurved; central 1 and to 34 in. long, hooked: fls. white, green outside, to 6 in. long. Argentina.

antes: Lobima aurea

Báckebergii: Lobivia Backebergii.

Bérlingii: listed name.

boliviénsis: see Lobivia boliviensis.

Bridgesii (E. Salmana). Cylindrical, to 12 in. tall and 3½ in. diam.; ribs 11-14, obtuse, straight, notched; radial spines 8-12, usually 10, to ½ in. long, straight; centrals 4, to 3½ in long: fls. white, tube of perianth shorter than limb. Bolivia.

cæspitòsa: Lobivia cæspitosa.

calochlòra. Globular to oval, to 3½ in. diam. and 4 in. tall; ribs 12, acute; spines straight, subulate, yellow to brown, radials 14-22, to ½ in. long, centrals 3-4, stouter: fis. white, to 6½ in. long, inner segms. acute. Brazil.

campylacántha: E. leucantha.

chionántha: Lobivia chionantha. cinnabarina: Lobina cinnabarina.

colmariensis: possibly Lobivia Pentlandii or a form of it.

cordobénsis. Simple, to 1½ ft. high and 1 ft. diam., slightly glaucous; ribs 13; radial spines 8-10; centrals 1-3 and to 2 in. long: fls. white, to 8 in. long. Argentina.

Droegeana. Hybrid between E. tubiflora and E. oxygona, having pink outer and white inner petals.

Duvallii. Probably a variety of E. Eyriesii or a hort. hybrid of which the latter is the mother parent and differs from that species in its inner perianth-segms. obtuse, not acute.

Eyrièsii. Simple or clustered, globular to columnar; Eyriesii. simple of clustered, glodular to columnar; ribs 11-18, areoles nearly spineless; spines 14-18, straight, very short: fls. from side of plant toward top, white. S. Brazil to Argentina. Var. grandiflora (E. grandiflora) has more acute ribs and dark pink fls. Var. Shelhäsei (E. Shelhasei), ribs more acute, and areoles with yellowishbrown wool. Var. cristata is offered in the trade.

famatiménsis: Lobivia famatimensis.

fèrox: Lobivia ferox.

Fièbrigii. Globular, to 7½ in. diam., usually spineless at top; ribs 18-24, obtuse, nearly ½ in. deep, strongly crenate; spines stout, curved, at least the 8-10 radials, to 1 in. long or more, central 1: fis white, to nearly 8 in. long, the tube much longer than the limb. Bolivia.

Fischeri: listed name.

Fórbesii (E. valùla). Simple, to 3 ft high and 8 in. diam., glaucous; ribs 10-15; spines straight, subulate, radials 8-15 and nearly white, centrals 1 or more and to 1½ in. long: fls. white, 4 in. long. Paraguay. Var. gigantèa (E. gigantea) has 8-11 ribs, radial spines 5-10, yellow-brown to tan colored, curved upward.

formbsa (Acanthocalycium formosum). Simple, oblong, to 20 in high; ribs 15-35, straight; radial spines 8-16 and yellowish, to 1½ in. long; centrals 2-4 and brown, to 2½ in. long; fis. golden-yellow, 3 in. across and as long. Argentina.

formosissima. St. to 6 ft. tall and 1 ft. diam.; spines

curved upwards, radials about 14, yellow, centrals 4, to 1½ in. long: fis. not known. Bolivia.—Probably only rarely cult.; some plants under this name are said to be Trichocerus pasacana.

gemmata: E. turbinata. gigantèa: E. Forbesis var. grandiflòra: E. Eyriesii var. grandis: Lobivia grandis. Graulichii: see E. Kratochviliana.

Haageana: Astrophytum ornatum: see also Lobivia

Haageana.

hæmatántha: see Lobivia hæmatantha. Hertrichiana: Lobina Hertrichiana. Higginsiana: Lobivia Higginsiana.

Hôssei: Lobivia Hossei.

Huòttii. Simple, short-columnar, to 1 ft. high; ribs 9-11; radial spines 9-11; central spines usually 4 and to 1½ in. long: fis. white, to 8 in. long. Bolivia.

imperialis. Listed name of form said to be club-shaped, to 15 in. tall or more and 4 in. dam; ribs 11, straight, obtuse, to ½ in. deep; spines straight, subulate, to ¼ in. long, radials 8-9, centrals 2-3: fis. white, to 7½ in. long and as wide. Origin not known, possibly a garden hybrid.

korethroides: Eriosyce korethroides.

Kratochviliàna (Lobina Graukchi). Globose, top flattened, not spiny; ribs usually 17, acute, straight; spines curved, stout, radials 8-12, to ½ in. long, whitish, centrals 1-2, usually hooked, to ½ in. long; fls. cream-white, to 2 in. long, tube shorter than limb. N. Argentina.

Kubeana: see Mila Kubeana.

leucántha (E. campylacantha. E. salpigophora). Globose or oblong, 1 ft. high; ribs 12-14; radial spines 8 and curved; central 1 and to 4 in. long: fls. purplish to nearly white, brownish outside, 6 in. or more long. Argentina.

leucorhodántha. Globose to subcylindric, dark green; ribs usually 18-22, to 36 in. high, compressed, acute, somewhat warty; spines yellow, to 36 in. long, radials 9, becoming gray, centrals 1-2, tipped brownish or black; fls. white and suffused pink inside, brownish-white outside, to 5 in. long, fragrant. N. Argentina.

lobivioldes. A plant from Argentina with the general appearance of Lobina cinnabarina but with white fis.

longispina: Lobivia longispina.

mamillosa. Globose, to 2½ in. tall and 3 in. diam., dark glossy green; ribs about 17, undulate, strongly tubercled; spines more or less curved, yellowish with brown tip, radials 8-10, subulate, centrals 1-4: fis. white, tinted rose at margin, to 71/2 in. long, tube longer than limb. Bolivia.

mia: listed name.

mirábilis. Cylindric, to 6 in. tall and ¾ in. diam.; ribs about 11, somewhat undulate; spines straight, radials 9-14, central 1, to ½ in. long, erect: fls. white, to 5 in. long; fr. to 1½ in. long and ¼ in. diam. Argentina.

mistiensis: Lobivia mistrensis.

Mùelleri: garden form, probably hybrid.

mûltiplex. Simple or proliferous, globular to clubshaped and rounded at top, to 6 in. high; ribs 13-15; radials 5-15; centrals 2-5: fls. rose-color, 6-8 in. long, tube enlarged. S. Brazil. Vars. cristâta and variegâta are listed.

Nealeana: Lobivia Nealeana.

nigérrima. Probably a hybrid between E. oxygona and E. Euricsii.

nigra. Globose to subcylindric, to 6 in. diam., bluegreen; ribs about 20, acute, tubercles to 1½ in. long; radial spines 12-14, to 1½ in. long, spreading, incurved, lower ones shorter than upper; central usually 1, to 3 in. long, brown to gray: fis. white within, greenish-red outside, to 4 in. long. Argentina.

nùda: listed name.

obrepánda (Echinocactus obrepandus). Depressed-globose, to 8 in. diam.; ribs 17-18, undulate, acutash; spines curved, brownish, radials 10, to ½ in. long, central 1, to 1 in. long; fis. white to purplish, 10 in. long or more, tube much longer than limb. Bolivia.

oxygòna. Subglobose, simple or clustered, to 10 in. diam., somewhat glaucous; ribs 14; spines about 14: fis. about midway of body, to nearly 1 ft. long, pale red inside. S. Brazil to Argentina. Var. cristata is listed.

paraguayénsis: E. tubiflora var.

pelecyrhàchis. Depressed-globose, bluish-green; ribs acute, low; radial spines about 10, to 1/2 in. long; central 1: fls. white, to 4 in. long. Argentina.

Péntlandii: Lobivia Pentlandii

polyancistra. Depressed-globose, to 2½ in. diam., usually smaller; ribs 17-30, about ½ in. high and slightly wider, obtuse, tubercled; spines numerous, to 1/2 in. long, slender, bristly; fis. white, to 4 in, long, fragrant, Probably Argentina.

potosina: Lobivia potosina.

pseudocachénsis: Lobina pseudocachensis.

rhodacántha: Denmoza rhodacantha.

rhodotrícha. Clustered, sts. to 2½ ft. high and 3½ in. diam.; ribs 8-13; radial spines 4-7 and slightly curved; central 1 and 1 in. long: fls. white, 6 in. long. Paraguay, Argentina. Var. argentiniensis has shorter darker sts.

Rôhlandii. Said to be a hybrid between E. tubifora and E. oxygona, characterized in part by its long spines and pink fis.

Potheriane: listed name

Rûteri: confused name, possibly referable to Echinocereus Roetteri or Aztekium Ritteri.

Salmiana: E. Bridgesii. salpigophora: E. leucantha. salténsis: Lobina saltensis.

Schickendantzii: Trichocereus Schickendantzii.

Schreiteri: Lobivia Schreiteri. Schwantèsii: listed name. Shelhasei E Eurossi var

Silvéstrii. Globular, simple or clustered, to 4 in high and 3 in. diam.; ribs 12-14; spines straight, subulate, yellow to brown but not white, radials 5-9, central 1: fls. white 8 in. long. Argentina.

Spegazziniana. Simple, 1 ft. high and 3½ in diamribs 12-14; spines straight, radials 7-8, central 1 and ¾ in long: fls. from middle of plant, white, 7 in. long. Argentina;

spinifldra: Acanthocalycrum spiniflorum.

thionantha: Acanthocalycium thionanthum.

triumphans: probably E. Eyriesii or a hort, form of it.

tubifora (E. Zuccarana). Simple or clustered, nearly globose, about 5 in. diam; rbs about 12; spines awl-like and black, to ½ in. long; fls from side, 6-8 in. long, white inside Brazil, Argentina. Var cristata is listed. Var. paraguayensis (E. paraguayensis) is longer spined and usually produces more offsets.

tucumanénsis: E. albispinosa.

turbinata (E. gemmata). Simple or clustered, globose; ribs 13 or 14; spines several and about 1/4 in long; fis. near top, about 6 in long, jasmine-fragrant, white inside Argentina.

umadeave: probably Pyrrhocactus umadeave.

undulata: hort, name for a form of E. Eurissii.

válida: E. Forbesii.

violacea: Acanthocalucium violaceum.

Wilkensii. Hybrid, probably between E. Eyriesii and E. oxygona.

Zuccarinii: E. tubistora.

ECHINOSPERMUM: Lappula.

ECHÌNUS (Braunsia). Aizoaceæ. shrubs or prostrate succulents allied to Mesembryanthemum, with lvs. united at base and solitary terminal fls.; stigmas 5. Native in S. Afr.

aniculatus: E. edentulus.

echinatus: listed name, probably Delosperma echinatum. edéntulus (E. apiculatus. M. edentulum). To 4 in.: lvs. to 3/4 in. long and 1/2 in. thick, united more than half way, velvety-pubescent: fls. rosy-magenta with white base,

1 in across.

geminatus (E. Mathewsii. M. geminatum). Sts. ascending, to 6 in long: lvs. 3-angled, united to about middle, to 3/4 in. long and 1/4 in. thick, glaucous: fls. rose, 11/4 in.

Máthewsii: E. geminatus.

Maximilianii (M. Maximilianii). Plant pubescent, sts. creeping and rooting at nodes: lvs. 3-angled, to ½ in. long and ¼ in. wide: fls. reddish.

ECHÎTES. A pocynaceæ. Twining shrubs with opposite simple lvs., salverform clustered fls. in purple, red, yellow, white, and fr. of 2 spreading follicles, the seeds with a tuft of hairs; native in trop. Amer. and one intro. to S. Calif.

tomentosa. Savannah Flower. Very hairy: lvs. oblong, to 4 in. long, lobed at base: fls. yellow with red center, 2 in. long, in long-stalked clusters. Trinidad, center, 2 in N. S. Amer.

ÉCHIUM. VIPERS-BUGLOSS. Boraginaceæ. Bien. and per. bristly herbs, sometimes shrubs, with alternate simple lvs. and blue, purple, rose or white irregular fls. in coiled racemes that are sometimes aggregated into long showy spikes. The species are native in the Old World, but E. vulgare is extensively nat. in this country.

Some of the large Canarian species are much planted in California, and other kinds are grown elsewhere in warm regions and sometimes under glass; the names are yet misunderstood. All of them three in open sunny places. Propagated by seeds or the shrubby kinds by cuttings and lavers.

Bourgeanum. Shrub to 11 ft.: lvs. linear, drooping: fls. rose, in dense pyramidal spikes. Canary Isls.

cándicans. White-hairy shrub to 6 ft.: lvs. lanceolate: fis. white or blue with white lines, in dense one-sided spikelets aggregated into a long spike. Madeira, Canaries.

créticum. Ann. to 2 ft., hairy: lvs. oblong to lanceolate: fls. brick-red, the spikelets in a loose cyme. S. Eu.

fastuosum. Gray-hairy shrub to 6 ft.: lvs. lanceolate: fls. purple or dark blue with red stamens, the dense one-sided spikelets aggregated into a cylindrical spike. Eu., Canaries

gigantèum. White-hairy shrub to 10 ft: lvs. lanceolate: fls. white, the spikelets in a dense panicle, the stamens long-exserted. Teneriffe.

plantagineum. Ann. or bien. to 3 ft., with stiff white hairs and no tomentum: lvs. oval to oblong-lanceolate, passing into broad-based bracts: fls. combined of blue and light purple, not pubescent outside but with hairs, the spikelets forming a long panicle. S. Eu. Var. excélsum is an improved form.

roseum: listed name of hort. form possibly referable to E. rubrum.

rùbrum. Bien. to 3 ft., white-hairy: lvs. linear-lanceolate. fls. red, in narrow panicles, the staniens long-exserted. Eu., W. Asia.

simplex. Woody unbranched bien to 10 ft.: lvs. ovate-lanceolate, large: fis. blue, in long spike-like panicles. Eu.

vulgare. BLUE-WELD, BLUE-DEVIL Bien, to 2½ ft., with stiff white hairs: lvs. oblong to linear-lanceolate: fls. blue or violet-purple, in narrow panicles, the stamens long-exserted. Eu., Asia.—Often a permicious pasture weed.

Wildpretii. Bien. to 3 ft, white-hairy: lvs. linear-lanceolate, sessile: fls. rose, in large terminal cymes, the stamens long-exserted. Canary Isls.

EDANTHE: Chamædorea Tepepilote.

EDDO: Colocasia esculenta.

EDELWEISS: Leontopodium alpinum.

EDGEWÓRTHIA. Thymclæacæ. Two shrubs in Himalayas, China and Japan, somewhat like Dirca, bearing dense heads of fragrant little yellow fls. in advance of the foliage or with it: lvs. alternate and crowded at ends of branches, entire: fr. a drupe-like dry body. E. papyrífera (E. chrysantha, E. Gardheri), Paper-Bush, Mitsumata, is not hardy N. nor does it thrive in hot dry summers, but is intro. in N. Amer.: small shrub with tough branches: lvs. lance-oblong, to 5 in. long: fls. precocious, narrow-tubular, silky, to ½ in. or more long. China, Japan.—The bast is a source of soft tough paper.

EDRAIÁNTHUS. Campanulaceæ. Low tufted per. herbs, about a dozen species in Italy to the Caucasus, particularly in the Dalmatian-Balkan region, distinguished technically from Wahlenbergia in the irregular rather than loculicidal dehiscence of the caps., and otherwise by the small condensed habit, usually clustered or capitate fis. and elongated linear lvs. The generic name has been spelled Hedræanthus, but not originally.

The species are good spring- and summer-flowering rockgarden plants, showy when in full bloom. The flower-stems lop on the ground, making a clump 6-12 inches or more across, and rise at the end with the bunches of purplish or violet bloom that may stand 1-6 inches above the ground. They come readily from seeds. A few species bear the blossoms singly at apex of the many short stems ascending from the rosette (as in E. dinaricus, E. Pumulo, and E. serpyllifolius), but most of them carry their flowers in dense terminal heads so that the individual blooms are not clearly defined; these heads are closely attended by calyx-like bracts, and the length and shape of these bracts are important points in identification; the calyx-lobes themselves (underneath the bracts) are characteristic of the species and in E. Kutabelii there is a tooth or minute auricle in their sinuses. Perhaps some of the named kinds are only variants.

carícinus. Very like *E. graminifolius* but the outer bracts (of the head) always thickly hairy and the head itself narrow.

caudatus: E. dalmaticus.

croaticus. Like E. graminifolius but corolla not hairy; bracts very thick at base, otherwise smooth or nearly so.

dalmáticus (E. caudatus. Wahlenbergia dalmatica). Like E. graminifolius, but outer bracts always longer than the fls. and with narrow end; calyx-lobes short-triangular, broader than long. Dalmatia.

dináricus (E. serpyllifolius var. dinaricus). Fls. solitary at end of st., short-pedicillate: lvs. narrow-linear, hairy on upper surface: corolla-lobes sharp; calyx-lobes sharp, ciliate, about ½ as long as corolla; bracts about equalling fl. E. S. Eu.

graminifòlius (Wahlenbergia graminifolia). Tufted, condensed, 2-4 in. high: lvs. green, linear and mucronate, I in. or less long in the wild, cilate or glabrous: heads few-fld. but broad; corolla hairy, particularly on margins of lobes; calyx-lobes about ½ length of corolla and bluntish; outer bracts not as long as fl. and mostly reflexed. Italy, Albania.

—First named binomially by Linnæus, 1753, as Campanula grammifolia.

Kitaibèlii (Wahlenbergia Kitaibelii). Distinguished from the other capitate species by the presence of a tooth or small auricle between bases of the calyx-lobes; these lobes are long-acuminate, loosely harry, and about ½ the length of the corolla-tube; bracts subtending calyx very broadbased and little if any exceeding the fl. S. E. Eu.

Pumilio (Wahlenbergia Pumilio). Low, condensed, 1-3 in. tall. lvs. very narrow, 1 in. or less long, mostly basal, more or less cliate: fls. solitary, sessile (st. leafy up to the bracts); lobes of corolla acute; calyx-lobes about ½ as long as corolla and hairy. Dalmatia.

sérbicus. Marked by fls. in heads, calyx-lobes broadtriangular and as wide as long and very much shorter than corolla-tube, bracts always shorter than fl.-head. Serbia.

serpyllifolius (Wahlenbergia serpyllifolia. Campanula serpyllifolia). Low, tufted but rather diffuse, to 3 or 4 in. high: lvs. many on the weak sts., spatulate but narrow, mostly 1 in. or so long: fls. bell-shaped, large, rich violet, pedicelled, with bluntish recurving lobes, forming around the outside of the mat of foliage; calyx-lobes broad, about ½ length of corolla, hairy. Dalmatia. In var. major the fls. may be 2 in. across and very showy, in spring.

tasmánicus: Wahlenbergia tasmanica.

tenuifòlius (E. graminifòlius var. tenuifòlius. Wahlenbergia tenuifòlia). Less compact than E. graminifòlius, and Ivs. much longer. bracts broad-cordate at base and abruptly narrowed, the outer ones equalling the fi.-head.

EDWINIA: Jamesia.

EEL-GRASS: Vallisneria.

EGG-FRUIT: Lucuma nervosa.

EGGPLANT (Solanum Melongena var. esculentum). Tender branching large-leaved herb, grown in the vegetable-garden for the edible fruits; sometimes known also as Guinea squash. The large fruits, in purple, white, and stripes, are cooked in various ways.

The eggplant is well at home in the southern states, the long season suiting it. Seeds may be sown in a plant-bed, and the young plants moved directly to the field. In the North, unless one has a greenhouse or warm hotbed, the growing of eggplants should be left to the professional gardener, as the young plants are very tender and should be grown without a check. The seed may be sown in the hotbed or greenhouse a month or more before warm weather, keeping a temperature of 65° to 70°. When the seedlings have made three rough leaves, they may be pricked out into shallow boxes, or, still better, into 3-inch pots. The pots or boxes should be

plunged to the rim in soil in a hotbed or coldframe so situated that protection may be given on chilly nights. Do not set in the field until the season is permanently settled. The soil should be "quick" but not of such nature as to keep the plants growing too large or too late. Watch for the potato-beetle and flea-beetle. The plants are usually set 2-3 feet apart each way. A dozen plants are sufficient for the needs of a family, as each plant should yield two to six large fruits. The fruits are fit to eat at most stages of growth, from those the size of a large egg to their largest development. One ounce of

seed will furnish 1,000–2,000 plants.

New York Improved Purple is a standard variety of eggplant. Black Pekin, Long Purple and Black Beauty are popular. For €arly, or for a short-season climate, New Hampshire Hybrid

is desirable.

EGLANTINE: Rosa Eglanteria.

EHRÈTIA. Boraginaceæ. Trop. or semitrop. shrubs or trees with alternate dentate or entire simple lvs. and short rough hairs, small white fls. in terminal corymbs or panicles or perhaps solitary, and fr. a small drupe; sometimes planted for ornament and interest in the extreme S. U. S. Propagated by seeds and cuttings.

acuminata: see E. thyrsiflora.

buxifdlia: E. microphylla.

elliptica. Tree to 50 ft.: lvs. oval or oblong, to 2 in. long, undulate or serrate: fis. in corymbs to 2½ in. across. Tex. to Mex.

lèvis. Variable shrub, or tree to 40 ft.: lvs. ovate, short-acuminate, to 5 in. long, scrate: fls. in corymbs 3 in. across. India.

macrophýlla. Tree, with elliptic or rhomboid pubescent or harry lvs. to 8 in. long, serrate: fis. small, in compound panicles: fr. a berry ½ in. or more diam. India; planted in 8. Calif.

microphfila (E. buxifolia). Philippine-Tea. Shrub to 12 ft.: lvs. in clusters, obovate, to 2½ in. long, serrate: fis. solitary or 2-4 together. India to Malaya and Philippines.

thrysiflora (Cordia thyrsiflora. E. acuminata of some). Tree to 50 ft.: lvs. obovate, to 7 in. long: fls. in panicles to 8 in. long. Formosa: fairly hardy N.

EICHHÓRNIA (Piaropus). Pontederiaceæ. Trop. American aquatic herbs with floating or submerged lvs. and showy fls. mostly borne in terminal spikes; grown in ponds and tanks. The water should not be more than about 1 ft. deep and good soil provided. Propagated by division.

azīrea. Lvs. broadly ovate to orbicular, the petioles not inflated: fls. lavender-blue with purple center. Brazil.

crássipes. Water-Hyacinth. Floating extensively, with feathery roots: lvs. ovate to orbicular, the petioles much inflated at base: fls. large and showy, violet with blue patch on upper lobe having a yellow spot. Trop. Amer. and nat. in Fla. where it chokes the ponds and streams. Var. mājor has rosy-hlae fls.

paniculata (E. Martiana). To 1 ft., rhizomes short and fleshy: basal lvs cordate-ovate, anex acuminate, blade to 4 in. long with shorter petiole, cauline lvs. smaller: fls. pale violet to blue, with 5-15 in panicles to 4 in. long. Brazil.

EINKORN: Triticum monococcum.

ELÆAGNÀCEÆ. OLEASTER FAMILY. Trees or shrubs of Eu., Asia, N. Amer. covered with silvery or golden scales, having simple and entire lvs., bisexual, polygamous or diœcious polypetalous fls. with 2-4-lobed calyx, no petals, 4 or 8 stamens, 1-celled ovary, and fr. inclosed by the fleshy calyx, forming a berry-like or drupe-like body. There are only three genera, Elæagnus, Hippophaë and Shepherdia, and they

are grown for ornament and somewhat for edible fr.

ELÆÁGNUS. Elæagnaceæ. Ornamental shrubs or small trees in many species, sometimes evergreen, with alternate lvs. covered with scales, inconspicuous perfect fls., and attractive drupe-like frs.; native in N. Amer., S. Eu., Asia.

The species grow in any well-drained soil and sunny location. Propagated by seeds, preferably stratified and sown the second spring, hardwood- and root-cuttings, lavers, and grafting.

angustifòlia (E. hortensis). OLEASTER. RUSSIAN OLIVE. Very hardy, to 20 ft, deciduous, sometimes spiny: branchlets and under sides of lvs. silvery: fls. fragrant, 1-3 in axils of lvs., in June: fr. yellow and silvery, on very short stalks. Eu, W. Asia. Var. orientàlis has broader lvs. and larger fr. and var. spinòsa is more spiny.

argentea: E. commutata.

commutata (E. argentea of cult.). SILVERBERRY. To 12 ft., deciduous: lvs. silvery on both sides: fts fragrant, 1-3 in axils, May-June: fr. silvery, on very short stalks. E. Canada to Minn. and Utah.

eduis: E. multiflora.

Fruitlandii: a form of E. pungens.

glàbra. To 20 ft., evergreen, climbing or sarmentose: under sides of lvs. with brown scales: fls. fragrant, in autumn: fr. gray or rusty. Japan, China.

horténsis: E. angustifolia.

latifòlia. Variable, either erect or climbing, sometimes tree-like: lvs. ovate to elliptic or broader, obtuse or acute, to 5 in. long, silvery or rusty underneath: fls. many, clustered: fr. to 1½ in. long, red. India.

longipes: E. multiflora.

macrophýlla. To 12 ft, evergreen: lvs. silvery beneath, becoming dark shining green above: fls. fragrant, 4-6 m axils, in autumn: fr. red. Japan; to be grown far S.

multiflora (E. edulis. E. longspes). Gumt. To 6 ft, deciduous: lvs. silvery beneath, also with brown scales: fls. fragrant, 1-2 in axils, Apr.—May: fr. scarlet, on slender stalks to 1 in. long, edible. Japan, China; hardy in the N. Leaf forms are known under the varietal names crispa, ovata and rotundifolia.

parvifòlia: E. umbellata var.

philippénsis. To 9 ft., with drooping branches: lvs. silvery beneath, slightly toothed: fls. axillary, often solitary: fr. red. Philippines.

púngens. To 15 ft, evergreen, usually spiny: lvs silvery beneath dotted with brown scales, wavy-margined: fis, fragrant, in axillary clusters in autumn: fr red, silvery and brown when young, short-stalked. Japan, China. Variegated forms are atrea, lvs. margined yellow; Fredericii variegata), lvs. with large yellow center; maculata (aureo-maculata), lvs. with large yellow blotch in middle; marginata, lvs. silver-edged; nana, a dwarf form; variegata, lvs. margined with yellowsh-white. In var. refléxa the lvs. are very brown-scaly beneath and the margins not wavy; var Simonii (E. Simonii), lvs. silvery beneath, sometimes variegated yellow and pinkish-white. Other listed vars. are compácta and rotundifolia. The various leaf forms are often grown under glass; in the open hardy only far S.

refléxa: E. pungens var.

Simonii: E. pungens var.

umbellåta. To 18 ft., deciduous, branchlets covered with brown scales: Ivs. silvery beneath: fls. fragrant, 1-3 in axils, May-June; fr. scarlet, silvery when young, short-stalked. Himalayas, China, Japan. Var. parvifolia (E. parvifolia). Branchlets silvery: fr. silvery becoming pink. Himalayas.

ELÆIS. Palmaceæ. Monœcious tall feather-palms of trop. Afr., probably only a single species, unarmed except perhaps on the petiole and bracts and tips of rachillæ: spadices among the bases of the lvs. tightly packed in the center of the crown like bird nests, branched but short, some of them staminate and others pistillate; stamens 6: fr. a 1-3-seeded ovoid or obovoid drupe surrounded by spine-like bracts. See Palm.

guineénsis. Aprican Oil Palm. Trunk to 60 and more ft, much scarred: lvs. 10 15 ft. long, the lower ones drooping and some of the dead ones hanging, with very many ridged narrow pinne, green both sides: staminate head composed of many finger-like appressed spine-tipped branches 4-6 in. long; fruiting head 1 ft. long more or less:

fr. ovoid or ovoid-conic, about 1 in. long, red, orange or yellowish W. and Cent. Afr.—Prized for the oil-bearing faunt planted for ornament and interest in the western hemisphere; stands in S. Fla.; spontaneous in parts of the American tropics.

melanocócca: a fruit form of E. quineensis: see Corozo.

ELÆOCARPÀCEÆ. ELÆOCARPUS FAMILY. About 8 genera of trees and shrubs, allied to Tiliaceæ, native in tropics and semi-tropics of both hemispheres: lvs. alternate or opposite. simple: fls. unisexual or bisexual, polypetalous, often showy, in racemes or panicles, having 4-5 sepals and petals, or sometimes petals absent, numerous stamens, superior ovary: fr. a caps. or drupe. Aristotelia, Crinodendron, Elæocarpus and Muntingia are known to hort. in the U.S., all grown in the warmer parts of the country.

ELÆÓCÁRPUS. Elæocarpaceæ. Trees native in the tropics and warm parts of the Old World, with alternate simple lvs., mostly bisexual fls. in axillary racemes, and small drupaceous frs.: sometimes grown for ornament in S. U. S., and in Calif. Propagated by cuttings, and by seeds when obtainable.

cyàneus. Small mostly glabrous tree: lvs. oblong or elliptic to nearly lanceolate, acuminate, to 4 in. or more, serrate: fls in loose racemes: fr. with 1 seed to ½ in. long. Queensland.

Queensland.

dentàtus. To 60 ft., foliage mostly at ends of branchlets which are silky: lys. leathery, linear-oblong to narrowly
obovate, to 4 in. long, finely wavy-toothed, the margins
recurved: fls. white, ½ in. aeross, drooping: fr. purplishgray, ½ in. long. New Zeal.

Hookeriànus. Tree to 40 ft. with glabrous branchlets:
lys. narrowly linear to nearly orbicular and even pinnatetoothed on young parts, narrow-oblong or lanceolate and
serrate or crenate on old plants: fls. greenish-white and
drooping: fr. ½ in. long. New Zeal.

ELÆODÉNDRON. Celastracex.Trop. or semi-trop, trees and shrubs with simple leathery lvs., small greenish or white fls. in axillary clusters, and drupaceous fr.; grown in trop. or warm regions or under glass in the juvenile state. Propagated by cuttings.

capense. Evergreen shrub: lvs. elliptic-ovate, margins revolute and slightly toothed: frs red, to 1 in. long. S. Afr.

Laneanum. Bermuda Olive-Wood Bark. Evergreen tree to 45 ft.: lvs. oblanceolate, shallowly toothed: fis. diocious: frs. yellowish-white, to 1 in long. Bermuda.

orientale (Aralia Chabrieri of gardens). FALSE OLIVE. Lvs. obovate, wavy-margined, in the juvenile state long and narrow with a dark red midrib: frs. about size of olive. Madagascar, Mauritius.

ELAPHOGLÓSSUM. Polypodiacex. Trop. ferns with creeping rhizomes and simple rather thick more or less tongue-like fronds; sori covering under surface of fronds. They are treated warmhouse plants, requiring abundant moisture if drainage is good. See Ferns.

crinitum (Acrostichum and Hymenodium crinitum). ELEPHANT-EAR-FERN. Fronds to 2 ft. long and 10 in. wide, on shaggy-hairy stipes 1 ft. long. W. Indies, Mex., Cent. Amer.—A striking plant.

ELAPHRIUM: Pistacia Simaruba,

ELATINOIDES: Kickxia,

ELDER: Sambucus. Box-: Acer Negundo.

ELECAMPANE: Inula Helenium,

ELEÓCHARIS. Cyperaceæ. Mostly per rush-like plants, allied to Scirpus, adapted for planting on the edges of ponds or boggy places: Ivs. commonly reduced to sheaths: fls. in solitary terminal spikelets. Originally spelled Heleocharis but corrected later.

acicularis. Tufted, hair-like, to 8 in.: spikelets flattened, to 14 in. long. N. Amer., Eu., Asia.

dúlcis (E. tuberosa. Scirpus tuberosus). Chinese Water-CHEENUT. MA-HAI. Slender rush-like plant with narrow lvs. shorter than the articular culms, often not fruiting: plant produces a solid tuber or corm at base, 2 in. or less in diam., much eaten by Chinese and sold in their shops; propagated by offsets from the corm, in moist conditions. E. Asia. Pacific Isls.

tuberòsa: E dulcis.

ELEPHANTS-EAR: Colocasia, Enterolobium cyclocarnum.

ELEPHANTS-FOOT: Testudinaria elephantipes.

ELETTÀRIA. CARDAMON. Zingiberaceæ. Per. herbs of 1 or more species native in India, the seeds of which are used medicinally and as spices. E. Cardamômum. To 10 ft., with creeping rootstocks: lys. to $2\frac{1}{2}$ ft. long and $3\frac{1}{2}$ in. wide: fls. white, the lip or staminodium margined with yellow and striped with blue, borne in bracts on panicles to 2 ft. long: caps. to 3/4 in. long, containing aromatic seeds.—The plants succeed in moist shady places in warm climates. Propagated by division of roots and by seeds. See Zinarberacex.

ELEUSINE. Graminex. Tufted annuals with flat lvs. and spikelets in dense spikes borne in digitate terminal umbels or toward top of sts.; native in the Old World and grown for ornament and in some countries for grain. See Grasses.

barcinonénsis: E. tristachua. coracana. AFRICAN MILLET. To 4 ft.: lvs. to 1 ft. long and ½ in. wide: spikes to 1½ in. long and ½ in. broad, erect. Probably Asia and Afr.

indica. Wire-Grass. To 2 ft.: lvs. to 1 ft. long and 1/4 in. wide: spikes to 4 in. long, spreading. Old World, but nat in N. and trop. Amer.

oligostachya: the plant grown under this name is E. indica

tristachya (E. barcinonensis). To 1 ft.: lvs. short, $\frac{1}{16}$ in. wide: spikes to $1\frac{1}{2}$ in. long and $\frac{1}{2}$ in. broad. India.

ELISÈNA. Amaryllidaceæ. A small genus in the Andes of S. Amer., allied to Hymenocallis but differing in having a much shorter perianthtube with longer linear lobes and the stamen filaments declined or recurved, not erect. One species, E. longipétala, is cult. To 3 ft.: lvs. linear, basal, about 2 ft. long: fls. white, lobes rotate, to 3 in. long, undulate and somewhat recurved at tip, scape 4-7-fld. Peru.

ELLIÓTTIA. Ericacex. One deciduous shrub, E. racemòsa, inhabiting sandy lands and pine woods in E. Ga. and S. C.: to 10 or 20 ft., sometimes tree-like: lvs. alternate, oblong to oblonglanceolate, to 5 in. long, pointed, entire, glabrous above: fls. small, white, with 4 petals and 8 stamens, in slender terminal racemes. To be expected in grounds.

ELLIPTIC: a flat part or body that is oval and narrowed to rounded ends.

ELM: Ulmus. Water-: Planera aquatica.

ELMÈRA. Saxifragacex. One low herbaceous species, E. racemosa (Heuchera racemosa), differing from the genus Heuchera in its simple racemose infl., leafy flowering branches, greenishyellow fls., petals usually notched or pinnately divided, and fr. gaping widely at maturity between the 2 persistent styles. Wash.

ELODEA: Anacharis.

ELONGATE: lengthened; stretched out.

ELSHÓLTZIA. Labiatæ. Herbs or undershrubs grown for their dense spikes of small 2-lipped blue or lilac fls., usually aromatic; stamens 4, exserted: lvs. opposite, toothed.

Elsholtzias require a sunny position for the most success in blooming. Propagated by seeds sown in the spring, the shrubby types also by greenwood cuttings in summer. The species below are hardy North.

cristata. Ann. to 1½ ft.: lvs. ovate to oblong, to 2 in. long: fis. light blue, in spikes to 3 in. long in terminal panicles. Asia.

Fárquhari: hort. name, probably of a form of E. Stauntonia

Stauntonii. Shrub to 5 ft.: lvs. ovate-oblong to oblong-lanceolate, to 5 in. long: fls. hlac-purple, in dense one-sided spikes to 8 in. long terminating the branches. Sept.-Oct. N. China.

ELSOTA: Securidaca diversifolia.

ÉLYMUS. WILD RYE. LYME-GRASS. Gramineæ. Tall per. grasses of temp. regions around the world, the spikelets borne in dense terminal spikes; a few may be planted for ornament on banks and rear borders. See Grasses.

arenarius. Sea Lyme-Grass. Dune-Grass. To 8 ft.: lvs. 1 ft. or more long and ½ in. wide, becoming involute, rough above: spikes to 10 in. long, awnless. Asia, Eu.— Used as a sand binder.

canadénsis. To 5 ft.: lvs. 1 ft. or more long and ¾ in. wide, rough: spikes to 1 ft. long, often nodding, awas to 2 in. long. N. Amer.

condensatus. To 10 ft.: lvs. 1 ft. or more long and 1 in. wide, rough: spikes stout, to 15 in. long, awnless. W. N. Amer.

gigantèus. Erect per to about 3 ft., with creeping rhizomes: lvs. rather stiff, to ½ in broad: spikes to 15 in. long, with awn points. Russia, Siberia.

gladcus. To 5 ft.: lvs. to 1 ft. long and 1/2 in. wide, nearly smooth: spikes to 8 in. long, awns to 3/4 in. long. Ont. to B. C. and Calif.

möllis. Differs from E. arenarius (of which it is often

considered a var) in the pubescent spikelets.

virginicus. To 3 ft.: lvs. to 14 in. long and ½ in. wide, rough: spikes to 7 in. long, awns to ½ in. long. N. S. to Fla. and Tex.

EMARGINATE: with a shallow notch at the apex.

EMBLIC: Phyllanthus Emblica.

EMBÒTHRIUM. Proteaceæ. A few shrubs and small trees of the southern hemisphere, one of which is intro. in Calif.: lvs. coriaceous, entire: fls. bisexual, showy, in dense racemes: fr. 1-celled many-seeded follicle. E. coccineum, of Chile, is a shrub with oblong to elliptic alternate lvs.: fls. scarlet, about 2 in. long, with exserted red style.

Compositx.Slender herbaceous annuals and perennials with alternate and basal lvs. and solitary or clustered rather small rayless heads in many colors; pappus of white soft bristles; mostly native in tropics of Old World. Two species, commonly confused, are grown as flower-garden annuals; of simple cult. in a sunny place.

coccinea: E. sagittata.

flámmea: E. sagittata.

sagittàta (E. flammea. E. and Cacalia coccinea). TASSEL-FLOWER. FLORAS-PAINTERUSH. Ann. to 2 ft.: lower lvs. ovate, toothed, narrowly wing-petioled: heads red or scarlet, ½ in. across, in loose corymbs. Tropics. Var. lùtea (Cacalia aurea) has golden-yellow fis.—This is the

sonchifolia (Cacalia sonchifolia). Ann. to 2 ft.: lower lvs. obovate, toothed or lyrate-pinnatifid: heads rose or purple, rarely white, 1/2 in. across, in loose corymbs. Tropics.

EMMENÁNTHE. Hydrophyllaceæ. herbs native in W. N. Amer., with alternate lvs. yellow fls. in terminal racemes and bell-shaped persistent corolla.

Seeds may be sown where the plants are to grow, or indoors if early bloom is desired, in open sunny exposure.

penduifiòra. Yellow- or Golden-Bells. Whispering Bells. To 1½ ft., but often only a few inches: lvs. pinnatifid into ovate segms.: fis. drooping, about ½ in. long, in summer. Calif., on slopes and deserts.

EMMENÓPTERYS. Rubiaceæ. One deciduous tree to 40 ft., adaptable to mild climates. Propagated by seeds and cuttings of soft wood under glass. E. Hénryi has lvs. opposite, oval. to 6 in. long, entire: fls. yellow, funnelform, 1 in. long, in many-fid. terminal panicles: fr. a caps. to 13/4 in. long, often with 1 wing-like calyx-lobe persistent. Cent. China.

EMMED. Trationen discomm

EMPETRÀCEÆ. CROWBERRY FAMILY. Three genera of heath-like evergreen small shrubs in the northern hemisphere: lvs. alternate and crowded, linear; fls. bisexual or unisexual, regular. with 2-3 sepals or none, no petals, 2-3 stamens, superior ovary: fr. a drupe. In the sequence of orders this family stands near Euphorbiaceae. Corema and Empetrum are sometimes grown for ornament.

ÉMPETRUM. Empetracex. A few shrublets, more or less procumbent or depressed, of the western hemisphere and N. Eurasia, sometimes transferred to grounds: fls. very small, solitary in the axils: fr. a little drupe. E. nigrum. Crow-BERRY. Spreading heath-like evergreen to 10 in. high: lvs. linear or nearly so, about 1/4 in. long, margins revolute: drupe berry-like, black. Var. purphreum has red or purple fr. Rocky places N. Y. to N. Calif. and northward, and in N. Eu. and Asia and mts. southward; adapted to rockgardens.

ENCÈLIA. Compositæ. Herbs or subshrubs with alternate or opposite entire or toothed lvs. and rather showy heads of yellow ray-fls. and yellow or purple disk-fls.; pappus none or of awns; native from W. N. Amer. to Chile. Sometimes planted for ornament.

californica. Per, woody at base, to 4 ft., strong-scented: lvs. ovate to broad-lanceolate, to 214 in. long: heads solitary, long-stalked, 214 in. across, golden-yellow, disk purple; involucre white-hairy. Calif.

eriocéphala: Gerwa canescens.

farinosa. Shrubby, to 5 ft.: lvs. ovate, to 2½ in. long, often silvery-tomentose: heads in cymes, about 1 in. across, with yellow disk and rays; involucre slightly pubescent. Calif, Ariz, Mex.—The clumps are very showy early in season on deserts.

ENCEPHALÁRTOS. Cucadacex. African plants with stout trunks terminated by a cluster of stiff pinnate lvs.; about 20 species of which a few are grown for the ornamental foliage. For cult. see Cycas, from which the genus is separated by technical characters of fls. and frs., and pinnæ without midrib.

Altensteinii (Zamia Altensteinii). Trunk to 6 ft. high and 1 ft. diam.: lvs. to 6 ft. long; lfts. thick, very spiny when young but on older plants often spineless, about 1 in. broad. S. Afr.

1 in. broad. S. Afr.

Hildebrandtii. Trunk to 20 ft. high and 1 ft. diam.:
Ifts. leathery, margins with 1-4 teeth on either side, tip
spiny. Trop. Afr.

Laurentianus. Trunk to 30 ft. high and 2½ ft. diam.:
lvs. to more than 20 ft. long; lfts. leathery, margins with
6-10 teeth on either side, spiny-tipped, some of them to
16 in. long and 2 in. broad. Trop. Afr.

Lèhmannii. Trunk very large: lits. pale green, to 7 in. long, entire or occasionally with 1 or 2 spines, tip spiny, petiole and rachis somewhat 4-angled. S. Afr.—The plants advertised as Zamia Lehmannii glauca and Skinneri probably belong here.

villosus (Zamia villosa). Trunk entirely underground, woolly: lvs. to 6 ft. long; lfts. bright green, with spiny teeth and tips. S. Afr.

ENCHOLIRION: Vriesia Saundersii.

ENCHYLÆNA. Little Chenopodiaceæ. shrub allied to Kochia, native in Australia,

E. tomentosa, adapted to planting in dry climates for its dense spreading habit and gray or silvery color: procumbent or horizontally much branched, to 3 ft. or more and making a broad mass: lvs. terete, ½ in. or less long: fls. small, solitary in axils, followed by fleshy red or yellow berry-like bodies.

ENCYCLIA, according to latest researches, is merely a well-marked section of the polymorphic genus Epidendrum.

ENDIVE (Cichorium Endivia). Hardy annual or biennial, grown for its rosette of leaves which are used as salad and for greens. It is grown mostly as a late summer, autumn and early winter product, more or less extending the season of lettuce.

Seedings should be started so that the plants will mature after the hot weather is past. The plants need protection from severe frosts by carefully lifting them and removing to a frame, where sash or cloth may cover them in freezing weather. The leaves, which constitute practically the whole plant, are blanched before being used, either by tying together or by standing boards on each side of the row, allowing the top of the boards to meet over the center of the row; in two to four weeks the interior leaves will be sufficiently blanched. If the foliage keeps wet inside, it is likely to decay; the leaves should be tied together only when dry, and it may be necessary to untie and open them after a rain, and a similar precaution is necessary in other methods of blanching. The rows should be $1\frac{1}{2}$ or 2 feet apart, the plants 1 foot apart in the rows. One ounce of seed will sow 150 feet of drill more or less, before thinning or transplanting.

ENGELMÁNNIA. Compositæ. One per. herb native in dry soil Kans. to Mex., sometimes transplanted, related to Parthenium. E. pinnatfida. To 3 ft., hairy: lvs. pinnatfid into lanceolate toothed or entire lobes, to 8 in. long: heads 1 in. across, of yellow ray- and disk-fls., in corymbs.

ENKIANTHUS. Ericacex. Mostly deciduous shrubs with alternate or crowded finely toothed lvs. turning bright colors in autumn, fls. in drooping umbels or racemes in spring, and capsular frs.; native in Asia and fairly hardy in the N. They thrive in well-drained peaty soil, like many other plants of the Heath family. Propagated by seeds, cuttings or layers.

campanulatus. To 30 ft.: fls. yellow or pale orange veined with red, bell-shaped, to 32 in. long. Japan. Var. albiflorus has fls. white or nearly so; var. Palibinii has narrower lvs. and red fls.

cérnuus. To 15 ft.: fls. white, bell-shaped with irregularly cut limb, ½ in. long. Japan. Var. rùbens has deep red fls.

chinénsis. Shrub or small tree, young sts. red: lvs. elliptic, with wavy-toothed margins, glabrous: fls. salmonred, to $\frac{1}{2}$ in. across. W. China.

deficus. Shrub or tree to 30 ft., branchlets bright red: lvs. elliptic-oboyate to oblong-lanceolate, to 3 in. long: fls. yellowish-red, veined darker, to \$\xi\$ in. across. W. China.—Differs from E. campanulatus in ovary and style pubescent, not glabrous.

japónicus: E. perulatus.

perulatus (E. japonicus). To 6 ft.: fls. before the lvs., white, urn-shaped, 35 in. long, the corolla gibbous at base. Jupan.

subséssilis. To 10 ft.: fls. white, urn-shaped, 1/5 in. long, gibbous at base. Japan.

ENTELEA. Tiliacex. One large-lvd. shrub or small tree to 20 ft., native in New Zeal. and

planted in S. Calif. E. arboréscens. Lvs. alternate, cordate-ovate, to 9 in. or more long, toothed and often slightly 3-lobed: fls. white, 1 in. across, in cymes: fr. a bristly caps. 1 in. across. For E. palmata see Sparmannia palmata.

ENTEROLÒBIUM. Leguminosæ. Trop. American trees with 2-pinnate lvs., fls. in heads or clusters with prominent whitish, greenish or purplish stamens, and broad leathery pods which are usually bent or coiled inward; planted in the tropics as windbreaks or for ornament.

cyclocárpum. Elephants-Ear. Caro. Large broadheaded tree to 50 ft. or more: Ifts. 20-30 pairs: stamens white: pods bent so as to form a complete circle, used as cattle feed in tropics. Jamaica, Venezuela.

Timboùva. Differs in its fewer lfts., 10-20 pairs, and the pods bent to form one-half or two-thirds of a circle. Brazil.

ENTIRE: margin continuous, not in any way indented;

EOMÈCON. Papaveracex. The only species, E. chionántha, from China, is a rhizomatous herbaceous per. with white poppy-like racemose fls. 2 in. across on a slender branching scape 1 ft. or more tall: lvs. radical and long-stalked, cordate, to 6 in. long, sinuate: petals 4: spring-blooming and hardy at N. Y. City. Known as Snow-Poppy.

EORA: Rhopalostulis.

EPACRIDACEÆ. EPACRIS FAMILY. Shrubs and small trees of the southern hemisphere related to Ericaceæ and differing in technical characters. The family comprises about two dozen genera of which only Cyathodes, Epacris and Leucopogon are much known in cult.

ÉPACRIS. Epacridaceæ. Heath-like evergreen shrubs, seen now and then under glass and adapted to warm climates; native in Australia and New Zeal.: lvs. small and entire, scattered: fls. solitary in axils of lvs. or bracts, the short peduncle covered with imbricating bracts; corolla tubular, white, red, purple, mostly small but often showy. Treatment as for ericas.

hýbrida: listed name.

impréssa. To 3 ft., with many ascending pubescent branches: lvs. narrow-lanceolate and sharp-pointed, mostly under ½ in. long: fls. white or red; corolla-tube ½ in. or less long, differing in the several forms. Australia.

EPAULETTE-TREE: Pterostyrax.

ÉPHEDRA. MEXICAN TEA. JOINT-FIR. Gnetaceæ. Shrubs growing mostly in dry or desert regions around the world, with jointed green branches resembling the horsetail, scale-like or sheath-like lvs., unisexual fls. and red berry-like frs.

Occasionally planted in this country in dry locations as ground-cover or for the green stemmy clumps, as in regions where the native kinds grow. Mexicans and Indians make a medicinal tea from the branches. Propagated by division of clumps and by seeds, suckers and layers.

altíssima. Climbing to 25 ft.: lvs. to 1 in. long. N. Afr. distàchya. Low or procumbent shrub to 2 ft.: lvs. scale-like, opposite. S. Eu., N. Asia. Var. helvética (E. helvetica) differs in technical fr. characters.

frágilis. Erect or climbing shrub, or sometimes prostrate: lvs. minute, opposite. Medit. region.

helvética: E. distachya var.

trifúrca. Erect, to 4 ft., pale green: scale-like lvs., mostly in 3's. Utah to Mex.

víridis. Erect, to 4 ft., bright green: awl-like lvs. opposite. Colo. to Calif. and Ariz.

EPHEMERAL: persisting for one day only, as flowers of spiderwort.

EPIBATERIUM: Cocculus.

EPICÁTTLEYA. Orchidaceæ. A small group of bigeneric hybrids between Epidendrum and Cattleya, most of which are known in the trade by vernacular names.

guatemalénsis. Parentage not known.

EPIDÉNDRUM, Orchidaceæ. Epiphytic orchids native in trop. Amer., with leaf-bearing pseudobulbs or leafy sts. and fls. mostly in terminal racemes or panicles, the sepals and petals commonly similar, the lip simple, bilobed or 3-lobed, with a distinct claw more or less united with column. They are plants of various habit, and require mostly intermediate temperature as for Cattlevas; see Orchids for cult.

arachnoglossum. Sts. cylindric, leafy, 4-5 ft. long: lvs. ovate-oblong, obtuse, to 4 in. long, coriaceous: fls. rich violet or crimson with bright orange-yellow lip; sepals and petals small, elliptic-oblong; lip 3-lobed. Jan.-May. Colombia, Venezuela.

aromáticum (Encyclia aromatica). Pseudobulbs sub-globular to pyriform, 1-3-lyd.: lvs. to 1 ft. long: fls. pale yellow to olive-green, fragrant, in many-fld. pendulous panicles to 3 ft. long. Apr.-June. Mex., Guatemala.

panicies to 3 it. long. Apr.-June. Mex., Guatemala.

atropurpureum (E. macrochilum, Encyclia atropurpurea and macrochila). Pseudobulbs ovoid-pyriform, 2-3-lvd.: lvs. to about 16 in. long: racemes (rarely branching) about 4-13-fid.; fis. 2-3 in. across; sepals and petals greenish-brown often tinged with purple; lip white or yellowish with purplish stripes. Dec.-Mar. Mex. to Panama, W. Indies, N. S. Amer.

aurantiacum: Cattleva aurantiaca.

auritum: E. paleaceum.

bicornutum: Diacrium bicornutum.

bifdum (E. papilionaceum). Pseudobulbs oblong-ellipsoid, 2-3-lvd. at the apex: lvs. narrowly oblong, to 14 in. long: scape to about 4 ft. tall, simple or branched above, few-many-fld.; sepals spatulate-oblong, greenish or pale purple, petals narrower; lip 2-lobed, purple or white with purple streaks. Oct.—May, Aug. W. Indies.

Boothianum (E. erythroniodes). To 10 in. high: pseudo-bulbs clustered, ovoid to pyriform, 2-lvd.: lvs. to 7 in. long, oblong-spatulate: fls. few in loose racemes; sepals and petals yellow spotted with dark brown; hp yellow. S. Fla., W. Indies, British Honduras.

Boundii. Hybrid between E. Burtonii and E. radicans.

Brassavolæ. Pseudobulbs ovoid to pyriform-cylindric, to 7 in. high, with 2 leathery lvs. to 9 in. long and 1¾ in. wide: fls. to 4 in. across, in 3–12-fld. loose racemes; sepals and petals narrow, yellow or greenish-yellow; lip white or pale yellow tipped with violet-red. Apr.—Sept. Cent. Amer.

Burtonii. Hybrid between E. O'Briemanum and E. ibaauense.

ciliare (Auliza ciliaris). Pseudobulbs to about 7 in. high, with 1-2 leathery lvs. rarely to 11 in. long: fls. in loose racemes; sepals and petals very narrow, yellowishgreen; lp 3-lobed, white with 2 yellow spots at base, side lobes deeply fringed, mid-lobe very narrow. Blooms all year. Trop. Amer.

cochleatum. Pseudobulbs to 10 in. long, with 2 or rarely 3 lvs. to 14 in. long: scapes commonly simple, loosely fld.; sepals and petals narrow, whitish-green; lip cochleate, dark purple with yellow radiating veins. Blooms all year. Trop. Amer.

conspicuum: E. roseum.

Cooperianum. Sts. cylindric, leafy above: racemes drooping, many-fld.; fls. about 1½ in. across; sepals and petals yellowish-brown; lip rose. Nov.-May, Aug. Brazil, British Guiana.

dellénse. Hybrid between E, radicans and E, xanthinum.

difforme (E. latilabre). Sts. cylindric: lvs. ligulate to oval: fls. to about 2 in. across, green, few to numerous in terminal umbellate racemes; lip much broader than long. Fla., Mex., Cent. Amer., S. Amer.

dirnum (E. virens. Encyclia diurna and virens). Pseudo-bulbs ovoid-oblong, 2-3-lvd.: lvs. to 1½ ft. long: infl. to almost 3 ft. long, paniculate; fis. about 1-1½ in. across; sepals and petals green or greenish-yellow; lip white with purple streaks. May-July, Nov., Feb. W. Indies, Venezuela.

elongatum: E. secundum.

erythronioides: E. Boothianum.

evéctum. Sts. slender, cylindric, to 5 ft., branched, leafy above: peduncle long, at the apex with a short dense raceme; fls. rose-purple, with fringed 3-lobed lip. Colombia.

fragrans. Pseudobulbs variable, 1-lvd. at the summit. tragrams. resudopulps variable, 1-ivo. at the summit, to 5 in. high: If. rarely to 13 in. long; fis. fragrant, in short few- to several-fid. racemes; sepals and petals yellowshwhite; lip white lined with violet. Blooms all year. Cent. Amer., W. Indies, S. Amer.

galtonense. Hybrid between E. Boundii and E. ranthinum,

Godseffianum: E. osmanthum.

graniticum: E. oncidioides.

ibaguénse (E. ybaguense). Sts. slender and tall, leafy above: lvs. very fleshy: infi. racemose at summit of long naked peduncle, densely-fld.; fls. orange and vellow; hp 3-lobed, toothed or fringed. S. Amer.

indivisum: Diacrium bicornutum var.

inversum. Pseudobulbs fusiform, to 6 in. long, with 2 leathery lvs. at the summit: lvs. 8¾ in. long: fls. in 7-12-fld. racemes, pale straw-color or white streaked with rose and with a rose spot on lip. Brazil.

kewense. Hybrid between E. evectum and E. ranthinum. lánipes. Sts. thick-cylindric, leafy above: panicles to 1 ft. long; fls. yellow with oblong-lanceolate sepals, filiform petals, and 3-lobed lip. Peru.

latilàbre: E. difforme.

Lindleyanum (E. spectabile. Barkeria spectabilis). Sts. cylindric or fusiform-cylindric; fis. racemose, rose spotted with darker color, about 1½-2 in. across. Mar.-Nov. Cent. Amer.

macrochilum: E. atropurpureum,

nemorales (Encyclia nemoralis). Pseudobulbs subglobular to pyriform, 2-3-lvd.. lvs. to 13 in. long: infl. racemose or paniculate, to about 40 in. high, loosely 8-or more-fld.; fls. large, to 4 in. across; sepals and petals lilac or violet; lip with deeper colored side lobes and whitish mid-lobe lined with violet. Apr.-July. Mex.

noctúrnum. Sts. cylindric, erect, to about 3 ft. tall: lvs. oval to oblong, to 6 in. long, obtuse, leathery: racemes very short, terminal, 2-3-fid.; fls. with greenish-yellow linear sepals and petals and white lip, very fragrant. Blooms all year. Trop. Amer.

O'Brienianum. Hybrid between E. evectum and E. radicans

odoratissimum (Encyclia odoratissima). Pseudobulbs ovoid, 2-3-lvd.: lvs. to 16 m. long: infl. commonly pameulate, to 2 ft. long, loosely many-fld.; fls. about 1 m. across, greenish often marked with puplish. Jan.-Mar., May-Oct. Colombia, British Guiana, Brazil.

oncidioides (E. granticum. Encyclia oncidioides). Pseudobulbs slender, pyriform or fusiform, to 8 m. long, 2-3-lvd.: lvs. oblong-ligulate, to 2 ft. long; panticles to 6 ft. tall, many-fid.; fis. 1-1½ m. across, fragrant; sepals and petals green or yellow with large red-brown blotch; lip white or yellow with red veins. Oct.-Aug. Cent. Amer., Trinidad, S. Amer.

osmánthum (E. Godseffianum. Encyclia osmantha). Pseudobulbs narrowly objyrnform, 1-2-lvd.: lvs. to about 15 m. long: infl. sumple or branched, to 2 ft. long; fls. to 2 m. across; sepals and petals yellow or yellow-green streaked with red or purple; lip white marked with crimson. Sept.— Oct. Brazil.

paleaceum (E. auritum). Small plant with 1-lvd. ellipsoid pseudobulbs on creeping rhizome: lvs. narrow, to about 9 in. long, erect: infl. short, loosely several-fld.; fls. white to yellow, fragrant. Blooms all year. Cent. Amer.

papilionaceum: E. bifidum.

pentotis. Pseudobulbs fusiform-cylindric, to 14 in. tall, 2-lvd.: lvs. ligulate: spike short, terminal, few-fid; fls. yellowish or creamy-white, to about 3 in. across, fragrant; lip white striped with purple. Mar.-May, July? Cent. Amer., Brazil.

polybúlbon (Dinema polybulbon). Plant with long creeping and branching rhizome bearing 2-lvd, pseudobulbs: lvs. rarely to 2% in. long: fils. solutary; sepals and petals yellowish or brownish; lp snow-white with yellow markings. Sept.—Apr., June–July. Cent. Amer., W. Indies.

porphýreum. Sts. cylindric, leafy: lvs. elliptic-oblong: fls. in a paniele, purple to orange, petals linear, mid-lobe of lip dilated and bilobed. S. Amer.

prismatocárpum. Pseudobulbs pyriform to cylindrie, to 1 ft. long, 2-3-lvd.: lvs. to 15 in. long: fs. in racemes to 14 in. long; sepals and petals yellow-green spotted with dark brown; lip 3-lobed, yellow-green at base, violet above. Dec.-Feb., May-Aug. Costa Rica, Panama.

radicans (E. hisophorum). Sts. cylindric, leafy, to 5 ft. long, commonly with long white roots among the lvs.: lvs. to 4 in. long: fls. about 1-1% in. across, in dense many-fld. racemes at the summit of a long peduncle; sepals and petals cinnabar-red; lip orange-yellow. Nov.-Aug. Cent. Amer.

ransferum. Sts. cylindric, to 5 ft. tall, leasy on terminal half: fls. 1-2 in. across, few to many in terminal drooping racemes; sepals and petals yellowish-green with dark red-

dish-brown spots; lip 4-lobed, white, greenish or lavender with margins of the lobes vellowish. Cent. Amer., S. Amer. rhizonhorum: E. radicans.

rigidum. Sts. cylindric from a creeping rhizome, to 11½ in. tail: lvs. elliptic-oblong, to 3½ in. long. racemes to 6 in. long; fls. small, green. Fla., trop. Amer.

roseum (E. conspicuum). Pseudobulbs to almost 5 in. high, with 2 lvs. to 8 m. long; racemes 6-12-fid., to 20 in. long; fis pale rose, almost 2 m. across. Brazil.

secúndum (E elongutum). Sts. cylindric, leafy: lvs. ovate-lanceolate to elliptic-oblong, to 4½ in. long: peduncle long, slender, densely many-fld. at the apex, fls rose-pink; sepals and petals oblanceolate, acute, more or less reflexed; lip 3-lobed, coarsely toothed. W. Indies, S. Amer.

Skinneri (Barkeria Skinneri). Sts. fusiform-cylindric, several-lvd.: racemes few- to many-fld; fls. about 1-1½ in. across, dark rose or purple, the lip with yellow ridges. Oct-Jan. Guatemala.

spectábile: E. Lindleyanum.

Stamfordianum. Pseudobulbs fusiform to clavate, to 12 in high, with 3-4 lvs. to 10 in long: fis in leafless lax panicles to about 24 in. long; sepals and petals yellow spotted with purple; lip white with yellow toothed midlobe. Nov.-June. Cent. Amer., Venezuela, Colombia.

stenophyllum: listed name.

stenopnylum: fisted name. tampénse. To about 32 in. high: pseudobulbs pyriform, 1-2-lvd: lvs. narrowly linear-oblong, to 9½ in. long: fis. loosely paniculate; sepals yellowish-green tinged with brown, petals similar but browner; hp 3-lobed, white with magenta-purple lines, mid-lobe nearly orbicular, sometimes white or magenta. Apr.-July, Oct.-Dec. Fla., Bahann Isls., Cuba.

vendsum. BUTTERFLY ORCHID. Rhizome creeping: pseudobulbs slender, 2-lvd.: fis. in few-fid. racemes; sepals and petals green; hp 3-lobed, white, often with violet lines. Mex.

virens: E. diurnum.

virgātum (Encycha virgata). Pseudobulbs ovoid to pynform, 2-3-lvd: lvs. to 2 ft. or more long: infl. paniculate, to 7 ft. long; fls. up to 1½ in. across; sepals and petals greenish stained with brown; hp whitsh-yellow. Oct.—July. Mex. to Honduras.

vitellinum. Pseudobulbs to 2 in. high, with 2-3 lvs. to 12 in long: infl. loosely racemose or paniculate, several-to many-fid, to 1½ ft. long; fls. cinnabar-red, to 1½ in. across May-Oct. Mcx, Guatemala. Var. majus has larger brighter colored fls.

xanthinum. Sts. cylindric, leafy above, to 2 ft. or more high: infl. racemose, densely fid. at the apex of a long peduncle; fis. yellow and sometimes tinted with orange; hp 3-lobed and fringed. Brazil.

ybaguense: E. ibaguense.

EPIGÆA. Ericaceæ. Evergreen perennials with woody creeping sts., clusters of delightfully fragrant flesh-colored fls. in very early spring; 2 species, N. E. Amer. and Japan.

The plants can be grown in the garden if given acid soil and shade, and their natural conditions imitated. Propagation by seed is much more satisfactory than by division; sow as soon as seed is ripe.

asiática. Differs in part from E, repens in its oblong acuminate or acute lvs. Japan.

rèpens. Trailing Arbutus. Mayflower. Sts. hairy: lvs ovate, to 3 m. long, bright green: fls. white or pink, sulverform, about ½ m. long. Newf. to Fla. and Ky.

EPILÒBIUM. WILLOW-HERB. Onagracex. Herbs or sometimes subshrubs with linear to willow-like to oblong lvs., mostly more or less weedy, rose-purple, white or rarely yellow small fls., and long narrow capsular frs.

Suitable for planting in damp places and wild-gardens. Propagated by seeds or division; some of them produce runners and rosettes. They are plants of minor horticultural importance.

adnatum. Large, branched, erect, appressed-pubescent above: lvs. oblong, acute, serrulate, but some of them sessile and decurrent: fls. rose. Eu.

ampléctens. Per. to 2 ft.: lvs. opposite, oblong, fine-toothed: fls purple, in racemes or spikes. Himalayas.

angustifolium (Chamanerion angustifolium). Fire-whed Giant W. Per. to 8 ft.: lvs. alternate, lanceolate, to 6 in. long: ffs. purple, 1½ in. across, in long terminal racemes. Eu., Asia, N. Amer. Var. album has pure white fls.

boreale. Branched per., becoming large, pubescent above: lvs. ovate to lanceolate, denticulate, to 3 in. long: fis. rosy, less than 1/4 in. long, becoming abundant. Alaska.

chlorsefolium. Per. to 1½ ft., sts. decumbent below: lvs. opposite, ovate or ovate-oblong, to ¾ in. long, slightly toothed: fls. white or rose, ⅓ in. across, in axils of upper lvs. New Zeal.

coloratum. Per, slender, much branching, 1-3 ft.: lvs. narrow-lanceolate, serrulate, 2-6 in. long: fls. very small but numerous, axillary, pmk or white. Weedy plant in low ground and dry ditches, Me. to Kans. and S. C.

Dodonæi (E. rosmarınıfolium). Per. to 3 ft.: lvs. scattered, linear, to 2 1/2 in. long: fls. rose-purple, rarely white, crowded near ends of branches. Eu.

Fleischeri. To 8 in.: lvs. lanceolate to linear-lanceo-late: fls. deep purple, in few-fld. panicles. Eu.

Hectori. Sts. decumbent and rooting but becoming erect to 6 in. high: lvs. small, mostly opposite, oblong, to ½ in. long: fls. about ¼ in. diam., in upper axils. New Zeal.

hirsûtum. Per. to 4 ft., hairy: lvs. usually opposite, lanceolate, to 3 in. long: fls. purple, 1 in. across, solitary or in short racemes. Eu.; nat. in E. U. S.

Hôrnemannii. Erect to 12 in., simple or nearly so: lvs. ovate or elliptic, nearly or quite entire, to 1½ in. long: fls. purple, about ¼ in. across, in upper axils. N. N. Amer.,

Lámyi. Depauperate bien., stoloniferous, with low st.; lys. lanceolate, small-toothed, resulate in autumn: fis. purple, funnelform. Eurasia.

latifòlium (Chamænerion latifolium). Per. to 1½ ft.: lvs. alternate, lanceolate or ovate-lunceolate, to 2 in. long: fls. purple, to 2 in. across, in short leafy-bracted racemes. N. N. Amer., Eu., Asia.

lineare: name of doubtful application.

lùteum. Per. to 2 ft.: lvs. ovate or lanceolate-ovate, to 3 in. long, toothed: fis. bright yellow, petals 34 in. long. Alaska to Wash.

macropus. Decumbent or creeping per. with purplish sts. to 9 in. long: lvs. opposite, ovate or ovate-oblong, to 34 in. long: fls. white, 14 in. across, few in the axils. New Zeal.

nummularifòlium. Creeping and tufted, the sts. to 8 in. long: lvs. opposite, orbicular, to ½ in. long: fls. pink or whitish, ½ in. across, axillary. New Zeal.

obcordatum. Sts decumbent, to 6 in long lvs. opposite, ovate, to 34 in long: fis rose-purple, the petals to 34 in long, few in axils. Mts., Calif., Nev.

obscùrum. Very low per, stoloniferous: lvs. lanceolate, remotely small-toothed, sessile: fis. small, purple, funnelform. Eurasia.

parviflorum. Erect per. to 1 or 2 ft, soft-pubescent, rosulate at base: lys. lanceolate, dentate, sessile: fis. very small, purple or white. Eurasia.

ròseum. Much branched per to 2½ ft.: lvs. mostly opposite, oblong, toothed: fls. white turning rose, small, petals about ½ in. long. Eu., Asia.

rosmarinifòlium: E. Dodonæi.

rubéscens. Stoloniferous per. to 1½ ft., simple, hairy above: lvs lanceolate, sharply acute, 1½ in. long: fis. white, small. Colo., Utah.

EPIMÈDIUM. Berberidaceæ. Low per. herbs of the north temp. zone, with small pinnate lvs. and dainty racemes of small fls. in red, pink, white, yellow; the outer colored parts are interpreted as sepals, and the 4 inner ones as netals which are usually nectaries and sometimes produced into prominent spurs. The species and vars. are confused in cult. and plants may not belong to the names they bear. Recent studies indicate that the genus Aceranthus may not be generically distinct from Epimedium.

The plants are very suitable for rock-gardens and semishady locations. In sheltered spots under trees the foliage often remains all winter and leaves persist when dead. Any usual soil is satisfactory. Propagated by division.

álbum: E. grandiflorum var.

alpinum. To 1 ft.: lvs. biternate: fls. red with yellow slipper-like nectaries and short spurs. Eu. Cult. apparently only in var. rübrum (E. rubrum) with larger fls. and petals red outside and lvs. red-margined. May-June.

bicoldrum: hort. form with rosy-brown fis., probably of E. alpinum

coccineum: hort, form with red and white fis.

cólchicum: E. pinnatum var.

diph filum: Aceranthus diphyllus.

élegans: E. mnnatum var.

erectum: hort, name for a form with white fis.

grandiflorum (E. macranthum). Long-spur E. To 9 in : grandifforum (E. macranthum). LONG-SPUR E. To 9 in.: lvs. triternate: outer sepals red, inner petals violet with white deflexed prominently projecting spurs 1 in. long. May-June. Japan. Var. álbum has white fis.; var. níveum (E. niveum), fis. pure white; var. rôseum (E. nozeum), pinkish or pale rosy-red; var. violaceum (E. nozeum), spurs violet.

lácteum: listed form with creamy-white fla.

lilaceum: listed name.

macram; insect name.
macramthum: E. grandiflorum.
Musschianum. Japanese E. Lvs. 1-ternate: fls. white or pale yellow, drooping, spurs or sacs very short and not prominent. Japan.—Perhaps not distinct from E. grandi-

niveum: E. grandiflorum var.

Perralderianum. Differs from E. pinnatum in lvs. only once ternate and lfts more ciliate-toothed: lvs. marked with bronze when young. Algeria.

pinnatum. Persian E. Lvs. usually biternate: fls. bright yellow with short red spurs or nectanes. Apr.-July. Persia, Caucasus. Var. colchicum, Golden-Fleece E., fls. brilant yellow; var. ciegans, June-Aug., larger and more numerous fls. than type.

roseum: E. grandiflorum var.

rubrum: E. alpınum var.

sulphureum: hort. name, probably form of E. pinnatum. violaceum: E. grandiflorum var.

EPIPÁCTIS. Orchidacex.Terrestrial erect orchids from shortened rhizomes, with leafy sts. and fls. in loose terminal racemes with conspicuous bracts, the sepals and petals similar, the lip free, 3-lobed, saccate at base. Sometimes grown in the wild-garden.

decipiens: Goodyera decipiens.

gigantèa (Seramas gigantea. Amesia gigantea). To 3 ft. high: lvs to 8 in long; fls. green and rose striped with red, about 1 in. across. June-Aug. W. N. Amer., Mex.

pubéscens: Goodyera pubescens. rèpens: Goodyera repens. tesselàta: Gooduera tesselata.

EPIPHRONÌTIS. Orchidacex. A group comprising hybrids between the genera Epidendrum and Sophronitis.

Veitchii (E. radicans X S. grandiflora).

EPIPHYLLÁNTHUS. Cactacex. plants, resembling Zygocactus in habit, with thick globular, cylindric or flattened joints not toothed and bearing areoles all around, often epiphytic, with or without spines: fls. irregular, slender, purple to white, stamens more or less exserted. Cent. Brazil, 3 species. See Cacti.

microsphéricus (Cereus obtusangulus). At first erect, becoming much branched and more or less prostrate, joints slender and terete or obtusely angled, somewhat spiny or nude: fis. terminal, purple to rose.—Slow growing and often grafted on Zygocactus.

EPIPHYLLOPSIS: Schlumbergera Gaertneri.

EPIPHÝLLUM (Phyllocactus). Cactacex. Mostly epiphytic cacti, branches usually flattened and leaf-like and sometimes 3-winged; mostly no spines on mature plants: fls. large and showy, tube longer than limb, with many long stamens, white, red or yellow, nocturnal or diurnal. Some 16 species, as now understood, Mex. and southward, some of them known as house plants; there are a number of hybrids.

The epiphyllums are very useful as greenhouse and window-garden subjects and are frequently seen in summer on porches. They propagate readily by cuttings and are of simple requirements.

Ackermannii: Nopalxochia Ackermannii.

álbum supérbum: probably a garden hybrid.

angiliger. Branches many, the lower ones terete, but upper ones flattened and deeply toothed: fls. brownish-yellow outside and otherwise white, tube about 3 in. long and segms. about 2 in. Mex.

bélla: probably a garden hybrid.

biforme: Disocactus biformis.

brasiliénse: garden hybrid.

Bridgesii: Schlumbergera Bridgesii.

Coòperi. Said to be a hybrid between E. crenatum and Selenicereus grandiflorus and characterized by fls. to 9 in. across. of variable color from white to golden-yellow.

crenatum. Sts. about 3 ft. long, terete, becoming woody, strongly crenate, branches glaucous and often tip-rooting: fls. 4 in. and more across and tube of similar length, very fragrant, cream-colored or greenish-yellow. Honduras, Guatemala. Var. spléndidum is listed.

crispatum: Lhipsalis crispata.

hermòsum: probably a garden hybrid.

Hobkeri. Sts. 6-10 ft. long and more, joints rather thin and deeply crenate and 2-3 in or more broad: fls. scentless, nocturnal, 8-9 in. long, yellow outside, petals white. Trinidad, Venezuela.

Jénkinsonii. Hybrid between Heliocereus speciosus and Nopalrochia phyllanthoides and has deep scarlet fis. to 4 in. across: fr. purple.

látifrons: E. oxypetalum.

lilácinum: garden hybrid.

Makoyanum: Schlumbergera Gaertneri.

nitidum: listed name.

oxypétalum (E. latifrons). Stout, to 10 ft. or more, with many thin flat branches to 4 in. or more broad and deeply crenate: fls. opening in evening and in full bloom about midnight, to 10 in. long, white, reddish outside, style white. Mex. to Brazil.-Much cult.

Pèacockii. Garden hybrid of which Heliocereus is be-lieved to be one of the parents and said to have white to yellow fis. which are frequently spotted; very variable.

Pférsdorffii: garden hybrid.

phyllanthoides: Nopalxochia phyllanthoides.

phyllanthus. Sts. 3-4-angled when old, branches to payiantaus. Sts. 3-4-angled when old, branches to nearly 3 in. wide, margin reddish, becoming woody, coarsely toothed: fls. white, to 1 ft. long, nocturnal, style red. Panama to Brazil and Peru.—Named variants have styles white, pink to brilliant red while others have lobes more sharply divergent from peranth-tube.

Pittièri. Branches to 18 m. long and 1½ in. wide, margin notched or toothed: fis. with outer pernanth-segms. green, inner white, to 5 in. long, nocturnal, hyacinth-scented, inner white, to 5 in. style pink. Costa Rica.

ròseum: garden name, perhaps of a hybrid.

Russellianum: Schlumbergera Russelliana,

Schlumbergerianum; listed name.

speciosum: probably a garden hybrid. stenopétalum. Like E. oxypcialum (latifrons) but ultimate joints not acuminate as in that species: fls. fragrant, nocturnal but remaining open in morning, about 10 in long, white, reddish outside, style pink or purplish. Mex.

strictum. Plant to 6 or 7 ft. or more, joints 2-3 in. broad and serrate: fls. opening at might and closing before dawn, white, brownish or pinkish outside, tube 6 in. long, sepals recurved. Mex. to Panama.

truncatum: Zygocactus truncatus. Urayi: probably a garden hybrid

EPIPHYTE: air-plant; a plant growing on another or on some other elevated support.

EPISCIA. Gesneriacex. Trop. American herbs with opposite often unequal lvs., scarlet, whitish or purple fls. with frequently spurred corollatube and 5-lobed limb, and leathery frs. opening by 2 valves; grown under glass and for hanging-baskets and in pyramids; require partial shade; propagated by cuttings or division of sts.

chontalénsis. Sts. to 10 in. long, reddish-purple: lvs. ovate, to 4 in. long, marked with purple between veins: fls. pale lilac or white, to 2 in. across, solitary or clustered. Nicaragua.

coccines. Lvs. metallic-green, to 4 in. long and 3 in. across. Probably Cent. Amer.

cupreata. Sts. rooting at joints, drooping: lvs. oval, wrinkled and soft-hairy, tinged with copper or red: fls. searlet, ¾ in. across, solitary. Nicaragua. Var virdifolia has fls. to 1 in. across and green lvs.—The best known species in cult.

fúlgida. Pubescent creeper: lvs. ovate, margins ciliate, rich dark green: fls. bright red, 1½ in. long, solitary. N. S.

metállica: hort. name, perhaps for a form of E. cupreata.

tessellata (Centrosolenia bullata). Pubescent, of robust habit: lvs. to 1 ft. long and 6 in. wide, bronzy-green, veined with purple, and elevated between veins, wavy and ciliate: fls. pale yellow, about 2 in., long, in clusters. Peru.

EPITHELANTHA. Cactaceæ. Button Cactus. One very small globular cactus from W. Tex. and N. Mex. For cult. see Cacti. E. micrómeris (Mammillaria micromeris). Simple or cespitose, about 2¼ in. or less diam., depressed at top; tubercles small in many spirals; spines many and white: fls. near center of plant among wool and spines, whitish to light pink, about ¼ in. across. Var. Gréggii (E. and Mammillaria Greggii) differs only in its somewhat larger size and may not be distinct.—The names E. fungifera, E. tuberosa and E. ungispina are in the trade but are not known botanically.

EQUISÈTUM. Horsetall. Equisetaceæ (the only genus). Per. rush-like cryptogamous herbs with hollow jointed sts. and no proper foliage; lvs. reduced to sheaths at the joints; spores borne in terminal cone-like spikes; widely distributed and rarely transplanted in moist locations.

hyemale. Evergreen, to 4 ft., sts. slender, furrowed and rough: spikes pointed. N. Amer., Eu., Asia.

præsitum (E robustum). Evergreen, to 11 ft., sts. furrowed and rough: spikes with stiff point. N. Amer., Asia.

robústum: E. prædum.
variegātum. Evergreen, sts. tufted, to 1½ ft. long, furrowed: sheaths variegated with black above: spikes with stiff point. N. N. Amer., Eu., Asia.

ERAGRÓSTIS. Graminex. Small or mediumsized ann. and per. grasses widely distributed in trop. and temp. countries, the small spikelets borne in open diffuse panicles; a few species are planted for the ornament of their delicate spray. See Grasses.

abyssínica. Teff. Ann. to 3 ft.: lvs. to 6 in. long and $\frac{1}{12}$ in. wide: panicles 1 ft. or more long, with long hair-like ascending branches. N Afr.

amábilis (Pou amabilis). Ann. to 1 ft.: lvs to 4 in. long and $\frac{1}{4}$ in. wide: pancles to 6 in. long, with slender spreading or ascending branches. India.—Some of the material cult. under this name is E. suareolens.

capillaris. Ann. to 1½ ft.: lvs. to 10 in. long and ¼ in. wide, rough above: panieles to 15 in long, with har-like sprending or ascending branches. N. H. to Ga. and Tex.—Some of the material cult. as *E. capillaris* is *E. mericana*.

chloromèlas. Tufted per to 1½ ft.: lvs. to 6 in. long and $\frac{1}{12}$ in. wide, convolute, glaucous: panicles to 8 in. long, stiff, with slender spreading branches. S. Afr.

carvula. Tufted per, to 2 ft.: lvs to 1 ft. long and $\frac{1}{12}$ in, wide, convolute: panicles to 10 in. long, with slender branches erect or spreading. S. Afr. Var. válida has lvs. to 2 ft. long and $\frac{1}{12}$ in. wide.

élegans: E. tenella. interrúpta: E. tenella.

japónica: E. tenella.

máxima. Ann to 3 ft.: lvs. lanceolate: panicles to 9 in. long, with hair-like branches. Madagascar.—Plants grown under this name may be E. suaveolens.

mexicana. Ann. to 2 ft.: lvs. to 8 in. long: panicles to 1 ft. long, the branches slender and spreading. S. Calif. to New Mex. and Mex.

obtusa (Briza generalata). Tufted per. to 1½ ft.: lvs. to 5 in. long and ½ in. wide, usually involute: panicles to 4 in. long, with thread-like spreading branches. S. Afr.

pilosa (Poa pilosa). Tufted ann. to 1½ ft.: lvs. to 5 in. long and ½ in. wide: panicles to 6 in. long, branches spreading. Eu.; nat. in N. Amer.

suavèolens. Ann. to 3 ft., resembling E. abyssinica but with less spreading panicles and more compact spikelets. W. Asia.

tenella (E. elegans. E. interrupta. E. japonica). Ann., erect, to 3 ft: panicles narrow, somewhat interrupted, comprising about half the entire height with numerous minute spikelets. Japan.

unioloides. Ann., erect or spreading, to 1 ft.: panicle ovoid and open, to 6 in. long, the spikelets usually pink or purplish and somewhat like those of a Briza. India, Malaysia, China.

ERANTHEMUM (Dædalacanthus). Acanthaceæ. Trop. Asian herbs and shrubs with opposite simple lvs. and blue or rose tubular 5-lobed fls. in dense bracted spikes; one species grown in S. Fla. and under glass. It thrives in light rich soil with ample sunlight and water. Propagated by cuttings of young wood.

atropurpureum: Pseuderanthemum atropurpureum.

bicolor: Pseuderanthemum bicolor.

Eldorado: a form of Pseuderanthemum atropurpureum.

nervosum (E. pulchellum). To 4 ft. lvs. ovate or oval, to 8 in. long, prominently veined, slightly toothed: fls. blue, 1 in. long and ¾ in. across, under pointed veiny bracts. India.—Commonly planted far S. and frequent under glass.

pulchéllum: E. nervosum.
reticulàtum: Pseuderanthemum reticulatum.
tuberculàtum: Pseuderanthemum tuberculatum,

ERÂNTHIS. WINTER ACONITE. Ranunculacex. Small per herbs with short tuberous root, native in Eu. and Asia, having basal palmately dissected lvs., solitary yellow vernal fls. subtended by an involuere-like lf., and fr. composed of many follicles. They are very hardy and thrive in moist situations. Propagated by division of roots.

cilícica: E. hyemalis var.

hyemalis. To 8 nn: lvs. long-stalked, 1½ in, across, cut into many linear or oblong segms: fls. to 1½ in, across, with 5-9 petal-like sepals, in very early spring. Eu; somewhat nat. in N. Amer. Var. cilicica (E. cilicica) has broader sepals ½ in. across.—Tubers may be planted in autumn as for tulps; plants are likely to persist.

pinnatifida. Distinguished by segms, of radical lvs. and involucre pinnatifid, and pedicelled fis, with ovate white sepals. Japan.

sibirica. Similar to E. hyemalis but only 3-4 in, high, with smaller fls, having 5 sepals. Siberia.

Tubergènii. Hybrid with large shiny golden-yellow fls.

ERCÍLLA. Phytolaccaceæ. Climbing evergreen shrubs with alternate entire lvs., pale purple fls. in many-fld. axillary racemes, and fr. a berry; sometimes grown in warm regions or under glass as a wall-cover as it climbs by aērial rootlets. Propagated by seeds and cuttings.

spicata (Bridgesia spicata). Lvs. leathery, elliptic or ovate, to 3 in. long and 1½ in. wide racemes slightly longer than lvs.: berries dark purple. Chile.

ERDÍSIA. Cactaceæ. S. American cacti with erect or drooping branches, few ribs having spiny areoles, and small short-tubed fls.

Meyenii (Cereus aureus. Cleistocactus aureus). Sts. underground, sending up club-shaped unjointed branches to 8 in. tall and 2 in. diam.; ribs 5-8, about ½ in. deep, remotely wavy; spines many, unequal, to 2½ in. long: fis. yellow, to 1½ in. long: fir. reddish. N. Chile and Peru,

squarrosa (Cereus squarrosus). Sts. to 6 ft. long; ribs 8-9, areoles ½ in. apart; spines 15, to 1½ in. long, yellowish: fls. bright red, to 1½ in. long. Peru.

EREMÆA. Myrtaceæ. W. Australian shrubs, some of them intro. in Calif., differing from Calothamnus chiefly in the fls. solitary or few and nearly terminal rather than in lateral clusters or spikes: lvs. heath-like, flat, alternate, often crowded: stamens longer than petals and showy, the fls. red.

ebracteata. Low bush, young parts somewhat hirsute: lvs. 1/4 in. or less long, linear: fis. 1-3 at a place, with few small bracts or none.

fimbriàta. Stiff coarse shrub, more or less hirsute: lvs. ½ in. or less long, lanceolate or elliptic: fis. solitary, surrounded by bracts.

violacea. Hirsute shrub with nearly cylindrical linear acute lvs. and solitary twin or sometimes clustered fis. bearing violet filaments that are joined near the base.

EREMÓCHLOA. Graminex. Per. grasses of Asia and Australia, with one-sided spikelets

borne in terminal narrow spikes; one species grown for lawns in the S. See Grasses.

ophiuroides. Centipede-Grass. Creeping by runners and stolons: lvs. about 3 in. long and ½ in. wide, bluish- or yellowish-green: racemes straight or somewhat falcate, cylindric and slender, glabrous, to 2½ in. long. China.

EREMOCÍTRUS. AUSTRALIAN DESERT KUMQUAT. Rutaceæ. One species, E. glaüca, in desert regions of subtrop. Australia, in this country resistant to cold and drought and promising beyond the regular citrus belt. It is a sharpspiny shrub or small tree with very narrow xerophytic lvs. to 1½ in. long: fls. small, white, fragrant, solitary or 2 or 3 together in the axils: fr. light yellow, pyriform or oblate, about ½ in. diam., commonly 4-celled, mildly acid and edible. Works as a graft on Citrus, and viceversa.

EREMÓSTACHYS. Labiatæ. Asian herbs with mostly basal toothed or cut lvs. and yellow 2-lipped fls. in many-fld. whorls in spikes; one species is known to hort.

laciniàta. To 2 ft. or more, hairy: lvs. 2-pinnate into lanceolate or linear segms.: fls. yellow or cream-colored, in spikes to 2 ft. long. Asia Minor.

EREMÙRUS. DESERT-CANDLE. Liliaceæ. Asian per. herbs with thick fibrous or cord-like roots, narrow basal lys. forming tufts or rosettes and white, pink or yellow fls. in racemes terminating stately scapes usually several ft. high, the perianth-segms. almost distinct.

These plants are hardy in the North with winter protection. They are good in rich well-drained soil. Propagated by division or slowly by seeds. They are seen to good advantage against a background of foliage.

altàicus. Probably not more than to 4 ft.: If. margins entre: fis. yellow, cylindrical to subcampanulate, pedicels jointed at apex, corolla-lobes somewhat incurved. W. Siberia.—Little known botanically.

aurantiacus. Similar to E. Bungei but with orange fis. and lvs. not so acutely keeled. Turkestan.

Búngei. Lvs. linear, 1 ft. long: fls. yellow or orange, in racemes to 5 in. long. Persia. Var. perféctus, an improved form with deep golden-orange fls. Var. sulphureus, fls. sulfur-yellow.

Élwesii. Lvs. ovate-lanceolate, glaucous: fls. pink with deeper band down center. Habitat unknown. Var. álbus is listed.

himalaicus. Lvs. strap-shaped, to 1½ ft. long: fls. white, in racemes to 2 ft. long and 4 in. through. Himalayas.—

The commonest species in cult.

Kaufmannii. Distinguished by lvs. white-hairy on both sides and linear-filiform bracts. Turkestan.

Ölgæ. I.vs. narrow, to 1 ft. long and ¾ in. or less broad, rough on margins: fis. white with brownish midnerves, in a dense raceme. Turkestan. Var. álbus has white fis.

robústus. Lvs. narrow-strap-shaped, to 2 ft. long, glaucous: fis. bright pink, in racemes to 3 ft. long and 5 in. through. Cent. Asia. Var. supérbus is an improved form.

Shéifordii. A hort, form with coppery-yellow fis. tinged outside with red.

spectabilis. Lvs. lorate, to 1½ ft. long and 1 in. wide, slightly glaucous: fls. light yellow with orange stamens, in racemes 1½-2 ft. long and 2 in. through. Asia Minor.

tauricus. Lvs. often with minutely denticulate margins: fis. white, campanulate, pedicels not jointed at apex. Russia.

turkestánicus. Fls. reddish-brown margined with white, in racemes to 2 ft. long. Turkestan.

Tubergènii. Hybrid between E. himalaicus and E. Bungei.

Warei. Probably hybrid between E. Bungei and E. Olgæ.

ERÉPSIA. Aizoaceæ. Separated from Mesembryanthemum (which see for cult.): per., more or less woody, branches erect or ascending: lvs. opposite, 3-angled, sometimes serrate or toothed: fis. solitary or ternate, whitish, yellow or reddish; stamens hidden under staminodes. S. Afr.

compressa (M. compressum). Lvs. to 1½ in. long and ½ in. wide, punctate, somewhat glaucous and rough; fis. red. inner petals vellowish and short.

gracilis (M. gracile). Lvs. about 1 in. long, finely punctate: fis. red, 11/4 in. across, inner petals yellowish and short.

Haworthii (M. Haworthii. Lampranthus Haworthii). To 2 ft.: lvs. glaucous and smooth, to 1½ in. long and ½ in. wide: fls. purplish, about 3 in. across.

heteropétala (M. heteropetalum). Lvs. somewhat compressed or flattened but 3-angled, glaucous, punctate, rough or cut on the keel, about 1 in. long: fls. pale red or whitish, ½ in. across, the petals unequal and shorter than

inclaudens (M. inclaudens). Lvs. punctate, scimitar-shaped, with wide keel, green, 1 in. or less long, essentially entire: fls. rose or purplish, 1½ in. across, with broad petals, inner ones very short.

mutábilis (M. mutabile). Lvs. to ¾ in. long and ⅓ in. wide, gray-green, acute, keel entire: fis. rose, petals narrow or subulate, a little longer than calyx.

ÈRIA. Orchidaceæ. Trop. Asian orchids, commonly epiphytes, of various habit, with fls. in racemes or solitary, the lateral sepals forming with the column a spur or sac-like projection. Subjects for the warm greenhouse; see Orchids.

ancorifera. Plant small: similar to E. flava but with black anchor-shaped mark on lip. Sumatra.

barbata. Pseudobulbs to 2 in. long, with 2-3 lvs. to 14 in. long: scape to 3 ft. high bearing several distant fis. on harry sts.; fis. yellow striped with brownish-purple. Oct.-Nov. India.

bractéscens. Pseudobulbs to 7 in. long, with 2-3 lvs. to 10½ in. long; racemes many-fid., to 9½ in. long; fls. white or cream-color, sometimes with purple on lip. Feb.-July. Himalayas, Burma, Indo-China, Malaya, Philippines.

convallarioides. Pseudobulbs to 8 in. long, with 3-4 lvs. to 7½ in. long: infl. a pendulous densely many-fld. raceme to 4½ in. long; fls. about ½ in. across, whitish with yellow on lip. Aug.-Oct. Himalayas, Burma, Indo-China, China.

coronaria (Trichosma suaris). Sts. cylindric, to 10 in. high, 2-lvd. at summit: lvs. to 9¾ in. long: racemes loosely few-fid., nodding, little shorter than lvs.; fis. fragrant, white or whitish with yellow on the 3-lobed lp and purple streaks on side lobes. Aug.—Feb. Himalayas, China.

excavata. Pseudobulbs in series, to about 2 in. long, with 4-6 lvs. to about 9 in. long: infl. a few-fld. raceme; fls. white with 3-lobed lip yellow with red side lobes. Himalayas.

ferruginea. Pseudobulbs cylindric, 2-4-lvd.: lvs. leathery, to 8 m. long: scape to about 8 m. long; accemes severalfid.; fls. about 1 m. across; sepals green or white, petals rosy; hp pink or red. Mar.-June, Nov. Himalayas.

fiàva. Pseudobulbs to 4 in. long, 2-5-lvd. near the apex: lvs. to 10 in. long: scapes white-tomentose, loosely fld.; fls. yellow, lip marked with purple. Himalayas. Var. lanàta has smaller fls. with purplish mid-lobe of lip.

floribûnda. Pseudobulbs cylindric to spindle-shaped, 3-7-lvd., to 18 in. high: lvs. oblong-lanceolate, to 13¾ in. long: mfl. to about 6½ in. long, densely many-fld., pendulous; fls. rose-red to nearly white, to ½ in. across, column dark purple. Blooms all year. Burma, Malaya, Philippines.

lanàta: E. flava var.

monostachya. Sts. cylindric: lvs. linear: fls. small, in long cylindrical racemes. Java, Sumatra.

obesa. Pseudoulbs crowded, stoutly clavate to fusiform, to 3 in. long: racemes loosely few-fid.; fis. white with green at base of lateral sepals, and pale yellow lip. Feb.—Mar., July. Buima.

ERIANTHUS. Plume-Grass. Gramineæ. Robust per. grasses, sometimes grown as annuals, with long flat lvs. and spikelets with tufts of silky hairs at their base, borne in large terminal panicles; native in warm and temp. regions and ornamental as specimen plants. See Grasses.

alopecuroides (E. divaricatus). Per. to 10 ft.: panicle oblong, to 1 ft. long and to 3 in. broad, the branches slender and loose. N. J. to Fla. and Tex.

divaricatus: E. alopecuroides.

Ravénnæ. RAVENNA-GRASS. To 12 ft.: lvs. to 3 ft. long and ½ in. and more wide, midrib paler: panicles to 3 ft. long, silky, dense and plume-like. S. Eu. to India.

saccharoides. To 10 ft.: lvs. to 2 ft. long and 1 in. wide: panicles 1 ft. or more long, loose. N. J. to Fla. and Tex., Cuba.

ERÌCA. Нелтн. Ericaceæ. Evergreen branchy shrubs or sometimes small trees, in very many species, with small needle-like or very narrow usually whorled lvs., small white, rose or yellow usually declined fls. that are mostly tubular, bell-shaped, urn-shaped, or globose, and capsular frs.; native in Eu. and S. Afr., particularly abundant in the latter country. Many Latin-named kinds occur in collections of fanciers, often representing variants and hybrids.

Heaths are grown somewhat in rock-gardens, but few of them are hardy in the North, also under glass for the profuse bloom. They are plants of attractive compact habit and slow growth. E. carnea and E. vagans are perhaps hardiest, standing in New York and central New England, but E. carera and E. Tetraltz are nearly equally durable, and E. scoparie stands in middle regions. Heaths of force, there is no second we bloom as and convolute to the durable, and E. scoparia stands in middle regions. Heaths of many kinds are profuse bloomers and popular in the open in California, where they bloom in winter and early spring. They are particular as to soil in pot culture, preferring one of light peat and coarse sand. In the open, they are given a light or sandy soil; they do not stand well in limestone soils. Propagated by cuttings of young wood under glass, given good ventilation when rooted. New blooming wood may be produced by heading back after flowering. flowering.

abietina: see note under E. Patersonii.

arborea. There H. To 20 ft., the sts. with long stout hans: lvs. in 3's, glabrous: fls. white, ½ in. long, fragrant, in large panicles in winter or spring. Medit. region. Var. alpina, slender erect tree to 3 ft.

atrorubens: E. cinerea var.

australis. To 4 ft.: lvs. in 4's, glabrous: fls. purplish-red, 1/4 in. long, in terminal clusters in spring. Spain, Portugal.

báccans. To 5 ft., erect, glabrous: lvs. in 4's, somewhat curved: fls. terminal in 4's, purple, the corolla narrowed at throat, about ¼ in. long. S. Afr.

Bergilan (E. cupressina. E. turrigera). To 3 ft.: lvs. in 4's, rough, ciliate: fls. red, to ¼ in. long, in 4's. May-June. S. Afr.

blanda: E. doliiformis; the material cult. under the name E. blanda may be of hybrid origin.

Bowieana. To 1 ft.: lvs. in 4's, glabrous: fis. white, tubular, to 3/4 in. long, axillary. S. Afr.

caffra (E. urceolaris). To 12 ft.: lvs. in 3's, gray-pubescent fls. white or yellowish-white, ¼ in. long, in few-fld. clusters. S. Afr.

capénsis: listed name.

capitàta. To 15 in., branches more or less woolly: lvs. in 3's, obtuse, woolly underneath: fis. 1-3, greenish-yellow, globular, 1/4 in. or less across. S. Afr.

cárnea. To 1 ft., the branches prostrate: lvs. in 4's, glabrous: fis. red, to ½ in. long, in one-sided racemes to 2 in. long in early spiing, the stamens exserted. Eu. Var. álba, fis. white; coccinea, fis. bright red; grácilis, a slender form; rôsea, a hort form of E. ventracosa; Vivellii, fis. light carmine-red.—Other forms bear hort, names.

Hybrid between E. depressa and E. Cavendishiàna. Patersonn: fls. yellow, tubular.

cerintholdes. To 3 ft.: lvs. in 4's-6's, pubescent and ciliate: fis. crimson or pink, tubular, to 1½ in. long, in umbels. S. Afr.

Charlesiana, Charlesworthiana: listed as a hybrid: fls. pale pink, tubular, 1/2 in. long.

ciliàris. Fringed H. To 1 ft., the branches prostrate: lvs. in 3's, ciliate: fls. rosy-red, ½ in. long, in terminal racemes to 5 in. long from July-Oct. W. Eu.

cinèrea. Twisted H. Sts. ascending to 2 ft., finely pubescent when young: Ivs. in 3's, glabrous, glossy above: fls. white to purple, in umbels or terminal racemes to 3 in. long. June-Sept. W. Eu.; nat. in Mass. Var. álba, fls. white; atropurpurea, fls. deep purple; atrorubens, fls. dark red; fúlgida (var. coccinca), fls. red; ròsea, fls. rose-pink.

coccinea. Erect to 3 ft., sts. densely pubescent: lvs. in 6's, glabrous: fts. bright red, to 1 in. long, in verticillate infl. crowded at ends of branches. S. Afr.

codonòdes: E. lusitanica.

compacta nana: listed name for a dwarf pink-fld. heath. concinna: E. verticillata.

cruénta. Erect, to 3 ft.: lvs. in 3's, pubescent when young: fis. blood-red, to 1 in. long, more or less tubular. S. Afr.

cupréssina: E. Bergiana.

darleyénsis (E. mediterranea hybrida). Hybrid between E. carnea and E. mediterranea: to 2 ft.: fis. red, 1/4 in. long.

depréssa. Branches decumbent, with revolute lvs. in 3's: fis. white, small, terminal. S. Afr.

doliifórmis (E. blanda). To 1 ft.: lvs. in 6's, glabrous, ciliate: fis. rosy, tubular. 1/2 in. long, in umbels. S. Afr.

élegans: E. glauca.

glandulòsa. Erect. to 2 ft. or more: lvs. in 4's: fls. in 4's, white, corolla nearly tubular, usually pubescent or glandular, about 1 in. long. S. Afr.

glauca (E. elegans). Erect glabrous plant to 3 ft.: lvs. in 3's, glaucous; fts. dull red to vivid purple, usually greentupped or greensh along throat, to ½ in. long. S. Afr.

gracilis. To 1 ft.: lvs. in 4's, glabrous: fls. rosy, ½ in. long, in whorls of 4 at ends of branchlets. Feb.-Mar. S. Afr. Var. autumnalis blooms in fall.

grandiflora. Stout and erect, to 5 ft.: lvs. scattered or in 6's: fts. orange-red to bright yellow, corolla narrowed to base, about 1 m. long. S. Afr.

hibérnica: E. mediterranea var.

Hieliana: see E. hyemalis.

hirtiflora. To 2 ft.: lvs. in 4's, hairy: fls. pale purple, 1/2 in. long, rough-hairy, in 4's. S. Afr.

hyalina: listed name, probably E. hyemalis.

hyemàlis (E. Hieliana!). To 2 ft.: lvs. in 4's, ciliate: fis. pink tipped with white, to 1 m. long, borne along the branchlets and forming a leafy raceme. Nov.-Feb. Origin unknown.

hypnoides: probably Calluna vulgaris var. hypnoides.

linnæoldes. Supposed hybrid, fls. mostly in 4's, corolla clavate, white in upper part, purple at base.

lusitánica (E. codonodes). Spanish H. To 12 ft.: lvs. in 3's-5's or irregular, glabrous: fls. pink or white in var. alba, 16 in. long, profusely borne along branches from Feb-Apr. W. Eu.

Mackàii (E. Mackaiana). Hybrid between E. Tetralix and E. ciliaris: fls. red, ¼ in. long. Var. plèna (var. flore-pleno) has double fls. Var. Wâtsonii (E. Watsonii) has longer fls. in shorter racemes.

mediterrànea. To 10 ft.: lvs. in 4's-5's, glabrous: fls. deep red, to ½ in. long, in short racemes in spring, the stamens exserted. W. Eu. Var. álba has white fls.; hibérnica (var. ylauca), to 3 ft., lvs. glaucous; nàna is a low-growing form.

melanthèra. To 2 ft.: lvs. in 3's, glabrous: fls. rosy, ½ in. long, blooming profusely at ends of branches in winter, the stamens exserted. S. Afr.—Color forms are purpurea, rosea and rubra.

mínima: perhaps E. scoparia var.

multiflora. To 3 ft.: lvs. in 5's or 6's, glabrous: fts. pink, ½ in. long, in dense spikes, stamens exserted. S. Eu. ovata: name for a pink early-flowering form.

Patersonii. The trade name probably belongs to E. abietina, which is an erect glabrous bush to 2 ft. high, imbricated lvs. to $\frac{1}{2}$ in. long, and fis. yellow with orange limb. S. Afr.

persolùta: E. subdivaricata.

pilòsa: E. villosa.

pygmæa: E. sicæfolia.

regerminans. To 2 ft.: lvs. in 6's, glabrous: fts. pink or red, 1/4 in. long, in dense spikes to 5 in. long. S. Afr. Var. rubra is listed.—The plants usually cult. under this name are E. hirtiflora.

scariosa. Erect, to 1½ ft.: lvs. crowded and mostly on short branchlets: fis. solitary, terminal, white or rosy, corolla tubular and inflated, about ½ in. long. S. Afr.

scopària. Besom H. To 10 ft.: lvs. in 3's or 4's, glabrous and shining: fis. greenish, 1/2 in. long, in long spikes. May-June. S. Eu. Var. minima (var. pumila) is a dwarf form.

sessiliflora. Erect, to 1½ ft., very leafy: lvs. scattered or in 6's: fls. in dense spike, bracts and sepals light colored or red, corolla greenish or yellowish, trumpet-shaped, about 1 in. long. S. Afr.

sicæfòlia (E. pygmæa). Suberect plant to 8 in. with ascending sts.: lvs. in 3's, glabrous and glossy: fis. dark purple, to ½ in. long. S. Afr.

stricta. Corsican H. To 9 ft., with stiff branches: lvs. mostly in 4's, glabrous: fls. rosy-purple, 1/2 in. long, in terminal umbels in summer. S. Eu. Var. erécta is said to be of more upright and fastigiate habit than type.—The identity of the hort. E. stricta is in doubt.

subdivaricata (E. persoluta). To 2 ft.: lvs. in 4's, glabrous: fls. rosy (var. rôsea) or white (var. álba or albiflòra), ½ in. long, in racemes in spring. S. Afr.

Tetralix. To 2 ft., the branches prostrate: lvs. in 4's, ciliate, whitish beneath: fls. rose, 14 in. lorg, in dense terminal clusters. June-Oct. Eu. Var. alba has white fls.; möllis (var. mollis-alba) is listed as a dwarf form with white fls.; rùbra has red fls.

translûcens. Hybrid between E. tubiflora and E. ventricosa: fls. rosy, 3/4 in. long, tubular.

Trèhanii: catalogue name for a purple-fld, heath with gray foliage.

tubiflòra: a name variously applied to several species. turrígera: E. Bergiana.

umbellata. To 3 ft., sts. erect or ascending: lvs. linear, obtuse, imbricated, glossy: fls. flesh-colored to rose-pink, in terminal umbels of 3-6. W. Medit. region.

urceolàris: E. caffra.

vàgans. Cornish H. To 1 ft.: lvs. in 4's or 5's, glabrous: fls. purplish-pink, ½ in. long, in leafy racemes to 6 in. long, the stamens exserted. W. Eu. Var. álba has white fls.; aùrea is listed as a yellow form; grandiflòra has larger fls.; rôsea has rose fls.; and rùbra has deeper red fls.—There are forms with hort. names.

Veltchii. Hybrid between E. arborea and E. lustanica: fls. white, borne profusely.

ventricosa. To 6 ft.: lvs. in 4's, ciliate: fls. white, pink or red, to $\frac{1}{23}$ in. long, in dense umbels in spring and summer. S. Afr. Var. grandiflora has larger fls.

verticillàta (E. concunna). To 5 ft.: lvs. mostly in 4's-6's, glabrous: fts. rosy, tubular, ¾ in. long, forming dense leafy racemes. S. Afr.

villosa (E. pilosa). To 1½ ft., sts. slender and ascending, pubescent: lvs. in 3's, usually pubescent: fls. white, to ½ in. long. S. Aft.

Vilmoreana: probably E. Wilmorei.

viridipurpurea. To 2 ft.: lvs. in 4's, glabrous: fls. red, $\frac{1}{12}$ in. long, in clusters. S. Afr.

vulgaris: Calluna vulgaris.

Wátsonii: E. Mackati var.

Webbiana: supposed hybrid

Williamsii. Hybrid between E. Tetralix and E. vagans: fls. rose, urn-shaped.

Wilmorei (E. Wilmoreana). Said to be a hybrid: fls. rosy tipped with white, tubular.

ERICACEÆ. HEATH FAMILY. Widely distributed hardwood shrubs and small trees with simple lvs., bisexual fls. mostly showy, with 4–5-parted calyx, 4–5-lobed gamopetalous corolla, 4–10 stamens, superior or inferior 2–5-celled ovary and 1 style, and fr. a caps., berry or drupe. The family furnishes many ornamental subjects and some, as the blueberry, grown for the edible frs. Some members of the family are the choicest broad-leaved evergreens. They are prevailingly plants of acid soils. Genera known to hort. are Andromeda, Arbutus, Arctostaphylos, Arctous, Befaria, Bruckenthalia, Calluna, Cassiope, Chamædaphne, Chiogenes, Cladothamnus, Daboecia, Elliottia, Enkianthus, Epigea, Erica, Gaultheria, Gaylussacia, Kalmia, Kalmiopsis, Ledum, Leiophyllum, Leucothoë, Loiseleuria, Lyonia, Menziesia, Oxydendrum, Pentapterygium, Pernettia, Phyllodoce, Pieris, Rhododendron, Rhodothamnus, Tripetaleia, Tsusiophyllum, Vaccinium, Zenobia.

ERICAMÈRIA. Compositæ. Evergreen shrubs often with heath-like foliage and yellow heads in terminal panicles or cymes, with or without rays; pappus of bristles; native in W. N. Amer. and sometimes planted.

ericoides (Aplopappus ericoides). MOCK-HEATHER. To 2½ ft.: lvs. crowded, cylindrical, to ¼ in. long: heads to ¼ in. long, with rays. Calif.

ERIGENIA. Umbelliferæ. One tuberous nearly stemless per. herb, native Ont. to Minn. and Kans. E. bulbòsa. Harbinger-of-Spring. To 9 in.: lvs. ternately decompound into oblong obtuse segms.: fls. white, in small usually compound umbels.

ERÍGERON. FLEABANE. Compositæ. Annuals and perennials of wide distribution, resembling wild asters: lvs. alternate or basal, entire or toothed or occasionally dissected: heads solitary

or in clusters, rays mostly white, rose, violet or purple, disk-fls. yellow; pappus of soft bristles.

Erigerons are of easy cultivation in the border or wildgarden and for colonizing, and the low kinds in rockgardens. Propagated by seeds, division or cuttings, the tufted perennial species best by division.

acris (E. umbellatus). Per, or bien, to 2 ft.: lvs. spatulate to oblong, entire: heads in racemes or panicles, ½ in. across, rays purple short, a row of thread-like pistillate fis. inside the rays. N. N. Amer.

álgidus. Per. to 8 in.: lvs. mostly basal, spatulate or oblanceolate: heads solitary, 1 in. across, rays lavender or purple. Mts., Calif. to Colo.

Alicese. Per. to 1 ft., pubescent: lvs. lanceolate, entire: heads solitary, ½-1 in. across, rays purple or violet. Wash.

alpinus. To 1 ft.: lvs. spatulate to linear, entire: heads usually solitary, % in. across, rays purple varying to white. N. Eu., N. Asia, Rocky Mts.

aurantiacus. Double Orange Daisy. To 10 in.: lvs. spatulate-oblong: heads 1-2, about 1 in. across, rays orange-vellow. Turkestan.

aureus. Per. to 4 in.: lvs. mostly basal, spatulate, entire, hairy: heads solitary, 1/2 in. across, rays yellow. B. C. to

australe. Per. to 6 in.: lvs. mostly in basal rosette, obovate-oblong, to 1 in. long, subentire, obtuse or acute; st.-lvs. few, sessile, linear: heads usually solitary, rays probably pink. Chile.

bellidifòlius: E. pulchellus.

Blodmeri (E. filifolius var.). To 6 in., strigose: lvs. basal, linear, to 4 in. long and 1/8 in. wide, numerous: heads to 1/2 in. across, ray-fis. absent. Ida. to Nev. west to Calif. and Ore.

cæspitòsus. Per. to 6 in., canescent: lvs. mostly basal, oblanceolate, to 4 in. long, obtuse: heads solitary, to 1 in. across, ray-fls. white to lavender-blue. Colo., Utah to Sask. and Yukon.

canus. Per. to 10 in., appressed-canescent. lvs. narrowly spatulate-linear, to 4 in. long, entire, acute: heads 1-4, to 34 in. across, ray-fis. purple or white. S. D. to Neb. south to New Mex. and Colo.

caucásicus. Per. to 10 in.: lvs. spatulate or oblong: heads 1-3, 1 in. across, rays rosy-purple. Caucasus.

Chrysopsidis. Per. to 4 in., white-harry: lvs. mostly basal, spatulate: heads solitary, 1 in. across, rays goldenyellow. Ore.

cilícicus: E. uniflorus.

commixtus. Similar to E. flagellaris, differing in its more densely hoary vesture. W. Tex. and New Mex.

compósitus. To 8 in.: radical lvs. crowded, usually 2-ternate into linear or spatulate segms.: heads solitary, ¾ in. across, rays white or purplish. Alaska to Calif. and Rocky Mts. Var. trifidus is said to have more finely cut follage.

concinnus (E. hispidissimus). Per. to 1 ft., white-hairy: lvs. oblanceolate to linear, densely hirsute: heads to 1½ in. across, corymbose, ray-fls. pink to purplish. Colo. to B. C.

Coulteri. Per. to 2 ft.: lvs. obovate to lanceolate, slightly toothed; heads usually solitary, to 1½ in. across, rays white to purplish. Rocky Mts. to Calif.

divergens. Ann. or bien. to 1½ ft., hairy: lvs. obovate to linear, the lower sometimes cut-toothed: heads solitary or in colymbs, ¾ in. across, lays violet to white, filiform. Wash. to Calif. and Neb.

dùbius: Hysterionica montevidensis.

elàtior (E. grandiflorus elatior). Per. to 2 ft.: lvs. ovate-lanceolate, entire: heads 1-3, to 1½ in. across, rays lilac or purple. Colo. to Wyo.

filifòlius. Per. to 2 ft., woody at base: lvs. filiform: heads 1/2 in. across, rays bluish, violet or white. B. C. to Ida and Calif.

flagellàris. Sts. decumbent, rooting at tips: basal lvs. spatulate or oblanceolate: heads solitary, on naked peduncles to 4 in. high, to ¾ in. across, rays white or purplish. B. C. to S. D. and Mex.

Fléttii: listed name.

follosus. Per. to 2 ft., leafy: lvs. linear or lanceolate: heads in terminal corymbs, 1 in. across, rays purple. Calif. Var. confinis is decumbent, to 8 in. high.

glabéllus. Per. to 1½ ft.: lvs. oblanceolate to linear-lanceolate: heads 1-3, to 2 in. across, rays violet or purple. Wis. to Rocky Mts.

glaber: listed name.

glabratus. Per. to 8 in.: lvs. spatulate: heads usually solitary, to 1/4 in. across, bright purple to white. Eu. Var. roseus is listed.

glandulòsus. Per. to 6 in.: lvs. mostly basal, oblanceo-

late: heads solitary, 1 in. across, rays violet or purple. Colo., Wyo. Var. major is listed.

glaucus. Beach Aster. Seaside Daisy. Per. to 10 in.: lvs. mostly basal, spatulate or oblong, entire: heads solitary, to 1½ in. across, rays lilac or violet. Pacific Coast.

grandiflorus. Per. to 8 in.: Ivs. lanceolate, hairy: heads solitary, rays purple to white, ½ in. long, involucres whitewoolly. Canadian Rockies. Var. rôseus has rose-pink fls.

hispidissimus: E. concinnus.

Howellii. Per. to 1½ ft.: lvs. obovate or ovate, clasping at base: heads solitary, ¾ in. across, white or rose. Mont. to Wash. and Ore.

hybridus: hort, name of uncertain application.

hyssopifolius. Per. to 15 in.: lvs. oblong to linear: heads solitary or several, ½ in. across, rays white or purplish. Newf. to Vt. and N. Mich.

intermedius: hort. name, probably E. speciosus.

Karvinskianus (E. mucronatus). Per, but blooming first year from seed, to 18 in, and some or all of the branches decumbent and more or less trailing; lvs. to 1 in, long, more or less toothed or lobed at apex; heads on solitary peduncles, to 34 in, across, rays many and white or pinkish. Mex. and south.—Grown as a border or bed plant, usually under the name Vittadina (which see).

Leibergii. Per. to 6 in., hairy: lvs. spatulate to oblanceolate: heads solitary, rays violet. Wash.

leiomèrus. Per. to 6 in.: basal lvs. spatulate, glabrous: heads solitary, to 1 in. across, rays violet. Mts., Alta. to New Mex.

linearis. Per. to 1 ft.: lvs. linear-filiform: heads solitary, 1/2 in. across, rays purple, violet or white. B. C. to Calif.

macránthus. Per. to 2½ ft.: lvs. oblanceolate to ovate: heads in corymbs, to 1½ in. across, rays very numerous, lilac or blush-purple. Mts., Alta. to Ariz.

melanocéphalus. Per. to 6 in., sts. with purplish-black haus: lvs. elliptic to narrowly oblong, to 1½ in. long: heads solitary, to ½ in. across, ray-fls. white or pinkish. Rocky Mis.

mèsa-gránde speciòsus: hort. name, referable probably to E. speciosus.

mexicanus: a listed name.

mucronatus: E. Karvinskianus.

multiradiàtus. Himalayan F. From 6 in.-2 ft.: lvs. oblong or lanceolate, entire. heads solitary, to 3 in. across, rays very numerous, purplish. Himalayas. Var. ròseus is listed.

nanus (E. poliospermus). Per. to 4 in., hairy: lvs. linear-oblanceolate: heads solitary, ½ in. across, rays purple, violet or white. Mont. to Utah.

peregrinus (Aster peregrinus). Similar to E. salsuginosus, differing in the less leafy sts. and in the involuce being sticky-pubescent and not villous. Alaska to Ore.

philadélphicus. Per. by offsets, to 3 ft.: lvs. spatulate or oblong, toothed or entire: heads in corymbose clusters, to 1 in. across, rays purplish-white. N. Amer.

pinnatiséctus. Tufted per. to 10 in.: lvs. 1-2-pinnatifid into linear segms.: heads ½ in. across, rays bluish-purple or violet. Mts., Wyo., Colo.

poliospérmus: E. nanus.

prostràtus: listed name.

pulchélius (E. bellidifolius). Poor Robins Plantain. Per. by offsets, to 2 ft.: basal lvs. tufted, spatulate, entire or toothed: heads 1-6, to 1½ in. across, rays violet or purplish. Me. to Fla. and La.

pûmilus. Per. to 1 ft., hairy: lvs. oblanceolate to linear: heads several, 1/2 in. across, rays white. B. C. to Kans.

radicatus. Per. to 4 in., densely tufted, hairy: lvs. oblanceolate to linear: heads solitary, to ¾ in. across, rays white. Mont. to Colo.

Rôylei: an uncertain name, possibly E. alpinus.

salsuginosus. Per. to 1½ ft.: lvs. spatulate to lanceolate, entire: heads solitary, to 1¾ in. across, rays purple or violet. Alaska to Calif. and New Mex. Var. albus is listed. Var. angustifolius, to 1 ft., upper lvs. linearlanceolate.

simplex. Per. to 10 in., hairy: lvs. oblanceolate or spatulate: heads solitary, ½ in. across, rays purplish-pink or white. Mts., Mont. to Calif.

speciòsus (Stenactis speciosa). Per. to 2 ft.: lvs. lanceolate to spatulate, entire: heads in corymbs, to 1½ in. across, rays very numerous, dark violet. B. C. to Ore. near the coast. Hort. vars. are grandifòrus, màjor, ròseus, semiplènus, sempérvirens, supérbus.

subtrinérvis. Per. to 2 ft., st. hairy: lvs. oblanceolate to ovate, lower ones to 4 in. long, all hirsute and 3-veined: fls. in corymbs, heads to 1½ in. acroes, rays white to violet or rose-purple. S. D. to Wash. south to Utah and New Mex.

Thompsonii. Per. to 1½ ft.: lvs. spatulate-oblanceolate: heads solitary, long-peduncled, 1 in. across, rays white. Wash.

trifidus. To 4 in.: lvs. basal, 3-cleft, segms, entire or 2-3-lobed: heads solitary, ½ in. across, rays white or pale lilac. Alaska to Rocky Mts.

umbellatus: E. acris.

uniflorus (E. cilicicus). To 4 in.: lvs. spatulate to linear, basal tufted: heads solitary, ¾ in. across, rays purple or sometimes white. Arctic regions.

ursinus. Per. to 6 in., densely tufted: lvs. linear-lanceolate: heads solitary, 1 in. across, rays purple or violet. Mont. to Calif.

Villársii. Bien. to 1 ft.: lvs. scabrous, 3-5-nerved, almost or quite entire. fis. rose-violet to purple, in corymbs. Eu.—Said to be a parent of *E. aurantiacus*.

ERINACEA. Leguminosæ. Dwarf deciduous shrub of Iberian Peninsula, hardy on Pacific Coast and S. U. S., armed with sharp stout spines, seemingly simple lvs. and blue fls. Propagated by seeds and greenwood cuttings under glass. One species, E. púngens, is known. Sts. to 1 ft., erect or ascending: lvs. spatulate to linear-lanceolate, white-tomentose: fls. blue to violet, in axillary clusters of 1-3: pod to ¾ in. long.

ERINUS. Scrophulariaceæ. A hardy tufted per. 3-4 in. high suitable for the steeper parts of the rock-garden and for margins; native in the mts. of W. and Cent. Eu. Erinus should be planted in partial shade and where there is exceptionally good drainage. Propagated by seed or by division. E. alpinus. Lvs. spatulate, to ½ in. long, coarsely toothed: fls. ½ in. across, purple, 5-lobed, in racemes 2½ in. long. Vars. ilbus, carmíneus, cárneus and rôseus are color forms. Var. hirsùtus (E. hirsutus) has hairy foliage and violet-red fls.

ERIOBÓTRYA. Rosaceæ. Several Asian evergreen trees and shrubs with alternate simple sessile lvs., white fls. in terminal panicles, and fr. a small pome; one is grown far S. for ornament and the edible fr. and is sometimes seen under glass. For cult. see Loquut.

japônica (Photinia japonica). Loquat. To 20 ft.: lvs. thick and stiff, obovate, to 1 ft. long, shining above, rusty-tomentose beneath: fls. fragrant, ½ in. across, in woolly panicles to 6 in. long: fr. pear-shaped, yellow, to 1½ in. long. China.—Sometimes called "Japan-plum." In var. variegata the lvs. are variegated with white.

ERIOCAULACEÆ. PIPEWORT FAMILY. Nine genera of mostly trop. aquatic or bog or wetground herbs, with tufted rush-like lvs. and small fls. in compact involucrate little heads; perianth of 2 series: fr. a 2-3-celled caps. Individual fls. are not distinguishable in the head without dissection. The genus Eriocaulon is rarely planted.

ERIOCAULON. PIPEWORT. Eriocaulaceæ. Per. herbs with grass-like basal lvs. and solitary woolly heads of small monœcious fls. borne on slender scapes; stamens twice as many as inner perianth-segms. One native species is advertised for the bog-garden.

decangulare. Lvs. to 1½ ft. long and ½ in. across, longer than sheaths: heads about ½ in. across, white. Swamps, N. J. to Fla. and Tex.

ERIOCÉPHALUS. Compositæ. S. African branching aromatic shrubs, mostly silvery, one of which is intro. in Calif.: lvs. alternate or opposite or clustered, small and usually linear, simple or 3-parted: heads hairy-white and becoming woolly, with pistillate ray-fis.

E. africanus has linear or 3-lobed thick silky lvs. to 1 in. long and heads umbelled at ends of branches.

ERIOCEREUS: most of the plants ascribed to this genus are treated here under Harrisia; for E. tephracanthus see Trichocereus tephracanthus: E. Palmeri is a listed name.

ERIODENDRON ANFRACTUOSUM: Cerba pentandra.

ERIODÍCTYON. Hudrophullaceæ. Aromatic shrubs of W. N. Amer. with alternate leathery toothed lys. and fls. in terminal panicles; allied to Nama, differing in caps, 4-valved, not 2-valved; may be planted in its native region.

californicum. Yerba Santa. To 8 ft.: lvs. oblong or oblanceolate, to 4 in. long, white-tomentose between veins beneath, sticky-resinous above: fls. white or pale blue, ½ in. long. Calif., Ore.

crassifòlium. To 6 ft. or more: lvs. oblong to ovate, to 4 in. long, leathery, densely tomentose, margin wavy: fls. lavender, in cymes to 3 in. across. S. Calif.

Párryi (Nama Parryi). Subshrub to 8 ft., sts. coarse, erect, woody at base only, sticky-hairy: lvs. lanceolate, to 6 in. long, nearly entire to dentate, crowded: fis. purplish, crowded in numerous cymes forming a long narrow panicle. Mts. in S. Calif.—Plant ill-scented.

ERIÓGONUM. Polygonaceæ. Herbs or subshrubs native in W. N. Amer. in many species of varied habit, with basal, alternate or whorled lvs. and fls. borne in involucres in heads or umbels or sometimes solitary along the branches; sometimes transplanted from the wild, and requiring sunny positions and well-drained soil.

annuum. Ann. to 3 ft., white-woolly: lvs. oblong, to 2 in. long: fls. white, in flat-topped cymes. S. D. to Tex.

arboréscens. Shrub: lvs. linear or oblong, to 1¼ in. long, white-tomentose beneath, revolute: fls. rose, white-hairy at base, in heads in compound cymes. Santa Barbara Isls.

compositum. Per. to 16 in., sts. scape-like: lvs. oblong-ovate, to 2 in. long, white-tomentose at least beneath: fis. cream or yellow, in heads borne in umbels. Wash. to Calif.

crassifolium: E. flavum.

depréssum (E. ovalifolium var. depressum). from E. ovalifolium in fis. cream-colored or grayish-white. Mont., Ore.

Douglasii. Dwarf matted white-woolly per. to 10 in., sts. scape-like with whorl of lvs. in middle lvs. spatulate to linear-lanceolate, white-tomentose beneath: fls. yellow, in solitary heads. Wash. to Calif.

elatum. Dwarf hairy per. to 10 in., sts. woody at base: lvs. large, to 2 in. long or more, usually ovate or oblanceolate, white-woolly or entirely glabrous: fls. greenish-white to rose. Calif.

to rose. Calif.

fasciculatum. Wild Buckwheat. To 3 ft., woody at base: lvs. clustered, oblong or linear, to ¾ in. long, densely white-woolly beneath: fis. white, in heads in simple or compound umbels. Calif., Nev. Var. polifolium (E. polifolium). Per. to 2 ft., sts. white-hairy: lvs. oblanceolate, margins somewhat revolute: fis. white or pinkish, pubescent at base. S. Calif. to Utah and Nev.

flàvum (E. crassifolium). Per. to 8 in., white-tomentose, sts. scape-like: Ivs. oblanceolate, to 2 in. long: fls. yellow, in umbels. Man. to Colo. Var. Piperi (E. Piperi). To 1 ft., sts. slender depressed forming mats bearing rosettes of Ivs.: Ivs. lanceolate to spatulate, to 4 in. long, white-tomentose below and pale green above: fls. yellow, often tipped red, pubescent. Mts. of E. Wash.

giganteum. Shrub to 8 ft.: lvs. ovate, to 2½ in. long, white-woolly: fis. white-woolly, in heads in dense compound cymes. Santa Barbara Isls.

grande. Subshrub to 3 ft.: lvs. to 3½ in. long, oblong-ovate, margins undulate, green above, white-woolly be-neath: fls. white. S. Calif. Var. rubéscens (E. rubescens), of low decumbent habit and red fls. Intermediate forms are not uncommon.

heracleoides. Per. to 3 ft., st. much branched with somewhat suberect branches: lvs. linear to narrowly orbicular, pale green, hairy: fls. pale straw or tipped with rose, in simple or compound umbels. Wyo., Ida., Utah and Ore. Var. roseum, fls. rose-pink.

latifolium. Per. to 2 ft.: lvs. ovate to oblong, to 2½ in. long, densely white-woolly at least beneath: fis. white or pink, in dense heads to ¾ in. across. Calif.

Lóbbii. Per. to 7 in., sts. with dense tuft of lvs. and peduncles scape-like: lvs. oval, to 1½ in. long, white-woolly: fls. white, in umbels. Calif.

marifolium. Per. to 1 ft.: lvs. oval or ovate, ½ in. long, white-woolly at least beneath: fls. yellowish, in umbels.

múlticeps. Per. to 6 in., with scape-like sts.: lvs. linear-oblanceolate, to 3 in. long, white-tomentose: fis. white or rose, in heads or rarely umbels. N. D. to Ida.

níveum. Per. to 16 in., white-tomentose: Ivs. ovate or oblong, 1 in. long: fis. white or rose, in umbels. B. C. to Ida.

nûdum. Per. to 2 ft.: lvs. all basal, ovate or oblong, to 2 in. long, white-tomentose beneath: fis. white, sometimes yellow or pink, in branched panicles. Ore., Calif.

ochrocephalum. Per. to 6 in., sts. scape-like: lvs. oblanceolate or ovate, to 1½ in. long, silvery-tomentose. fls. yellow, in heads. Ore., Calif., Nev.

ovalifòlium. Per. to 3 in., forming dense mat with scape-like sts.: lvs. ovate, to ½ in. long, white-tomentose: fls. bright yellow turning purplish, in dense heads. B. C. to Calif.

parvifolium. Shrub to 3 ft.: lvs. ovate to oblong, to ½ in. long, densely white-woolly beneath: fls. white or pink, in heads or umbels. Calif.

Pîperi: E. flavum var.

polifolium: E. fasciculatum var.

polyphýllum. Per. to 6 in., sts. scape-like: lvs. basal, spatulate, to 1 in. long, white-tomentose beneath: fis. deep yellow, in umbels. Alta. to Ore.

pyrolæfòlium. Tufted per. with scape-like sts. to 314 in.: lvs. oval, to 1 in. long, leathery: fls. white or pinkish, in small umbels. Wash. to Calif. Var. coryphæum is more tomentose with narrower lvs.

racemòsum. Per. to 2½ ft., st. sparingly branched, white-tomentose: lvs. to 2½ in. long, orbiculate to elliptical, sessile or nearly so, white-tomentose beneath: fls. white or pink. Colo., Utah, Nev., N. Mex.

rubéscens: E. grande vai.

sphærocéphalum. To 8 in., branches decumbent: lvs. verticillate, narrowly oblanceolate, to 1½ in. long, white-hairy beneath, margins revolute: fls. yellow, lobes oblanceolate. Wash., Ida., N. Cahf.

stellåtum: E. umbellatum var.

subapinum. Sulphur Plant. Per. to 1 ft.: lvs. orbicular or spatulate, to 2½ in. long, petioled, white-tomentose beneath: fis. pale straw-colored to yellow sometimes becoming rose-colored with age. Mts. of Colo., Mont.—Closely related to E. umbellatum and by some not considered distinct from it.

sulphureum. Considered a subspecies of E. latifolium differing in its yellow fis. N. Cahf.

thymoides. Much branched shrub to 1 ft.: lvs. linear to spatulate, to ½ in. long, white-woolly, margins revolute: fls. pink to purplish, lobes broad and rounded. E. Ore. fls. pink to and Wash.

tomentosum. Per. to 3½ ft., st. not much branched: lvs. elliptical, sessile, glabrous above: fls. white or reddish. S. C. to Fla.

Torreyanum: E. umbellatum var.

umbellatum. Per, to 1 ft.: Ivs. basal, obovate or oval, to 2½ in. long, white-tomentose beneath: fls. deep yellow, in umbels. Wash. to Wyo, and Calif. Var. stellatum (E. stellatum) has compound umbels. Var. Torreyanum (E. Torreyanum) has lvs. spatulate and glabrous.

vimineum. Ann. to 2 ft. or less, sts. much branched: lvs. to ¾ in. long, orbicular, white-tomentose beneath: fls. white or pink, in glabrous infl. N. W. U. S.

vineum. Low per., sts. somewhat decumbent: lvs. orbicular, to ½ in. long, white tomentose beneath: fls. white to rose, in rather dense heads. Orc., Calif. and Nev.—Similar to E. oralifolium and by some authors considered a variation of it.

ERIOGYNIA: Petrophytum Hendersonii.

ERIÓPHORUM. Cotton-Grass. Cyperacex. Per. sedges native in bogs in the northern hemisphere, with linear lvs. and fls. with perianth of soft white or brown bristles giving a cottony appearance; sometimes planted along the edges of ponds or in bog-gardening for the cotton-like heads on stiffish sts.

angustifolium. To 2 ft.: lvs. to ½ in. wide, flat except the tip: spikelets 2-12, in terminal umbels, the white bristles 1 in. long. Eu., Asia, N. N. Amer.

callithrix. To 1½ ft., tufted, the sheaths inflated: lvs. filiform: spikelets solitary, bustles white or red-brown. N. Amer., Asia.

Chamissonis. Sts. to 2½ ft., solitary or tufted, terete or triangular, erect, stoloniferous: lvs. usually shorter than sts., triangular-channelled, those of sterile shoots rarely to 4 ft. long: spikelets solitary. N. N. Amer., Eu. and Asia.

latifolium. To 1 ft.: lvs. about 1/4 in. wide, flat: spikelets several, in terminal umbels, the white bristles 1 in. long.

vaginatum. To 1½ ft., tufted: lvs. mostly reduced to sheaths: spikelets solitary, the numerous white bristles 1 in. long. Eu., N. Asia.

wirginicum. To 4 ft.: lvs. flat, narrow-linear, rough-margined, those of involucre to 6 in. long: spikelets several or many, bristles brownish. Newf. to Fla. and Neb.

viridicarinatum. Differs from E. angustifolium in thinner lvs. and more numerous spikelets with white or yellowish-white bristles. N. N. Amer.

ERIOPHYLLUM. Compositæ. Ann. or per. herbs or subshrubs native in W. N. Amer., with alternate white-tomentose lvs. which are entire or divided, and heads of yellow ray- and diskfls.; pappus of scales or lacking; sometimes placed in gardens in dry regions.

cæspitosum (Bahia lanata). Per. to 1½ ft.: lvs. deeply 3-5-lobed, to ¾ in. long, green above: heads usually solitary, to 1¼ in. across. Calif.

confertiflorum. Golden Yarrow. Per. to 2 ft.: lvs divided into linear segms., to 1 in. long, tomentose on both sides; heads in terminal clusters. 1/2 in. across. S. Calif.

landtum. Per. to 1½ ft., white-woolly: lvs. deeply divided into 3-7 oblong or linear segms.: heads mostly solitary, rays deep yellow, ½ in. long. B. C. to Ida. and

leucoph filum. Per. to 12 in., branching from base, woolly-tomentose: lvs. oblanceolate, 3-cleft or lobed, occasionally punnate-incused or entire: heads solitary, long-peduncled. Calif. to Alaska.

multifidrum. To 16 in., loosely woolly: lvs. oblong-spatulate, pinnatifid, segms. acute: heads about 1½ in. across. Ore.-Mont.

pedunculatum. Per. to 1½ ft.: lvs. oblong-lanceolate, to 2 in. long, entire, tomentose on both sides. Ida.

stæchadifòlium. Subshrub to 3 ft.: lvs. linear, to 13/4 in. long, entire or rarely few-toothed, green above: heads in dense corymbs. Calif. Var. artemisiæfòlium. Lvs. pinnately cut into entire or pinnate lobes.

Wállacel. Ann. to 4 in., densely woolly: lvs. spatulate or obovate, to 1/2 in. long, usually entire: heads solitary, 1/2 in. across. Calif., Utah, Anz.

ERIÓPSIS. Orchidaceæ. S. American epiphytes with strong pseudobulbs bearing 2-4 plicate lanceolate lvs. and yellow or brownish fls. in lateral racemes, the sepals and petals similar, the lip 3-lobed. For cult. see Orchids.

rutidobúlbon. Pseudobulbs 2-3 in. long, 2-3-lvd. near the apex: fls. about 1½-2 in. across; sepals orange-yellow with red-purple margins, lip with white violet-spotted mid-lobe. Feb.-Aug., Oct. Colombia.

ERIOSÝCE. Cactacex. Short-columnar or globular cacti from Chile and Argentina characterized by campanulate fls. whose ovary and perianth-tube is covered with acute scales and wool; fr. dry and spiny.

ceratistes (E. Sandillon. Echinocactus ceratistes and Sandillon). To 3 ft. high and 1 ft. or more thick, very woolly at top; ribs 21-35, arcoles large and 1 in. apart; spines 11-20 and to 1½ in. long: fls. at top of plant, yellowish-red, to 1½ in. long. Chile.

korethroides (Echinocactus and Echinopsis korethroides). Simple, globose or short-cylindric, to 1 ft. thick; ribs 15-20 or more; radial spines 12-20 and 1 in. long; centrals 4 and yellowish-brown: fis. red, to 3 in. long. Argentins.

Sandillon: E. ceratistes.

ERIOSTEMON. Rutaceæ. Evergreen shrubs, chiefly Australian: lvs. simple and entire, alternate, often bearing large glands: infl. axillary or terminal, the fls. white, pink, blue: fr. of 5 (or fewer) mostly distinct elastic carpels. Two species are listed in Calif.

myoporoides. Glabrous stout shrub, with glandular tubercles often very marked: lvs. narrow-obovate to narrow-lanceolate, to 4 in. long, mucronate: fls. white or pink, the petuls about $\frac{1}{2}$ 6 in. long. Queensland to Victoria.

spicatus. Heath-like shrub to 2 ft., glabrous or nearly so: lvs. almost needle-like, ½ in. or less long: fis. blue or pink; petals about ½ in. long. W. Australia.

ERITRÍCHIUM. Boraginacex. Small depressed mostly hispid per. herbs with alternate simple lvs. and small blue fls. borne in racemes or cymes: sometimes planted in rock-gardens.

argénteum: E. elongatum var.

barbigerum: Cryptantha barbigera,

elongatum. Similar to E. nanum from which it differs in its woolly pubescence and slightly smaller corolla. Ida., Ore. south to New Mex. and Utah. Var. argénteum (E. aryenteum) differs in its nutlet margins toothed. Colo.

Howardii. To 5 in. high: lvs. linear-oblanceolate, brown-ish-strigose: fls. dark blue, to 3/8 in. across. Mont., Wyo. and Wash.

nanum. Densely white-woolly tufted plant, fl.-sts. to 3 in. high: lvs. elliptic to oblanceolate or linear, to 3 in. long: fls. small but sky-blue and brilliant, with yellow eye, to 1/4 in. across. Alps.

strictum. Per. to 10 in., appressed-silky lvs. linear, to 1½ in. long, sessile: fis. blue, to ½ in. across, in branched racemes to 3 in. long. W. Himalayas.

ERLÁNGEA. Compositæ. African herbs or shrubs allied to Vernonia and differing chiefly in technical characters of the achene and pappus: E. tomentosa is sometimes seen in the greenhouse.

cordifòlia (Gutenbergia cordufòlia). Erect pubescent herb: lvs. ovate, nearly sessile to clasping and somewhat cordate, serrulate, to 3 in. long: heads purple or lavender, about ½ in. diam. Trop. Afr.—Reported in Calif.

tomentosa (Bothrocline Schimperi var. tomentosa), Shrub to 5 ft.: Ivs. oblong to ovate-lanceolate, to 5 in. long, toothed, white-tomentose beneath, scented, heads to 34 in. across, in flat-topped panicles, of mauve or lilac disk-fls. Trop. Afr.

ERÒDIUM. HERONSBILL. Geraniaceæ. Herbs with lobed or pinnately dissected lvs., fls. in axillary umbels having 5 fertile stamens, 5-celled ovary and styles coiled at maturity; grown in the border or rock-garden and some sorts for forage. Some species have become weedy.

Erodiums thrive in dry sunny positions in loamy soil. Propagated by seeds and division. E. cicutarium, E. moschatum and E. Boti ys are forage plants in California.

absinthioldes (E. olympicum). Per. to 8 in.: lvs. bipinnate: fis. violet, rarely rose or white, 34 in. across. Asia Minor. Var. amanum (E. amanum) has gray-pubescent foliage and white fis. Var. Sibthorpianum is smaller with short lvs.

amanum: E. absinthioides var.

Billardièri: listed name.

Bôtrys. Ann., prostrate or sometimes erect, white-pubescent: basal lvs. lobed, st.-lvs. pinnatifid: fis. violet. Medit. region; nat. in W. U. S.

chamædryoides. Per. to 3 in.: lvs. round-ovate, wavy-margmed, ½ in. long on long petroles: fls. white veined with rose. Balearic Isls., Corsica. Var. roseum has pink fls. with veins of deep rose.—A compact desirable rock-garden plant propagated by cuttings or division; partial shade.

cheilanthifòlium. Per. to 4 in.: lvs. all basal, bipinnate, ay-tomentose: fls. white veined with rose, to ¾ in. across. Mts. of S. Spain and Morocco.

chrysanthum. Tufted per. to 5 in., silvery: lvs. bipinnate, the st.-lvs. few: fis. yellow, 1/2 in. across, in umbels of 2-3 fis. Greece.

ciconium. Ann. to 2 ft., hairy: lvs. bipinnate: fls. purplish-blue, large. S. Eu.

cicutàrium. Alfilaria. Red-stem Filaree. Ann. to 1½ ft.: basal lvs. in rosettes, the lfts. pinnatifid: fis. purple or pink, about ¼ in. across. Medit. region; nat. in U. S.

córsicum. Per. to 6 in.: lvs. ovate, undivided or only slightly lobed: fis. pink veined with rose, 1/2 in. across. Corsica, Sardinia.

daucoides. Per. to 4 in.: lvs. all basal, pinnate: fls. rose, ½ in. across. Spain.
geifolium. Per. to 10 in.: lvs. simple, ovate-orbicular, to 8 in. long, remotely 3-lobed, obtusely dentate, sparsely short-pubescent: fls. white with purple-red stamens, to ½ in. across petals unequal, umbel of 5-8 fls.: fruiting beaks to 2½ in. long. Algiers.

gruinum. Ann. or bien. to 1½ ft.: lvs. somewhat lobed, margins crenate-dentate: fls. violet-blue, about 24 in. across: fr. to 3½ in. long at maturity. Sicily, N. Afr. to

Guicciárdii. Tufted per. to 8 in., silvery: lvs. pinnate, to 2 in. long, white-pubescent, upper ones sessile: fis. rosepink. to ½ in. across, in umbels of 5-7 fis. N. Greece.

guttatum. Shrubby per. to 6 in.: lvs. simple, oval, blade to 1/2 in. long on long petiole, faintly lobed, silky: fis. pink, in umbels of 2-3 each. S. W. Medit. region.

hýbridum. Hort. hybrid of E. Manescavii and E. daucoides: similar to E. Manescavi, but differs in more finely dissected foliage and smaller paler fis.

Kolbianum. Hybrid between E. supracanum and E. macradenum: fis. pale rose with darker veins.

macradènum. Per. to 1 ft.: lvs. all basal, pinnate: fls. light purple with dark spots, about ½ in. across. Pyrenees. Var. ròseum is listed with rose-pink fls.

Manescavii. Per. to 1½ ft.: lvs. all basal, pinnate: fls. rosy-purple, to 1½ in. across. Pyrenees.

moschatum. White-stem Filaree, Musk-Clover. Ann. or bien. to 1½ ft.: lvs. pinnate: fls. rose-purple. Eu.; nat. in U. S.

olympicum: E. absinthioides.

pelargoniflòrum. Shrubby per. to 1 ft.: lvs. simple, ovate-cordate, remotely lobed, pubescent above, obtusely dentate: fls. white, the 2 upper petals pink spotted at base. Asia Minor.

petræum. Per. to 6 in.: lvs. all basal, bipinnate, long-petioled: fls. veined with red. Pyrenees.

romanum. Per. to 8 in.: lvs. all basal, pinnate: fls. purplish, ½ in. across. Medit. region.

roseum: hort. name, possibly E. chamædryoides var.

supracanum. Per. to 4 in.: lvs. all basal, bipinnate, silvery: fls. pink veined with rose, ½ in. across. Pyrences. texanum. Tufted ann. to 1 ft., pubescent: lvs. ovate, palmately lobed or divided, long-petioled: fls. purple. Tex. to Calif.

tordylioides. Ann. or bien., 4-20 in. high, sts. solitary or few, ascending: basal lvs. pinnate, oblong to ovate-oblong, lanate; lfts. very broadly ovate, terminal ones becoming confluent: fis. probably rose-purple; fr. with beak about 1½ in. long. N. Afr.

trichomanifòlium. Per. to 5 in.: lvs. all basal, bipinnate: fls. violet veined with rose, $\frac{1}{2}$ in. across. Syria.

Wilkommianum. Hybrid between E. cheilanthifolium and E. macradenum.

EROPHILA: see Draba verna.

ERPETION RENIFORME: Viola hederacea.

ERŪCA. Cruciferæ. Ann. and bien. erect more or less Brassica-like herbs of few species in Eu. and W. Asia, one sometimes grown as a salad plant: lvs. large-toothed or pinnatifid: fls. whitish, yellow, purplish, in long terminal racemes: fr. an oblong to long-linear pod or silique.

sativa. Rocket-Salad. Roquette. Half-hardy ann., branching, to 2½ ft., with scattered hairs: fls. to 1 in. long, whitish or cream-yellow with purplish veins: pods 1 in. or more long, flat-beaked, erect and appressed. S. Eu.—Grown in the vegetable-garden for salad. The foliage is strong-tasting, and therefore it should be kept tender by continuous growth and frequent cutting; best results are obtained from lvs. in fit condition in spring and autumn, as in summer the plant runs quickly to seed. Seed is sown in open ground as soon as weather is settled, and lvs. fit for use should be had in two months or less.

ERVATÀMIA. A pocynaceæ. Shrubs or small trees, one of which is much planted far S. for ornament, differing from Tabernæmontana in technical characters, native in Old World tropics.

coronaria (Tabernamontana coronaria). Crape-Jas-Mine. Clavel de la India. Large much branched glabrous shrub: Ivs. oblong-lanceolate to elliptic, abruptly acuminate, entire, to 8 in. long: fis. waxy-white, very fragrant, to 2 in. across. Var. fibre-plèno, with double fis., is the usual form. India; widely spread in trop. and warm countries.

ERVIL: Vicia Ervilia.

ERXLEBENIA: Pyrola minor.

ERÝNGIUM. ERYNGO. Umbelliferæ. Mostly per. herbs with spiny-toothed lvs. which are simple and variously lobed or divided, small white or blue fls. in dense bracted heads or spikes, and ovoid frs. without ribs.

Planted in borders and rock-gardens. They thrive in sunny positions in light rich soil. Propagated by seed sown as soon as ripe, and by division.

agavifòlium. To 6 ft.: lvs. sword-shaped, coarsely spiny-

toothed: heads 2 in. long, subtended by long ovate bracts. Argentina.

alpinum. To 2 ft.: lower lvs. triangular-cordate, the upper round and often 3-lobed or palmately cut, tinged with blue: fis. blue or white, the heads 1½ in. long, subtended by long finely divided bracts. Eu. Var. atroviolàceum is listed.

ameth stinum. To 1 1/4 it.: lvs. obovate, 2-pinnate: fls. blue, the heads 1/2 in. long, subtended by long lanceolate bracts. Eu.—The plant grown under this name may be E. planum.

aquáticum (E. yuccæfolium). BUTTON SNAKEROOT. RATTLESNAKE MASTER. To 6 ft.: lvs. long-lmear, rigid, parallel-veined, the margins bristly: fls. white or pale blue, the heads about 1/2 in. long, subtended by short bracts. E. U. S.

Bourgatii. To 1½ ft.: lvs. nearly orbicular, palmately 3-5-parted and lobed, stiff, spiny-toothed fis. blue, the heads ½ in. long, subtended by long spiny-tipped bracts. Medit, region.

cerûleum. To 3 ft.: lvs. ovate or oblong, heart-shaped at base, undivided or 3-lobed or -parted; fis. blue, the heads less than ½ in. long, subtended by very long stiff bracts. Orient.

cceléstinum: an unidentified trade name; possibly referable to E. amethystinum.

gigantèum. To 6 ft.: lvs. ovate or triangular, heart-shaped at base, the st.-lvs. 3-lobed: fls. blue or pale green, the heads to 4 in. long, subtended by long, rigid, much-cut bracts. Caucasus.

Heldreichii. To 1½ ft.: basal lvs. twice ternate, to 12 in. long, segms. prickly, overlapping, pale below and bluishgreen above: fls. in subglobose heads about ½ in. long. Syria.

Leávenworthii. To 3 ft. lvs. oblanceolate or palmately parted, very spiny: fls. blue or white, the heads to 2 in. long, subtended by long spiny bracts. Kans. to Tex.

maritimum. Sea-Holly. To 1 ft., glaucous-blue: lvs. fleshy and stiff, bloadly ovate, 3-lobed, with course spiny teeth: fls. pale blue, the heads to 1 in. long, subtended by bracts similar to lvs. but much smaller. Eu.

Oliverianum. To 3 ft.: lvs. broadly ovate, beart-shaped at base, the upper st.-lvs. palmately 4-5-parted: fis. blue, the heads 1½ in. long, subtended by stiff linear bracts. Hybrid of uncertain parentage.

planum. To 3 ft.: lvs. oval to oblong, heart-shaped, the st.-lvs. 3-5-lobed or -parted: fls. blue, the heads ½ in. long, subtended by narrow rigid bracts. Eu., Asia. Color forms listed are azūreum and roseum.

prostratum. Prostrate, rooting at nodes, much branched: Ivs. oval or oblong, entire or few-toothed or st.-Ivs. sometimes 3-parted: heads 1/2 in. long, dense, subtended by narrow reflexed bracts. Ky. to Fla. and Tex.

Sérra. To 4 ft. or more: lvs. sword-shaped, spiny-toothed: fls. whitish, the globose heads 1/2 in. across, subtended by lanceolate bracts. Brazil.

Spinsiba. To 16 in., whitish-green: lvs. leathery and stiff, broadly ovate, 4-5-parted, with coarse spiny teeth: fls. blue, the heads 2 in. long, subtended by stiff spiny-pointed pinnathid bracts. Alps of Eu.

virginianum. To 3 ft.: lvs. linear or linear-oblong, upper spiny-toothed or rarely laciniate: heads $\frac{1}{2}$ in. long, subtended by long reflexed bracts. N. J. to Fla. and Tex.

yuccæfdlium: E. aquaticum.

Zabélii. Hybrid between E. alpinum and E. Bourgatii: to 1½ ft.: heads about 1 in. long.

ERÝSIMUM. BLISTER-CRESS. Cruciferæ. Ann., bien. and per. herbs of many species mostly in temp. regions as the genus is traditionally defined, some of them flower-garden subjects related to wallflowers and stocks, mostly with yellow but sometimes lilac or blue fls. The group is closely related to Cheiranthus, differing only in technical characters.

The plants in cultivation are hardy and of simple requirements; perennials raised from seeds sown the year before bloom is wanted; annuals, seeds usually sown where plants are to stand, for summer bloom. They should have sunny exposure.

Allidnii: see E. asperum.

arkansanum: E. asperum, E. murale.

**sperum (E. arkansanum. Cheirinia aspera). Per., 1-3 ft., erect, pubescenti lvs. lanceolate or narrower, entire or lower ones remotely dentate, to 4 in. long: fls. orange to yellow: mature pods slender and spreading, 2-4 in. long. Widespread in N. Amer. Var., perénne is shorter with more slender sts. and lemon-yellow fls. Mts., Calif.—The cult.

plant known as Cheiranthus Allionii apparently belongs here. Often erroneously grown as E. Perofskianum. See E murale

aurantiacum. Sts. usually simple: lys. linear-lanceolate: fls. with white claw and orange-vellow limb. S. E. Eu.

aureum nanum: see E. murale.

canéscens. Bien., gray-canescent, to 3 ft., much branched. lvs. linear-lanceolate, entire: fis. yellow. E. Eu., Cancasus

capitatum. Coast Wallflower. Bien. to 1 14 ft., erect and leafy, simple or branching, lightly pubescent. Ivs. linear to narrow-oblong, entire or dentate, to 3 in. long; fis. cream-color, yellowish, or white. Calif. to Wash.

cuspidatum. Bien., rigid, simple or somewhat branched above, somewhat harry: lvs. oblong, lower ones lyrate: fis. yellow. S. E. Eu., S. W. Asia.

elatum (Cheirinia elata). Bien, to 3 ft. lvs. linear, deeply wavy-toothed to nearly pinnatifid: fis. bright yellow. S. D. to Wash, and Calif.

helvéticum: E. ochroleucum.

hieracifòlium (E. Wahlenbergi). Bien. to 3 ½ ft.: lvs. oblong-lanceolate, entire or toothed: fis. bright to pale yellow, to ½ in. across, pedicels shorter than calyx. Eu.

insulare. Per., sts. much branched from base: lvs. linear, to 2½ in. long. fls. yellow. Isls. off Calif.

Kotschyanum. Per., cespitose, pale green, st. simple, to 5 in. or less. Ivs. crowded, narrow-linear to awl-like, denticulate: fls. yellow-orange High mts., Asia Minor.

linifòlium (Cheirainthus linifolius). Per, making low elump 1 ft. or less high, grayish, much bianched, shoots decumbent: lvs. linear, entire or toothed, fls. lilac or mauve. Spain. Var. bicolor is listed as having both pink and white fis. on the same plant.

murâle. Bien., perhaps per., but may be grown as ann., dwarf and compact, 20 in. or less high, very leafy, the lvs. very little if at all toothed: fls. golden-yellow, in compact racemes that lengthen in fr.: pods crect, short and thick, 1½ in. or less long. Eu.—An old garden plant of indefinite botanical history; sometimes grown as E. nanum, E. arkansanum nanum compactum and E. Perofskianum. See E. pulchellum.

nànum: see E. murale.

nivåle (Cheirinia nivalis). Tufted per. to 10 in.: lvs. dense, narrowly oblanceolate to linear, to 2 in. long: fls. bright yellow, to 1 in. across: pods to 2 in. long. Mts., Colo.

ochroleucum (E. helveticum). Per. to 1 ft., with yellowish creeping sts.: lvs. oblong-lanceolate, toothed, pubescent: fls. pale yellow, fragrant. Eu.

pachycárpum. Per. to 2 ft., stout, with appressed hairs, branched, sts. angled: lvs. lanceolate, sinuate-dentate, stalked: fls. orange-yellow. Himalayas.

Perofskianum. Ann. to 2 ft., erect, simple or little branching, grayish-pubescent: lvs. lanceolate or narrower, entire or remotely toothed, to 3 in. long: fls. yellow or orange, showy. Beluchistan, Afghanistan.—A good flowergarden subject, but the per. plants sold under this name are likely to be E. asperum or E. murale.

podocárpum: hort. name, possibly for a low form of

pulchéllum. Per., cespitose or many-headed, green, from a few inches to 2 ft. high, sts. simple: lvs. oblong-spatulate, toothed or lyrate, upper ones narrow and deeply tothed. fls. deep orange. pod crect-spicading, slender. Greece, Asia Minor.—The plant grown under this name may be E. murale.

pumilum. Per., 6 in., sts. simple and angled: lvs. mostly radical, lance-linear, entire, those on st. 3-5; fis. sulfur-yellow, slightly fragrant. Mts., Eu.

purpureum. Per. with procumbent woody sts., flowering sts. to 6 in.: lvs. narrow-linear, the lower pinnate, upper toothed or entire: fls. purple. Asia Minor.

repándum. Ann., somewhat appressed-hairy, to 1 ft. or more: lvs. lanceolate, entire or remotely toothed, to 2½ in. fls. small, yellow. S. E. Eu. to India.

rupéstre. Per., low, woody at base: lvs. spatulate or oblong, somewhat toothed, somewhat pubescent: fls. few, yellow, Greece. Var. aurantiacum is listed.

suffrutéscens. Beach Wallflower. To 2 ft., woody, much branched: fis. pale yellow or cream-colored. Calif., along coast.

torulosum, Bien. to 1½ ft., st. usually unbranched: lvs. mostly basal, spatulate, to 3½ in. long, coarsely dentate to nearly entire: fis. yellow, to ½ in. across, in terminal raceme, pods to 3½ in. long. N. W. Amer.

Wahlenbérgii: E. hieracifolium.

ERYTHÈA. Palmaceæ. Six species, as now recognized, of Mexican hermaphrodite fan-palms

of mostly low or medium stature, unarmed except on petioles of some species, most of which are planted in S. Calif.: allied to Brahea (from which it was separated) but distinguished by technical characters of fls. and seeds, by the primary branches of the spadix attended by spathes, larger fls. and mostly much larger fr., and in most cases filaments in lf.-sinuses very few or none. For cult. see Palm.

armata (Brahea and Glaucothea armata, B. glauca).

MEXICAN BLUE PALM. Stout robust palm to 40 ft. or more, the trunk naturally covered by a dense "petticoat" or shag as in Washingtonia; Ivs. waxy-blue, in a heavy crown, deeply cut into about 50 segms; petiole bearing strong curved white teeth or spines: spadix very long and extending much beyond lvs., bending over. fr. globose, about 34 in. long, fleshy. Lower Calif.

Brándegeei. Tall, reaching 125 ft., and in nature generally shedding the old foliage: lys. about 3 ft. long. dark green above and pale-glaucous underneath, cut to middle green above and pale-glaucous underneath, cut to middle or somewhat beyond into segms, about 1 in. or less broad and cleft 1-4 in. deep at apex, the ends eventually hanging; petiole glabrous, 3-5 ft. long, with many marginal irregular spine-like teeth mostly less than ½ in. long, fr. about ½ in. diam. Southern part of Lower Calif.

edulis (Brahea edulis). Guadalupe Palm. Trunk stout and columnar, to 30 ft., becoming naked, ringed with sears. Ivs. 3 ft. long, green both sides but paler underneath; segms. 70 or 80, extending ½ to ½ depth of blade, 1½ in or less broad, deeply cleft at apex, with few fibers in sinuses; petuole nearly or quite destitute of spine-teeth or else short petiole nearly or quite destitute of spine-teeth or else short and not very sharp: spadix not much if any exceeding petiole when in bloom: fr. globose, black, 1 in. more or less diam., hanging in an elongated cluster, the pulp sweet; seed about 34 in. diam. Guadalupe Isl., Lower Calif.—Commonly planted in S. Calif.

élegans. Small tree as seen in cult.: lf.-blade thinly glaucous on both surfaces; segms. extending about half way down, shortly bifid at apex; petiole aimed spadices prominent: fi. with crust-like exterior at maturity, nearly globular, uniformly colored, often more or less pyriform. Sonora, N. Mex.

ERYTHRÆA: Centaurium.

ERYTHRÌNA. CORAL-TREE. Leauminosæ. Trees or shrubs or sometimes herbs, commonly thorny, with lvs. of 3 broad lfts., showy red or reddish or yellowish, nearly papilionaceous fls. in racemes, and elongated pods constricted between the seeds.

Grown for ornament in warm countries or the herba-Grown for ornament in warm countries or the herbaceous kinds under glass; showy when in bloom, which usually precedes the foliage. Some species are planted as shade in coffee and cocoa plantations under the name "immortelles"; the flowers are cooked and eaten; the seeds are made into necklaces; some species also have medicinal and poisonous properties. Propagated by seeds and cutturgs. The herbaceous kinds are propagated by rootdivision and the woody sorts from cuttings of growing wood.

arbòrea: E. herbacea var.

arboréscens. Low tree, the branches prickly: lfts. to ft. long and broad: fls. in short dense racemes. pods to 9 in. long, curved. Himalayas.

cáffra. Tree to 60 ft., having small prickles. much like E. Corallodendrum but calyx 2-hpped or splitting. S. Afr.

Corallodéndrum. Tree to 20 ft., prickly or unarmed. Its. rhombic-ovate: fls. with standard never opening, scarlet, in loose racemes: pods to 4 in. long, the seeds scallet and mostly with black spot. Trop. Amer.

Crista-gállii. Cockspur C. Shrub or small tree, the petioles and often midribs spiny: lfts. ovate-oblong to oblong-lanceolate: fls. with standard erect, crimson, in loose racemes. Brazil.

flabellifórmis. Shrub or small tree with spiny branches: lfts. usually broader than long; fls. in dense short racemes: pods to 1 ft. long. S. Arız., New Mex., Mex.

fúsca. To 8 ft., the bark brownish, prickly: lfts. lanceolate: fls. brownish-red, in terminal racemes, the calyx split. Cochin-China.

glauca. Tree to 60 ft., prickly at least when young: lfts. ovate, pale or glaucous beneath, leathery. fis. with orange standard and brown wings tipped with crimson, in racemes to 8 in. long: pods to 10 m. long. Trop. Amer.

herbacea. Sts. herbaceous, to 4 ft., the petioles usually prickly: lvs. triangular, often angled: fls. with standard closed, scarlet, in few-fld. racemes to 2 ft. long: pods to 5 in. long. N. C. to Fla. and Tex. Var. arbòrea (E. arborea) is a shrub or tree with shorter racemes.

indica. Tall broad tree, unarmed or sometimes with small black prickles: lfts. broadly ovate: fls. deep red or scarlet, in dense racemes, the standard erect, the calyx splitting down the back, appearing mostly when tree is leafless: pods to 1 ft. long. India, Malaya. Var. picta (E. picta) has spotted or variegated lvs. and is grown under the names E. Parcelli and E. marmorata.

insignis. Tree, somewhat prickly: lfts, ovate, immature ones tomentose: fis. scarlet, in short dense racemes. Origin unknown.

marmorata: E. indica var. picta.

micrópteryx: E. Poeppigiana.

pállida. Similar to E. Corallodendrum but with fis. pale or salmon-red. Trop. Amer.

Parcéllii: E. indica var. picta.

nicta: E. indica var.

Poeppigiana (E. micropteryx). Bucare. Tree to 60 ft., prickly: lits. ovate: fis. with erect standard, cinnabar-red, in short racemes. Probably Peru.

polathes. To 50 ft., sts. spiny becoming spineless: lvs. ternate, lfts. ovate to rhombic-ovate, to 6 in. long, obtuse, entire, petiole jointed at base fls. red, often striped or suffused white, to ¾ in. across, in erect racemes: fr. torulose, apex acuminate. Portugal.

poinoides: listed name.

retusa: catalogue name of Mexican form said to have clear bright red bloom.

setòsa. To 2 ft., sts. herbaccous, prickly: lfts. to 5 in. long, acute, usually glabrous fts. bright red, in short dense racemes on very long peduncles. Mex.

speciòsa. To 12 ft., bushy, prickly: lfts. 3-lobed, long-acumnate: fls. crimson, in pubescent racemes. W. Indies.

velùtina. Tree to 30 ft., spiny: lfts. roundish or triangular, tomentose beneath: fis. orange-red, the standard erect, ealyx split: pods to 5 in. long. Trop. Amer.

ERYTHROCHÆTE PALMATIFIDA: Liquiaria ja ponica.

ERYTHRÒNIUM. Adders-Tongue. Trout-Lily. Liliaceæ. Bulbous spring-blooming herbs with 2 basal lvs., which are often mottled, and attractive nodding fls. solitary or in racemes terminating the scape, the perianth-segms. distinct.

Planted in wild-gardens or rockeries. They prosper in shady or partially shady places in well-drained soil rich in leaf-mold; a winter mulch is beneficial. Propagated by seeds, or by offsets planted 3-5 inches deep.

seeds, or by onsets planted 3-3 mens deep.

álbidum. To 1 ft., producing offsets: lvs. green or mottled: fls. white, pink or purplish, 1½ in. long, the segms recurved. Ont. to Ga. and Tex.

americanum. To 1 ft., producing offsets: lvs. mottled with brown and whitish. fls. yellow, to 2 in. long, the segms recurved. N. S. to Fla. and Ark.

californicum. FAWN-LILY. To 1 ft.: lvs. strongly mottled. fls. creamy-white, 1½ in. long, stigma lobed, filaments filiform and anthers white. Calif. Var. bicolor, fis. white and chrome-yellow, fragiant.

citrinum. To 8 in.: lvs. mottled: fis. lemon-yellow to white, 1½ in. long, the segms. recurved. Ore., Calif.—Differs from E. Howelln in having a pair of somewhat inflated appendages at inner base of segms.

déns-cànis. Dogs-rooth VIOLET. To 6 in.: lvs. mottled with reddish-brown: fis. rose or purple, 1 in. long, the segms. recurved. Eu., Asia.

gigantèum: E. oregonum.

granteum: E. oregonum.
grandiflorum. To 2 ft.: lvs. not mottled: fls. bright
yellow, 2 in. long, the segms. strongly recurved. B. C. to
Ore. and Utah. Var. robústum grows near the sea-level.
Var. álbum has white fls. with yellow center. Var. Smíthii
is smaller with punk fls.—Material in the trade under this
name but having mottled lvs. is likely to be E. oregonum.

Hártwegii: E. multisca poideum.

Héndersonii. To 1 ft. lvs. mottled: fls. purple, 11/4 in, long, strongly recurved. S. Ore.

Howellii. To 1½ ft.: lvs. mottled: fls. pale yellow with orange center. S. Ore.

idahoénse. To 10 in.: lvs. not mottled, oblanceolate, to 5 in. long, abruptly acute: fls. 1-3, greenish to creamwhite and yellow within, anthers white, stigma lobed. Boundary of Ida. and Wash.

Jóhnsonii: E. revolutum var.

klamathénse. To 10 in.: lvs. shining yellow-green, not mottled: fis. milk-white, yellow at base, 1 in. long, segms. strongly recurved, appendages present, stigma not lobed, on short club-shaped style. Ore.

montanum. To 1½ ft.: lvs. not mottled: fls. white, orange at base, 1½ in. long, segms. slightly recurved. Wash., Ore.

multiscapoideum (E. Hartwegts. E. Purdyt). To 6 in., producing offsets: lvs. not mottled: fls. white or cream with yellow center, stigma distinctly lobed, style slender and long. Calif.

obtusatum. Similar to E. parviforum but with smaller bulb, obtuse lvs. and purple instead of yellow anthers, Wyo. to Mont.—Plants so named in trade may be E. grandiflorum.

oregonum (E. giganteum of hort.). To 1 ft.: lvs. lanceolate to oblong-lanceolate, to 6 in. long, acute, mottled on upper surface: fis. white or creamy-white, segms. to 2 in. long, filaments strongly dilated. N. Calif. to B. C.

parviflorum. To 1 ft.: lvs. not mottled: fls. bright yellow, about 1 in. long, the segms. strongly recurved. Colo. to Utah.—Probably only a small-fld. form of E. grandsflorum.

præcox: E. revolutum var.

Púrdvi: E. multiscapoideum.

purpuråscens. To 1 ft.: lvs. not mottled: fts. light yellow tinged with purple, 34 in. long. Calif.—Distinguished from E. klamathense by absence of inflated perianth appendages.

revolutum. To 1 ft.: lvs. mottled: fls. white or lavender. revolutum. To 1 ft.: Ivs. mottled: fis. white or layender, turning purple, stigma lobed, filaments dilated. B. C. to Calif. Var. Jóhnsonii has lvs. mottled with dark brown and dark rose fis., and by some not considered distinct from typical form. In var. præcox the lvs. are mottled with mahogany color and fis. creamy-white. Var. albiflorum (var. Watsonii) has white fis. banded at base with maroon.

Smithii: E. grandsflorum var.

tuolumnėnse. To 1 ft.: lvs. shining yellow-green, not mottled: fls. deep yellow, greenish-yellow at base, 11/4 in. long, stigma not lobed, style filiform. Calif.

Wátsonii: E. revolutum var. albistorum.

ERYTHROXYLÀCEÆ. COCA FAMILY. Two trop, genera of shrubs or small trees with alternate lys., small regular fls. and fr. a 1- or 2-seeded drupe; only Erythroxylon is cult. In the sequence of families it is placed near Rutaceæ and Zygophyllaceæ.

ERYTHRÓXYLON. Eruthroxylacca. About 90 species, with the characters of the family; the lvs. of E. Coca yield cocaine, for which the bush is cult. in S. Amer. and eastern tropics. Sometimes grown in the open in the far S. or in economic greenhouse collections N. Under glass propagated by cuttings over bottom heat.

Côca. Coca. Cocaine-Plant. Shrub to 12 ft.: lvs. to 2½ in. long: fts. yellowish, ¼ in. across, not showy: drupe about ½ in. long, reddish, with furrowed stone. Nativity unknown, but probably W. S. Amer.

ESCALLÒNIA. Saxifragacex.Good ornamental shrubs of S. Amer., sometimes tree-like, mostly in the Andean region, evergreen, or some kinds deciduous (if so stated), well adapted to warmer parts of the country and a few of them north to Va. or farther: species 60 and more: lvs. alternate or clustered, simple, entire or serrate, often resinous-dotted and glandular: fls. more or less grossularia-like, fragrant, mostly in terminal racemes and panicles; fl.-parts mostly 5: fr. a many-seeded caps. The leading white-fld. kinds in cult. with us are E. floribunda and E. montevidensis, and others are E. Grahamiana, E. illinita, E. leucantha, E. pterocladon (tinted), E. pulverulenta, E. revoluta, E. virgata with intermediate effects in E. Rockii and E. rubricalyx; the remainder are pink, rose, or shades of red.

The escallonias thrive under the usual conditions of parks and yards, being rapid and free growers. They are sometimes trained as vines and on pillars. They have become well known in California, where they are prized for general adaptability as well as for the habit of blooming in autumn and early winter although the flowering of several species is nearly continuous in proper climates Propagation may be by seeds, but the usual method in mild climates is by means of cuttings in a coldframe in autumn and transplanting to nursery in spring.

álba: E. montevidensis.

Berteriàna: E. pulverulenta var. glabra.

hifida: El monteridensis

donardénsis: listed name.

edinénsis. Hybrid of same or similar origin and character as E. langleyensis.

exoniénsis (E. pteroclaton × E. rubra). To 20 ft., with sparingly glandular angled or ribbed branchlets: lvs. somewhat elliptic, to 1½ in , pointed, serrate, essentially glabrous: fls. rose-tinted or nearly white, in terminal panicles to 2 or 3 in long.

floribinda. Large bush or small tree, with somewhat vised branchlets: lvs. oblong to narrowly obovate, to 4 in. long, mostly obtuse, long-tapering at base, entire or very finely serrulate, bright or glossy green above, sparingly dotted underneath: fls. white, \(\frac{1}{2}\) in. across, in long terminal rather narrow panicles, the petals long-clawed. Venezuela and down the Andean region.—See E. monteridensis.

franciscana. Tall glandular and viscid shrub with erect branches and strong odor: lys. thick, oblong, with short margined petiole, acute or obtuse at apex: fis. pink, in narrow viscid paniele. A garden form or hybrid, with the odor of shippery elm.

Frévtheyi: listed name.

glasneviénsis: hsted name for a form with pinkishwhite fla.

glutinòsa. Sts. leafy, glandular: lvs. cuncate-lanceolate, to 34 in. long, serrate in part, leathery: fls. red, to 1 in. across, petals narrowly spatulate. Chile.

grácilis: the plant grown under this name appears to be E practata.

Grahamiana. Erect shrub with more or less spreading Grandmana. Erect surub with more or less spreading branchlets which bear sessile glands: 1vs. stiffish, elliptic or oblong, to 2 in. or more long, obtuse but mucronate, narrowed to base, serrate, glossy above: fls. white, in terminal narrow or pyramidal panieles. Chile.

illinita. To 10 ft. or more, glabrous but young parts remous and glandular, strong-scented: lvs. obvate or long-oval, to 2 in. or more long, obtuse or short-pointed, narrowed to buse, glossy above, serrate: fls. white, in large bracted paniele. Chile.

Ingramii. Garden plant, perhaps hybrid between E. macrantha and E. punctata, the lvs. smaller than those of the former and fls. slightly smaller but similar in color (rose-red).

langleyénsis. Hybrid, probably E. Philippiana \times E. punctata: to 10 ft, somewhat glandular, with spreading arching branches: lvs. small, 1 in. or less long, oval or obovate, sessile or nearly so, serrate, resmous underneath: fls rose-carmine, about $\frac{1}{12}$ in. across, in short raceines on latent hybrid latent hybrid. lateral twigs.

leucántha. Very leafy large shrub: lvs. small, obovate, nearly or quite obtuse, finely serrate toward apex, glabrous, ½ in. or less broad: fls. small, white, many in very dense racemes. Chile.

macrántha. Compact spreading shrub to 10 ft., densely leafy: lvs thick, broad-oval, to 3 in long and one-half or more as broad, shining on upper side and bearing many prominent glands underneath; fls. crimson or rose-red, to 1/2 in, or more long, in short close more or less leafy panieles. Chile—Common where escallonias are grown and often passing under other names.

microphýlla: listed name.

montana. Shrub to 6 ft.: lvs. obovate-oblong to lanceolate, to 34 in. long, more or less serrate: fis. white, about a dozen in a dense terminal raceme; petals nearly 1/2 in. long. Chile.

montevidénsis (E. floribunda var. montevidensis. E. bifida. E. alba). Much like E. floribunda but branchlets not viscid, lvs. mostly slightly emarginate at apex, fls. larger in a more rounded corymb-like cluster, the petals not narrowly clawed, stamens and pistils prominent. S. Brazil, Uruguay.—Varrously understood, by some authors considered to be a geographical form of E. floribunda, but probably distinct. probably distinct.

organénsis. To 6 ft., very leafy, branchlets angled, glabrous but somewhat resinous or glandular: lvs. narrowly obovate to oblong, often red-margined, firm, to 3 in. long, obtuse, dentate: fis. rose-red, to 3/2 in. across, in short dense broad terminal cluster close to the lvs. Organ Mts., Brazil

Philippiana: E. rirgata var.

pterocladon. To 10 ft. or more, pubescent, the branches thin-edged or winged: lys narrow-obovate, to 1 in. long (usually less), toothed, tapering to buse, shining above: fls white, in slender racemes to 3 in. long, the petals ½ in. long. Patagonia.

pulverulenta. Downy viscid shrub to 12 ft.: lvs oblong, obtuse, tapering at base, to 4 in long, fine-toothed, var-nished above fis, white, crowded in slender or tail-like raceme to 9 in long. Chile. Var. glabra (E. Berteriana) is nearly or quite glabrous.

punctata (E. rubra var. punctata). Shrub to 10 ft., the young parts glandular-sticky and pubescent: lvs. oval or obovate, to 1 or 2 in. long, tapering both ends, toothed toward apex, strongly glandular underneath: fis. crimson, sometimes solitary but mostly in terminal corymbose glandular panicles, calyx glandular. Chile.

revolûta. To 25 ft. or more, white-pubescent: lvs. thick, obovate, to 2 in. long, apex obtuse or acutish, base tapering, toothed, margins revolute: fls. white, in dense terminal pyramidal panicles, the petals about ½ in. long. Chile.

Rôckii (E. marantha × E. monteudensis). Tall widely branched shrub: lvs. obovate, obtuse, tapering at base, to 2 m. long, glandular-serrate: fis pale pink or white, in thyrse-like paniele to 12 in. or more long.

ròsea: a name of doubtful standing in hort., applied to rose-colored forms of different species or hybrids.

robe-colored forms of different species or hybrids.

robra. Erect shrub to 15 ft, the young parts more or less glandular and viscud; lvs. oblanceolate to long-obovate, to 2 in. long, acute, tapering at base, serrate toward apex, nearly or quite glabrous and with few glands underneath; fls. red or crimson about ½ in. across, in terminal panicles, the callyx typically not at all or very little glandular. Chile. Var glabriúscula is listed.

rubricalyx. Spreading shrub of medium size and rounded outline, with slender branches: fis. having white petals and red calyx, the petals forming a tube: lvs. like those of E. Grahamiana, and the plant perhaps a hybrid between that species and E. rubra.

sanguinea: hort, form of E. macrantha.

virgata. Deciduous shrub to 8 ft., with aspect of Leptospermum, branchlets glabrous and very leafy: Ivs obovate to lanceolate, acute, tapering at base, serrate toward apex, to ½ in. long, glabrous: fls. white, to ½ in across, in leafy terminal racemes. Chile. Var. Philippiana (E. Philippiana). Branches rugose: Ivs. strongly acute, crowded-fasciculate in short very leafy branches. Chile. Considered by some authors as unsengrable from the typical form. authors as inseparable from the typical form.

viscosa. To 10 ft., with drooping sticky resinous branches: Ivs. obovate, to 3 in. long, obtuse or with short abrupt point, tapering to short petiole, clammy, serrate: fts. white, in rather loose large panicles, corolla 1/2 in. or less across. Chile.

ESCHSCHÓLZIA. Papaveracex. Herbs native in W. N. Amer. with much dissected lvs. and showy yellow solitary fls.; popular for the flower-garden. Many species that have been described are probably seasonal forms of E. californica.

Grown as annuals, the seeds sown where the plants are to stand in sunny exposure; in mild climates may be treated as winter annuals, and *E. californica* may live over winter after blooming.

álba: E. californica var.

aurantiaca: E. californica var.

cæspitôsa. To 9 in., the fl.-sts. exceeding the basal tufted lys.: fls. yellow, to 2 in. across: fr. linear, to 3 in. long. Calif.

californica. California-Poppy. To 2 ft., very variable: fls. pale yellow to orange, to 3 in. across: fr. linear, to 4 in. long. Calif., Ore; nat. in Eu. Var. álba, fls. cream-white. Var. aurantiaca, fls. orange. Var. compacta, a habit form. Var. cròcea, fls. deep orange. Var. marítima (E. maritima) has prostrate or ascending branches with lemon-yellow fls. to 2 in. across, segms. of st.-lvs. more densely crowded and caps. 1½-2 in. long. Var. ròsea, fls. salmon-pink.

cròcea: E. californica var.

marîtima: E. californica var.

tenuifòlia. To 1 ft.: fis. light yellow, 1/2 in. long. Calif.

ESCOBÀRIA. Cactacex. Globose or cylindric and mostly espitose cacti, juicy not milky, several species in Mex. and S. Tex.: tubercles grooved above, spines never hooked: fls. small, from top of plant. See Cacti.

bélla. Tufted, cylindrical, to 3 in. high, tubercled; radial spines several, to $\frac{3}{8}$ s in. long, whitish; centrals 3–5, to $\frac{3}{4}$ in. long, brown: fis. pink, to $\frac{3}{4}$ in. across, wheelshaped, segms. linear-oblong, acute. Mex.

Cháffeyi: Coryphantha Chaffeyi.

chihuahuénsis. Globose to short-cylindric, spiny, short-tubercled; central spines longer and darker than radials: fls. purple, to 1/2 in. long, inner segms. acute. Mex.

dasyacántha (Mammillaria dasyacantha). Body globose, usually about 3 in. diam.; radial spines 20 or more, white and bristle-like; central spines about 9 and to ¾ in. long: fls. pinkish, 1 in. long. W. Tex., New Mex., Mex.

durispina: E. tuberculosa var.

Llóydii. Similar to E. tuberculosa but central spines stouter and fls. greenish-white, the perianth-segms. not ciliate. Mex.

Muhlbaueriàna. Ovoid to subcylindrical, about 2 in. high, dark glossy green; tubercles about ½ m. high, ovoid-conical, soft, with nearly glabrous axils; radial spines 15-20, to ½ in. long, white tipped brown, radiating; centrals usually 6, to ½ m. long, grayish: fls. to 1 in. across, petals greenish-yellow with red stripe: fr. red, to ¼ in. diam. Mex.

multiceps: probably Mammillaria multiceps.

Rúnyonii. Body globose, to 2 in. long, grayish-green, in clumps; radial spines numerous and white; central spines 5-7 and to 1/3 in. long: fls. pale purple, 1/2 in. long. Mex

Sneèdii. Body cylindrical, to 2½ in. long and ¾ in. diam., in dense clumps; spines 20 or more, appressed and to ¼ in. long: fls. pink, ⅓ in. long. Tex.

tuberculòsa (Mammillaria tuberculosa; one of the plants tuberculòsa (Mammillaria tuberculosa; one of the plants known as M. strobilformis). Body cylindric or becoming so, to 1 ft. or so high, usually in clumps; tubercles about ¼ in. long; radials numerous and white; centrals several and stouter: fls. light pink, 1 in. across. S. W. Tex., New Mex., N. Mex. Var. durispina (E. durispina) has radial spines tipped red or brown, they are also more numerous and more brittle. Var. rufispina has pink-tipped grayish

ESCÓNTRIA. Cactacex. One cactus of S. Mex., separated from Cereus, the ovary bearing papery persistent scales rather than essentially naked: fis. small, yellow, diurnal. Apparently not often planted. See Cacti. E. Chiotilla (Cereus Chiotilla). Tree-like, numerously branched, to 20 ft. and more, ribs few; radial spines 10-15; centrals several, all similar: fls. near ends of branches. about 1 in. long.

ESMERALDA: Arachnis Clarkei. Sanderiana: Vanda Sanderiana.

ESPARCET: Onobrychis vicixfolia. ESPINO CAVAN: Acacia Cavenia.

ESPOSTÒA. Cactaceæ. One columnar cactus from Ecuador. E. lanàta (E. sericatus. Pilocereus Dautwitzii and Haagei. Cereus and Cephalocereus Dautwitzii). To 15 ft., simple with spreading branches which are tipped with mass of hairs or bristles; ribs 20–25, areoles ¼ in. apart with numerous radial spines ¼ in. long and long white hairs: fls. pinkish, to 2 in. long, surrounded by wool.

ESTRAGON: Artemisia Dracunculus.

ETROG: Citrus medica. **EUANTHE:** Vanda Sanderiana. EUBOTRYS: Leucothoe.

EUCAL ÝPTUS. GUM-TREE. Myrtacex.Evergreen trees, or sometimes shrubs, much grown in warm and semitrop, climates for the valuable timber and oil, for ornament and firewood, some of them for bee pasture, mostly native in Australia, having simple entire lvs. alternate or opposite on young shoots and often polymorphous, white, yellowish or red fls. in umbels or heads, the petals and calyx-lobes united to form a lid or cap which opens transversely and falls off, revealing the numerous showy stamens; there are 300 and more species, and the understanding of them is a special study.

Eucalypts are grown from seed. The capsules should be gathered and placed on canvas sheets in the sun till the seeds fall out. Seed should be sown in June or July in seeds fall out. Seed should be sown in June or July in flats, either one seed in a place or broadcast and the seedlings then transplanted. Screens or lath-houses should be provided for shade. These seedlings will be ready to set permanently by about the following February, when from 6-10 inches high. On heavy soils the trees for forest plantations should be set 6 by 6 feet or if irrigation is employed 4 by 8 feet; on light soils 8 by 8 feet is best. The stands should be cultivated for at least the first two years.

Many species besides these entered in this erticle have

Many species besides those entered in this article have

been introduced into North America, largely in California. been introduced into North America, largely in California, for forest purposes, specimen planting, and for test, represented by such names as E. acmenioides, annulata, buprestium, Caleyi, camphora, Considencina, corrugata, decipiens, Drummondii, Flocktonia, facunda, gracitis, grandis, Guilfoylei, gummifera, leptophylla (equals uncinata), Le-Souchi, maculosa, Moitoniana, obtusifolia, olcosa, odorata, ptychocarpa, redunca, saligna, Smithii, Stowardii, tetragona, Todtiana, uncinata.

álba. Bark rough, ash-colored: lvs. ovate-oblong to broadly lanceolate, pale and glaucous: fls. small, in few-fld. umbels: fr. 1/4 in. across.

álbens: E. hemiphlora var.

alpina. Shrub to 12 ft.: lvs. ovate to oblong, very thick: fls. rather large, solitary or few together: fr. to 1 in. across. amplifòlia: a form of E. tereticornis having large round

lvs. when young. amygdálina. Peppermint Gum. To 300 ft., with persistent fibrous bark: Ivs. lanceolate, with peppermint odor: fis. rather small, in many-fld. umbels: fr. \(\frac{1}{2}\)4 in. across. Var. angustifòlia (E. linearis) has very nairow Ivs. and drooping branchlets. Var. numeròsa has more than 20 fis. in an umbel. Var. régnans (E. reynans), to 325 ft., Ivs. broad-lanceolate.

anguldes. E dumosa var

angulòsa var. robústa: E. robusta.

angustifòlia: E. amygdalına var.

astringens. To 60 ft.: lvs. oblong to ovate-cordate and lanceolate on mature trees, to 5 m. long: fis. about 7 m long-peduncled umbel: fr. ovoid, about ½ in. long.

bicolor. Black Box. To 40 ft., with persistent rough bark: lvs. lanceolate: fis. small, in few-fid. umbels forming panicles: fr. about 1/6 in. across.

Bláckeleyi. Tree to 40 ft. or more: lvs. ovate to lanceolate, to 7 m. long, midrib conspicuous: fls. small, 4-7 m loose umbels: fr. globular, somewhat tapered at base, 14 in. across.

Bláxlandii. Similar to E. capitellata but with less stringy bark and young ivs. undulate with toothed margin.

Rosistoàna. BAIRNSDALE GRAY BOX. Lvs. narrowly lanceolate: fls. in few-fld. umbels.

botryoides. Bastard Mahogany. Bangalay. To 150 ft., with persistent rough furrowed bark; lys. lanceolate: fis. rather large, nearly sessile. fr. 16 m. across.

cæsia. Dwarf, with slender drooping branches: lvs. ovate-lanceolate or lanceolate: fis. pink, in clusters: fr. 34 in. across.

calophylla. Medium-sized tree, with rough corky deciduous bark: lvs. ovate-lanceolate, thick: fis. rather large, white or pink in var. rôsea, in umbels forming a terminal paniele. fi. to 1½ in. across.

capitellata. Large tree, with furrowed fibrous bark: lvs. ovate-lanceolate, very thick and shining, fis. sessile, in umbels: fr. 1/3 in. across.

cinèrea. Medium-sized tree, the bark whitish and persistent: Ivs. ovate to ovate-lanceolate, glancous or mealy-white: fls. in clusters: fr. 1/4 in. across. Var. multiflora is listed.

citriodòra: E. maculata var.

ciadócalyx (E. corynocalyx). Sugar (ium. To 120 ft., with smooth deciduous bark: lvs. ovate-lanceolate to lanceolate: fls. 1/2 in. across, in 6-12-fld. umbels: fr. 1/2 in. across.

clemondénsis: listed name.

coccifera. Small tree, the bark smooth and white: lvs. lanceolate, glaucous: fis. in clusters: fr. to 1/2 in. across.

constricta: listed name.

cordata. To 50 ft.: lvs. orbicular to ovate, often crenate, usually glaucous or mealy-white: fis. rather small, nearly sessile: fr. ½ in. across.

coriacea. Tall tree, the bark deciduous, the inner bark smooth and whitish: lvs. ovate-lanceolate to lanceolate, very thick and shining; fis. in umbels: fr. 1/4 in. across.

cornuta. YATE-TREE. Medium-sized tree: Ivs. oblong or broadly lanceolate: fis. greenish-yellow, in dense heads, having a long horn-like lid: fr. 1/3 in. across.

coronata: listed name.

corymbòsa. Bloodwood. Medium-sized tree, with persistent rough bark: lvs. lanceolate: fls. yellowish-white, fragrant, in panicled umbels: fr. 1/2 in. across.

corynócalyx: E. cladocalyx.

cosmophýila. Shrub or small tree with smooth ash-colored bark: lvs. broadly lanceolate: fls. rather large, nearly sessile: fr. \(\frac{2}{3} \) in across.

crèbra. NARROW-LEAVED IRONBARK. Bark deeply furowed, persistent: lvs. lanceolate: fls. to 1/2 in. long, in panicles: fr. to 1/6 in. across.

crùcis. To 25 ft.: lvs. broadly lanceolate to ovate, to 2 in. long, acuminate to apiculate, glaucous: fis. in axillary umbels of 4-7. fr. to $\frac{5}{4}$ in. diam.

desmodénsis. Shrub to 15 ft., branches drooping and pendulous, bark whitish mature lvs. oblong to lanceolate, to 5 in. long, alternate, glaucous, leathery: fis. 7-15 in axillary umbels.

diversicolor. Karri Gum. To 100 ft. and more, the bark smooth and white: lvs. lanceolate: fts. in umbels: fr. 14 in. across.

dumbsa. Shrub or small tree to 30 ft; lvs. lanceolate, to 4 in. long; fls. white or pink, on axillary peduncles. Var. angulosa (E. angulosa) has angular branches; intermediate forms between it and the type are known.

elæóphora: E. goniocalux.

eremóphila. Shrub or small tree, with smooth scaly bark; lvs. narrow-lanceolate; fls. with reddish lid to 1 in.

erythrocdrys. To 30 ft.: lvs. lanceolate or linear: fls. in clusters, with red lid: fr. 1½ in. across.

erythronema. Small tree with rough reddish bark: lvs. lanceolate, thick and shining; fis. pink-red, in umbels: fr. to \(\frac{1}{2} \) in. across.

eugenioldes. Resembling E piperita, but with strongly fibrous bark, thicker not odorous lvs., and the rim of fr. flat or raised instead of depressed.

eximia. MOUNTAIN BLOODWOOD. Large tree, the bark brown or yellowish and scaly; lvs. falcate-lanecolate; fis. in panicles; fr. ½ in. across

ficifolia. SCARLET-FLOWERING GUM. To 30 ft. or more, the bark dark and furrowed: lvs. ovate to lanceolate, thick: fls. white to pink and scarlet, to 1½ in. long, in panicles: fr. to 1½ in. across.

Forrestiana. Shrub to 12 ft.: lvs. usually lanceolate, to 5 m. long, glaucous. fis. large, solitary, scarlet peduncles to 2 in. long, drooping: fr. 4-sided, to $1\frac{3}{4}$ in. long.

gigantèa: E. obliqua.

globulus. Blue Gum. To 300 ft., the bark deciduous, the trunk smooth grayish or bluish-white: lvs lanceolate in mature trees, much broader and very glaucous on young ones: fls. 1½ in. across, solitary or few together: fr. to 1 m. across.—The commonest species in N. Amer. Var. compacta is a densely branched dwarf form.

gomphocéphala. Tooarr-Tree. To 120 ft., with persistent rough burk: lvs. lanceolate, thick and shining: fls. in umbels, sessile: fr. ½ in. across.

goniócalyx (E. elwophora). BASTARD BOX. Tall tree with rough deciduous bark: Ivs. lanceolate, pale green: fis. in umbels: fr. ½ in. across.

gróssa. Shrub: lvs. ovate to lanceolate, very thick and shming: fls. in clusters, large.

Gúnnii. Cider Gum. To 30 ft., with smooth whitish deciduous bark; lvs. ovate to lanceolate, thick and shining: fls. rather large, in umbels: fr. to 1/3 in. across.

hæmástoma. Large tree, the bark smooth and deciduous. Ivs. fulcate-lanceolate: fis. in umbels: fr. to ½ in. aeross. Var. micrántha (E. mcrantha) has longer lvs. and smaller fis. and frs. Var. capitâta is listed.

hemiphloia. To 90 ft., with rough persistent bark: lvs. lanceolate or broader, thick, often gray: fis. in panicles: fr. ½ in. across. Var. sibens (E. albens) has glaucous or white-mealy lvs. and larger frs.

Léhmannii. Small tree, the bark rough and deciduous: lvs. ovate to oblong: fls. in dense heads, the lid to 1½ in. long: fr. ½ in. across.

leucóxylon. White Ironbark. Tall tree with smooth pale deciduous bark; lvs. narrowly lanceolate, grayishgreen: fls. I in. across, in umbels: fr. ½ in. across. Var. purpurea hus bright purple fls. and var. rôsea pink fls.

linearis: E. amygdalına var. angustifolia.

longifòlia. Woollybutt. To 200 ft., with rough persistent bark: lvs. lanceolate: fls. rather large, in umbels: fr. ½ in. across.

Macarthuri. Bark rough and woolly: lvs. lanceolate: fls in umbels: fr. to 1/4 in. across.

macrándra. Shrub or small tree to 30 ft.: lvs. ovate-lanceolaté to narrowly lanceolate, to 4½ in. long, thick and cornaceous: fis. 8-20 in dense umbels: fr. to ½ in. across.—By some authors considered a variant of *E. occidentalis*.

macrocárpa. Shrub to 15 ft., usually white-mealy: lvs. cordate-ovate, thick and stiff: fls. solitary, orange to crimson, stamens 1 in. long: fr. to 3 in. across.

macrorhýncha. Tall tree, the bark dark gray, fibrous and furrowed: lvs. lanceolate: fis. in umbels: fr. to ½ in.

maculata. Spotted Gum. To 150 ft., the bark deciduous in patches: Ivs. lanceolate: fis. ½ in. long, in many-fid. panicles: fr. ½ in. across. Var. citrodora (E. citrodora), LEMON-SCENTED GUM, has Ivs. with strong odor of lemon.

Måidenii. Tall tree, the bark smooth and whitish: lvs. narrow-lanceolate, chalky-white: fls. in umbels: fr. 1/4 in. narrow-

marginata. Jarrah. Tall tree, the bark persistent or flaking: lvs. lanceolate: fls. in umbels: fr $\frac{1}{2}$ in. or more across.

megacárpa. To 100 ft., the grayish-white bark smooth and deciduous; fis, in umbels; fr. to 1 in, across.

melliodòra. Honey-scented Gum. Yellow Box. To 150 ft., the roughish bark flaking off: lvs. narrowly lanceolate: fls. small, in umbels: fr. 1/4 in. or less across.

micrántha: E. hamastoma var.

miniata. To about 10 ft.: lvs. oblong-lanceolate, thick and stiff, shining above: fls. solitary, very large, stamens white or red and ½ in. long: fr. to 3 in. across.

Muelleriana. Yellow Stringybark. Medium-sized tree with stringy bark and yellow inner bark: lvs. lanceolate, glossy: fis in umbels: fr. ½ in. across.

numeròsa: E. amugdalina var.

nûtans. Shrub or small tree: lvs. suborbicular, to 2 in long, alternate, glaucous, pellucid-dotted: fis. 3-7, with conspicuous purple or reddish filaments to % in. long: fr. nodding, to % in. long.

obliqua (E. gyantea). To 300 ft., with persistent fibrous bark: lvs. ovate-lanceolate, very oblique, thick: fls. in unbels: fr. to ½ in. across.

occidentalis. Flat-topped Yate. Small tree, the bark usually smooth and deciduous: lvs. lanceolate: fls. in umbels, the lid to ¾ in. long: fr. ⅓ in. across.

Oldfieldii. Shrub to 10 ft. with smooth deciduous bark: lvs. ovate-lanceolate, very thick: fis. in clusters, stamens dark colored: fr. 3% in. across.

ovata. Medium-sized to tall tree: lvs. lanceolate or very broad. fls. small, in axillary clusters, the lid sometimes beaked.

paniculata. Tall tree with hard deeply furrowed persistent bark: lvs. lanceolate: fis. in panicles or umbels: fr. 1/3 in. across.

pilulàris. Blackbutt. To 150 ft, with blackish-gray persistent bark; lvs. lanceolate; fls. in umbels; fr. ¼ in. across.

piperita. Peppermint Stringybark. Tall tree, with rough gray persistent bark: lvs narrowly lanceolate, oblique, with peppermint odor: fis. in umbels: fr. 1/4 in across

platyphfila. Bark deciduous, smooth and white: lvs. ovate: fls in umbels, on short thick stalks: fr. 1/3 in. across.

plátypus. Small tree with smooth grayish bark: lvs. oval, very thick and shining: fls. dull red or yellowishwhite, in umbels with thick stalks: fr. ½ in. across.

polyánthemos. Red Box. Australian Beech. To 150 ft, the bark persistent: lvs. orbicular to ovate, grayishgreen: fls. small, in many-fld. panieles: fr. ½ in. across.

populifòlia. Poplar Box. Bark rough: lvs. ovate, shining and very dark green: fls. small, in panicled umbels: fr. very small.

Preissiàna. Spindly shrub to $10\,$ ft.: lvs elliptic-oblong, to $4\,$ in. long, strongly pellucid-dotted: fis. in umbels, stamens yellow: fr. to $34\,$ in. across.

pulverulenta. Small tree: lvs orbicular or ovate, glaucous or mealy-white: fls. in 1-3-fld. umbels: fr. 1/2 in. across.

punctata. Leather-Jacket. To 100 ft., the smooth dark bark deciduous in flakes: lvs. narrowly lanceolate: fls. in umbels: fr. 1/3 in. across.

pyrifórmis. To 12 ft.: lvs. ovate-lanceolate or lanceolate, very thick: fls. to 3 in. across, in drooping clusters: fr. 2 in. across.

rariflora. Tall tree, branches red: lvs. lanceolate to ovate: fls. in panicles or small umbels: fr. about ½ in. across.

régnans: E. amygdalina var.

resinifera. Red Mahogany. To 100 ft., with rough persistent bark: lvs. lanceolate, thick: fis. in umbels: fr. 1/3 in. across.

Risdonii. To 50 ft., the smooth bark deciduous in patches: lvs. ovate or lanceolate, on young shoots opposite and united at base, glaucous: fis. in umbels: fr. 1/4 in. across.

robústa. Swamp Mahogany. To 100 ft., with rough persistent bark: lvs. ovate-lanceolate: fis. ¾ in. across, in umbels: fr. ½ in. across.

rostrata. Red Gum. To 200 ft., with smooth gray deciduous bark: lvs. narrowly lanceolate: fls. to ½ in. across, in umbels: fr. ¼ in. across.

rûbida. Resembling E. riminals but with smooth white bark often having reddish patches.

rudis. Desert Gum. To 100 ft., with rough gray persistent bark: lvs. lanceolate: fls. ½ in. across, in umbels: fr. ½ in. across.

salmonophlòia. Tall tree, bark smooth, salmon-colored, beconing red on drying: Ivs. ovate to ovate-lanceolate, dull yellowish-green, becoming glossy at maturity: fis. small, in umbels: fr. about ½ in. across.

sepulcralis: poorly understood species of questionable botanical standing.

siderophlòia. Broad-leaved Ironbark. To 100 ft., with deeply furrowed persistent bark: lvs. ovate-lanceolate to lanceolate: fis. in panicles: fr. 14 in. across.

sideróxylon. Red Ironbark Medium-sized tree with rough dark red or black persistent bark: Ivs. narrowly-lanceolate, or young Ivs. linear-lanceolate: fis. white or yellowish, in umbels: fr. /2 in. across. Var. rôsea has rose-colored fis. Var. pâllens has rose-colored fis. and silvery-gray foliage.

Sieberiàna. Differs from E. hamastoma chiefly in the dark furrowed bark.

spathulata. Shrub to about 8 ft.: lvs. linear-lanceolate, to 3 in. long, obtuse, opposite, tapering toward base: fls. 4-8, in solutary and axillary umbels: fr. about ½ in. diam.

Steèdmanii: listed name.

Stricklandii. Probably a shrub, branchlets glaucous: lvs lanceolate, to 4 in. long, thick, stalked: fis. sessile in small clusters, about 34 in. across, filaments red: fr. subcyindrical, more than ½ in. long.

Stuartiana. APPLE-SCENTED GUM. Tall tree with rough fibrous bark: lvs. ovate-lanceolate to lanceolate: fls. in umbels: fr. to 1/3 in. across.

tereticornis. Gray or Slaty Gum. To 150 ft., with smooth gray deciduous bark: lvs. broadly lanceolate: fis. ¾ in. across, in umbels: fr. ¼ in. across.

tetráptera. Small tree with sharply 4-angled branches: lvs oblong-lanceolate, very thick: fis. very large, sessile and solitary: fr. 1 in. across.

torquata. Lvs. lanceolate, leathery, grayish-green: fls. in umbels, base of calyx dilated into ring, stamens ½ in. long, reddish-orange.

urnigera. Bark smooth, pale brown, branchlets drooping: lvs. ovate to lanceolate, glaucous: fis. in 3-fid. umbels: fr. 1/3 in. across.

viminalis, Manna Gum. To 300 ft., the branches pendulous: lvs. lanceolate: fls. ½ in. across, in umbels: fr ¼ in. across.

virgata. Shrub or small tree: lvs. lanceolate, shining: fls. in umbels: fr to ½ in. across.

EUCEPHALUS: Aster.

EUCHARIDIUM: Clarkia.

EÙCHARIS. Amaryllidaceæ. Bulbous herbs from Colombia, with broad basal lvs. narrowed into petioles, and large beautiful chaste-white fls. in umbels terminating the scape, the perianth with cylindrical tube and spreading segms.

The Amazon-lily is grown out-of-doors in warm countries or in a greenhouse with the night temperature at about 65°. It succeeds in coarse fibrous soil and should be liberally watered except in the resting period. Protection from the sun should be given except in the winter months. Propagated by offsets in spring.

amazónica: E. grandiflora.

grandiflora (E. amazonica). Amazon-Lilly. Livis. about 1 ft. long and 6 in. broad, the petiole 1 ft. long: fls. fragrant, to 3 in. across, on scapes 2 ft. high. Andes of Colombia.

EUCHLENA. TEOSINTE. Gramineæ. Broadleaved grasses resembling maize and grown for forage in the S.: monoccious; staminate spikelets in terminal panicles; pistillate in axillary spikes inclosed in a husk from which the long styles protrude; grain or seed large; native in Mex. and Cent. Amer.

luxurians: E. mexicana.

mexicana (E. luxurans). Ann. to 10 ft. or more, very leafy. Ivs. to several ft. long and 1-2 in. wide, midrib prominent grain shining, ¼ in. long. Mex.

perénnis. Differs from *E. mexicana* in being per. and propagating by rhizomes. Mex.

EUCNIDE. Loasaceæ. Ann. or bien. herbs of S. W. U. S. and Mex., allied to Mentzelia but differing in being armed with stinging hairs, the petals connate and not free and in technical characters of the ovary. Propagated by seed.

bartonioldes (Mentzelia gronoviæfolia). Bien., much

branched and usually spreading on the ground: lvs. ovate, lacinate or lobed: fis. bright yellow, opening only in full sun, on slender pedicels to $6\,$ in. long: caps. opening by 5 valves at top. W. Tex. and Mex.

EÙCOMIS. Liliacex. S. African bulbous herbs with basal lvs. in rosettes and greenish or whitish fls. in racemes terminating the scape and tipped with a crest of leafy bracts, the perianth-segms. distinct. Of easy cult. in warm climates or in greenhouses in the N. Propagated by offsets.

comòsa (E. punctata). Pineapple-Flower. To 2 ft.: lvs. to 2 ft. long and 3 in. across, spotted with brown beneath: fls. green, ½ in. long.

punctata: E. comosa.

undulate. Lvs. to 1 ft. long and 1½ in. across, strapshaped, undulate, with finely crenulate cartilaginous margins, strongly keeled beneath: fis. greenish, to ½ in. across, with spatulate diverging segms, in dense raceine above which is a tufted crown of small lvs.

EUCÓMMIA, the only genus of Eucommiacew, which stands near Hamamelidacew and Rosacew. One deciduous tree from Cent. China, yielding rubber although difficult of extraction. E. ulmoides. To 60 ft.: lvs. alternate, elliptic to oblong-ovate, to 3 in. long, toothed, elm-like as the specific name implies: fls. unisexual, in Apr. before or with the lvs., without perianth, the anthers red: fr. a winged nutlet to $1\frac{1}{2}$ in. long.—Hardy N. Propagated by seeds and cuttings of young wood under glass.

EUCRÝPHIA, the only genus in Eucryphiaceæ. A few species in Australia and Chile, by some authors formerly included in Rosaceæ and also in Saxifragaceæ and Hypericaceæ: evergreen shrubs or trees, sometimes partially deciduous, planted for ornament, intro. particularly in Calif.: lvs. opposite, simple or pinnate, bearing large white somewhat rose-like fls. in the axils: petals 4, large; stamens numerous and conspicuous: fr. a dehiscent caps.

Billardièri. Large glabrous tree, sometimes grown as a shrub: lvs. simple, oblong, obtuse, entire, whitish underneath: fls. to 2 in. across. Tasmania.

cordifòlia. Small tree or large shrub: lvs. simple, cordate and oblong, pubescent, crenate. fls. large. Chile.

glutinosa (E. pinnatifolia). Tree to 20 ft.: lvs. pinnate, the 3-5 lfts. elliptic to lance-ovate, to 2 in. long: fls. 2 in. or more across. Chile.

pinnatifòlia: E. glutinosa.

EUGÈNIA (incl., Jambosa, Myrciaria). Myrtaceæ. Trop. and semi-trop. evergreen bushes and trees in many parts of the world and of very many species, in the western hemisphere native as far north as S. Fla.: lvs. opposite, simple, mostly firm and glossy: fls. commonly white, cream-colored or purple, solitary, racemose or paniculate, the stamens numerous and conspicuous: fr. a drupe-like yellow, red, purple or black berry, sometimes edible.

Eugenias are grown in Florida, California and similar climates for the ornamental habit, foliage, flowers and berries, and some kinds for the eatable fruits. They are of simple requirements, propagating by means of seeds, and by cuttings on a bench or in a frame. In California, E. paniculata and its variety are much planted, and in Florida also; the young growths are red-brown and showy, the winter color often brilliant; there is a form with variegated leaves.

apiculata (Myrtus Luma). To 4 ft. or more: lvs. oval, to 1 in. long: fls. white, ½ in. across, in 3's: fr. black. Chile.

aromática (Caryophyllus aromaticus). CLOVE-TREE.
Tree to 30 ft.: lvs. ovate-oblong, to 5 in. long: fis. pale
purple, ¼ in. across, in terminal cymes, the dried fl.-buds
comprising the cloves of commerce. Moluccas.

austràlis: E. paniculata var.

axillaris: probably E. supraaxillaris.

brasiliénsis: E. Dombeyi.

cauliflora (Myrciaria cauliflora). JABOTICABA. Tree to 40 ft., upward-branching from near the ground and bearing clusters of fls. and fr. along the trunk and branches: livs. lanceolate or somewhat broader, acuminate, to 4 in. long: fls. small, white: fr. globular, to 1 or 1½ in. diam., purple. S. Brazil, prized for the edible fr.—Haa been tried in Fla. and S. Calif. Two or three related species are apparently known as jaboticabas.

coronata. Shrub to 6 ft. with ovate or elliptic lvs. 1 in. or less long and not more than ½ in. broad: fls. solitary in axils of lvs., on pedicels ¼ in. or less long. Upper Guinea.—Reported in S. Fla.

Cuminii: Suzugium Cuminii.

Curranii. Tree to 50 ft.: lvs. oblong-elliptic, to 12 in. long: fls. in panicles often from tubercles on st.: fr. size of grape, edible. Philippines.

cyanocárpa. Glabrous tree with lanceolate willow-like lys. to 3 in. long and tapering both ways from middle, strongly cross-veined, petiole very short: fis. to 1/4 in. across, in terminal clusters: fr. blue. Australia.

Dómbeyi (E. brasiliensis of planters). Grumixametra-Tree. Tree to 50 ft.: lvs. oval to somewhat obovate, cornaceous, to 5 m. long: fis. solitary, white: fr. dark red becoming black, edible. Brazil.

edùlis (Myrciaria edulis). Lvs. willow-like, rusty-pubescent when young: fr. orange or yellow, the size of an apple, downy. Brazil.

eucalyptoides. Small tree or shrub: lvs. lanceolate, to 6 in. or more long, pointed fls. in compact terminal cymes, the orbicular petals about ¼ in. across: fr. globular. Australia

floribunda (Myrciaria floribunda). Tree to 30 ft., glabrous: lvs. lanceolate to ovate-lanceolate, to about 3 in. long, long-acuminate: fls. white, sessile in lateral clusters: fr. red or yellow, to ½ in. diam. W. Indies.

Hodkeri, Hookeriana: E. paniculata.

Jambolàna: Syzygium Cuminii.

Jámbos (Jambos vulgaris and J. Jambos. Caryophyllus Jambos). Rose-Apple. Jambos. Broad tree to 30 ft.: long-lanceolate, tapering both ends, to 8 in. long: fts. greenish-white, to 3 in. across, the stamens very conspicuous, terminal and few together: fr. to 2 in. diam., greenish or yellow, employed in making preserves and confectionary. Trop. Asia; nat. elsewhere.

malaccénsis (Jambosa malaccensis). Malay-Apple.
Pomerack. Tree to 30 ft. or more high, with thick heavy
top: lys. oblong to somewhat oboyate, thick, to 12 in. long:
fls. red-purple, 2 in. across, boine along branches, stamens
much exceeding petals and covering the ground as they
fall: fr. red, 2 in. long. India, Malaya.

Mato. Tree to 20 ft.: lvs. ovate to oblong-lanceolate, obtuse: fs. white, solitary in the axils, on stalks to ¾ in. long. Argentina.

Michelii: E. uniflora.

microphylla: see E. myriophylla.

monticola. Shrub or tree to 30 ft.: lvs. ovate to lanceolate, to 1½ in. long, pale beneath: fls. small, in axillary clusters: fr. black at maturity, very small. W. Indies.

myriophfila (Myrciaria myriophylla). Much branched bush: lvs. very narrow and crowded (at least on juvenile plants), to 1½ in. or more long, ¼ in. or less broad, entire, punctate, midrib obscure above but prominent underneath. fls. white, solitary on axillary peduncles. S. Cent. Brazil.—Grown in pots in its vegetative stage for decoration under the mistaken name E. microphylla.

myrtifòlia: E. paniculata var. australis.

operculata: Syzygium operculatum.

operculata: Syzygium operculatum.

paniculata (E. Hookeri and Hookeriana, hort.). Small
vigorous tree, mostly not continuous-blooming: ivs. oblonglanceolate, to 3 in. or more long, prominently acuminate,
tapering at base: fls. white or whitish with conspicuous
stamens, about ½ in. across, in small clusters terminal and
on the ends of short branchlets or long peduncles and
therefore showing beyond the foliage: fr. rose-purple, to
about ¾ in. diam., employed in jelly-making. Australia.
Var. australis (E. australis. E. myrtifolia). Remaining
more bushy and usually blooming more or less throughout
the year: lvs. on young shoots oblong-acuminate but on
flowering shoots prevailingly short-elliptic and obtuse or
short-acute and about 2½ in. long or less: fls. not prominent beyond the foliage: fr. usually smaller.

Pitánga. Low shrub, young parts pubescent: lvs.

Pitánga. Low shrub, young parts pubescent: lvs. elliptic-oblong or narrow-lanceolate, to 3 in. long: fis. solutary or in one form fascicled: fr. red, nerved, about 1/2 in. diam. Brazil, Argentina.

púngens. To 40 ft.: lvs. elliptic-oblong, to 3 in. long, spine-tipped: fls. solitary, the peduncles shorter than lvs.: fr. white-tomentose or puberulent, small. Brazil.

Smithii. Tall tree: lvs. ovate to ovate-lanceolate, to 3 in. long: fis. white, small, in terminal panicles: fr. white or purplish. Australia.

supraaxillaris. Tree to 25 ft.: lvs. oval-oblong, to 5 in. long, shining, pale beneath: fls. in about 9-fld. racemes to 3/4 in. long, supraaxillary. Brazil.

Úgni: Myrtus Ugni.

uniflora (E. Michelis). PITANGA. SURINAM-CHERRY. Shrub or tree to 25 ft.: lvs. ovate to ovate-lanceolate, to 2 in. long: fls. white, fragrant, ½ in. across, solitary or few together: fr. deep crimson at maturity, 8-ribbed, edible,

EULALIA: Miscanthus.

EULOBUS: see Enothera californica.

EULÝCHNIA. Cactacex. Branched cacti with parallel spiny ribs and white or pinkish fls. having a very short tube; native in Chile.

iquiquénsis. To 25 ft. tall, often nearly spineless toward base; ribs 12-15; spines 12-15 at areole, usually about ½ in. long but the longest to nearly 5 in.: fis. white, to 3 in. long.

spinibárbis (Cereus spinibarbis). To 15 ft., much branched; ribs 12-13; spines about 20, usually 34 in. long, the central to 6 in. long; fls. to 2 in. long, woolly.

EUÓNYMUS. SPINDLE-TREE. Celastraceæ. Shrubs or small trees, sometimes root-climbers or creepers, mostly of the north temp, zone, sometimes evergreen, with opposite simple lvs., small greenish or purplish bisexual fis. in axillary cymes, and capsular fr. having the seeds inclosed in an orange-colored aril.

closed in an orange-colored aril.

Whether the name of this genus shall be spelled Evonymus is a question of varying practice. Botanical nomenclature begins with Linnæus, Species Plantarum, 1753, with which it is agreed to associate the generic descriptions of his Genera Plantarum, fifth edition, 1754. In the former work Linnæus spelled the name Evonymus, having taken it over from Touinefort, and in the latter Euonymus as if it were at that time a preference. In those days less importance was attached to such variables. There are good arguments for either spelling and neither one can be, said to be "correct" as against the other, but Euonymus is generally preferred.

Many species and varieties are grown for ornament. Most of the species are hardy in the northern states. Ordinary soil and position are satisfactory. Propagated by seeds stratified and sown in spring, hardwood cuttings, the evergeen species under glass, and layers. Grafting is sometimes practiced with varieties and weak kinds, using strong kinds for stock.

acutus: E. Fortunei.

alâtus (E. Thunbergianus). Deciduous shrub to 8 ft., the branches with corky wings: Ivs. elliptic, finely toothed: fr. purplish. China, Japan. In var. ápterus (subtriflorus) the branches are not winged. Var. compâctus is a dwarf

americanus. STRAWBERRY-BUSH. Deciduous shrub to 8 ft.: lvs. ovate- to oblong-pink. N. Y. to Fla. and Tex. to oblong-lanceolate, wavy-toothed: fr.

arboréscens: listed name.

atropurpureus. Wahoo. Burning-Bush. Deciduous shrub or tree to 25 ft.: lvs. elliptic, pubescent beneath, finely-toothed: fls. purple: fr. scarlet. Ont. to Fla. and Mont.

britzénsis: listed name, probably a form of E. Fortunei var. radicans.

Bungeanus. Deciduous shrub to 15 ft.: lvs. elliptic-ovate or -lanceolate, finely toothed: fr. yellowish. China, Manchuria. Var. péndulus has drooping branches. Var. semipersístens is half-evergreen. Bungeanus.

Carrièrei: a form of E. Fortunei var. radicans.

coloratus: a form of E. Fortunes.

europæus. Deciduous shrub or tree to 25 ft.: lvs. ovate to oblong-lanceolate, finely toothed: fr. pink. Eu. Var. álbus (var. leucocarpus) has whitsh fr. Var. hæmatocarpus (var. fructucoccineus) has deep red fruit. Var. lineāris is said to have much narrower lvs. Var. nānus is a dwarf

fimbriàtus. Shrub or small tree: lvs. elliptic to oblong-obovate, to 4 in. long, abruptly acuminate, serrulate: fr. orange, covered with long pointed wings. Himalayas.

Fortunei (E. radicans var. acutus). Evergreen shrub, trailing or climbing by rootlets: Ivs. ovate-lanceolate, margins entire or nearly so: fr. greenish-white or pinkish. Cent. and W. China.—Recent investigations have shown the plants commonly grown as E. radicans to represent only variants of the above species and not a distinct species apart from it. Most of the hort, variants of what was E. radicans are now considered as forms of the same plant, although a few have been raised to equal rank and are also

treated as varieties. A form of the typical element is coloratus (E. radicans var. coloratus) with lvs. dark deep purple above and paler beneath in autumn and winter. Var. radicans (E. radicans, E. repens) differs in its smaller and less pointed lvs. which are distinctly and sharply serrate, of thicker texture and has obsolete lateral veins; often confused with var. vegetus. Cent. Japan and S. Korea. Forms of this variety are Carrièrei (E. radicans vars. Carrièrei and erectus) which is of a more shrubby and distinctly non-climbing habit with lvs. glossy dark green above, to 2 in. long and occasionally white-margined; grácilis (E. radicans vars. argenteo-marginatus, argenteo-variegatus, pictus and roseo-marginatus, E. tricolor) is a climbing plant with lvs. variously variegated with white, yellow, or pink or combinations of these; mínimus (E. radicans vars. kewensis and minimus, a sterile creeping plant with lvs. only to ½ in. long or less; reticulatus (E. radicans var.), a low-spreading shrub to 5 ft. high or climbing with rootlets when supported, lvs. orbicular-oval to elliptic, more coarsely crenate and leathery than in var. radicans and with larger inflorescences: fr. orange; perhaps more common than the true var. radicans.

grandiflarus. Half evergreen shrub to 15 ft.: lvs. obo-

grandiflorus. Half evergreen shrub to 15 ft.: lvs. obovate, to 4 in. long, margins wavy-toothed: fis. whitish to ¾ in. across: fr. yellowish, scarlet within. Himalayas,

Hamiltonianus. Small tree: lvs. lanceolate-oblong, finely toothed: fr. pink. Himalayas.

japónicus. Evergreen shrub to 15 ft.: lvs. oval, obscurely toothed, shining above: fr. pink. Japan; planted in southern states. There are many forms, a few of which are: álbo-marginatus, lvs. with narrow white border; argenteo-variegatus, lvs. edged and marked with white; adreus, lvs. variegatus, ivs. edged and marked with white; aureus, ivs. yellow when young; aûreo-marginàtus, lvs. edged with yellow; aûreo-variegàtus, lvs. blotched with yellow; columnàris is not distinct from pyramidatus; compáctus variegàtus, a low dense variegated form; mèdio-pictus, lvs with yellow blotch in center; microphyflus (E. pulchel-lws) lvs wild yellow; premidatus lus). lvs. small: pállens, voung lvs. pale vellow: pyramidàtus (var columnaris), of columnar habit; viridi-variegatus or "Duc d'Anjou," lvs. bright green variegated with yellow and green. Vars. elegantissimus and fértilis are listed.

kewénsis: not distinct from a form of E. Fortunei var. radicans known as minimus.

kiautschövica (E. patens). Partially evergreen shrub to 10 ft.: lys, oval to obovate, wavy-toothed, fr. pink, China.

lanceifòlius. Deciduous shrub or tree to 30 ft.: lvs. lanceolate, wavy-toothed: fr. pale. China.

latifòlius. Deciduous shrub or tree to 20 ft.: lvs. oval to oblong, finely toothed: fr. rosy-red. Eu., W. Asia. Var. plánipes is E. sachalinensis.

Maackii. Shrub or small tree: lvs. oblong, finely toothed: fr. pink. China, Manchuria, Korea.

magnificus: hort, name.

myrtifdlius: probably E. japonicus var. microphyllus.

nanus (E. rosmarınıfolus). Deciduous shrub to 3 ft., sometimes procumbent: lvs. linear, usually entire, the margins revolute: fr. pink. Asia. Var turkestánīcus (var. Koopmannu) has broader non-revolute lvs.

obovatus (E. americanus var. obovatus). Running Strawberry-Bush. Deciduous procumbent shrub to 1 ft., the branches rooting: lvs. obovate, finely toothed: fr. pink. Ont. to Kv.

occidentalis. Deciduous shrub to 15 ft.: lvs. elliptic-lanceolate, to 4½ in. long, on short petioles, glabrous, serrulate: fis. purple or dark brown, 5-merous, to ½ in. across. Puget Sound to Calif.

oxyphfilus. Deciduous shrub or small tree: lvs. ovate to ovate-oblong, finely toothed; fr. dark red. Japan.

patens: E. kiautschovica.

péndulus. Small evergreen tree, branches drooping: lvs. oblong-lanceolate, finely sharp-toothed: fr. 4-winged.

plánipes: E. sachalinensis.

pulchéllus: E. japonicus var. microphyllus.

radicans: see E. Fortunei.

rèpens: E. Fortunei var. radicans.

rosmarinifòlius: E. nanus.

sachalinénsis (E.planipes). Allied to E. latifolius: lvs. ovate-oblong, wavy-toothed: fr. 5-angled, purple. N. E. Asia.

Sieboldiànus. Lvs. elliptic: fr. 4-ribbed. Japan.—The plant usually cult. under this name is E. kiautschonca.

speciosus: listed as very dwarf with dark green foliage. Thunbergianus: E. alatus.

tricolor: E. Fortunei gracilis. végetus: E. Fortunei var.

verrucòsus. Shrub to 6 ft.: lvs. ovate, crenate-toothed: fr. yellowish-red, deeply 4-lobed. S. Eu., W. Asia.

Wilsonii. Shrub climbing to 20 ft.: lvs. lanceolate, to 5 in. or more long, serrate: fis. many, yellowish, in cymes: fr. 4-lobed, with yellow aril. China.

yedoénsis. Deciduous shrub to 10 ft.: lvs. obovate, minutely toothed: fr. pink. Japan.

EUPATÒRIUM. Thoroughwort. Boneset. Compositæ. Mostly herbaceous perennials with opposite lys. and heads in clusters or panicles, of purple, rose and white disk-fls. blooming in late summer and autumn; pappus of hair-like bristles; mostly native in Mex., W. Indies and trop. S. Amer.

Many tropical bonesets are very satisfactory in the green-house and others in the hardy border or wild-garden. Those grown under glass are given the same care as the florists stevia (Piqueria), being propagated usually by cuttings in winter or early spring. The hardy herbaceous types require the treatment of the average perennial and are increased by division or by seeds. The species most likely to be seen under glass are E. glabratum, glandulosum, dechanophillum hunstrinum rungrum sorthdum (unglechonophyllum, ligustrinum, riparium, sordidum (ian-

adenánthum: E. glandulosum.

adenophorum: E. glandulosum.

ageratoides: E. rugosum.

album. To 3 ft., rough-hairy: lvs. oblong, to 4 in. long, coarsely toothed: heads white. L. I. to Fla. and La.— Suited to poor soil.

altissimum. To 8 ft., gravish-pubescent: lvs. lanceolate. to 5 in. long, toothed or entire: heads white or pinkish. Pa. to N. C. and Tex.

americanum: E. glandulosum.

araliæfðlium. Shrub: lvs. oblong, to 8 in. long, entire, leathery and glabrous: heads white. Mex. to Guatemala.

aromáticum. To 2 ft., slightly pubescent: lvs. ovate, to 3 in. long, coarsely toothed; heads white. Mass to Fla. and Miss. Var. melissoides has smaller nearly sessile lvs.

atrorubens. To 2½ ft., with red or purple hairs: lvs. ovate, to 1 ft. long, toothed; heads red or purple. Mex.

Bruneri. To 5 ft : lvs. in whorls of 3, lanceolate, to 6 in. long, toothed, tomentose beneath, rugose: heads pink or rose. B. C. to Colo.

cannábinum. Hemp Agrimony. To 6 ft., pubescent: lvs. 3-5-parted into lanceolate coarsely toothed segms.: heads pale purple. Eu.

cinèreum. Shrubby: lvs. ovatc-lanceolate, 3 in. long, toothed, white-tomentose beneath: pappus white. Trinidad.

coléstinum (Conochnium calestrum). Mist-Flower. To 3 ft., pubescent: Ivs. triangular-ovate, to 3 in. long, coarsely toothed; heads light blue to violet. N. J. to Fla. and Tex.

conspicuum (E. grandifolium). Herb or shrub to 6 ft.: lvs. triangular-ovate, to 5 in. long, toothed; heads white. Mex., Guatemala.

dibium (E. verticillatum). Joe-Pye Weed. To 8 ft. or more, st. speckled purple: lvs. ovate to narrow-ovate, mostly in 3's and 4's, to 8 in. long, broadly contracted at base: fls purple, in convex or rounded panicles. Coastal plain, Mass. to S. C.—See E. purpureum.

élegans: E. glabratum.

Fraseri: E. rugosum.

glabratum (E. elegans. E. latifolium). Shrub to 8 ft., sticky and nearly glabrous: lvs. ovate to oblong, to 2½ in. long, fine-toothed or entire, pale beneath: heads pale pink.

glandulòsum (E. adenanthum. E. adenophorum. E. americanum). Often decumbent, glandular-pubescent: lvs. ovate, coarsely toothed: heads pure white, ageratum-like. Mex.—Sometimes grown erroneously as E. glutmosum.

glechonophýllum (Ageratum conspicuum). Low branching subshrub, nearly glabrous: lvs. triangular-ovate, about 1 in. long, bluntly few-toothed: heads white. Chile.

glutinòsum; see E. glandulosum.

grandiflorum: probably E. atrorubens.

grandifòlium: E. conspicuum.

ianthinum: E. sordidum.

incarnatum. To 4 ft., pubescent: lvs. triangular-ovate, to 2 in. long, toothed; heads pink or pale purple. Va. to Fla. and Mex.

Lasseauxii (Ageratum and Conoclinium Lasseauxii). To 2 ft., glandular-hairy: lvs. alternate, oblong-lanceolate, bluntly toothed: heads white changing to rose. Temp.

latifolium: E. glabratum.

ligustrinum (E. micranthum. E. Weinmannianum). Shrub to 15 ft.: lvs. oblong, to 3½ in. long, few-toothed, glandular below: heads white, often with deep rose pappus. Mex. to Cent. Amer.

macrophyllum (Hebeclinium macrophyllum). To 9 ft.: lvs. broad-ovate, to 8 in. long, pubescent, crenate, subcordate at base. heads white. Trop. Amer.

maculatum. Joe-Pye Weed. To 6 ft., rough-pubescent, maculatum. JOE-171E WEED. To 6 It., rough-pubescent, st. often spotted purple, not glaucous: Ivs. ovate or ovate-lanceolate, often whorled, thick, coarsely toothed: heads pink or purple, in flat-topped infl., the florets 9-15. Newf. to B. C. south to Ill. and N. Mex.—Probably most of the stock planted as E. purpureum belongs here.

micránthum: E. liquistrinum.

occidentale. To 1½ ft.: lvs. ovate, to 1½ in. long, toothed or nearly entire: heads pink or sometimes white. Wash, to Calif. and Nev.

odoratum (Osmia odorata). Shrubby, to 2 ft. or partially climbing, pubescent: lvs. ovate or ovate-lanceolate, to 6 in. long, toothed: heads white to blue. Fla., W. Indies, S. Amer.

perfoliatum. Common B. To 5 ft., pubescent: lvs. lanccolate, to 8 in. long, the pairs united at base around the st., rugose, fine-toothed: heads grayish-white varying to blush-purple. N. S. to Fla. and Tex.

purpureum. Jose-Pye Weed. To 10 ft., sts. mostly not speckled, glaucous: lvs. mostly in whorls, oval to lanceolate, to 1 ft. long, tapering at base, coarsely toothed: heads pink or purple, rarely whitish, in open convex infl., the florets 5-7. Me. to Fla., Okla. and Tex.—See E. maculatum and E. dubium.

riparium. Woody at base, 2 ft., sts. pubescent, reddish: lvs. lanceolate, to 4 in. long, toothed: heads white. Mex.

rugosum (E. urticæfolium. E. ageratoides. E. Fraseri). White Snakeroot. To 4 ft., glabrous or hairy: Ivs. ovate, to 6 m. long, coarsely toothed: heads white. N. B. to Fla.

serótinum. To 8 ft., pubescent, much branched: lvs. ovate-lanceolate, to 6 in. long, coarsely toothed: heads white. Del. to Fla. and Tex. n. long, coarsely toothed: heads

serrulatum. Shrub: lvs. lanceolate, to 2½ in. long, finely toothed, slightly glandular-pubescent: heads white. Brazil.

sessilifòlium. To 6 ft., nearly glabrous: lvs. lanceolate or ovate-lanceolate, to 6 in. long, sharp-toothed, sessile: heads white. Vt. to Ga. and Ala.

sordidum (E. ianthinum). Shrub, the sts. densely reddish-tomentose. lvs. ovate to ovate-oblong, to 4 in. long, toothed: heads violet, fragrant. Mex.

speciòsum: Latris elevans.

stochadósmum. To 3 ft. or more, sts. not purple-spotted: lower lvs. trifoliolate, lfts. lanceolate, sharply and rather coansely serrate, uppermost lvs. simple: heads few in loosely branched cymes. E. China and Japan.

Torreyanum. To 3 ft.: lvs. lanceolate, to 3 in. long, slightly toothed, sessile: heads white. Pa. to Fla. and Tex. urticæfdlium: E. rugosum.

vernàle. Shrub, pubescent: lvs. oblong-ovate, to 5 in. long, toothed, grayish-tomentose beneath: heads white. Mex.

verticillatum: E. dubium.

Weinmannianum: E. liqustrinum.

EUPHÓRBIA. Spurge. Euphorbiacex. Herbs or shrubs or small more or less succulent trees of many classes and kinds (sometimes ranged in several genera), often cactus-like, with milky juice, simple lvs., fls. in cyathia (see *Euphorbiacex*), and fr. a 3-parted caps. The species are native in various parts of the world.

The succulent or cactus-like forms are grown in the greenhouse, and for hedges and specimen plants in the South; see Succulents.

The hardy herbaceous species are suitable for the border or rock-garden and thrive in any good garden soil. Seeds may be sown where the plants are to stand and then thinned to about 10 inches.

Poinsettias (E. pulcherrima) are propagated by cuttings, Poinsettias (E. pulcherrima) are propagated by cuttings, usually taken in early summer from young growth of stock that has been kept over winter. These cuttings afford bloom about Christmas time. They should be kept in pots in a temperature of about 65°. Where grown in the open poinsettias may be propagated from April on by canes about 3 feet long stuck in the ground. Other shrubby cuphorbias are similarly handled.

The milky juice of most euphorbias is capable of producing a severe dermatitis much like that of poison ivy on susceptible individuals. Succulent ones should not be

planted along edges of stocked pools inasmuch as secretions from broken roots may be fatal to the fish.

abyssínica. Large tree, branches leafless, succulent and spiny, becoming woody, sts. of young plants definitely 8-angled; spines to ½ in. long, sharp, weak, in groups of 5: fls. in crowded cymes: caps. deep crimson streaked white. Taranta Mt., Abyssinia.—Probably not in cult., although plants of this name are listed; some of them belong to E. acrurensis and E. neglecta.

acturents and E. neglectic.

acrurénsis. Woody, spiny, succulent, tree-like, sts. of young plants 3-9-angled; spines to ½ in. long, gray with dark tips: fls. in cymes of 3 golden-yellow involucres on short peduncles. Abyssinia.—Reputed to have been distributed as E. abyssinica.

aggregata. Tufted shrub 3 in. high with succulent angled sts. to 1 1/4 in. thick having strong yellow-brown to black spines: lvs. very small, soon falling: fls. sessule at tips of sts. S. Afr.

alcicornis. To 10 ft., sts. with elevated rib-like lf.-bases usually 5-angled, fleshy, branches to ½ in. wide; spines dark colored, short, slender: bracts not conspicuously colored. Madagascar.

angularis (E. Lemaireana). Shrub to 16 ft., branches constructed into joints to 8 in. long and 4½ in. thick, with 3 broad horny-margined wings; spines short: lvs. scalelike, central part deciduous: fis. in cymes. Trop. Afr.

antiquorum. Shrub to 10 ft., branches to 2 in. thick, erect, jointed, flattened, the ribs somewhat dentate; spines to $\frac{1}{2}$ in. long: lvs. somewhat orbicular, small. India.—Occasionally used as a hedge plant and confused in the trade with E. lactea.

antisyphilitica. Candelilla. Shrub to 3 ft., branches numerous, slender, erect, spineless, almost leafless, simple or branched: involucres along sts. in small clusters. Mex.—Sts. and branches covered with a wax, used in manufacture of candles, soaps, polishes, lubricants and ointments.

aphýlla. Low much branched shrub with cylindrical gray-green sts. to 3 in. long: lvs. few, linear: fis. solitary or 2-3 at tips of sts., short-stalked. Canary Isls.

arborea: a synonym of E. Tuckeyana, not known to be in cult.; the catalogue description under E. arborea indicates that the plant in the trade is probably E. antisyphilataca

atropurpurea. Shrub to 6 ft.: lvs. oblanceolate, to 3 in. long, glaucous, clustered at ends of branches: fis. in umbels, the bracts dark purple. Teneriffe.

australis. Sts. prostrate, much branched, to 1 ft. long: lvs. ovate or nearly orbicular, 1/2 in. long, pubescent: fis. solitary in upper axils, with white or red petal-like appendages. Australia.

balsamífera. Much branched shrub with gray sts.: lvs. at tips of branches, linear-lanceolate, to 1 in. long: fis. solitary in the rosette of lvs., the bracts yellowish. Canary Isls.

biglandulòsa. To nearly 2 ft., not much branched: lvs. lanceolate, to 1½ in. long, fleshy, prickly-pointed: bracts turning pink, fls. in umbels. Asia Minor.

Bojeri. Similar to E. splendens, differing in lys. paler gray-green beneath, obtuse and not acute, and spines rarely branched at base. Madagascar.

bubalina. Spineless shrub to 5 ft., branches glabrous, to ¾ in. thick, terete: lvs. lanceolate to oblanceolate, to 6 in. long, alternate, scattered: floral bracts green edged with red, deltond, to ¾ in. long. S. Afr.

bupleurifòlia. Sts. spherical, to 9 in. high and 3 in. thick: lvs. clustered at tip of sts., lanceolate, to 6 in. long: fis. solitary on long stalks, bracts green. S. Afr.

ceruléscens. Succulent shrub with thick 4-5-angled jointed bluish-glaucous branches, spines to ½ in. long, and triangular scale-like lvs. S. Afr.—By some authors not considered distinct from E. Ledienii.

canariénsis. Shrub or tree to 20 ft., with thick 4-6-angled branches and small black spines, a few foliage lvs. Canary Isla.

candélla: listed name of succulent form.

Caput-Commelinii: a listed name probably referable to E. Caput-Medusæ.

Caput-Medùsæ (E.Commelinii). MEDUSAS Branches snake-like, to 1 ft. long and 2 in. thick, from a thick globose st. lvs. very small, soon falling: fls. solitary on short stalks. S. Afr. Var. Gorgônis is E. Gorgônis and var. inérmis is E. inermis. Vars. mājor and minor are listed.

cereiformis (E. polygonata). Sts. to 3 ft. long and 2 in. thick, angular, branching, with needle-like spines: lvs. very small, soon falling: fls. solitary with small purple bracts. S. Afr.

Chamsesyce. Prostrate ann. with short thread-like sts.: b. roundish: fis. solitary, having whitish appendages. Medit. region.

clandéstina. With solitary unbranched sts. to 2 ft. tall,

usually cylindrical, spineless, fleshy, covered with wart-like tubercles: lvs. to 1½ in. long, present in crown at apex, when in fl.: inner bracts purple, outer ones larger and greenish-yellow. S. Afr.

clava. To 4 ft., sts. branching with age, branches erect with tubercles to $\frac{2}{3}$ in. across: Ivs. linear-lanceolate, to 51% in. long, alternate, deciduous, on upper part of branches only: bracts green, very small. S. Afr.

Commelinii: E. Caput-Medusæ.

corollata (Tithymalopsis corollata). Flowering S. Per. to 3 ft.: lvs. oblong to linear: fis. in umbels, with white petal-like appendages. Ont. to Fla. and Tex.

crássipes. To 1 ft., plant-body globose-cylindric, nearly flat on top, to 6 in. long, usually half buried: rosette of lvs. to 8 in. across: fls. small and inconspicuous. S. Afr.

Cyparissias (Tithymalus Cyparissias). CYPRESS S. Per. to 1 ft.: lvs. lucar: fis. in many-rayed umbels, the bracts yellowish. Eu.; nat. in E. U. S., on banks and in cemeteries.

—A good ground-cover, but may become a weed.

dendroides. Shrub to 7 ft., sts. much branched: lvs. linear-lanceolate, to 3 in. long, clustered at ends of branches: floral bracts greenish-yellow. Medit. region.

Dinteri. To 18 in. or more, branches cylindrical with 7-8 somewhat spirally compressed brown-horny spined margins; spines brown turning grayish-white, to ¾ in. long: lys. minute, early-deciduous, deltoid, acute: fls. not seen. S. W. Afr.

Echinus. Much branched shrub to 6 ft. or more, sts. 6-angled, branches ascending, If.-bases united into rbs with spine shields fused along each rib into continuous hornlike ridge; spines to ½ in. long, red or gray. Morocco.

elliptica. Stemless dioccious plant with tuberous root: lvs. linear to elliptic-lanceolate, to 8 in. long, petiole as long as blade, all basal and entire, dark bluish-green above. S. Afr.

enópla. To 2 ft., sts. erect, leafless, spiny, fleshy, to nearly 2 in. thick, usually 6-8-angled, grooves distinctly marked with irregular line down center; spines on ridges, to 1 in. long, purplish-brown to gray. S. Afr.

epithymoides (E. polychroma). Per. to 1 ft., forming attractive clumps: lvs. oblong, the floral ones often yellow: fls. in umbels. E. Eu.—Showy in the border.

esculénta. To 1½ ft., st. obconical, buried most of its length, to 8 in. across its flat or depressed crown, rosette of branches arising from crown to 18 in. across; branches terete and tapering, to 1 in. thick at base, spineless, essentially leafless, unbranched: fls. inconspicuous, violet-scented. S. Afr.—Branches sometimes roasted and eaten.

Ésula. Leafy S. Per. to 3 ft., sts. usually unbranched except at infl., arising from rhizomes which bear numerous buds: Ivs. linear-oblong, to ½ in. wide, pale green: fls. greenish-yellow: seeds abundantly produced. Eu.; nat. in N. E. U. S., spreading westward to N. D. and Colo.—A troublesome weed, particularly on well-drained soils. Not known to be in the trade, but seed is offered by botanic gardens.

Eustacei (E. Hystrix in part). To 9 in.; branches numerous, erect, crowded into compact succulent cushion-like structure to 6 in. tall and 1 ft. across, light green; spines many, white, solitary, to 2 in. long, rigid: lvs. oblanceolate, to ½ in. long: bracts light green, becoming spine-like after flowering period: plants dicecious. S. Afr.

exigua. Ann. to 10 in., sts. erect or ascending: lvs. linear-acute: bracts green, in small cymes. Cent. Eu. and Medit. region.

Fálconeri: listed name.

fasciculata. Sts. to 1 ft. high and 3 in. thick, solitary, cylindrical, covered with large tubercles bearing a stiff spine to 2 in. long; lvs. linear, to 1 in. long, soon falling: fl.-sts. arising from depressions back of spines. S. Afr.

ferox. To 6 in., sts. in clumps to 2 ft. across, succulent, leafless, spiny, not much branched, to 2 in. thick, 9-12-angled; spines along ridges, close together, to 1½ in. long, woody, brown to gray: involucre purple with small white dots. S. Afr.

Franckiana. Succulent shrub to 3 ft. with 3-4-angled gray-green branches 1 in. thick bearing spines on the horny margins: lvs. scale-like, soon falling: fls. borne on margins between spines. S. Afr.?

Frickiana: listed name, perhaps intended to be E. Franckiana.

fülgens (E. jacquinæflora). Scarlet Plume. Shrub to 4 ft.: lvs. lanceolate: fis. in oymes, with scarlet petal-like appendages. Mex.—Grown under glass N.

globosa. To 3 in., the fleshy joints globose or club-shaped and about 1 in. diam.: lvs. very small, deciduous; involucre with green white-pitted lobes. S. Afr.

Gorgònis. Main plant globose, to 4 in. thick, with a crown of radiating cylindrical branches 1-2 in. long covered with small tubercles: lvs. very small, soon falling: fis.

solitary in axils of tubercles, with purple-brown glands. S. Afr.—Lvs. and branches often become elongated and less fleshy in cult. when more moisture is available.

grandicornis. To 6 ft., much branched branches 3-angled, to 6 in thick, angles wing-like with horny grayish margins; spines to 2½ in. long, grayish: lvs. scale-like: fis. sessile between spines. S. Afr.

grandidens. Tree to 30 ft. with trunk to 3 ft. diam., branchlets 3-4-angled, deeply toothed; spines small: lvs. minute, soon falling: fls. in 3-fld. cymes. S. Afr.

Grántii. Shrub to 10 ft.: lvs. strap-shaped, to 1 ft. long and 1 in. wide, somewhat leathery: fis. in umbels to 15 in. across. Trop. Afr.

handlénsis. Shrub to 3 ft. or more, leafless, succulent, monœcious; main st. woody, 8-12-angled, ridges with paired red to white spines to 1½ in. long: fls. greenish, minute. Canary 1818.

havanénsis: E. lactea.

Hermentiana. Shrub or small tree; branches erect, straight, fleshy, spiny, usually 3-4-angled, dark green with wavy white band down each face becoming obscure with age; edges somewhat toothed, bearing pairs of brown to gray spines to ½ in. long; lvs. broadly oblong, to ½ in. long, early deciduous: fls. not seen. S. Afr.

heptagòna. To 2 ft., branching, sts. 5-10-angled, to 1¾ in. thick; spines to 1 in. long; lvs. very small, triangular-lanceolate, purple-brown: fls. solitary. S. Afr.

heterophylla (Poinsettia heterophylla). Mexican Fire-Plant. Ann. to 3 ft.: lvs. variable, ovate to linear, entire, toothed or fiddle-shaped, the upper lvs. blotched with red and white: fls. in terminal clusters. Ill. to Fla., trop. Amer.—An acceptable flower-garden subject.

hôttentotæ. Succulent shrub to 6 ft., with main st. much branched at ground level; primary branches 5-angled, to 134 in. diam, ridges low, twigs usually 4-angled; spines to 15 in. long; fls. small, in short-peduncled cymes. S. Afr.

Hystrix: a confused name; plants so listed are probably E. loricuta, but may be referred to E. Eustager.

inérmis (E. viperuna). Resembling E. Caput-Medusæ but with branches ½ in. thick and involucres with woolly white hairs. S. Afr.

ingens. Tree to 30 ft., said to branch in a broadly obconical manner; branches succulent, usually erect, leafless, spiny; fl. branches with 4-7 winged angles bearing very minute or no spines; infl. a cyme, bracts light green. Transvaal, S. Afr.

Intisy. Shrub with fleshy globose forked branches, gray-green and with numerous white dots: lvs. small, borne on protuberances. Madagascar.—Intro. in U. S. for test as a rubber-producing plant.

Ipecacuánhæ (Tithymalopsis Ipecacuanhæ). IPECAC S. Per. to 10 in, branched, from deep root: lvs. variable, linear to orbicular, entire: fls. in umbels, with inconspicuous green appendages. Conn. to Fla.

jacquinæflòra: E. fulgens.

lactea (E. havanensis). Cactus-like shrub or tree of candelabra form, the branches 3-4-angled with a marbled white band down the center, bearing short thick spines and no foliage lvs. E. Indies. Var. cristata has crested branches.—Planted only in warm countries or under glass.

Lathyrus (Tithymalus Lathyrus). CAPER S. MOLE-PLANT. Ann. to 3 ft.: lys. lanceolate, the floral ones ovate: fls. in umbels. Eu.; nat. in N. Amer.

Lediènii. Shrub to 6 ft, branches leafless, succulent, spiny, usually 4-7-angled; spines in pairs, to ¼ in. long, occasionally absent: cymes of bright yellow involucres. S. Afr.

Lemaireana: E. angularis.

lignosa. Shrub to 1½ ft., main st. top-shaped, mostly underground; branches numerous, many-forked, woody at maturity, forming dense cushion to 3 ft. across: Ivs present only on young branchlets, lanceolate, to ½ in. long: cymes greenish, terminal or axillary on long peduncles. Namaqualand Desert region, S. W. Afr.

loricata (E. Hystrix in part). Shrub to 3 ft.; branches fleshy, terete, spiny and somewhat spirally tuberculate, with well developed lvs.; spines solitary, numerous, stiff, to 2 in. long, brown or gray; lvs. linear-lanceolate, to 3 in. long, obtuse: cymes green. S. Afr.—Often confused in cult. with E. clava, from which it differs by its larger sts. and more spiny branches and infl. Most of the cult. material of E. Hystrix belongs here.

mammillaris. To 3 ft, branches cylindrical, 8-17-angled, to 1¾ in. thick, spines ½ in. long, angles tubercled: lvs. scale-like: fls. with small purple bracts. S. Afr.

marginata (E. variegata. Lepadenia marginata). Snow-on-the-Mountain. Ann. to 2 ft.: lvs. ovate to oblong, the upper ones with white margins: fis. in umbels, with white petal-like appendages. Minn. to Tex.—Popular as a flower-garden subject.

Marlothii: E Montieri

mauritánica. Succulent spineless shrub to 4 ft., branches cylindrical, 1/2 in. thick: lvs. to 1 in. long, soon falling: fis. in terminal umbels. S. Afr.

meloformis. Melon S. Plant globose, unbranched, to 6 in, diam., with 8 spineless angles, transversely striped light and dark green: lvs. minute, soon falling: fls. in cymes at depressed apex. S. Afr.

mitrifórmis: catalogue name.

Montièri (B. Marlothii). To 2 ft., main st. unbranched to 1 ft., to 2 in. thick, fleshy, tuberculate; fl. branches slender, creet, not tuberculate: Ivs. spatulate, to 6 in. long, glaucous-green: fls. green, in terminal cymes. Trop. Afr.

Mornia: Plant fleshy, sts. to 2 in. thick, green or grayish, sparsely hairy, rarely branched, ribs 5–8, about ¾ in. high and as wide: lvs. ovate, to ¼ in. long; spines as long, few: bracts brownish-red. S. Afr.

Mûiri. To 1½ ft. or less, main st. below ground; branches erect, usually solitary or few, slender, fleshy, often with crown of small branchlets at or near top, spineless, tubereles abundant, large, usually white-tipped with persistent lf.-base: lvs. linear, to ½ in. long, erect, fleshy. S. Afr.

Myrsinites. Fleshy bien, or per., prostrate or decumbent at base, then ascending or erect: lvs. obovate, in spirals, sessile: fls. yellow, in umbels. Eu.

natalénsis. Per. to 2 ft., woody at base: lvs. linear, to 3/2 in. long, deflexed, sessile: fis. in terminal umbels to 2 in. across. S. Afr. Var. cristata is listed.—The name natalensis is sometimes applied to E. similis.

neglécta. Tree, branches succulent, becoming woody with age, usually 5-8-angled, wings conspicuous with swollen veins; spines in pairs, to 16 in. long. Iv. linear, to 1 in. long. N. Afr.—This plant often listed as E. abyssinica.

neriifòlia (E. Nivulia). Succulent tree or shrub, with 5-angled sts. and short spines: Ivs. thick, obovate-oblong, to 5 in. long. fls. in cymes. E. Indies.

niceensis. Per to 20 in., differing from E. Esula in having ovate to obovate lvs. subtending umbel and lanceolate to oblanceolate foliage lvs. N. Medit. region and Cent. Eu.; perhaps nat. in E. U. S.

Nivùlia: E. neriifolia.

nubica. Shrub to 6 ft., branches spineless, terete, slender, glabrous. Ivs. early deciduous with persistent bases remaining on sts.: fls. green, in terminal umbels. N. Afr.—Some of the material in trade as E. Schumperi belongs here.

nitans. Ann., ascending or creet to 2 ft.: Ivs. linear-oblong to ovate or falcate, scrrate, often blotched or margined red. A common weed of fields and pastures in E. U. S., intro. in Calif.

Nylkæ. Tree to 45 ft.; branches ascending, fleshy, spiny, leafless, 3-4-angled or nearly flat, angles thin-winged; spines to 1/3 in. long, gray: fls. green, minute, in almost sessile cymes. Mozambique.

obèsa. Similar to E. meloformis but with scars of fallen peduncles along angles more crowded. S. Afr.

officinarum. Shrub, branches many-angled, spreading or erect; spines erect, to ½ in. long, stiff, yellow to gray with age: lvs. minute. N. Afr.

ornithopus. Succulent and spineless little plant, branching near ground into cylindric tuberculate branches to 4 in. long, with long-jointed and short-jointed forms: lvs. rudimentary and soon falling: peduncles 1½-3 in. long, bearing cup-shaped green involucres. S. Afr.

bearing cup-shaped green involucies. S. Afr.

palústris. Per. to 1½ ft., sts. not fleshy, glabrous: lvs.
oblong, nearly entire: fls. in umbels, bracts bright yellow:
caps. warty. Eu.
péndula. Sts. cylindrical, long and pendulous, ¾ in.
thick: lvs. minute. Supposed to come from S. Afr. but of
doubtful identity; some of the stock may be a Sarcostemma,
one of the Asclepiadacem.

pentagona. Shrub to 10 ft., somewhat globose in habit; branches succulent, spiny, in whorls along sts. at ½-1½ ft. introvals, usually 5-6-acutely angled, green to gray, lighter line down each groove; spines solitary, scattered, to ½ in. long, light brown: lvs. linear, to ½ in. long. S. Afr.

Péntlandii. Prostrate ann., sts. somewhat fleshy, branched, to 6 in. long: lvs. ovate-oblong, to 1/4 in. long, obtuse, entire or dentate-ciliate toward apex: fls. inconspicuous. Bolivia.

Pférsdorfii. Low shrub, sts. terete, to 2½ in. thick, 9-angled, grooves very deep, much branched with age; spines to nearly 1 in. long. Afr.?

pilòsa. Per. to 1½ ft.: lvs. oblong: fis. in umbels. Eu., N. Asis. Var. màjor has golden-yellow foliage.—Differs from *E. palustris* in pilose vesture, fewer rays in umbel and caps. not warty.

polyacántha. Fleshy leafless shrub to 5 ft., spiny; sts. to 1½ in. diam., 4-5-angled, angles crenately toothed, spines about ¼ in. or less long, diverging, often curved: fls. small, in cymes. Ethiopia.

polychroma: E. epithymoides.

polygona. Sts. to 2 ft. high and 4 in. thick, 10-20-angled, the angles slightly wavy and with small spines: lvs. very small, soon falling: fis. near top of sts. S. Air.

polygonata: E. cereiformis.

polygonifòlia. SEASIDE S. Prostrate ann. to 8 in., branches spreading radiately: lvs. opposite, linear-oblong, to nearly 1 in. long, entire, fleshy: fls. inconspicuous. R. I. to Fla. and sandy shores of the Great Lakes.

Pseudocáctus. Sts. 4-, seldom 5-, angled, to 2 in. thick, gray-green with yellow U-shaped marks, spines 1/2 in. long. Habitat unknown.

pteroneura. Low shrub with jointed angled branches 1/3 in. thick, the lvs. soon falling. Mex.—Grown under glass N.

pugniformis. Very dwarf succulent plant, main st. subglobose, flat on top, with crown of spineless branches to 1½ in. long: lvs. linear-lanceolate, to ½ in. long: fls. borne on main st. below branches with whitish-green glands. S. Afr.—Distinguished from E. Gorgonis by its longer lvs. and color of glands.

pulchérrima (Poinsettia pulcherrima). Poinsettia. Shrub to 10 ft. or more. lvs. ovate to lanceolate, entire or lobed, the upper ones narrower and bright red (white, var. alba, or pink, var. ròsea) and constituting the showy part of the plant: fls. in cymes. Trop. Amer., Cent. Mex. Var. pleníssima has fls. transformed into red bracts.

ramipréssa: catalogue name.

Rangeana: hort, name of invalid botanical standing.

Règis-Jûbæ. Similar to E. atropurpurea but with linear lys. and yellow bracts. Teneriffe.

Reinhardtii. Tree to 50 ft., trunk branching about 10 ft. from ground, to 1½ ft. thick, crown obconical and flat-topped; branches fleshy, leafless, spiny, glabrous, constricted into segms. to 1 ft. long: fis. greenish, in cymes: caps. globose, to 3/4 in. across, cherry-red. Mozambique.

resinifera. Much branched shrub to 6 ft., sts. 4-angled, spines short: lvs. very small, brownish: fts. at tips of branches. Morocco.

rhipsalioides. Differs from E. Tirucalli in having ovatelanceolate lvs. about ¾ in. long. Trop. Afr.

Royleana. Similar to E. canariensis from which it may be distinguished by its involucres yellow and not brown.

Schimperi: a confused name; material so listed may be E. nubica or E. scoparia.

scoparia. Tree to 25 ft., branchlets terete, fleshy, spinoless and usually leafless, clustered about ends of larger branches: lvs., when present, linear, to % in. long, clustered about ends of branchlets: sessile clusters of involucres at ends of branchlets. Abyssinia.

Scotanum (E. venenata). Prostrate shrub: lvs. fleshy, ternate, ovate-orbicular, emarginate, entire, petiole and primary veins villous: fls. in terminal and axillary trichotomous umbels. Mex.

segetàlis. Ann. or bien., rarely per., sts. decumbent or ascending, to 12 in. high lvs. narrowly oblong, pale green: fls. inconspicuous. Coastal plant of W. Medit. region north to Scotland.

similis. Tree to 30 ft., spiny, with 4-5-angled fleshy branches, the joints to 1½ ft. long; lvs. scale-like or sometimes to 3½ in. long, deciduous. S. Afr.

speciòsa: catalogue name.

splendens. Crown-or-Thorns. Woody, the climbing sts. to 4 ft. long and armed with spines to 1 in. long: lvs. obovate, soon falling: fls. in cymes, the bracts bright red. Madagascar.—Grown under glass.

squarròsa. Fleshy herb to 8 in., sts. decumbent, unbranched, ridges obtuse and toothed: lvs. minute and soon falling: fls. in axillary cymes. S. Afr.

stellaespina. Shrub to 2 ft.; sts. erect, branching at base, in clumps, fleshy, spiny, leafless, many-angled, grooves to ½ in. deep, green without lighter bands, ridges toothed; spines solitary between the teeth, to ½ in. long, brown. Cent. Afr.

stellata (E. uncinata). Somewhat prostrate tuberous-rooted succulent shrub; branches to 6 in. long, flattened, green with purple and gray mottling, concave above, leaf-less; spines minute, in pairs: fis. dull yellow. S. Afr.

stricta (Tuhymalus stricta). Ann. to 2 ft.: lvs. ovoid to lanceolate: fis. in umbels. Eu.

submammillaris. Much branched shrub to 1 ft.; branches spiny, succulent, 7-10-angled, ridges toothed, grooves without lighter markings; spines solitary, to 1 in. long, between teeth: bracts purple, minute. S. Afr.

Susanniæ. Plant seemingly tufted but actually with a group of fleshy subterranean sts. whose tips only protrude above the surface and then usually in a ring-like arrangement; sts. globose-cylindrical, 1-1½ in. diam. with toothed ridges, apex hemispherical, the upper portion above ground: lvs. present only on young shoots, reduced to apical bristles and soon falling: plants diœcious; fis. in small cymes, greenish. S. Afr.

tenuirama. Similar to E. grandidens, but differing chiefly in spines about 3% in. long, not 3% in. long. S. Afr.

tetragona. Tree to 40 ft., trunk to 6 irr. thick; branches 4-8-angled, to 2 in. thick, usually in whorls: fl. branchlets smaller, toothed ridges, sometimes spiny: bracts yellow. S. Afr.

Tirucálli. Milk-Bush. Indian Tree S. Shrub or tree to 30 ft., with a crown of slender irregular branches, leafless as the narrow lvs. soon fall: fts. in small clusters. Afr.—Grown in the open in S. Fla., under glass in the N.

tithymaloides. Subcrect shrub to 6 ft.; younger sts. greenish, becoming whitish with age, glabrous, terete: lvs. ovate, to 3 m. long, leathery, alternate, deciduous: bracts red. Carribean region.

tridentâta. Succulent and spineless little plant; branches from the base to 6 in. long, cylindrical or tapering, with angled tubercles: lvs. ½ in. or less long, soon falling: peduncles 3-4 at ends of branches, beating 1 involucre and a pair of bracts. S. Afr.

trigona. Erect shrub to 7 ft., sts. 3-5-winged, ascending and usually branching in 3's.: lvs. obovate, to ¾ in. long, fleshy, dark green, solitary between spines: fis. in short-peduncled cymes. India to Moluccas.

tùbiglans. Succulent per., sts. 2-5, 5-sided, to 6 in. long and ¾ in. diam.: Ivs. triangular, early deciduous: fis. greenish-white, in clusters at ends of sts. S. Afr.

uncinàta: E. stellata.

válida. To 1 ft., st. unbranched, fleshy, leafless, spineless, somewhat globose in young plants and becoming more oblong with age, terete at base, 8-sided above, dull to purplish-green with irregular transverse bands of light green fls. green, in cymes borne on lower more woody portion of st. S. Afr.

variegàta: E. marginata. venenàta: E. Scotanum. viperina: E. inermis.

Wúlfenii. Subshrub to 5 ft.: lvs. linear, to 5 in. long, usually close together on younger branch ends: fis. greenish-yellow, in large dense terminal cymes. Dalmatia.

xylophylloides. Shrub or tree, much branched, sts. flat or 2-angled, ½ in. wide, slightly toothed: lvs. minute, soon falling. Madagascar.

EUPHORBIÀCEÆ. Spurge Family. A large and important assemblage of herbs, shrubs and trees, sometimes cactus-like, often with milky juice, of about 250 widely distributed genera. The fls. are of various forms, sometimes in cyathia, i. e., an apetalous pistillate fl. is surrounded by several staminate fls. which consist of a single stamen jointed on the pedicel and all inclosed by a corolla-like involucre which often has petal-like appendages; ovary superior and commonly 3-celled: fr. usually a caps. This family includes many plants of economic importance, yielding rubber, edible roots and fruits, and having valuable medicinal and poisonous properties; there are also many ornamental subjects. In some cases, as poinsettia, the showy parts are colored bracts. Those genera cult. with us are Acalypha, Aleurites, Antidesma, Bischofia, Breynia, Cnidoscolus, Codiæum, Dalechampia, Daphniphyllum, Euphorbia, Glochidion, Hemicyclia, Hevea, Homalanthus, Hura, Jatropha, Mallotus, Manihot, Mercurialis, Pedilanthus, Phyllanthus, Ricinus, Sapium, Securinega, Stillingia, Synadenium, Xylophylla.

EUPHÒRIA. Sapindaceæ. Trop. Asian trees with alternate pinnate lvs., small regular fls. in panicles, and fr. covered with flattened tubercles; grown for the edible fr.

Longans withstand slight frost and also should be protected from the sun in summer; they thrive in protected places in southern Florida and southern California. Propagated by seed, layers and grafting.

Longana (Nephelium Longana). Longan, Lungan. To 40 ft.: Ivs. of 2-5 pairs of glossy elliptic to lanceolate lfts. to 1 ft. long: fls. yellowish-white, in terminal panicles: fr. yellow-brown, 1 in. across, with white juicy edible flesh. India

EUPHRASIA. Scrophulariaceæ. Ann. or per. herbs of wide distribution in the temp. and subarctic regions of both hemispheres: lvs. opposite: fls. sessile or nearly so, in terminal spikes, with tubular 2-lipped corolla: fr. an oblong compressed caps., seeds conspicuously striate. Propagated by seeds.

Eurotia

Brownii: a confused name, sometimes referable to the following.

collina. To 1 ft., much branched: lvs. oblong to linearcuneate, to ½ in. long or more, somewhat toothed: fls. purplish-blue to white, rarely yellow, in long interrupted terminal spikes with fls. in opposite pairs. Australia.

EÙPLOCA. Boraginacex. Small ann. hispid herbs with alternate entire pubescent lvs. and white salver-shaped solitary fls., the corolla narrowed at orifice; one or two N. American plants sometimes united with Heliotropium.

convolvulacea (Heliotropium convolvulaceum). To 1 ft.: lvs. lanceolate or ovate, to 1½ in. long; fts. ½ in. long, fragrant. Wash, to Calif. and New Mex.

EUPTÈLEA. Trochodendracea. Asian deciduous shrubs or trees with alternate toothed lvs., fls. in clusters before the lvs., without sepals and petals but with long red anthers, and fr. a samara.

These plants do best in lonmy well-drained soil in rather moist positions. Propagated by seeds or by grafting on their own roots. The following stand in southern New England.

Franchètii. To 75 ft.: lvs. roundish-ovate, to 5 in. long, regularly toothed frs. 1-3-seeded. Cent. China.

polyándra. Differs from above in the lvs. being coarsely and unequally toothed, and the frs. usually 1-seeded. Japan.

EUPRITCHÁRDIA (Pritchardia. Styloma). PRITCHARDIA. Palmaceæ. Tall or middle-sized hermaphrodite unarmed fan-palms of the Pacific Isls: Ivs. heavy and large but pliant, cuneate-fan-shaped, strongly plicate: spadix among the Ivs., short- or long-peduncled and the fis. in a more or less compact cluster at its end; fis. small, green, placed singly, clongated in bud; stamens 6: fr. globose or ellipsoid, small, 1-seeded. The pritchardias are striking palms of regular form, prominent in the Hawaiian, Samoan, Fiji and other archipelagoes; some of them thrive in protected places in S. Fla. and a few in S. Calif. The species known in the continental U. S. fall into the small-fruited (E. pacifica, E. Thurstonii) and the large-fruited (E. Gaudichaudii, E. Martii) groups. See Palm for cult. The generic name Pritchardia is a later homonym.

Gaudichaùdii. To 20 ft. and trunk 1 ft. thick: lvs. 3-4 ft. long, on the young plant bearing brown matted wool underneath but nearly or quite nude with age; segms, about 60 and 1 ft. long; petioles 2-3 ft. long; fr. spherical, to 1¾ in. diam. Hawanan Isls.

Mártii. To 12 ft., trunk stout: Ivs. with appressed ciliate scales underneath: fr. ovoid-ellipsoid or somewhat obovoid, to 1¾ in. long and 1¾ in. thick. Oahu.

pacifica. Trunk to 30 ft. and 1 ft. thick: lvs. to 4 ft. and more long, green both sides and with minute scales or with tubercles underneath; segms. about 90, extending about ½ the way down; petiole to 3 ft. or more: spadices shorter than lvs.: fr. globose, about ½ in. diam. Fiji. Widely distributed as a planted tree.

Thirstonii. Slender: segms. thickish and stiff, glaucescent underneath and bearing elliptic scales; segms. about 70, reaching ½ to ½ the length of blade: spadices with much-elongated peduncles that hang below the lvs. and bear the compact cluster at the end: fr. about ½ in. diam. Fiii.

EURÒTIA. Chenopodiacex. Small white-tomentose shrubs of Eu. and N. Amer., one rarely planted: lvs. alternate, entire: fls. unisexual, in small clusters borne in spikes.

landta. Winter Fat. To 2 ft.: lvs. linear, to 1¼ in. long, revolute: pistillate fis. with tufts of silvery-white hairs. Sask. to Calif. and New Mex.

EÙRYA. Theaceæ (Ternstræmiaceæ). Evergreen shrubs or trees with alternate simple lvs., mostly diœcious fls. in axillary clusters, and berry-like frs.; suitable for greenhouse cult. or in the open in the S. For cult. see Camellia.

chinensis. Distinguished from E. japonica by more finely toothed lys, and young branchlets and terminal buds pubescent. China.—Some of the material passing as E. japonica belongs here.

emarginata (*Hex emarginata*). Branches covered with reddish-brown tomentum. lvs. thick and leathery, obovate, crenate, emarginate: fls. axillary. fr. usually in pairs. Japan.

japónica (E. lattfolia). Lvs. toothed: fis. small, greenishwhite. E. Asia. Var. variegata has lvs. variegated with white.

latifòlia: E. japonica.

ochacea (Clepra japonica), Lvs. entire: fis. creamy-white, fragrant. bernes red. Himalayas to Japan. The lvs. are variegated in var. variegata.

EURŶALE. Nymphæacæ. One species, very prickly and spiny, somewhat similar to Victoria regia but the fls. much smaller and all stamens fertile. E. fèrox. Lvs. 1–4 ft. across, circular, purple and spiny-ribbed beneath, dark green and uneven above: fls. green outside, bright red inside, about 2 in. across, open by day, prickly outside: fr. many-seeded globular berry, seeds edible. India, China.—Treated as an ann.; propagated by seeds only, planted in rich earth as for nympheas, temperature 70–75° F. Hardy as far north as Philadelphia and St. Louis.

EURYOPS. Compositæ. African shrubs of the Senecio tribe with alternate lvs. and solitary heads of yellow ray- and disk-fls.; pappus of caducous bristles. Suitable for planting in mild climates.

Athanasiæ. To 4 ft., resinous: lvs. to 6 in. long, pinnately parted into linear-filiform lobes: heads terminal, on peduncles to 1 ft. long, the numerous rays to 1½ in. long. S. Afr.

petinatus. To 3 ft., soft whitish-pubescent: lvs. pin-natifid, to 3 in. long including petiole, lobes linear, obtuse, usually 8-10 pairs: heads terminal, on peduncles to 6 in. long. S. Afr.

EÙSCAPHIS. Staphyleaceæ. One deciduous shrub to 10 ft., native in Japan and China and not fully hardy in the N. Propagated by seeds and cuttings of green wood under glass. **E.** japônica (E. staphyleoides). Lvs. pinnate, of 7-11 ovate-lanceolate toothed lfts. to 3 in. long: fls. yellowish-green, in terminal panicles to 5 in. across: fr. of 3 reddish leathery pods ½ in. long.

EÙSTOMA. Gentianaccæ. A few N. American glaucous herbs with opposite lvs. and white or blue bell-shaped fls. in panieles or solitary, with keeled calyx, 5- or 6-lobed corolla, and many-seeded capsular fr.; sometimes grown in the flower-garden.

Russellianum (Lisianthus Russellianus). Prairie Gentian. Ann. erect herb to 3 ft.: lvs. ovate to oblong, to 3 in. long: fis. pale purple, about 2 in. across and 2 in. long, erect or flaring. Neb. to Tex.—Showy plant but not often seen in cult.; sometimes treated as bien., the well established seedlings being carried over winter in a frame.

EÙSTREPHUS. Liliacex. Australian vinelike plants woody at base, having alternate lvs. and fls. clustered in axils of upper lvs., the perianth-segms. distinct and fringed. Of easy cult. under glass or in the open in warm climates. Propagated by division or seeds.

latifolius. Lvs. linear-lanceolate, to 4 in. long: fis. white or light blue, 1/4 in. long: fr. an orange-colored berry about 1/4 in. across.

EÙSTYLIS. Iridaceæ. One species, a bulbous herb. sometimes included in Nemastylis but differing in technical characters of stamens and frs. E. purpurea (Nemastylis purpurea). To 2 ft.: lvs. linear, to 2 ft. long, plicate: fls. 2-3 to a spathe, purple with color markings, to 3/4 in. long, the outer perianth-segms. longer than inner. Tex., La.—For other names, see Nemastylis

EUTÁXIA. Leguminosæ. Australian nearly or quite glabrous shrubs, one intro. in Calif.: lvs. small and opposite: fls. yellow, papilionaceous, mostly axillary and solitary or few together. E. empetrifòlia (E. diffusa) is a heath-like bush with lvs. about ¼ in. or less long: fls. ¼ in. or less long, each one with a pair of leaf-like bracts at base: pod to ¼ in. long.

EUTÉRPE. Palmacex. Feather-palms of trop. Amer., perhaps 40 species, unarmed, monœcious, with branched spadices below the lvs.: trunk solitary or plant gregarious: fls. white, sessile, in 3's and the middle one pistillate or one of them often abortive; stamens 6, distinct: fr. globose, small, with thin outer flesh or a shell. Probably none of the species is established within our territory.

EUTHAMIA: Solidago.
EUTOCA: Phacelia.
EVEA: Cephaelis.

EVENING-SNOW: Gilia dichotoma.

EVERGREENS: see Conifers.

EVERLASTING. IMMORTELLE. Plants used for "dry bouquets" for winter decoration, comprising various kinds that retain their form and color when dried; usually the flowers have chaffy or papery parts. Most of the common everlastings are members of the 'Compositæ, as Ammobium, Anaphalis, Antennaria, Helipterum, Helichrysum, Xeranthemum. One common kind, Gomphrena, is an amaranth. Limonium, of the Plumbaginaceæ, is much used. Cut before the flowers are fully expanded, with long stems, and hang in an airy shady place to cure. Various dry fruits are used with everlastings, as Physalis, Lunaria. Many of the grasses are also employed for dry bouquets, as well as teasels, cat-tails and many other plants from the wild. All the foregoing plants are of simple culture.

EVÒDIA. Rutaceæ. Trees or shrubs, often somewhat Rhus-like, native in E. Asia, Australia and Polynesia, with opposite simple or compound aromatic lvs., small unisexual fls. in cymes or panicles, and fr. of 4–5 carpels.

Some species (as those here described) are hardy in the North and others are greenhouse subjects. Propagated by seeds, cuttings of half-ripened wood, and root-cuttings.

chinénsis: catalogue name.

Dániellii. Small tree: lvs. of 7-11 lfts.: fls. white, in terminal corymbs to 6 in. across. N. China, Korea.

Hénryl. Tree to 35 ft.; lvs. of 5-9 lfts.; fls. whitish, in panicles to $2\frac{1}{2}$ in. across. Cent. China.

hupehensis. Similar to E. Henryi but lvs. light green beneath and fis. smaller in panicles to 6 in. across. Cent. China.

EVÓLVULUS. Convolvulaceæ. Prostrate or erect herbs or sometimes shrubs, having small alternate lvs. and small blue, rose or white axillary fls. 5-angled or -lobed; native in warm regions.

bocasanus. Herb to 2 ft.: lvs. lanceolate, to 2 in. long, sessile: fls. bright blue with white center, 1/2 in. across. Trinidad, Venezuela.

Nuttalliànus. Per. to 10 in., silky-hairy: lvs. oblong or oblanceolate, ½ in. long: fis. pink, ½ in. across. S. D. to

EVONYMUS: Euonymus.

ÉXACUM. Gentianaceæ. Old World herbs with opposite, simple and entire lvs. and blue or white wide-open fls. solitary or in forking cymes; corolla 4- or 5-lobed: fr. a 2-valved caps. Grown under glass or out-of-doors in warm regions. Propagated by seed.

affine. Bien. to 2 ft.: lvs. to 11/4 in. long, ovate: fls. bluish. 1/2 in. across. Socotra. Var. atroceruleum, fls. dark lavender with golden-yellow stamens.

macranthum. Bien. to 2 ft.: lvs. to 3 in. long, oblong: fls. purplish-blue, ringed with yellow in throat, 2 in. across. Ceylon.

tères. To 4 ft., sts. subquadrangular: lvs. lanceolate, to 3½ in. long, 3-nerved: fis. blue. India.

tetragonum. To 4 ft., sts. quadrangular: lvs. broadly lanceolate, to 5 in. long, 5-nerved: fts. azure-blue. N. India China.—Not known to be in cult., but confused with E. teres.

zeylánicum. Ann. to 2 ft.: lvs. 3 in. long, oval-oblong: fls. blue, 1½ in. across. Ceylon.—Differs from E. macranthum in the lobes of corolla obtuse rather than pointed,

EXOCHORDA. PEARL-BUSH. Rosacex. Asian spirea-like deciduous shrubs with alternate lys... white fls. in terminal racemes in spring, and fr. a 5-angled caps, with winged seeds.

Eue

Pearl-bushes are very ornamental and hardy North, prospering in sunny positions in well-drained soil. Propagated by seeds, by layers, and by cuttings of soft wood.

Albertii: E. Korolkowii.

Giráldii. To 15 ft.: lvs. elliptic, to 2½ in. long, petioles to 1 in. long, often red: fis. 1½ in. across; stamens 20-30. China. Var. Wilsonii has fis. to 2 in. across and green petioles.

grandiflòra: E. racemosa.

Korolkowii (E. Albertii). To 12 ft.: lvs. oblong, to 3 in. long, petioles ½ in. long: fls. 1½ in. across; stamens 25. Turkestan.

macrántha. Hybrid between E. racemosa and E.

racemòsa (E. grandistora). To 10 ft.: lvs. elliptic to oblong-obovate, to 2½ in. long, petioles to ½ in. long: fis. to 2 in. across; stamens 15. China.

Wilsonii: E. Gıraldii var.

EXSERTED: sticking out; projecting beyond, as stamens from a perianth; not included.

EYE: the marked center of a flower; a bud on a tuber, as on a potato; a single-bud cutting.

FABIANA, Solanacex. Heath-like small or medium shrubs grown in greenhouses and in the open in mild climates for the numerous small white tubular fls.: lvs. very small, narrow and crowded: native in S. Amer., one grown in S. Calif. where it blooms at different seasons. Easily increased by cuttings taken in Aug.

imbricata. To 8 ft, much branched: lvs. very numerous, scale-like, overlapping: fis. borne singly but in great numbers on the ends of the short branches, ½ in. long, constricted at base. Peru.

FABRICIA: Leptospermum.

FACHEIRÒA. Cactacex. One Brazilian species, F. Ülei (F. pubiflora). Sts. cylindrical, much branched, erect to 18 ft. high, branches to 3 in. diam.; ribs 15-20, to 1/3 in. high, areoles about ½ in. apart; spines brown, radials 10-15, to 5% in. long, spreading, centrals 3-4, to 1 in. long; cephalium on one side of terminal sts., to 8 in. long, densely reddish-brown-woolly, the hairs to nearly 2 in, long; fls. white, to 2½ in, across, the ovary and tube scaly with hairs to ½ in. long in scale axils.

FAGACEÆ. BEECH FAMILY. Six widely distributed genera of woody monocious plants, with alternate simple lys., staminate fls. in catkins or heads, pistillate solitary or clustered, 4-7-lobed perianth, 4-20 stamens, inferior 3-7-celled ovary, and fr. a nut inclosed in a cup or bur. The family furnishes valuable timber, edible nuts, medicinal and dyeing products, cork, and numerous ornamental subjects. Genera cult. are Castanea, Castanopsis, Fagus, Lithocarpus, Nothofagus, Quercus. Most of the planted subjects are hardy in the central or northern U.S. but some of them only far S., and comprise some of the most desirable lawn and shade and grove hardwood trees.

FAGARA: see Zanthoxylum. FAGELIA: ('alceolaria,

FAGOPYRUM. Polygonacex. European and Asian soft herbs with alternate lvs., small white fls. in racemes or corymbs, and fr. a pointed triangular achene.

Plants are grown for the seeds from which flour is made and as a cover- or catch-crop in orchards; the following are tender annuals of quick growth. Of easy cultivation on a wide range of soils. Seeds are sown broadcast or in drills late in June or early in July in the northern states.

esculéntum. Buckwheat. To 3 ft.: lvs. triangular-ovate, to 3 in long: fls. white, fragrant, in short dense raceines or clusters mostly near summit of plant. Cent. or N. Asia.

tatáricum. INDIA-WHEAT. KANGRA BUCKWHEAT. 2 ft.: lvs. broadly arrow-shaped, to 2 in. long: fls. greenish or yellowish, in slender open racemes along the st. India.—
It has been known as duckwheat.

FAGUS. Beech. Fagacex. Large deciduous monœcious trees with smooth light gray bark, alternate toothed lvs., staminate fls. in drooping heads, and 1 or 2 brown 3-angled nuts inclosed in a prickly involucre; native of the north temp. zone.

Beeches are excellent and emphatic ornamental trees, furnish valuable timber, and the nuts are eaten. They prosper on loam limestone soil. Propagated readily by seeds sown in fall or stratified and kept until spring; protect seeds sown in an of stratined and approximation from vermin. Seedlings should be transplanted to prevent the formation of long tap-roots. Varieties are grafted on seedling stock under glass.

americana: F. grandifolia.

Cunninghamii: Nothofagus Cunninghamii. cuprea: F. sylvatica var. atropunicea.

ferruginea: F. grandifolia.

ferruginea: F. grantifolia.
grandifòlia (F. americana. F. ferruginea). AMERICAN B.
Large and characteristic tree: Ivs. ovate-oblong, to 5 in.
long, dark bluish-green above, turning yellow in autumn.
N. B. to Fla. and Tex.—Variable in If. characters. Differs
from the frequently planted European beech in longer
coarsely serrate lvs. with more veins (9-14 pairs).

Sièboldii. Japanese B. Lvs. ovate, to 4 in. long: involucre with bract-like appendages at base. Japan.

volucre with bract-like appendages at base. Japan. sylvática. European B. Lvs. ovate, to 4 in. long, denticulate, shining dark green above, turning reddishbrown in autumn. Eu. to Caucasus. Some of the hort. vars. are: álbo-variegāta, lvs. variegated with white; asplenifòlia, lvs. very narrow, deeply toothed or lobed: atropunícea (var. atropurpurea, var. purpurea, var. Riversi, var. cuprea). Purple B, lvs. purple; borneyénsis, intervar. cuprea), Purple B, lvs. purple; borneyénsis, intermediate between vars. pendula and tortuosa; fastigiàta (var. pyramulatis), of columnar habit; grandidentàta, lvs. coarsely toothed; laciniàta (var. incisa, var. heterophylla), Ferniera for Curleaf B, lvs. deeply toothed or lobed or sometimes nearly entire and linear; latifòlia, lvs. to 6 in long and 4 in. wide; lùteo-variegàta lvs. variegated with yellow; miltoniénsis, drooping form; péndula, Weeping B, branches drooping; purpureo-péndula, branches drooping, lvs. purple; rôseo-marginata, lvs. purple edged with pale pink; rotundifòlia, lvs. nearly orbicular, 1 in or less long; tortuosa (var. remullyemiss), branches twisted, drooping at tips; trécolor, lvs. nearly white, spotted with green and edged with pink; variegàta, lvs. variegated with white or yellow.

FAIRY BELLS: Disporum. FAIRY FANS: Clarkia Breweri. FAIRYWAND: Chamælirium luteum. FALCATA: Amphicarpa monoica. FALCATE: sickle-shaped.

FALLÙGIA. Small shrub with Rosaceæ. shredded bark, allied to Cowania from which it differs in the absence of calyx-bractlets and fewer pistils in the fl. One species is cult., F. paradóxa. To 7 ft., sts. whitish: lvs. palmately 3-7-lobed, segms. linear, to $\frac{3}{4}$ in. long, margins revolute: fls. white, to $\frac{1}{2}$ in. across, usually solitary on long peduncles: achenes with purplish feathery plumes to 2 in. long. Utah to W. Tex., Ariz. and Mex.

FAME-FLOWER: Talinum.

FAMILY. An assemblage of genera that rather closely or uniformly resemble each other in general appearance and technical characters. A few genera are so unlike all others that a family is constituted for them alone, as in the case of Eucryphia, Eucommia, Cercidiphyllum, Casuarina, Punica, Equisctum. Other families are vast associations of genera that are more like each other than they are similar to others, as the great Composite or Composite family that comprises well toward 1,000. Opinions differ as to the natural or practicable limits of families as they do also in respect to genera and species; thus the Composite family may be divided into two or more, as the maple genus may be divided into Acer, Negundo and others. Nature sets no formal limits. More than 300 families of seed-bearing or flowering plants are commonly recognized. The attentive gardener and botanist soon learns to recognize the important natural families and thereby to place a given plant in its proper relationship: this is the beginning of the mastery of the subject. In this book all the families represented by genera in the text are placed with the other entries in alphabetic order; the lists of genera under them suggest the family kinships and constitute the best ready definition

FANWORT: Cabomba.

FAREWELL-TO-SPRING: Godetia amæna.

FARFUGIUM: Ligularia.

FARKLEBERRY: Vaccinium arboreum.

Cruciferæ. Erect woolly tomentose ann. or per. herbs or subshrubs of Old World, having small linear-oblong to spatulate lvs., entire or pinnately lobed, and white, pink or yellow fls. in spikes or racemes; lateral sepals often inflated at base: fr. a much flattened linear or elliptical pod containing many suborbicular broadly-winged seeds.

lunarioides. Per. to 1 ft., woody at base, much branched, sts. often tinged purplish: lvs. spatulate to oblong, to 2½ in. long, obtuse, stellate-hairy on each side, margins wavy; fts. bright yellow, to ½ in. across, in dense corymbs: pod elliptical, flattened and pubescent. Greece.—This species is

put in the genus Fibigia by some authors.

FASCIATED: much flattened; an abnormal or teratological widening and flattening of the stem.

FASCICLE: a condensed or close cluster, as of flowers,

FATSHÉDERA. Araliaceæ. Shrub head high with 3-5-lobed lvs., F. Lìzei, hybrid between Fatsia japonica and Hedera Helix, is sometimes planted; tender N.

FÁTSIA. Araliaccæ. A single evergreen shrub or small tree native in Japan, grown under glass in the N. and out-of-doors in mild regions for its prominent foliage. Propagated by seeds, cuttings, and root-cuttings in spring. F. japonica (Aralia japonica. A. Sieboldii). To 20 ft.: lvs. to 16 in. across, glossy above, palmately cut beyond the middle into 5-9 toothed lobes: fls. whitish, in umbels 1 in. or more across in long panicles. Var. Mòseri is a compact-growing form. Var. variegata lvs. marked or bordered with golden-yellow. F. papyrifera is Tetrapanax papyriferum.

FAUCÀRIA. Aizoaceæ. Separated from Mesembryanthemum: plant at first stemless but becoming more or less short-stemmed, the lvs. half-cylindric in cross-section and keeled or 3-angled at end, the fls. large and nearly or quite sessile and bractless; stigmas 5 or 6. S. Afr.

álbidens. Lvs. crowded, to 1½ in. long and ¾ in. wide, the few stout teeth with white horny tips and margins, shining, dotted: fls yellow, 1½ in. across.

Bosscheana (M. Bosscheanum). Lvs. 6-8, to 1¼ in. long and ⅓ in. wide, shining, the edges white-cartilaginous and with 2·3 teeth: fls. shining golden-yellow, 1½ in. across.

Britteniæ. Lvs. glaucous, densely spotted, keeled, margins strongly toothed: petals in 3 series, mostly obtuse, yellow,

purphsh-pink on outside, I in. long. felina (M. felinum). Lys. in rosettes, rhomboidal, to 2 in. long and $\frac{3}{2}$ in. wide, keeled on back, with 3-5 fleshy teeth on either side: fls. golden-yellow, 2 in. across, sessile.

Hangei (M. Haagei). Lvs. to 2 in long, 1 in. wide and ½ in thick, keeled on back, with white cartilaginous margins and 3-4 small teeth on each side; fs. shining goldenyellow slightly purplish at tips, to 2½ in. across, solitary. Jamesii: listed name.

lupina (M. lupinum). Lvs. in rosettes, spreading and somewhat recurved, to 1¾ in. long and ½ in. wide, lanceolate with 3-angled apex, with 7-9 fine-pointed teeth on either side: fls. yellow, 1½ in. across, solitary. tigrina (M. tigrinum). Lvs. ovate-cordate and glaucousgreen, spotted or dotted white, to 2 in. long and 1 in. wide, edges with 9-10 strong ciliate teeth: fls. 1-2, yellow, 1 in. across. Var. supérba is listed.

tuberculòsa (M. tuberculosum). Lvs. very thick, about 1 in. long and ½ in. wide, upper surface covered with white tubercles, edges with 3 strong teeth: fis. yellow, 1½ in.

FAÙRIA (Villarsia). Gentianacex. One stemless per., F. Crista-gálli (F. japonica). To 1 ft.: lvs. broadly ovate to reniform, obtuse to emarginate, margins obtusely dentate, to 1½ in. long; petiole to 2½ in. long, somewhat clasping rootstock at base: fls. white, about ½ in. across, in fastigiate terminal corymbs on erect peduncle, petals lanceolate, margins cristate, style short with 2-lobed stigma. N. Japan.

FEATHER-FLEECE: Stenanthium robustum.

FEATHERLING. RUSH-: Pleea. White-: Tofieldia

FÈDIA. Valerianaceæ. One ann. herb native in the Medit. region and occasionally grown in the flower-garden or as a salad plant. F. Cornucòpiæ (F. scorpioides). AFRICAN VALERIAN. Sts. late, to 4 in. long, entire or toothed: fls. red, small, in terminal cymes, stamens 2: fr. about 1/2 in. long.

FEIJOA. Myrtacex. Showy S. American shrubs or trees with opposite simple lvs., solitary fls. with long-exserted stamens, and fr. a berry; one is grown for the edible fr. and as an ornamental. This plant was first named Orthostemon Sellowianus by Berg but subsequently changed by him to Ferioa because of an earlier Orthostemon.

Feijoas are adapted to subtropical dry climates but will withstand several degrees of frost. The best soil is sandy loam rich in humus. Plants should be spaced 15 to 18 feet apart. Propagated by seeds sown in pans or flats, a good soil being silver-sand and well-rotted redwood sawdust; the seedlings should be shaded and transplanted permanently when about 4 inches high. Also increased by layering, whip-grafting, and cuttings of young wood from ends of branches under glass.

Coolidgei: pomological variety of F. Sellowiana.

Sellowina. To 18 ft.: lves or 1. Sectional Sellowina. To 18 ft.: lves oval-oblong, to 3 in. long, white-tomentose beneath: fls. to 1½ in. across, the petals fleshy, white-tomentose outside and purplish within, the stannens dark red, handsome: fr. green tinged with red, to 3 in. long. S. Brazil, Paraguay, Uruguay, Argentina.—Successful as a fruit plant in Calif.; stands in N. Fla. Grafted named vars. are Choiceana and supérba.

FELÍCIA. Compositæ. African herbs or subshrubs grown in the greenhouse and in the open in warm regions for the attractive daisy-like fls. with blue or white rays and yellow disks: lvs. alternate or opposite, entire or dentate: pappus of bristles. Propagated by seeds and by cuttings.

adfinis. Ann., to 1 ft., branching and hairy: lvs. obovate-oblong, to 1½ in. long, entire, hairy on both sides, base cuneate: heads usually solitary on peduncles to 4 in. long, rays bluish. S. Afr.

æthiòpica: listed name.

amelloides (Agathæa calestis). BLUE DAISY. BLUE MARGUERITE. Subshrub to 3 ft., somewhat hairy: lvs. opposite, oval or obovate, about 1 in. long, entire or nearly so: heads solitary, to 1½ in. across, rays numerous, skyblue, on long stalks. S. Afr.

Bergeriana (Aster Bergerianus). Hairy ann. to 8 in.: lvs. obovate-oblong, to 1½ in. long, toothed: heads solitary. S. Afr.

echinata. Subshrub to 2 ft., many erect branches: lvs. lanceolate- to ovate-oblong, to 1 in. long, mucronate, nearly glabrous, often ciliate-serrate: heads corymbose, to 1½ in. across, blue or white. S. Afr.

frágilis: F. tenella.

peticiata. Subshrub with prostrate branches: Ive obovate or lanceolate: heads rose changing to blue. S. Afr.-Grown in hanging-baskets. Var. rosea is listed.

rotundifòlia: catalogue name.

tenélla (F. fragulis). Ann. or bien, to 14 in., often prostrate: lvs. narrow-linear, to 2 in. long: heads solitary, rays pale blue. S. Afr.

FEMININE: pistillate (in higher plants); the seed-bearing parent or flower when the sexes are separate.

FENDLERA. Saxifragacex. Ornamental deciduous shrubs of W. N. Amer. with opposite entire lvs., fls. with 4 clawed petals, and capsular frs.; related to Jamesia and Deutzia.

One species is planted and is hardy in New England. It does best in sunny places in well-drained sandy or peaty soil. Propagated by seeds or by greenwood cuttings under

rupicola. To 6 ft.: lvs. oblong or oblong-lanceolate, to 1 in. long: fs. solitary, white, 1 in. across. May-June. Tex., N. Mex.

FENESTRÀRIA. Aizoaceæ. One of the many segregates from the old genus Mesembryanthemum (which see) from S. W. Afr., characterized by a tufted stemless habit with fleshy upwardly thickened lvs. that bear a small more or less colorless or translucid area or "window" at the apex, the lvs. of each pair about equal: fls. large and showy; stigmas 10 or 11.

aurantlaca. Similar to F. rhopalophulla but fis. orangeyellow tinged pink.

rhopalophfila (M. rhopalophyllum). Lvs. to 1½ in. long and ½ in. thick: fls. white, to 1¾ in. dam., the petals about 35 in a single series to ¾ in. long; stigmas filiform, pale yellowish-green.

FENNEL: Faniculum vulgare. Common Giant: Ferula communis

FENNEL-FLOWER: Nigella.

FENUGREEK: Trigonella Fanum-Gracum.

FENZLIA: Gilia dianthordes.

FERDINANDA. Podachænium eminens.

FERDINANDA. Podachænium eminens.

FERN: see Ferns. Adders-tongue: Ophioglossum. Asparagus: Asparagus plumosus. Ball: Davallia bullata. Bamboo: Coniograme japonea. Basket: Nephrolepis pectinata. Bears-foot: Humata Tyermanni. Beech: Dryopteris Phegopteris and hexogonoptera. Birds-nest: Asplenium Nidus. Bladder: Cystopteris. Boston: Nephrolepis exalitata var. bostoniensis. Brittle: Cystopteris fragilis. Chain: Woodwarda. Christmas: Polystichum acrostichoides. Cinnamon: Osmunda cinnamomea. Claw: Onychium. Climbing: Lygodium. Cup-: Dennstaedia. Curly-grass: Schizwa pusilla. Dagger: Polystichum acrostichoides. Deer: Blechnum spicant. Elephodiossum crintum. Felt: Cyclophorus. Floating: Ceratopteris. Gold: Pityrogramma. Goldies: Dryopteris Goldiana. Grape: Botrychium. Hacksaw: Dooda aspera. Hares-foot: Polypodium aureum. Hartford: Lygodium palmatum. Harts-tongue: Phyllitis Scolopendrum. Hayscented: Dennstaedta punctilobila. Holly: Cyrlomium falcatum, and species of Polystichum. Interrupted: Osmunda Clayloniana. Lace: Cheilanthes gracillima. Lady: Athyrium Filu-femina. Licorice: Polypodium plycyrrhiza. Lip: Cheilanthes. Maidenhair: Adanium. Male: Dryopteris Filux-mas. Marsh: Dryopteris Thelypteris. New-York: Dryopteris noveboracensis. Oak: Dryopteris. Oakleaved: Polypodium quercyfolium. Ostrich: Peteris. Parsley-6, American: Cryptogramma crispa var. acrostichoides. leaved-: Polypodium quercifolium. Ostrich-: Pleretis. Parsley-, American: Cryptogramma crispa var. acrostichoides. Rattlesnake-: Botrychium virginianium. Resurrection: Polypodium polypodioides. Royal-: Osmunda regalis. Sago:: Cyathea medullaris. Saw-: Blechnum serrulatum. Sensitive-: Onoclea sensibitis. Shield-: Dryopteris, Polypstichium Braunii. Silver-: Pityrogramma. Squirrels-foot-: Davalla bullata. Staghorn-: Platycerium. Strap-: Polypodium Phyllitidis. Strawberry-: Hemionitis palmata. Sweet-: Comptonia peregrina. Swod-: Nephrolepis. Tongue-: Cyclophorus Lingua. Tree-: Alsophila, Cyathea. Walking-: Camptosorus. Wall-: Polypodium vulgare and virginanum. Water-: Ceratopteris. Winter-: Conium maculatum. Wood-: Dryopteris. Druopterss.

FERNS. So-called flowerless plants (Pteridophytes) formerly included in the one family (order) Filices, but now distributed in several families, as Polypodiaceæ which includes most of the common ferns, Cyatheaceæ and Dicksoniaceæ comprising most of the tree-ferns, Osmundacex, the native royal-ferns and similar kinds, Schizæaceæ including the climbing ferns of the Lygodium class. Ferns are perennial plants widely spread in temperate and tropical regions, of perhaps 6,000 or more species.

Gardeners recognize two groups of ferns, the hardy kinds often transplanted from the wild and given conditions as nearly as possible like those in which they grew, and the glass-house kinds of tropical and warm-temperate origin and that require more or less special skill in the growing. All kinds are raised for the gracefulness and beauty of the foliage, and the gardener therefore aims at luxuriousness in vegetation. Most of them do not arrive at the best state in a dry or parched atmosphere or when exposed to wind. Some kinds, however, withstand untoward and changing conditions, and these are adapted to window-gardens and porches; the Boston-fern (Nephrolepis) is one of this class.

In all fern culture, standing water in the pot is to be avoided, as also heavy clay soils. Extremes should be avoided, in air temperature and in moisture conditions. Shade should be provided. and protection from wind. For living-room ferns a night temperature of about 55° is to be recommended, with a rise of 10-20° by day in bright weather. Soils for pot ferns should be fibrous; gardeners like to mix fine fibry peat or turfy loam with it; ample drainage should be provided in the bottom. See that the pot does not dry out, or the atmosphere become very dry.

Ferns are propagated by division, by the buds or offsets that form on the fronds of some kinds, and by means of spores. The spores are usually borne on the back of the frond or leaf; when ripe they may be shaken off on paper, or parts of the frond may be cut and placed in dishes or paper bags in a dry protected place until the spores shed. They should be sown on fine sterilized moist soil in well-drained pans or pots. Spores are sown on a well-prepared soil surface and not covered with earth or watered on top; the pans or pots are kept in a close propagating frame until germination takes place, when more air may be admitted. The frame or house may be kept at a temperature of about 65° F. When watering becomes necessary, sterile water should be used. The sporelings should be pricked out—usually at first in little clumps—and transplanted as soon as a deft person can handle them and the first regular foliage appears. From eight months to a year are usually required to produce good ferns from spores.

One desiring a list of the ferns in cultivation may find the names of the genera under Ceratopteridaceæ, Cyatheaceæ, Dicksoniaceæ, Marattiacea, Marsileacea, Ophioglossacea, Osmundacea, Polypodiacea, Salviniacea, Schizacea, and then trace the species in each genus. Any of the native ferns, however, may be transplanted to grounds in the same region.

Plants allied to ferns are in the families Equisetaceæ, Lycopodiaceæ, Selaginellaceæ. The socalled asparagus-fern, common in conservatories and windows, is one of the Lily family, Asparagus plumosus.

The American Fern Society publishes a journal.

FEROCÁCTUS. Cactaceæ. Very spiny often large cacti, globular to cylindric, separated from Echinocactus by the axils of the scales on the ovary and fl.-tube being naked rather than woolly, and thick-walled dry fr.; S. U. S. and Mex. They are grown like the echinocacti and are adaptable to similar uses. See Cacti.

acanthodes (F. Lecontei. Echinocactus acanthodes. Ecylindraceus). Globular but becoming cylindric and 8 or 9 ft. tall, very spiny; ribs up to 27; spines pinkish to red to white, radials very weak, centrals awl-like: fls. 2 in. long more or less, bell-shaped, yellow to orange. S. Nev. and Calif., Lower Calif.

alamosanus (Echinocactus alamosanus). Solitary or clustered, sts. depressed-globose, to 1 ft. diam.; ribs 18-23, narrow; spines yellow, radials about 8, to 1½ in. long, spreading, central 1, to 2½ in. long: fls. probably yellow. Mex.

califórnicus (Echinocactus californicus). Globular to nearly cylindrical, perhaps to 3 ft. or more; ribs 15-20, notched, straight; spines straight, yellowish-red to dark red, radials 5-9, to 1½ in. long, centrals 4, the lowest to 2½ in. long: fis. reddish-yellow, to 1½ in. long. Lower Calif.

chrysacanthus (Echinocactus chrysacanthus, E. Emoryi var.). Globular to cylindrical, to nearly 4 ft. tall and 1½ ft.

diam.; ribs 13-20, wavy, obtuse, becoming acute toward apex; spines slender, radials 4-6, white, centrals 4-10, red to brownish-yellow: fls. yellow, to nearly 3 in. long. Lower Calif

coloratus. To 31/2 ft. tall and 1 ft. diam.: ribs 13-20. fewer on young plants; spines spreading, stiff, radials 10-14, white, centrals 9-11, brownish-red: fis. pale yellow with reddish stripe down dorsal side. Lower Calif.

Côvillei. Globular to short-cylindric, to 5 ft.; ribs 22-32; spines red to white, radials 5-8 and central 1: fis. 2-3 in. long, red tipped yellow. Mex.

crassihamatus (Echinocacius crassihamatus and Mathssonii). Globose or short-cylindric, slightly glaucous; 11bs 13; radial spines 8 and some of the lower ones hooked; central spines 5 and usually red: fis, purple, ¾ in. long. Mex.

echidne. Globular, to 10 in. tall: ribs usually 14, sharp angled, somewhat wavy; spines amber-colored to gray, radials 7-8, central 1, longer than radials: fls. yellow, to 1½ in. long. Mex.

electracánthus: F. melocactiformis.

flavovirens (Echinocacius flavovirens). Globose to sub-cylindrical, to 18 in. tall and 9 in. diam.; ribs 11-13, to ½ in. high; spines subulate, ringed, ied to brown or yellow, radials 13-15, to ½ in. long, centrals 4, to 3 in. long or more: fls. reddish-yellow, to 11/2 in. long, segms, narrow, ciliated. Mex.

Fórdii (Echinocactus Fordii). Globular, often depressed on top; ribs 20-22, acute; spines white, radials usually 14-16, divergent, centrals 4, to 1½ in. long, ringed, the longest one hooked: fls. pink, to 1½ in. long. Lower Calif.

glaucéscens (Echinocactus glaucescens and Pfeifferi). Globular, 8-16 in. diam., or sometimes higher than broad, glaucous; ribs 11-15; radials 6; central 1: fis. nearly 1 in. long, yellow. Mex.

grácilis. Globose to cylindric, to 10 ft. tall and 1 ft. diam.; ribs 24, notched; spines to 1½ in. long, straight or hooked, radials 10, whitish, centrals 7-13, ringed, dark red becoming black: fls. pale yellow with red stripe down center of reverse side, to 1½ in. long: fr. yellow. Lower Calif.

Grisonii: Echinocactus Grusonii.

hamatacánthus: Hamatocactus hamatacanthus.

hórridus. Globose, to 1 ft. or more diam.; ribs 13, not tubercled; radial spines 8-12, acicular, to 2 in. long, white; centrals 6-8, to 5 in. long, reddish: fls. not known. Lower Calif.

ingens: see Echinocactus ingens.

Johnsonii: Echinomastus Johnsonii.

latispinus (Echinocactus latispinus). Globular or somewhat depressed, to 16 in. high; ribs 15-23; radials 6-10; centrals 4 or more and stouter: fls. 1 in. or a little more long. bell-shaped, rose to purple. Mex.

Lecôntei: F. acanthodes.

longihamatus: Hamatocactus hamatacanthus.

macrodiscus (Echinocaclus macrodiscus). Depressed-globose or short-cylindric, to 1½ ft. across; ribs 16; radial spines 6-8 and yellow; central spines 4 and 1½ in. long: fis. dark red or purple, 2 in. long. Mex.

Máthssonii: F. crassihamatus.

melocactiformis (Echnocactus melocactiformis, E. electracanthus). Cylindric, to 2 ft. diam., bluish-green; ribs about 24; spines 10-12, with 3 or 4 of them more or less central, yellow to brown: fs. 1-1½ in. long, bright yellow and perhaps reddish outside. Mex.

nobilis (F. recurvus. Echinocactus recurvus. E. nobilis). Globular, to 10 in. tall and 8 in. diam., apex rounded; ribs 10-14, to 1½ in. high, acute, straight, somewhat tubercled; spines stiff, yellow when young becoming reddish, radials several, to 1 in. long, central 1, to 2 in. long, hooked: fis. pink, campanulate, to 2 in. long. Mex.

Orcuttii (Echinocactus Orcuttii). To 4 ft. high and 1½ ft. across, often clustered; ribs 13-30; radial spines 9-13 and reddish; centrals 4: fts. crimson, to 2 in. long. Lower Calif. Var. cristatus is listed.

penínsulæ (Echnocactus peninsulæ). Cylindric to clubshaped, to 8 ft. or so; ribs 12-30; spines red with yellow tips, radials 11, centrals 4: fls. yellow. Lower Calif.

Pfeifferi: F. glaucescens.

Pringlei (Echinocacius Pringlei). Cylindric, to 10 ft. high and 1 ft. across, in clumps; ribs 16-18; spines red and various: fls. yellow, red outside, 1 in. long. Mex.

rafaelénsis (Echinocactus rafaelensis). Globular to depressed-globular, to 1½ ft. across; ribs 14-22, acute, to 1 in. high or more; spines red becoming brownish-yellow and gray, radials 7-9, spreading, to 1½ in. long, central 1, to 2¾ in. long, ringed: fls. yellow. Mex.

rectispinus (Echinocactus rectispinus). Globose or cylindric, to 6 ft. high; radial spines 8-12; central spine 1 and to 5 in. long: fls. yellowish, 2½ in. long. Lower Calif.

recurvus: F. nobilis.

robústus (Echinocactus robustus). Makes large clumps with hundreds of branches; ribs 8; radials about 10 and often thread-like; centrals about 6 and awl-like; fis. 1½ in. long, yellowish. Mex.

Stàinesii (Echinocactus Stainesii. E. pilosus). Globular to columnar, to 4 ft. or more; ribs 13-20; radial spines represented by long white hairs; centrals several; fls. yellow. Mex.

tortulospinus. Globular to cylindrical, occasionally conical, to 2 ft. tall; ribs 16-20, acutush; radial spines 9-11, to 134 in. long, divergent; centrals 4-5, unequal, the longest to 334 in. long, twisted, pink to red: fis. not known. Lower Colif

Townsendianus. Short-cylindric, to 16 in or more high; ribs about 10; radial spines 14-16 and to 1½ in. long, one of central spines hooked at tip: fls. greenish-yellow with pink stripe down center of segms., to 2½ in. long. Lower Calif.

uncinatus: Hamatocactus uncinatus.

viridescens (Echanocactus virulescens). Nearly globose or somewhat flattened, to 15 in diam., deep green; ribs 13-21, bearing spines and felt, the spines at first red: fls. greenish-yellow, about ¾ in. long. Calif., Lower Calif. Var. httoràlis is listed.

viscainénsis. Globose to subcylindric, to 5½ ft. tall and 1½ ft. dnam; ribs 13-21, thin, wavy, to ¾ in. high; radials 1-4, grayish-white; centrals 5-9, unequal, to 5 in. long, flattened; fls. pale yellow with purple stripe down reverse center of each segm, to 1¾ in. long. Lower Calif.

Whipplei: probably Sclerocactus Whipplei.

Wisigenii (Echnocactus Wishzenu). Becoming cylindric, at length elongated and 7 ft. or more; ribs often 25; radials thread-like or needle-like or absent in young plants; centruls several! fls. 2 in. or more long, yellow. W. Tex. to Ariz, and Mex.

FERÒNIA. Rutacex. A single spiny deciduous tree, F. Limonia, the WOOD-APPLE, of India and Indo-China, planted somewhat in Fla. and Calif. for interest and edible frs.: lvs. small, oddpinnate, lfts. obovate and obtuse or emarginate, rachis and petiole margined: fls. dull red, in panicles, stamens 8-12: fr. globose or oblate, hard-shelled, to 3 in. diam., with pinkish edible acid pulp used in making jellies; seeds woolly. Suggested as a citrus stock.

FERONIÉLLA. Rutacea. A small genus much like Feronia, but evergreen, seeds smooth and the woody rind comprised of a radical structure. F. lùcida is somewhat known in this country for ornament and as an experimental stock for citrus frs.: small spiny tree: lvs. small, odd-pinnate, lfts. oval or obovate, obtuse or emarginate, rachis and petiole pubescent: fls. white: fr. globose, to nearly 3 in. diam., pulp glutinous and eaten in Java where it is native.

FERRARIA. Iridaceæ. Cormous herbs mostly from S. Afr., allied to Tigridia: lvs. linear, passing into ovate bracts: fls. large, fugitive, several borne in inflated sheaths; perianth-segms. united at base, the lobes crisped.

obtusifòlia. To 11/2 ft.: lvs. short, obtuse: fls. brownish-purple, 11/2 in. across.

undulata. Differs from F. obtusifolia in the lvs. long and narrowed to acute apex.

FERTILE: producing their normal sex products, said of pollen-bearing stamens and seed-bearing fruits; a plant that bears good seeds (not sterile).

FERULA. Umbelliferæ. A few per. thickrooted herbs with pinnately decompound lvs., small yellow or greenish fls. in compound umbels, and ovate compressed frs.; one species is planted for ornament, others yielding medicines and gums; the edible fennel is Fœniculum. Propagated by seeds sown in spring where plants are to grow.

communis. Common Giant Fennel. To 12 ft.: lvs. very finely divided into linear segms. S. Eu. to Syria.— A striking plant with very finely divided foliage and umbels

above it.

gigantès: the plant grown under this name is probably

FESCUE: Festuca.

FESTUCA. Fescue. Graminex. Grasses of temp. regions, per., mostly tufted, with flat or involute lvs. and spikelets borne in narrow panicles; grown in pastures, meadows, lawns, and some kinds planted for ornament. The principal meadow and forage species are F. elatior, F. ovina, F. rubra, See Grasses.

alpina: confused name.

amethýstina. To 2½ ft.: lvs. about 1 ft. long, involute: panieles about 3 in. long. S. Eu., Asia Minor.

arundinàcea: F. elatror var. capillata: F. ovina var. duriúscula: F. onna var.

elatior (F. pratensis). TALL F. MEADOW F. To 5 ft.: lvs. to 1 ft. long and 1/8 in. wide, flat: panieles to 1 ft. long, erect or nodding at top. Eu.; nat. in N. Amer. Var. arundinacea (F. arundinacea). To 6 ft.: lvs. several ft. long and to 3/8 in. wide, flat: panieles to 10 in. long.

geniculata (F. stipondes). To 1½ ft.: lvs. to 1 ft. long and ½ in. across, flat: panicles to 4 in. long, with awns ½ in. long, heavy for size of plant. W. Medit. region.

gigantea. To 4 ft.: lvs. to 1 ft. long and ½ in. wide, flat: panicles to 1 ft. long, awns ½ in. long. Eu.; nat. E. N. Amer.

glaûca: F. ovina var.

heteroph fila: F. rubra var.

Myùros. RATS-TAIL F. Ann. to 2 ft.: lvs. to 5 in. long, involute: panieles to 1 ft. long, one-sided, awns 1/4 in. and more long. Fu.; nat. in N. Amer.

ovina (F. vulgaris). Sheeps F. To 2 ft.: lvs. to 8 in. long, involute: panieles to 6 in. long, short-awned. Eu, Asia; nat. in N. Amer. Var. capillata (F. capillata, F. tenusfolia) has hair-like lvs. and awnless spikelets. Var. duriúscula (F. duriuscula), HARD F., has stiff lvs. Var. glauca (F. gliuca), BLUE F., has glaucous foliage.

praténsis: F. elatror

rígida: Scleropoa rigida.

ribra (F viridis). Rep F. To 3 ft., stoloniferous: lvs. to 6 in. long, involute: panicles to 5 in. long, sometimes reddish or glaucous, short-awned. Eu, Asia, N. Amer. Var. fállax differs from the type in not being stoloniferous. Var. heterophylla (F. heterophylla) has basal lvs. involute and stalva flux.

stipoldes: F. geniculata.

supina: probably F. ovina.

tenuifòlia: F. ovina var. capillata.

víridis: F. rubra.
vulgāris: F. ovina.

FETERITA: Sorghum vulgare var. caudatum.

FETID: having a disagreeable odor.

FETTER-BUSH: Lyonia lucida.

FEVERFEW: Chrusanthemum Parthenium.

FEVERWORT: Triosteum. FIBIGIA: see Farsetia.

FICARIA: Ranunculus Ficaria.

FICUS. Fig. Moraceæ. Many trees, shrubs and woody root-clinging vines, with milky sap, and minute fls. and seeds inside a globular or oblong or pyriform fleshy receptacle (or fig) that has a small opening at the apex: lvs. thick or stiff and mostly persistent, often large and showy. Species numerous, native in warm and trop. countries in many parts of the world. Some of the species are among the wonders of the vegetable world, as the banyan (F. benghalensis) that sends down aerial roots that make trunks and thus extend the top of the single tree over great areas; others begin as epiphytes, and after strangling the host become self-supporting and make independent trees. Many of the kinds emit aerial roots. In the following entries the lvs. are persistent (evergreen) unless otherwise noted. Other species than those listed here are to be expected within the limits of the U.S.; frs. as well as lvs. are necessary for identification.

Several kinds of ficus trees are planted for shade and ornament in the southermost parts of the United States, and they are frequent in the tropics. The creeping fig. commonly but erroneously known as F. repens, is used for covering walls far south, and often also in conservatories. The rubber plant, F. elastica, is one of the most popular and indestructible house plants and is grown in great quantititles by florists; it is propagated by air-layering, which consists in tying a ball of moss about a young shoot that has been notched or cut for the formation of roots, the shoot has been noticed or cut for the formation of roots, the snoot being severed from the parent branch when the part is well rooted. Tall and ungainly pot specimens may be shortened in this way, by layering them under the leaves; but it is usually better to discard the old plant and to purchase a new one.

The arboreous species of Ficus may be grown in the South from air-layers; a small notch is cut in a shoot, moss is placed in the notch and also made into a ball around the place, the work is kept wet for two weeks or so, and then the shoot may be severed and established in a pot. The trailing kinds grow from division of the rooting stems.

Afzelii: F. errobotryordes.

altíssima. Large spreading tree with few aerial roots: lvs. thick, oval or elliptic, blade 4-6 in. long; fr. about 3/4 in. diam. India.

aùrea. Epiphytal at first, making a tree to 60 ft.: lvs. oblong and narrowed at both ends: fr. sessile or nearly so, ½ in. duam., yellow. S. Fla.

australis: F. rubiginosa.

benghalénsis. Banyan. Very large tree, top spreading by secondary trunks. lvs. broad-ovate to elliptic, 4-8 in. long: fr. in pairs, globose, red, about ½ in. diam. India.

benjamina. Large broad shining tree with graceful drooping branches, poplar-like. Ivs. oval to elliptic, 2-5 in. long, narrowed to short but not sharp point fr. becoming red, in var. combsa ¾ in. diam., yellow. India.

brevifòlia (F. populnea). Epiphytal, making tree to 50 ft.. lvs. broadly ovate, cordate at base: fr. on drooping stalks, to ½ in. long, red. S. Fla.

Cánnonii. Perhaps Artocarpus Cannonii, although greenhouse material under this name seems not to be the

carica. Fig (common or pomological F.). Broad irregular deciduous tree to 25 or 30 ft.: lvs. thick, rough above and pubescent underneath, deeply 3-5-lobed. fr. large, variable, edible. Medit. region. See Fig.

Chauvièri. Hort. name for a plant something like F. elastica with broader oval lvs. with lighter veins: fr. large, red. Perhaps New Caledonia.

clavata. Erect shrub. lvs. oblong-lanceolate or oblanceolate, 4-5 in long, cuspidate or caudate: fr. about 1/2 in. diam., yellow. India.

Cúnninghamii. Glabrous tree to 80 ft.: lvs. ovate to commingnami. Giadrous tree to 80 ft.: Ivs. ovate to oblong-elliptic, abriptly acuminate, to 5 in. long and about 2 in. broad, thick, shining above: fr. 1 or 2 in axils, sessile, globular, white becoming purplish, nearly ½ in. diam. Queensland.

diversifòlia (F. lutescens). MISTLETOE F. Shrub or small tree. lvs. variable, mostly broadly obovate and broad on top, to 2 in. long: fr. 1/3 in. or less diam., yellow. Malaya. -Sometimes grown as pot-plant.

Doèscheri: F. elastica var.

elástica. Rubber-Plant. Large glabrous tree but grown in its juvenile state as a pot- and tub-plant: lvs. thick and glossy, oblong or elliptic, 5-12 in. long; fr. about ½ in. long, yellowsh. India, Malaya. Var. abrea-marginata has lvs. yellow margined. Var. bélgica has juvenile lvs. red. Var. Doèscheri is probably var. variegata. Var. rubra may be var. belgica. Var. variegata has variegated

erécta. Shrub or small tree, glabrous or hairy: lvs. ovate to obovate, usually entire: fr. solitary or in pairs, globose to pyriform. E. Asia.

eriobotypoldes (F. Afzelii). Large tree, with lvs. at ends of branches: lvs. stiff, long-oblanceolate, to 1 ft. long and 4 in. broad, lighter colored underneath: fr. to 1½ in. diam., yellow-hairy. Trop. Afr.

falcata. Creeping and rooting, with slender hairy sts.: lvs. thick, oblong and usually angled, unequal-sided, obtuse, 1 in. or less long: fr. 1/2 in. long, brown or orange. Malaya.—Grown sometimes under glass.

figuiosa. Shrub or small tree: lvs. opposite or alternate, oblong to obovate-lanceolate, to 10 in. long, entire or subserrate: fr. clustered, depressed-globose, to 1 in. long.

glomerata. Cluster F. Thick-topped tree: lvs. ovate to oblong, to 6 or 7 in. long, with strong lateral nerves: fr. about 1 in. diam., reddish, in clusters. India.

hispida. Shrub or small tree, hispid: lvs. opposite, entire or toothed: fr. yellowish, in clusters. Asia, Australia.

Hookeri. Glabrous tree: lvs. broadly elliptic, 5-11 in. long, pale underneath, with short broad apex: fr. to 1 in. diam., in a cup formed of the bracts. India.

indica. Large spreading glabrous tree: lvs. oblong, 4-7 in. long, acuminate, reddish when young: fr. $\frac{1}{2}$ in. diam, yellowish-red, with rather large ovate acute bracts at base. Burma, Malaya.—Some of the trees known under this name may be F. retusa.

infectoria (F. lucescens). Deciduous tree: lvs. thin, ovate or somewhat oblong, 3-5 in. long, base broad: fr. ¼ in. diam., whitish tinged and dotted red. India.

lucéscens: F. infectoria.

lutéscens: F. diversifolia.

lyrata (F. pandurata). Close-headed tree to 40 ft.: lvs. large, 10-15 in. long, fiddle-shaped, apex large and rounded: fr. nearly 2 m. diam., with white dots. Trop. Afr.—Popular in juvenile state under glass, and grown in open in S. Fla.

macrophylla. Moreton Bay F. Large tree: lvs. oval to broad-oblong, blunt or nearly so or apex very short, to 10 m. long and 4 m. broad, brownish underneath: fr. to 1 m. dann., purple spotted white, peduncled. Queensland.

microphylla (Urostigma rufum). Lvs. oblong to ovateelliptic, to 8½ in. long, usually obtuse, base truncate to subcordate, coriaceous, glabrous above, somewhat pubescent beneath, lateral veins branched and reticulated toward margin, stipules of terminal lvs. ovate, acuminate, to ½ in. long: fis. axillary. Brazil.

minima: F. pumila var.

mysorensis. Large tree, twigs brown-tomentose becoming glabrous: lvs. elliptic-ovate, to 8 in. long, leathery, smooth above, hairy beneath, entire: fr. orange-red, to 1 in. long, sessile in pairs. India to Burma.

Nekbūdu (F. uthlas). Large forest tree with pubescent young parts: lvs. thick, elliptic or nearly obovate, 6-15 in. long, rounded or broad at both ends: fr. about ½ in. diam., pubescent or woolly. Trop. Afr.—Sometimes grown under glass in juvenile state and planted in open far S.

nítida: F. retusa.

paimata. Shrub or small tree: lvs. orbicular-ovate, sometimes 3-5-lobed, toothed or entire, to 5 in. long: fr. subglobose to pyriform, to 1 in. across, yellow, solitary. N. W. India to Ethiopia and Egypt.

Pálmeri. Tree to 12 ft. or more, often densely woolly beneath when young, shrub-like in its branching: lvs. to 3 m. long and 2½ in. across: fr. globose, ½ in. dam., white, usually in pairs. San Pedro Martin Isl., Mex.

panduràta: F. lyrata.

Parcéllii. Shrub, probably deciduous in the open: lvs. thm, ovate or oblong, acuminate, hairy at least underneath, oblique at base, 4-8 in. long, marbled creamywhite: fr. about ½ in. diam., peduncled, in different colors, Pacific Lab.

parietalis. Shrub or tree, twigs rusty-pubescent: lvs. elliptic-oblong to obovate, leathery, to 12 in. long, petiole stout, hispid. fr. globose to ovoid, yellow or orange, to ½ in. diam., hispid when young. India, Malasian Isls.

popúlnea: F. brevifolia.

princeps. Tree or shrub, listed in Calif.: lvs. long-ovate to oblanceolate, to 15 in. or more long, obscurely 5-7-nerved, short-acuminate, cuneate at base, entire; petiole 5-6 in. long; stipules lanceolate, glabrous, or harry inside. Brazil.

pseudopálma. Shrub or small tree, mostly unbranched with stiffish long lvs. clustered at top and solitary or twin frs. in the axils: lvs. to 2 ft. or more long and 4 in. broad, acuminate, long-tapering to base, coarsely notched, the young ones very slender. Philippines.

pimila (F. repens). Creeping, and clinging to walls by means of roots, the fruiting branches erect: lvs. on creeping sts. 1 in. or less long and cordate-ovate, those on fruiting sts. 2-4 in. long and elliptic or oblong and not cordate: fr. to 2 in. long, yellowish, pyriform. China, Japan, Australia. Common in greenhouses and in the open far S. Var. minima is a slender small-lvd. form of the creeping stage. Var. variegata is said to have small pointed green and white foliage.

quercifòlia. Shrub, more or less prostrate: lvs. elliptic or ovate, lobed and notched on sides, 2-6 in. long: fr. to ½ in. diam., peduncled. Burma.—Grown under glass.

radicans. Trailing: lvs. oblong-lanceolate, about 2 in. long, base rounded or notched. Origin unrecorded.—Useful in vases; a form with variegated foliage.

religiosa. Peepul. Bo-Tree. Large glabrous tree: lvs. round-ovate with a projection or tail half as long as body of blade: fr. 1/2 in. diam., purple. Sacred tree of India.

rèpens: F. pumila.

retusa (F. nitida). Attractive glabrous thick-topped evergreen tree much planted for shade and avenues in American tropics and also in S. Fla.: 1vs. small, broadly ovate or somewhat rhomboid, 2-4 in. long: fr. 1/4 in. long,

yellow or reddish, with obtuse bracts at base. India, Malava.

Réxburghii. Low spreading tree or great bush: lvs. broad-ovate to nearly orbicular, to 15 in. long and 12 in. broad, pubescent underneath: fr. 2 in. diam., depressed-globose, brown or purplish, borne in clusters on trunk and branches. India.

rubiginosa (F. australis). Broad tree, top spreading by means of aerial roots, but often remaining bushy: lvs. oval or elliptic, 3-4 in. long, rusty-pubescent underneath: fr. 1/2 in. diam., warty. Australia.

sápida. Glabrous tree: lvs. oblong-lanceolate, 2-3 in. long and to 1 in. broad, acuminate: fr. globular, to nearly ½ in. diam., peduncled. Costa Rica.

Sycamorus. Sycamorus. Gound-headed large tree: lvs. ovate and subcordate, 3-ribbed, 4-10 m. long: fr. in leafless clusters, about 34 in. long, edible. Egypt, Syria.—In S. Fla. usually deciduous in early spring and late summer, the new lvs. coming at same time.

Thônningii. Tree to 40 ft.: lvs. obovate-elliptic, to 9 in. long, obtuse, papery, glabrous: fr. globose, to 1/3 in. diam., axillary in pairs. Trop. Afr.

ulmifòlia. Tall rough-twigged shrub or somewhat treelike: Ivs. various, mostly oblong or elliptic, 5-7 in. long, very rough on both surfaces, dentate or sometimes lobed: fr. about ½ in. long, orange-red or purplish. Philippines.

ùtilis: F. Nekbudu.

velitina. Tree: lvs. oblong, short-acute or obtuse, 4-5 in. or more long, obtuse or subcordate at base, glabrous above and rusty soft-pubescent underneath, petiole pubescent and 1 in. long. Colombia.

villosa. Scandent or creeping shrub: lvs. ovate-oblong or longer, 5-7 in. long, rounded at base, acuminate, brownish-velvety underneath as are also the shoots: fr. ½ in. diam., yellow, in clusters. Malaya.

Wéndlandii: a hort. name.

FIDDLE-WOOD: Citharexylum spinosum.

FIESTA-FLOWER: Pholistoma auritum.

FIG. The pomological or commercial fig is not a fruit in the strict botanical sense but a hollow fleshy receptacle with the many true fruits or "seeds" on the inside of it, and an opening at the top through which passes the insect that pollinates the minute flowers. The fig fruit grows on the young shoots as if it were a branch. The cultivated fig is one of the great genus Ficus (F. carica), which see. It is a small very broad tree or large bush with soft wood.

Propagation is by means of hardwood cuttings

taken in autumn, much after the way of grapes. In two to four years, bearing plants may be expected. The trees are usually planted about 18 to 25 feet apart. Figs stand considerable frost, and seedling or inferior varieties grow out-of-doors without protection as far north as Virginia and Maryland. Many of the varieties fruit on young sprouts, and, inasmuch as the roots endure cold, these varieties may give a few figs in the northern states. Figs have been fruited in the open ground in Michigan with good winter protection. In cold countries the figs should be laid down in winter, particularly if the temperature is likely to go ten degrees below frost. For such treatment the trees are made to branch close to the ground, and the branches are then bent down and covered with earth and a mound is made over the central or trunk part. In Louisiana, Texas, California the fig is grown in regular orchard plantations for commercial purposes.

In California, which produces the largest volume of figs, both the Mission or Adriatic and the Smyrna types are grown. The latter requires special provision for pollination with the gall wasp. In Texas and the eastern states only the Adriatic type is grown which requires no pollination to set fruit.

FIG, HOTTENTOT: Carpobrotus edulis. Indian-Opuntia Ficus-indica. -Marigold: Mesembryanthemum. FIGWORT: Scrophularia.

FILAGO. Compositæ. Ann. white-woolly little herbs with alternate entire lys, and heads of disk-fls. borne in dense clusters; pappus none.

níves. To 6 in.: lvs. oblong or oblong-lanceolate, to ½ in. long: heads ½ in. across, bracts white-woolly. Ga. to Tex.

FILAMENT: thread, particularly the stalk supporting the anther.

FILAREE: Erodium cicutarium and moschatum.

FILBERTS are fruits of species of Corylus (which see), particularly of C. maxima in which the husk is much longer than the nut itself; the nuts of other species are cobs (a form of C. Avellana) and hazelnuts. Some of the hazelnuts are native in America; but the usual filberts and cobs are European and western Asian. Filberts can be grown in this country, but in the East the yield has not been satisfactory as a rule. because of disease, lack of adaptable varieties, tenderness to northern climates, and perhaps other causes. Many of the difficulties have been overcome by breeding in which the larger-fruited European sorts have been crossed with the hardier more disease-resistant species, particularly C. americana. There is, however, no commercial industry in the East as yet. parts of Oregon filbert growing on a considerable basis is now fairly well established. Filberts and cobnuts are not ordinarily distinguished in this country, but the true filbert is an oblong nut. whereas the cob is roundish and usually angular and contained in a shorter husk.

FILIFORM: thread-like, long and very slender.

FILIPÉNDULA. MEADOWSWEET. Rosaceæ. Per, herbs native in the north temp, zone, once included in the genus Spiræa, having alternate pinnate lvs., small fls. in large terminal panieles in late spring and summer, and 1-seeded achenes; grown in the hardy border. Propagated by seeds and by division of old plants.

camtschática (Spiræa camtschatica. S. gigantea). To 10 ft.: lvs. with ovate-cordate 3-5-lobed terminal lft. and lateral lfts. usually wanting: fls. white. Manchuria, Kamtchatka. Var. rôsea is listed.

grandifiòra; hort. name; some of the material so listed is F. hexapetala.

hexapétala (Spiraca and Ulmaria Filipendula). Drorwort. To 3 ft., rootstock tuberous: lvs. fern-like, of numerous small pinnatifid lfts.: fis. white. Eu., Asia. Var. flôreplêno has double fis.

lobata: F. rubra.

multijuga. Glabrous: basal lvs. of many pairs of lits terminal segms. cordate, lateral ones ovate, petioled, all incised-serrate: fls. rose to white. S. Japan.

palmata (Spræa palmata). To 3 ft.: lvs. with large 7-9-lobed terminal lft, white-hairy or glabrous beneath, stipules large and heart-shaped: fis pale pink becoming white. Siberia, Kamtchatka.—Plants listed under this name are usually referable to F. purpurea.

pentapétala: F. Ulmaria.

purpurea. To 4 ft.: lvs. with large 5-7-lobed terminal lft. and few unlobed or no lateral lfts, stipules narrow: fls. pink or purplish. Japan. Var. alba has white fls. Var. elegans has white fls. with red stamens.

ribra (Spirea lobata). QUEEN-OF-THE-PRAIRIE. To 8 ft.: lvs. with large 7-9-parted terminal lft. and lobed lateral lfts.: fis. pesch-blossom pink, with conspicuous stamens, very attractive. Pa. to Ga. and Ky. Var. venústa (Spirea venusta) has deep pink fis.

Ulmaria (F. pentapetala. Spira Ulmaria). Queen-of-the-Meadow. To 6 ft.: Ivs. with large 3-5-lobed terminal lit. and toothed lateral lits., white-tomentose beneath: fis. white. Eu., Asia; nat. in E. N. Amer. Var. airco-variegata has Ivs. variegated with yellow. Var. plèna has double fis.

FILIX: Cystopteris.

FIMBRIATE: fringed.

FINOCCHIO: Faniculum vulgare var. dulce.

FIORIN: Agrostis alba.

FIR: Abies. China-: Cunninghamia. Douglas-: Pseudotsuya taxifolia. Joint-: Ephedra. Summer-: Artemisia sacrorum var. viridis.

FIRE-CRACKER, FLORAL: Brevoortia Ida-Maia.

FIRE-PLANT, MEXICAN: Euphorbia heterophylla.

FIRETHORN: Puracantha.

FIREWEED: Emlobium angustifolium.

FIRMIÀNA. Sterculiaceæ. Warm-country trees with alternate lvs., unisexual or polygamous small fls. without petals in axillary panicles, and membranaceous fr. which opens into leaf-like carpels; grown in the S. as a shade or lawn tree. Propagated by seeds.

platanifòlia: F. sımplex.

Simplex (F. platanifolia, Sterculia platanifolia). Chinese Parasol-Tree. Phoenix-Tree. To 50 ft., deciduous: Ivs. platanus-like, palmately 3-5-lobed, to 1 ft. across: fls. small, greenish: fr. to 5 in. long, separating into 4 leaf-like bodies that bear the round wrinkled seeds along the margins. China, Japan. In var. variegata the Ivs. are variegated

FISSIPES: Cypripedium acaule.

FITTÒNIA. Acanthaceæ. Ornamental hairy low or creeping herbs with opposite entire lvs. having white or colored veins and small tubular 2-lipped fls. borne beneath bracts in slender spikes; native of S. Amer.

Fittonias are grown as choice foliage plants in the green-house, often under benches, and should be kept shaded and the temperature never allowed to drop below 55°. Propagated easily by stem-cuttings which should contain

argyroneùra: F. Verschaffeltii var.

gigantèa. To 1½ ft., erect: lvs. oval, dark green veined with carmine, short-pointed.

Verschafféltii. Creeping and rooting: lvs. ovate or oval, repling and rooting: 1vs. ovale or oval, to 4 in. long, dark green veined with deep red, obtuse. Var. argyonedra is veined with white and var. Pearcel is glaucous beneath with carmine veins.

FITZRÒYA. Cupressacex. One evergreen tree or sometimes shrubby in cult. F. cupressoides (F. patagonica). Lvs. spreading or overlapping, ½ in. long, dark green above and with 2 white bands beneath: cones globose, 1/3 in. across. S. Chile. For cult. see Conifers. Adaptable only to the lower S. and Calif. It belongs to the Cupressus tribe, with Thuja and Chamæcyparis.

FIVE-SPOT: Nemophila maculata.

FLACOURTIA. Flacourtiacex. Fruit-bearing shrubs or trees with alternate simple lvs., small bisexual or polygamous fls. in racemes or clusters, and fr. a berry-like drupe, the pulp of which is made into jams and preserves. It is not particular as to soil but will not withstand frost. Propagated by seeds and budding.

indica (F. Ramontchi), RAMONTCHI. GOVERNORS-PLUM. BATOKO-PLUM. To 25 ft., often with long slender spines: lvs. ovate, to 3 in. long: fls. yellowish: fr. deep maroon colored, to 1 in. across. S. Asia, Madagascar.

Ramóntchi: F. indica.

sepiària. Shrub, usually spiny: lvs. obovate, 11/2 in. long: fr. 1/2 in. across. India.

FLACOURTIÀCEÆ. FLACOURTIA FAMILY. Trop. trees and shrubs of both hemispheres, of about 70 genera, characterized by alternate simple lvs., regular bisexual or unisexual fis. having 4 or more sepals and petals or without petals, numerous stamens, superior 1-celled ovary and fr. mostly a berry or drupe; placed near Cistaceæ in the series. Azara, Berberidopsis,

Carrierea, Idesia, Oncoba, Poliothyrsis, Xylosma are cult. for ornament, Dovyalis (Aberia) and Flacourtia for the edible fr., and Taraktogenos for the curative oil.

FLAG, BLUE-: Iris. Crimson: Schizostylis. Spiral: Costus. Sweet: Acorus Calamus. Yellow: Iris Pseudacorus.

FLAMBOYANT: Delonix regia.

FLAME-OF-THE-FOREST: Butea frondosa. -Tree: Brachuchton acertfolium.

FLANNEL-BUSH: Fremontia californica. -Flower: Actiontus Helianthi

FLAX. To gardeners the flaxes are annual and perennial plants grown for the bright showy bloom. They are species of Linum. The flax of commerce is Linum usitatissimum, an annual grown for two classes of products,—the fiber of the bast in the stem from which flax-fiber and fine linen are derived, and the seeds from which linseed oil and linseed cake and meal are manufactured. These are not horticultural products. In North America flax is raised mostly in Minnesota, the Dakotas and Canada. Seed is sown directly in the field when the weather is warm, as in May and June, and the crop should be ready in one hundred days or less.

FLAX, NEW ZEALAND: Phormium tenax. Yellow: Reinwardtia indica.

FLEABANE: Erigeron. Marsh -: Pluchea.

FLEECE-FLOWER: Polygonum. Mountain: Polygonum amplezicaule. -Vine, China: Polygonum Aubertii.

FLEMÍNGIA. Leguminosæ. Herbs or shrubs, often twining, with lvs. commonly of 3 digitate lfts. but sometimes simple, red or purple papilionaceous fls. and short swollen pods; native in tropics of Old World and intro. in S. U. S.

strobilifera. Shrub to 10 ft.: lvs. simple, ovate, to 3½ in. long, silky beneath: fis. purple, hidden by large bracts, in racemes to 6 in. long: pods to ½ in. long. India, Malaya.

FLEXUOUS, FLEXUOSE: having a more or less zigzag or wavy form; said of stems of various kinds.

FLOATING-HEART: Nymphoides.

FLOERKEA: Limnanthes Douglassi.

FLOPPERS: Kalanchoë pinnata.

FLORAS-PAINTBRUSH: Emilia sagittata.

FLORETS: individual flowers of composites and grasses also other very small flowers that make up a very dense form of inflorescence.

FLORIFEROUS: flower-bearing.

FLOSS-SILK TREE: Chorisia speciosa.

FLOWER-OF-AN-HOUR: Hibiscus Trionum. -of-Jove: Lychnis Flos-Jovis.

FLY-POISON: Amianthium muscatoxicum.

FOAM-FLOWER: Tiarella cordifolia.

FŒNÍCULUM. Umbelliferæ. Herbs native in the Old World, having pinnately decompound lvs., small yellow fls. in compound umbels, and narrow prominently ribbed frs.; one species is grown for the lvs. and aromatic seeds which are used in flavoring; lvs. and lf.-bases sometimes eaten. Propagated by seeds in spring.

atrosanguinea: listed name.

dúlce: F. vulgare var.

officinale: F. vulgare.

vulgare (F. officinale). FENNEL. Per. but grown as an ann., to 5 ft.: lvs. 3-4-pinnate into linear thread-like segms. S. Eu. Var. dílce, FLORENCE F. or FINOCCHIO, has the base of the lvs. much enlarged and thickened and, when blanched, serves as article of food. Var. piperitum, CAROSELLA, is grown for the young sts. which are caten.

FOLIACEOUS: leaf-like; said particularly of sepals and calyx-lobes and of bracts that in texture, size or color look like small or large leaves.

FOLLICLE: dry dehiscent pericarp opening only on the front suture.

FONTANÈSIA. Olcaceæ. Two Asian deciduous somewhat Ligustrum-like shrubs with opposite entire lvs., small white fls. in narrow leafy panicles in May-June, and fr. a flat winged nutlet

Fontanesias thrive in any good garden soil. Propagated by seeds, layers, and cuttings of green wood under glass. californica: F. Fortunci.

Fortunei (F. californica). To 15 ft.: lvs. lanceolate or ovate-lanceolate, to 4 in. long, shining. China; hardy N. phillyreoides. To 10 ft.: lvs. ovate-lanceolate to oblong, to 3 in. long, grayish-green. Asia Minor; less hardy.

FORCING. Plants are forced when made to grow or bloom outside their normal season, particularly in advance of the season, by some artificial means. The mere imitation of the natural conditions under which any plant grows may not constitute forcing. Growing in greenhouses is not necessarily forcing; it may be only protection. The word forcing has come to be associated with particular crops and sometimes quite independently of its proper restricted meaning; thus we speak of the forcing of tomatoes, cucumbers, melons, bulbs. A forcing-house is only a glass-house: its use determines its title or designation.

FORESTIÈRA (Adelia). Oleaceæ. American deciduous (seldom evergreen) trees or shrubs with opposite lvs., small yellowish diceious or imperfect fls. without petals in clusters or racemes before the lvs., and fr. a small black or dark purple drupe with scant flesh. Only F. acuminata is hardy North without protection. They thrive best in moist locations. Propagated by seeds and lavers.

acuminata. To 30 ft.: lvs. to 4 in. long, acuminate: fr. 12 in. long. Ill. to Ga. and Tex.

ligustrina. To 10 ft.: lvs. to 11/2 in. long, obtuse: fr. 1/3 in. long. Tenn. to Fla.

neo-mexicana. To 10 ft.: lvs. to 1½ in. long, acute or obtuse: fr. ½ in. long. Tex. to New Mex. and Colo.

FORESTRY. The growing and utilizing of forests, with all the science, craft and commerce consequent thereto. The forest is a crop, making use of land, and is therefore agriculture in its broad sense. In its general relations it is also within the realm of political economy inasmuch as great permanent forests are almost necessarily public domains, and it is directly concerned in the conservation and utilization of natural resources as well as with governmental problems. These domains are to be kept and utilized in the interest of all the people, in consideration with all related questions. Silviculture is the science and practice of raising forests, one of the main departments or components of forestry. Arboriculture (which see) is properly not within the realm of forestry, although popularly con-fused with it, but rather a department of horticulture. Farm forestry is that smaller applica-tion having to do with the raising and using of wood-lots.

FORGET-ME-NOT: Myosotis. Creeping: Omphalodes

FORSÝTHIA. GOLDEN-BELLS. Oleaceæ. Deciduous erect or diffuse shrubs of the Old World with opposite, simple or 3-parted lvs., showy yellow fis. deeply 4-parted into oblong corollalobes, appearing before the lvs., and fr. a woody caps. with winged seeds.

Forsythias are amongst the showiest spring-blooming shrubs and are hardy North. They are not particular as to soil. Propagated by cuttings of young wood in summer, of ripe wood in fall and winter, by seeds, and the drooping sorts by rooting at the tips.

deciniens: F. suspensa var.

europæa. To 6 ft., with erect branches having lamellate pith: lvs. to 3 in. long, entire or with few shallow teeth. Albania.

Fórtunei: F. suspensa var.

rortune: F. suspensa var.
intermēdia. Hybrid between F. suspensa and F. viridissima: to 10 ft., with arching or spreading branches having lamellate pith: lvs. to 5 in. long, sometimes 3-parted. Var. densiflöra, fis. pale, crowded. Var. nāna, low-growing. Var. primūlina has pale yellow fis. crowded at base of branches. Var. spectabilis has bright yellow fis. more than 1 in. long. Var. vitellina, fis. deep yellow, 1 in. long.

ovata. Very early: lvs. ovate to broad-ovate, to 2½ in. long, serrate, not lobed: fls. solitary, amber-yellow. Korea.

primúlina: F. intermedia var.

Sièboldii: F. suspensa var

spectábilis: F. intermedia var.

superasis: F. Intermedia var.

suspensa. To 10 ft., with hollow drooping branches: lvs. to 4 in. long, toothed, often 3-parted: fls. golden-yellow. China. Commonly planted. Var. atrocatilis has dark purple branchlets. Var. atrea, lvs. yellow. Var. decipiens (F. decipiens) has solitary deep yellow fls. Var. Fórtunei (F. Fortunei), is of more erect habit, often with 3-parted lvs. Var. Sieboldii (F. Sieboldii) has more slender drooping or trailing branches. Var. variegata, lvs. variegated with yellow. vellow

viridissima. To 10 ft., with erect branches having lamellate pith: lvs. to 6 in. long, toothed above middle: fls. greensh-yellow. China.—May be distinguished from F. intermetha and F. suspensa by pith not solid at the nodes. In var. variegāta the lvs. are variegated with white. Var. koreāna has more spreading branches, larger fls. and is more showy. Korea.

FORTUNELLA. KUMQUAT. Rutacex. Four known or recognized small evergreen fruit-trees or shrubs native probably in S. E. China, differing from Citrus in few-celled ovary with but 2 ovules in each cell, characteristic hollowed stigma and smaller frs. Grown in the orange belt, but somewhat hardier than the sweet orange particularly when grown on trifoliata (Poncirus) stock: lvs. lanceolate or somewhat broader. The attractive aromatic frs. are used for preserves and may be eaten raw. Kumquats make ornamental tub plants. Full grown plants reach a height of 10 or 12 ft. They hybridize with other citrus fruits. For general culture, consult Citrus fruits, page 183.

crassifòlia. Melwa K. Shrub, with or without spines: lvs. thick and trough-like, petioles narrowly winged: frs. slightly ovoid, to 1½ in. diam., cells 6 or 7; pulp-vescicles oval or ovate.

Hindsii. Spiny small tree, wild on Hongkong and adjacent mainland, grown somewhat for curiosity: lvs. ovalelliptic, petiole winged: fr. less than 1 in. diam., subglobose, orange-red, with 3 or 4 cells, with few nearly juiceless small pulp-vescicles.

japonica (Citrus japonica). ROUND and MARUMI K. Much branched shrub with or without spines: lvs. to 3 in. long, blunt-pointed and relatively broad; fr. round, to about 11/4 in. diam., without rudiments of style, and 5-6 cells

margarita. Oval and Nagami K. Shrub or small tree, nearly or quite thornless: lvs. longer than in F. japonica and relatively narrower and more pointed: fr. oval or oblong, to 1 in. cross diam., with persistent rudiment of style, cells 4 or 5.

FOSTÈRA. Stylidiaceæ. Glabrous perennials, mostly from New Zeal, having erect or decumbent sts. with white fls. on slender peduncles; calyx tubular with 5-6 equal lobes; corolla nearly regular, campanulate: fr. a 1-celled caps. Propagated by seeds and layers.

tenélla. Sts. to 8 in. long, decumbent and rooting at base, branched above: lvs. usually confined to terminal parts of sts., narrowly oblong-obovate, to 3\(\frac{1}{2}\) in. long, few and laxly placed, narrowed into short petiole, dark green and veinless above: fls. 1-3, on peduncle to 4 in. long, to \(\frac{1}{2}\) in. across: caps. narrowly clavate.

FOTHERGÍLLA. Hamamelidacex. Deciduous N. American shrubs with alternate simple coarsely toothed witch-hazel-like lvs., white fls. without petals borne in dense terminal heads or spikes in which the stamens are the conspicuous part, and fr. a beaked caps.

Fothergillas are hardy and thrive in moist soils. Propagated by seeds, by layers which will not root for two years, and F. Gardenn by suckers and root-cuttings.

alnifòlia: F. Gardenii.

carolina: F Gardenii

Gárdenii (F. alnifolia. F. carolina). To 3 ft.: lvs. obovate to oblong, base rounded or broadly cuneate, to 2 in. long, pale beneath: fls. before lvs. Va. to Ga.

major. To 10 ft.: lvs. to 4 in. long, glaucous and stellate-pubsecent beneath: fls. with lvs. Ga.—Differs from F. monticola in its more pyramidal and less spreading habit and in its shorter ft.-spikes 1-2 in. long.

monticola. To 6 ft.: lvs. to 4 in. long, light green and sparingly pubescent beneath; fls. with lvs. N. C. to Ala.

parvifòlia. To 2 ft.: lvs. suborbicular to ovate, base often cordate, to 2¼ in. long, gray-pubescent beneath: fis. before lvs. N. C. to Fla.

FOUNTAIN-PLANT: Russelia equisetiformis.

FOUQUIÈRIA. Fouquieriaceæ. Singular spiny shrubs or trees in Mex., one extending into the desert regions of S. W. U. S. and there planted for hedges. F. splendens. Ocotillo. Coach-Whip. Vine-Cactus. Jacobs-Staff. Shrub of many sts. to 20 ft. with slender rigid spines bearing clusters of small lys, in their axils which soon fall: fls. scarlet, to 1 in. long, the stamens exserted, in terminal racemes or panicles to 10 in. long: fr. 34 in. long. For F. columnaris, see

FOUQUIERIÀCEÆ. FOUQUIERIA FAMILY. Two genera of spiny trees and shrubs, often leafless, with bisexual fls. having 5 sepals, 5-lobed corolla, 10-17 stamens, superior 3-celled ovary and capsular fr. It has mostly been associated with Tamaricacce, but has lately been placed in the sequence near Polemoniaceæ. Fouquieria and Idria are sometimes planted.

FOURCROYA: Furcræa.

FOUR-O'CLOCK: Mirabilis Jalapa.

FOXGLOVE: Digitalis.

FOXTAIL, MEADOW: Alopecurus pratensis.

FRAGARIA. STRAWBERRY. Rosaceæ. per. herbs with rooting runners, lvs. of 3 lfts., white or reddish sometimes more or less imperfect fls. in small clusters on radical peduncles, and fr. a berry formed of the fleshy receptacle bearing the seed-like frs. on the surface; a few grown for ornament and the edible fr. For cult. see Strawberry.

alpina: F. vesca.

americana. The American form or var. of F. vesca, but apparently not regularly in cult.

californica. To 5 in.: Ifts. silky-pubescent beneath: fis. 1/2 in. across: fr. 1/2 in. across, the achenes in shallow pits. Calif.

chiloénsis. To 8 in.: lfts. thick and glossy, silky beneath: fls. to 1 in. across: fr. ¾ in. across, the achenes in shallow pits. Alaska to Patagonia. Var. ananássa comprises most of the common garden strawberries, with larger frs.; hybridization may have modified them.

Daltoniana. Small hairy or nearly glabrous plant with thread-like runners: lfts. with few teeth: fls. solitary, calyx-lobes toothed: fr. scarlet, nearly 1 in. long and one-half as broad. Himalayas.—Name recently intro. to U. S., but plant not correctly determined.

elatior: F. moschata.

Grayana: F. virginiana var. illinoensis.

illinoénsis: F. virginiana var.

indica: Duchesnea indica.

mexicana. To 4 in.: Ifts. silky beneath: fls. about 1/3 in. across: fr. 1/3 in. across, the achenes superficial. Mex.

moschata (F. elatior). HAUTBOIS S. To 1 ft.: lifts. silky beneath: fis. usually diocious, standing above foliage: fr. musky, the achenes superficial, hull strongly reflexed. Eu.

vésca (F. alpina). To 1 ft.: Ifts. slightly silky beneath: fls. ½ in. across: fr. red, or white in var. álba, ½ in. across, the achenes superficial. Eu.; nat. in E. N. Amer.—Here belong the races of strawberries known as Alpine, Everbearing and Perpetual.

virginiana. To 8 in.: Ifts. becoming glabrous: fls. to ¼ in. across: pedicels bearing appressed hairs: fr. ½ in. across, the achenes in deep pits. Stout forms with spreading hairs on the pedicels are known as var. illinoensis. (F. tl-linoensis, F. Grayana). E. N. Amer.—Supposed to have entered into some of the garden strawberries.

FRAÎLEA. Cactaceæ. Small S. American cacti with many low tubercled ribs and small spines: fls. small and often cleistogamous.

cataphracta (Echinocacius cataphractus). St. solitary or sprouting about base, globular; ribs 15, indistinct, tubercles low and flat; spines all radial, 5, yellow to gray, to ¾ in. long. fls. cleistogamous, to 1¾ in. long: fr. red, globose; seeds smooth, glossy black. Paraguay.

columbiàna (Echinocactus columbianus). Cespitose, sts. globular, to 1½ in. diam., glossy green, ribs usually 18, indistinct; spines yellow to white, to ¼ in. long, radials 15-20, centrals 2-5: fls. yellow, to 1 in. long. Colombia.

Dádakii. Globular, depressed on top; ribs 12; spines all radial, usually 8, recurved and contorted, brown to white: fls. yellow, to 1 in. long, mostly cleistogamous. Argentina, Uruguay.

gracillima. Globular to cylindrical, to 4 in. tall and 1½ in. diam.; ribs 12-14; spines white to gray, radials 15-17, curved, centrals usually 2, stiff: fls. red without, pale yellow within, to 1½ in. long. Paraguay.

Grahliana. Cesputose, globular, flattened on top, brownish-green; ribs 13, indistinct, shallowly tubercled; spines all radial, usually 9-11, yellow to brown or gray, about ½ in. long, curved: fls. pale yellow with red throat, to 1½ in. long: seeds yellowish-brown, puberulent. Paraguay.

pseudopulchérrima: listed name.

pulchérrima (Echinocactus and Malacocarpus pulcherrimus). Cespitose, globular, to 1 in. diam., dark green; ribs 19-21, indistinct, tubercled; spines pale brown, radials usually 14, reflexed, central 1, straight, sometimes absent: fls. yellow, 1 in. across. Argentina, Paraguay, Uruguay.

pamila (Echnocactus pumilus). Globose, flattened at center, dark green, to 1½ in. diam. and 1 m. tall; ribs 13-15. flat; spines gray to brown, curved, radials 12-14, to ½ in. long, centrals 1-2, slightly longer: fls. yellow. Argentina, Paraguay.

pygmæus). Cespitose, globular, flattened on top, to 1¼ in. diam.; ribs 13-21, tubercled; spines alke, 6-9, bristle-like, twisted and recurved, to nearly ¼ in. long; fls. yellow, to 1 in. long, mostly cleistogamous. Argentina, Uruguay.

Schilinzkyana (Echinocactus Schilinzkyanus). Globular, flattened above, 1 in. across, sometimes forming clumps; ribs 10-13, indistinct; radial spines 12-14, flattened. Paraguay, Argentina.

FRANCISCEA: Brunfelsia.

FRANCÒA. Saxifragaceæ. Herbaceous perennials from Chile with lyrate lvs. and terminal dense racemes of white or pink fls.; suitable for outdoor planting in mild climates. Propagated by seeds sown in spring in a cool house or frame; also by division.

appendiculata. To 21/2 ft.: fis. pale rose, usually not spotted.

glabràta: F. ramosa.

ramòsa (F. glabrata). To 3 ft.: infl. pubescent; fis. white, in spikes 2 ft. long and 1 in. thick.—The sprays of fis. are much used for table decoration; incorrectly called Bridal Wreath. Var. álba is listed, but may not differ from type. Var. hýbrida has larger pure white fis.

sonchifòlia. To 2 ft.: lf.-stalks with broad wings at base; fls. pink marked with darker color.

FRANGIPANI: Plumeria.

FRANKÈNIA. Frankeniaceæ. Evergreen more or less heath-like per. herbs or subshrubs with small entire lvs. opposite or in 4's, small inconspicuous fls., and capsular frs.; seldom grown

under glass and perhaps in the open in mild regions.

capitata. Branches prostrate or ascending, to 1½ ft., glabrous or harry. Ivs. Innear, glabrous with strongly revolute margins: fls. pink to purple. Salt marshes, S. Afr. Var. lævis (F. lævis), sts. and calyces not harry.

Jamesii. Much branched shrub to 2 ft.: lvs. linear, in long, margins revolute: fls. white. Colo., Tex., Mex. latvis: F. capitata var.

pulverulenta. Sts. straggling, to 1½ ft. long: lvs. many, broadly oval to obovate, to ½ in. long, close together: fls. pink, less than ¼ in. long. S. Eu. to India, S. Afr.

FRANKENIÀCEÆ. FRANKENIA Herbs or subshrubs of 4 genera in warm countries, with often heath-like lys., small bisexual fls. having 4-7 sepals and petals, mainly 6 stamens, superior 1-celled ovary, and fr. a caps. inclosed in the calyx. In natural sequence it is placed near Hypericaceæ and Tamaricaceæ. Frankenia may be cult.

FRANKLINIA: Gordonia alatamaha.

FRASÈRA. COLUMBO. Gentianaceæ. N. American large stout herbs with opposite or whorled simple and entire lvs. that are mostly basal, and white, yellowish or bluish fls. in panicled clusters on tall single sts.; corolla rotate and 4-parted, style awl-shaped; sometimes transplanted from the wild and usually of simple handling.

carolinénsis. To 7 ft.: lvs. to 6 in. long: fis. yellowish-white spotted with brown-purple, 1 in. across, with fringed glands, in panicles to 2 ft. long. Mich. to Ga. and Mo.

nftida. To 1½ ft.: lvs. to 10 in. long, with narrow white margins: fls. greenish with deeply fringed glands, in cymes ¾ in. across. Ida. to Calif. Var. albicaülis (Swertu albicaults, Leucocraspedium albicaule) is somewhat pubescent.

Párryi (Swertia Parryi). To 3 ft.: lvs. to 8 in. long, white-margined: fls. greenish-white, the lobes spotted with black around the yoke-shaped fringed gland, in broad panicles to 1 ft. long. S. Calif.

speciòsa (Tessaranthium speciosum. Swertia radiata). To 5 ft.: lys. to 1 ft. long: fls. greenish-white spotted with purple, with fringed glands, in narrow panicles to 2 ft. long. Ore. to Mont. and Calif.

FRAXINELLA: Dictamnus albus.

FRÁXINUS. Ash. Oleacex.Trees with opposite mostly pinnate lvs., usually deciduous, small not showy bisexual or unisexual fls. in panicles and in some species in early spring before the lvs., and fr. a 1-seeded winged samara; mostly native in the north temp. zone but some of them extending to the tropics. Shade and timber trees are in the genus, and many interesting hort, forms. The following species are hardy N. unless otherwise stated.

Ashes are valuable as street or lawn trees and succeed in good fairly most soil. They transplant readily. Propa-gated by seeds which should be stratified and sown the following year. The named sorts are grafted in spring on seedling stocks or budded in summer.

álba: F. americana.

americana (F. alba, F. novæ-angliæ). White A. To 120 ft.: lvs. of 5-9 lfts. to 6 in. long, glaucous beneath: fls. diœcious, before the lvs., without petals, the calyx persistent on fr.: fr. linear-oblong, to 2 in. long. N. S. to Fls. and Tex. Var. ascidiàta has lfts. somewhat hollow or pitcher-shaped at base. Var. pendula has drooping branches. Var. subcoriàcea has thick lfts. silvery-white beneath.

angustifòlia. To 75 ft.: lvs of 7-13 lanceolate lifts to 3 in. long: fls. before the lvs., without calyx or corolla: fr. oval-oblong, to 1½ in long S. Eu, N. Afr., W. Asia; not hardy N. Var. lentiscifòlia (F. lentiscifolia) has lifts, further apart. Var. austràlis (F. australıs) has lifts. slightly pubescent beneath.

anomala. Single-Leaf A. To 20 ft., with slightly winged branchlets: Ivs. usually of 1 broad-ovate lft. to 2½ in. long: fls. with the lvs., without petals, the calyx persistent on fr.: fr. oblong, ¾ in. long. Colo. to Calif.; not hardy far N.

arbutifòlia: F. pennsylvanica.

atrhvirens. E erceleior var crisna aucubæfòlia: F. pennsulvanica var.

austràlis: F. angustrfolia var.

Biltmoreana. To 50 ft.: lvs. of 7-11 lfts. to 6 in. long, pubescent beneath: fls. directous, before the lvs., without petals, with 2 may x persistent in fr.: fr. linear-oblong, to 1½ in. long. N. J. to Ca. and Ala.

Bungeana. To 15 ft.: lvs. usually of 5 broad-ovate lfts. to 1½ in. long; ffs. with or after lvs., with petals; fr. oblong, 1 in. long. China.

califórnica: F. oregona.

caroliniàna (F. platycarpa). WATER A. To 50 ft.: lvs. of 5-7 lfts. to 5 in. long: fls. dicecious, before the lvs., without petals, the culyx persistent on fr.: fr oval to oblong, to 2 in. long, winged to base. Swamps, Va. to Fla. and Tex.; not hardy in the N.

chinénsis. To 50 ft.: lvs. of 5-9 lfts. to 4 in. long: fls. with or after lvs, without petals, with calyx: fr. lanceolate, to 2 in. long. China. Var. rhynchophýlla (F. rhynchophylla) has larger lys.

cuspidata. To 20 ft.: lvs. of 7 lfts. to 2½ in. long: ffs. fragrant, with or after lvs., with petals united into tube: fr. oblong, 1 m. long. Tex. to Mex.; to be planted only far S.

dipétala. To 15 ft., with 4-sided branchlets: lvs. usually of 5 lfts to 1¾ in. long: fls. with the lvs., with 2 white petals: fr. oblanceolate, 1 in. long. Calif.; to be planted only in mild climates.

Elónza. Small tree, the branchlets with whitish warts: lvs. of 9-13 lfts. to 3 in. long; fr. oblong. Of uncertain origin.

Ivs. of 9-13 lfts. to 3 in. long; fr. oblong. Of uncertain origin.

excélsior. European A. To 140 ft., with black buds:
lvs. of 7-11 lfts. to 5 in. long; fls. before lvs., without calyx
or corolla; fr. oblong, 1½ in. long. Eu, Asia Minor. A few
of the hort. vars. are; asplenifòlia, lfts. linear; añrea,
branchlets yellow; añrea-péndua, branchlets yellow, drooping; añreo-variegăta, lvs. variegated or edged with yellow;
crfspa (var. atrovernes, var. cucullata), lfts. sinall and curled
or twisted; diversifòlia (var. simplicifolia laciniata, F.
monophylla, F. heterophylla), lvs. of 1-3 cut-toothed lfts.;
var. eròsa, lfts. narrow, jagged or cut-toothed; var globbsa
is var. nana; nāna (var. globosa, F. polemonifolia), dwarf,
lfts. small; péndula (var. Wentworthi), branches drooping;
spectábilis, habit pyramidal; verrucòsa, branches warty;
verticillàta (F. verticillata), lvs. clustered.

floribinda. To 120 ft.: lys. of 7-9 lfts. to 6 in. long the

floribunda. To 120 ft.: lvs. of 7-9 lfts. to 6 in. long, the rachs slightly winged: fls. with or after lvs., in panicles to 1 ft. long, with corolla: fr. linear, about 1 in. long. Himalayas; adapted only far S.

Gréggii. To 25 ft.: lvs. of 3-7 leathery lfts. to 3/4 in. long: fls. before lvs., without corolla, with ealyx: fr. oblong, to 3/4 in. long. Tex., N. Mex.; to be planted only far S.

heteroph flla: F. excelsior var. diversifolia.

lanceolàta: F. pennsylvanica var.

lentiscifòlia: F. angustrfolia var.

longicúspis. To 50 ft.: lvs. of 5-7 lfts. to 4 in. long, the lowest pair much smaller: fls. with or after lvs., with corolla and minute culyx: fr. linear-oblong, 1½ in. long. Japan. Var. Sieboldiàna (F. Sieboldiana) has slightly smaller lfts. which are pubescent beneath along midrib. Japan, Korea.

mandshurica. To 100 ft.: lvs. of 9-11 lfts. to 5 in. long, rusty-tomentose at base: fls. dioecious, before the lvs., without calyx or corolla: fr. oblong-lanceolate, to 1½ in. long. N. E. Asia.

Marièsii. To 25 ft.; lvs. usually of 3-5 close lfts. to 3 in. long, pale beneath: fts. with or after the lvs., with corolla and minute calyx: fr. oblanceolate, to 1 in. long, purplish. China; not hardy N.

monophýlla: F. excelsior var. diversifolia.

nigra (F. sambucifolia). BLACK A. To 75 ft.: lvs. of 7-11 lfts. to 5 in. long, rusty-tomentose at base: fls. directous, before the lvs., without calyx or corolla: fr. oblong, to 1½ in. long, winged to base. Newf. to W. Va. and Ark., in low lands.

novæ-ángliæ: F. americana.

oregona (F. californica). To 75 ft.: lvs. of 5-9 sessile lfts. to 6 in. long, pubescent beneath: fls. diocious, before the lvs., without petals, with calyx: fr. 2 in. long, winged nearly to base. Wash. to Calif.; not hardy far N.

Ornus (Ornus europæa). Flowering A. To 60 ft.: lvs. usually of 7 lfts. to 3 in. long; fls. fragrant, with the lys., with linear white petals and with calyx: fr. linear or lanceolate, 1 in. long S. Eu., W. Asia.

oxyacanthifòlia: F. xanthoxyloides.

parvifòlia: F. rotundifolia.

Paxiàna. To 60 ft.: lvs. of 7-9 sessile lfts. to 7 in. long: fis. with or after lvs., with corolla and large calyx: fr. linear, 1 in. long. China, Himalayas.

pennsylvánica (F. pubescens. F. arbutifolia. F. Richardu). RED A. To 60 ft.: lvs. of 5-9 lfts. to 6 in. long, pubescent beneath: fls. diœcious, before the lvs., without

petals, with calyx: fr. to 2½ in. long, winged nearly to base. N. S. to Ga. and Miss. Var. aucubæfòlia has lvs. mottled with yellow. Var. lanceolàta (F. lanceolata. F. viridis). Green A. Lits. narrower, pubescent only on midnb base. neath. Me. to Fla. and Tex.

platycárpa: F. caroliniana.

platýpoda. To 70 ft.: lvs. of 7-11 sessile lfts. to 4 in. long, petioles enlarged at base: fis. dioccious, before the lvs., without petals, with ealyx: fr. oblong, to 2 in. long, winged to base. China.

polemoniifòlia: F. excelsior vai. nana.

potamóphila. To 30 ft.: lvs. of 9-11 lfts. to 2 in. long: fls. before the lvs., without calyx or corolla: fr. oblong, to 2 in. long. Turkestan.

pubéscens: F. pennsylvanica.

pubinérvis. Tree: lvs. of 5-11 lfts. to 4 in. long: fls. with lvs. having corolla: fr. oblanceolate. 11/6 in. long. Japan.

quadrangilata. Blue A. To 80 ft. or more, the branches 4-angled: lvs. of 7-11 lfts. to 5 in. long: fls. bisexual, before the lvs., without calyx or corolla: fr. oblong, to 2 in. long, winged to base. Mich. to Ark.

retisa. Tender shrub allied to F. Mariesii, differing in its stalked lits. which are reticulated beneath and often dentate: fls. with a large calyx. E. China.

rhynchophélla: F. chinensis var.

Richárdii: F. pennsylvanica.

rotundifòlia (F. parufolia). To 15 ft.: lvs. of 7-13 sessile líts. to 1½ in. long: fls. before the lvs., without calyx or corolla: fr. oblong, 1½ in. long. S. Eu., W. Asıa; hardy in cent. region. Var. pendula has drooping branches.

sambucifòlia: F. mora

Sieboldiana: F. longicuspis var.

sogdiana. Small tree: lvs. of 7-11 lfts. to 2½ in. long: fls. before the lvs, without calyx or corolla: fr. oblong,

13. in long. Turkestan.

syriaca. Small tree: lvs. of 3-5 lanceolate lfts. to 4 in. long: fls. before the lvs., without calyx or corolla: fr. ob-ovate, to 1½ in. long. Asia.

texénsis. To 50 ft.: lvs. of usually 5 lfts. to 3 in. long: fls. discious, before the lvs., without petals, with calyx: fr. oblong, to 1 m. long. Tex.

Tolmeyi (F. velutna var. Toumeyi). Medium-sized gray-barked tree with young branchlets usually pubescent as well as under surface of narrow acumnate lits. New Mex., Ariz., Mex., sometimes planted in its region.

velutina. To 50 ft.: lvs. of 3-5 lfts. to 1½ in. long, pubescent beneath: fis. diœcious, before the lvs., without petals, with calyx: fr. oblong, ½ in. long. Aliz., New Mex.; not hardy N.

verticillata: F. excelsior var.

víridis: F. pennsylvanica var. lanceolata.

xanthoxyloides (F. oxyacanthifolia). Small tree: lvs. of 5-9 lfts. to 1½ in. long, the rachis winged: fls. before the lvs., without petals, with calyx: fr. linear-oblong, to 2 in. long, winged to base. W. Asia; not hardy N.

FREESIA. Iridacex. S. African tender herbs with bulb-like corms, linear basal and st.-lvs., and white or yellow, very fragrant, erect funnelform fls. in raceme-like spikes which are bent at right angles to st.

Freesias are forced under glass for the late winter and Freesias are forced under glass for the late winter and early spring bloom, but bulbs do not withstand the previous potting and cold treatment required by hyacinths and tulips. They should be kept cool and moist when growing, and the soil well drained. Bloom may be expected ten or twelve weeks after planting if bulbs are strong. Several bulbs or corms are plantied together in pots, pans or boxes. Started in late winter or early spring, they are useful for porch- and window-boxes. After blooming and ripening, gradually dry off the plant, shake out the corms and keep for subsequent planting. Seeds should give blooming corms in second or third year. The offsets reproduce the stock rapidly. rapidly.

Armstrongii. Differs from F. refracta in having fls. with white tube orange at base and segms, margined with rose-

purple.

hybrida. A hort group containing many hybrid or variant forms known as "colored freesias," the fis. variously tinted and veined with shades of rose, purple, brown, blue and orange.

Ragionièri. A hybrid race with fragrant fls. in shades of rose, purple, blue, brown, orange.

refracta. To 1½ ft.: fls. greenish-yellow to bright yellow, to 2 in. long, the segms. unequal. Var. alba has white fls. with gradually narrowed tube while the white fls. of var. xanthospila have abruptly narrowed tube. The fls. of var. Leichtlinii are pale yellow and abruptly narrowed and of var. odorata bright yellow.

Regina-Maria: catalogue name.

spléndens: hort, form with violet fls.

Tubergenii. A hybrid of F. Armstrongii and F. refracta var. alba: fis. rose-lilae with white markings.

FREMÓNTIA (Fremontodendron). Sterculiacex. Two evergreen shrubs with alternate usually palmately lobed lvs., showy yellow fls. without petals, solitary in the axils, and capsular fr. F. californica. Flannel-Bush. To 10 ft.: lvs. to 1 in. long, densely tomentose beneath: fls. to 2 in. across. Calif. F. mexicana differs in the glands at the base of the calvx not being hairy. S. and Lower Calif.—Fremontias require rather dry soil. They are not hardy N. Propagated by seeds or cuttings of green wood under glass.

FREMONTODENDRON: Fremontia.

FREYCINÈTIA. Pandanacex. shrubs climbing or scrambling, largely in Australia and New Zeal., of many species, the sts. rooting: lvs. long-linear and mostly serrate or spinescent, sheathing at base: fls. in terminal spadices: fr. an aggregate oblong mass or cone of woody or somewhat fleshy berry-like bodies. F. Bánksii is a tall climber on trees and over rocks, the spinose-serrate lvs. towards ends of branches. New Zeal.

FRIESIA: Purrhocactus umadeave.

FRINGE-BELL: Shortia soldanelloides. -Tree: Chionanthus

FRITILLÀRIA. FRITILLARY. Liliaceæ. Bulbous simple-stemmed herbs with alternate or whorled lvs. and nodding bell-shaped often oddly colored fls. solitary or in racemes or umbels, the perianth-segms. distinct; native in north temp, zone.

Most of the species are hardy and of easy cultivation in good garden soil; they are usually early spring-flowering. Most kinds should be lifted and divided every two or three years. Propagated by offsets, rarely by seeds.

agréstis. STINK BELLS. To 1½ ft.: lvs. oblanceolate, mostly near base of st.: fls. yellowish-green, to 1½ in. long, in 3-5-fld. racemes, having disagreeable odor. Calif.

atropurpurea. To 1½ ft.: lvs. narrow-linear: fls. dull purple somewhat spotted with yellowish-green, to ¾ in. long, in 1-6-fld. racemes. Ore., Calif. to N. D.

biflora. To 1½ ft.: lvs. oblong-lanccolate: fis. brownish-purple tinged with green, to 1½ in. long, in 1-4-fid. racemes. Calif.

camschatcénsis. To 1½ ft.: lvs. lanceolate: fls. livid wine-purple, 1¼ in. long, in 1-3-fld. racemes. Siberia.

cirrhosa. To 2 ft.: lvs. linear-lanceolate, the upper with tendrilled tips: fis. yellowish-green checkered with purple, to 2 in. long, 1-2 together. Himalayas.

coccinea: F. recurva var.

delphinénsis: F. tubæformis.

glauca. To 8 in.: lvs. oblong-lanceolate, glaucous: fls. purple marked with greenish-yellow, ¾ in. long, in 1-3-fld.

imperialis. Crown Imperial. To 4 ft., having strong odor: lvs. lanceolate: fls. purplish, brick- or yellow-red, to 2 in. long, borne on curved stalks under a whorl of lvs. at top of st. Persia. Named hort forms are follis argénteis vittàtis and máxima.—An interesting old-fashioned plant, persisting for years.

japónica. Low: lvs. lanceolate: fls. yellow spotted with brown, drooping, solitary and terminal. Japan.—A doubtful species.

lanceolata. To 2 ft.: lvs. ovate-lanceolate: fls. dark purple mottled with greenish-yellow, to 1½ in. long, in 1-4-fld. racemes. B. C. to Calif. Var. flávida is listed. Var. grácilis has smaller fls.

liliàcea. White F. To 1 ft.: lvs. linear to oblanceolate: dull white, ¾ in. long, fragrant, in 1-5-fld. racemes.

meleagris. Checkered-Lily. Snakes-Head. To 1½ ft.: lvs. linear to oblanceolate: fis. checkered and veined with purplish or marcon, to 3 in. across, in 1-3-fd. racemes. Eu., Asia. Var. áiba has white fis. and purptrea purplish.

montana: F. nigra.

multiflora (F. parviflora). To 2½ ft.: lvs. linear or linear-lanceolate: fls. purplish or greenish, ½ in. long, in long racemes. Calif.

nigra (F. montana. F. tenella). To 1 ft.: lvs. linear. fls. purple outside or yellowish-green spotted with purple, inside yellowish spotted purple, 1 in. long, solitary or in pairs. S. E. En.

pallidiflora. To 15 in.: lvs. oblong, the upper lanceolate fis. yellow, checkered inside, 1½ in. long, in 1-6-fid. racemes. Siberia.

parviflora: F. multiflora.

pluriflora. PINK F. ADOBE-LILY. To 1 ft.: lvs. oblong-lanceolate: fis. pink-purple, to 1½ in. long, in 4-12-fid. racemes. Calif.

pàdica (Ochrocodon pudicus). Yellow F. To 9 in.: lvs. narrowly oblanceolate: fls. yellow or orange tinged with purple, ¾ in. long, in 1-3-fld. racemes. B. C. to Calif. and N. Mex.

Púrdyi. To 16 in.: basal lvs. ovate, upper linear: fls. white mottled with purple, to 1 in. long, 1-2 together. Calif

pyrenàica. To 1½ ft.: lvs. linear, glaucous: fls. dark purple spotted with green, usually solitary. Pyrenees.

recurva. Scarlet F. To 2½ ft.: lvs. linear to linear-lanceolate: fls. scarlet checkered with yellow, to 1½ in. long, in 3-6-fld. racemes. S. Ore. to Calif. Var. coccinea has more brilliantly scarlet fis.

Rôylei. To 2 ft.: lvs. in whorls of 3-6, linear-lanceolate, to 4 in. long, suberect: fls. greenish-yellow netted dull purple, solitary or few, campanulate, to 2 in. long. Himalayas.

ruthénica. To 2 ft.: lvs. linear-lanceolate, to 20 in number: fis. brilliant purple, indistinctly checkered. Caucasus

serópsis: listed name.

Strachevi: Nomocharis nana.

tenélla: F. nigra

tubæfórmis (F. delphinensis). To 1 ft.: lvs. oblanceolate

to be to linear; fis. purple spotted and checkered with yellow, often soltary. Alps.

verticillata. To 1½ ft.: lvs. ovate: fis. white or yellow, dotted at base, in 1-5-fid. racemes. Altai Mts. Var. Thúnbergii differs in technical fl. characters.

FRŒLÍCHIA. Amaranthacex. American ann. or bien, herbs, woolly or silky, with opposite lvs. and small fls. in dense spikes borne in panicles; of little ornamental value but may be listed.

floridana. Ann. to 6 ft.: lvs. few, linear, to 5 in. long: spikes to 2½ in. long. Ga., Fla.

FROGS-BIT: Hydrocharis Morsus-ranæ.

FROND: leaf of fern, and frequently applied to palms and similar plants; sometimes used in the sense of foliage.

FRUIT: the ripened pericarp or pericarps with the adnate parts; the seed-bearing organ or body. In horticultural usage, a fruit is an edible body or product developed from a flower, independently of its morphology, sometimes with other parts associated with the seed-bearing organ.

FUCHSIA. Onagracex. Shrubs and trees native in Mex. to S. Amer. and New Zeal., but usually treated under glass essentially as herbs, with simple lvs., usually showy hanging fls. in shades of rose, red and purple, sometimes white, exserted stamens and pistil, and fr. a berry.

Fuchsias are grown in the cool greenhouse and often bedded out in summer, and in mild climates they are outdoor subjects. They are sometimes trained to large pyramids with a central stem; and when grown permanently in the open they are useful for covering walls and fences. For window-garden and conservatory use in pots new plants are commonly started each year. Propagated by cuttings of soft green wood in pots or boxes or on benches. If plants are to be kept over winter, the branches should be cut back after blooming.

arboréscens (F. syringæflora). To 18 ft.: lvs. lanceolate-oblong, to 8 in. long: fis. pink or purplish, 1/2 in. long, in erect terminal panicles. Mex.

boliviàna. To 10 ft., the branches becoming drooping: lvs. elliptic-ovate, large, pubescent: fls. to 3 in. long, sepals pale rose, petals rich rose, in long drooping corymbs. Bolivia.

cárnea: listed name.

coccinea. Lvs. narrow-ovate, about 2 in. long, pointed, dentate, with very short hairy petioles, twigs also hairy:

fls. 1-3 in the axils, the narrow pointed sepals scarlet, petals purplish, rolled and much shorter. Probably Brazil.—The name coccinea may be applied to forms of F. magellanica.

Colensoi. Shrub with long straggling branches: lvs. ovate, to 2 in. long: fls. solitary, drooping, about 1 in. long, petals small. New Zeal.

cónica: F. magellanica var.

corállina: hort, form.

cordifòlia. Loose shrub: lvs. heart-shaped, with reddish midribs and petroles, pubescent. fis. with dull red tube, green sepals and yellow petals. Mex.

corymbiflora. To 6 ft., requiring support: lvs. ovateoblong, large, fls. deep red, to 4 in. long, in long drooping corymbs. Peru. Var. álba is listed.

excorticata. Tree to 40 ft. lvs. ovate-lanceolate, to 5 in. long: fls. to 1½ in. long, petals small. New Zeal.

fúlgens. To 4 ft.: lvs. broadly ovate, to 7 in. long: fls. red, to 3 in. long, in short racemes. Mex.

globòsa: F. mayellanıca var.

grácilis: F. mayellanica var.

hýbrida (F. speciosa). Lvs. ovate, to 4 in. long: fls. with crimson calyx and purple, rose or white petals, sometimes double, to 3 in. long, stamens long-exested. Various cultigens; probably of hybrid derivation from forms of F. magellanica and F. fulgens; common in conservatories and windows.

lycioldes: F. rosea.

macrostémma: F. magellanica.

magellánica (F. macrostemma). To 20 ft. when trained on walls but usually a low shrub, thinly pubescent or glabrous. Ivs. ovate-lanceolate, to 2 m. long, smuate-dentate fis. with red calyx and blue petals, 1-2 in. long, the stamens long-exserted. Peru to Tierra del Fuego. Var. cônica (F. conica) has ovate lvs., the scarlet calyx-tube widest at base, and dark purple petals. Var. globòsa has ovate lvs. and small red-purple fis. with nearly globose buds. Var. grácilis is a slender graceful form with scarlet calyx and purple petals. Var. Riccartonii grows to 10 ft. high and is very flonferous.—This species, in various forms, is much planted in the open in Calif.

microphylla. To 6 ft.: lvs. ovate or round, less than 1 in. long: fls. deep red, ½ in. long, drooping. Mex., Cent. Amer.

mínima: a listed name.

monstròsa: listed name.

parviflora. Shrubby: lvs. small, the obtuse mostly entire blades oval and less than 1 in. long on longer petioles: fls. less than ½ in. long, pink and purple, solitary, sepals reflexed. Mex.

procumbens. Trailing F. Sts. prostrate and trailing: lvs. round-ovate, 3/4 in. long: fls. pale orange with purple callyx-lobes, petals lacking, to 3/4 in. long, erect and solitary. New Zeal.

pùmila: probably one of the many forms of F. magellanica.

recurva: listed name. refléxa: listed name.

Riccartonii: F. mayellanica var.

rosea (F. lycioides). Shrub with horizontal branches: lvs. oval to lanceolate, more or less acute, entire, about 1 m. or less long: fls. small, axillary, sepals becoming reflexed, the shorter corolla purple-violet. Chile.

serratifòlia. Tall shrub: lvs. oblong to lanceolate, toothed, pale beneath with reddish midvein and petioles: fis. with calyx red at base becoming pink and white at tips. Peru.

speciòsa: F. hybrida.

spléndens. Lvs. broadly ovate, to 5 in. long: fis. scarlet with small greenish petals, to 1½ in. long, the stamens long-exserted. Mex., Guatemala.

syringæfldra: F. arborescens.

tenélla: hort. form of F. magellanica.

Thompsonii: form of F. magellanica var. gracilis.

thymifòlia. To 3 ft.: lvs. ovate-lanceolate or orbicular, to 2 in. long: fls. purplish-red, ½ in. long. Mex.

triphfila. To 1½ ft.: lvs. oblanceolate, small: fls. cinnabar-red, 1½ in. long, in terminal racemes. W. Indies. Var. purpurascens is listed.

virgata: name of uncertain application.

FUCHSIA, CALIFORNIA: Zauschneria californica. Cape: Phygelius capensis.

FUGACIOUS: falling or withering away very early.

FUGOSIA: Cienfuegosia.

FUMÀNA. Cistaceæ. Low shrubs of the Old World, distinguished from Helianthemum in

the presence of sterile outer stamens and the anatropous ovules. One species, **F. nudifòlia** (F. and Helianthemum procumbens), is cult. Low subshrub, sts. procumbent: lvs. linear, to $1\frac{1}{2}$ in. long, mucronate: fls. yellow, in 3-4-fld. terminal racemes. Cent. Eu.

FUMÀRIA. FUMITORY. Fumariaceæ. Ann. and bien. herbs with soft finely dissected lvs. and small 1-spurred fls. in racemes; occasionally grown for medicinal uses. Propagated by seeds.

officinalis. To 3 ft. producing small underground tuber: fls. purplish tipped with crimson. Eu.; nat. in N. Amer.

FUMARIÀCEÆ. Fumitory Family. Five genera of herbs native in the north temp. zone and S. Afr., allied to the Poppy family, having dissected thin or flaccid lvs., irregular bisexual fls. with 2 scale-like sepals, 4 petals of which the 2 inner are crested and one or both of the outer spurred, 6 stamens, superior 1-celled ovary, and capsular frs. The genera Adlumia, Corydalis, Dicentra are cult. to some extent for ornament, and one l'umaria is officinal and cult..

FUMITORY: Fumaria, Climbing: Adlumia fungosa.

FUNASTRUM: Philibertia clausa.

FIINKIA. Hosta

FUNNELFORM: with tube gradually widening upward and passing insensibly into the limb like a trumpet, as in many flowers of Convolvulus; infundibuliform.

FUNTUMIA. Apocynaceæ. A small genus of large trop. African trees. F. elástica is intro. in semi-tropic regions as a rubber plant: to 100 ft. in its native places: lvs. opposite, long-oblong, to 7 or 8 in., abruptly acuminate, entire: fls. white or yellowish, in dense clusters: pods woody, 4 in. or more long; seeds with long hairs on an extended beak.

FURCRÈA (Fourcroya). Amaryllidaceæ. Succulent plants native in the warm parts of Amer., having lvs. in basal rosettes and whitish or greenish fls. in terminal panieles on tall scapes, the perianth-segms. slightly united at base; they usually bloom only once and then die. Bulblets are commonly borne in the fl.-clusters. Cult. as for Agave, from which the Furcræas differ in the rotate whitish fls. rather than funnelform and colored and in character of stamens; propagated by bulblets.

altíssima: F. inermis.

Bedinghausii. Trunk to 3 ft.; lvs. to 2 ft. long and 3 in. wide, rough-margined; infl. to 15 ft.; fls. 1½ in. long. Mex.

gigantèa. Nearly trunkless: lvs. to 8 ft. long and 8 in. wide, with few distant prickles: infl. to 25 ft.; ffs. 1½ in. long. Brazil. Var. mèdio-picta (F. Watsoniana) is unarmed and is variegated with cream-color.

inérmis (F. altissima). Trunk very short: lvs. to 3 ft. long and 3 in. broad, nearly entire: infl. to 10 ft. high; fls. 1 in. long. Trop. Amer.

Lindenii: F. Selloa var. marginata.

pubéscens. Nearly trunkless: lvs. to 5 ft. long and 3 in. broad, toothed: infl. to 20 ft. high; fls. 2½ in. long. Mex. Roseili Trunk to 6 ft. lvs. to 4 ft. long and 5 in wide.

Roézlii. Trunk to 6 ft.: lvs. to 4 ft. long and 5 in. wide, rough-margined: infl. to 15 ft.; fls. 13/2 in. long. Mex.

Selloa. Trunk to 5 ft.: lvs. to 4 ft. long and 3 in. wide, with curved teeth: infl. to 20 ft. high; fls. 1½ in. long. Colombia. Var. marginata (F. Lindensi) has lvs. margined with white or yellow.

Watsoniana: F. gigantea var. medio-picta.

FURROWED: with longitudinal channels or grooves.

FURZE: Ulex.

FUSIFORM: spindle-shaped; narrowed both ways from a prominent or swollen middle, as dahlia roots,

FUSTIC: Chlorophora tinctoria.

GACHIPAES: Guilielma Gasipaës.

GAGEA. Liliacex. Small bulbous herbs of Eu., N. Afr. and Asia, with usually 1 developed If, to a bulb, the others forming bracts under the umbel of mostly yellow fls., the perianth-segms. distinct. Cult. as for *Ornithogalum*.

lûtea: G. silvatica.

silvática (G. lutea). To 1 ft.: lf. to 1½ ft. long and ½ in. wide: fts. yellow, ½ in. long, in umbels of 1-7, in spring. Eu. to Himalayas.

GAILLÁRDIA. Compositæ. American herbaceous annuals, biennials and perennials with alternate and basal lvs., toothed and spotted or dotted, and large showy solitary heads, the rays yellow and red, 3-toothed, the disk purple; pappus of awned scales.

Gaillardias grow best in light open well-drained soil and full sunlight, and are favorites for cut-flowers. species are propagated by seed sown in the open where the plants are to stand or started earlier under glass; the peren-nials by seeds, by cuttings in August or September, or by division; sometimes root-cuttings are employed in early

amblyodon. Ann. to 2 ft., hairy: lvs. oblong, to 3 in. long, entire or nearly so, sessile and auriculate: heads 2 in. across, rays brown-red throughout, lobes of disk-fis. obtuse. Tex.

aristata (G. grandaflora. G. lutea. G. maxima. G. perennis). Per. to 3 ft., hairy lvs. lanceolate to spatulate, to 5 in. long, entire or pinnately cut: heads to 4 in. across, rays yellow, lobes of disk-fls. acuminate. Minn. to B. C. and New Mex. Vars. compácta, máxima, oculata and supérba are listed.

Drůmmondii: G. nulchella.

grandiflòra: G. aristata.

kermesina spléndens: probably a form of G. aristata.

lanceolata. Ann. or bien. to 21/2 ft., hairy: lvs spatulate to linear, to $3\frac{1}{2}$ in. long, acute, entire or nearly so; heads to $2\frac{1}{2}$ in. across, ray-fis. yellow, disk purplish-brown, the lobes long-acuminate. S. C. to Fla. west to Kans. and Tex.

Lorenziàna. A form of G. pulchella var. picta with ray-fis. and sometimes disk-fis. enlarged and tubular.

lùtea: G. aristata.

máxima: G. aristata.

perénnis: G. aristata.

pícta: G. pulchella var.

pinnatifida. Per. to 15 in., hairy: lvs. spatulate-oblong, to 3 in. long, pinnatifid, segms. linear: heads to 1¾ in. across, ray-fis. yellow, disk yellow, lobes long-aristate. Tex. to Utah and Ariz.

portòla: a listed name.

pulchélla (G. Drummondii). Ann. to 20 in., soft-pubescent: lvs. oblong to spatulate, to 4 in. long, entire or cut: heads 2 in across, rays yellow with rose-purple at base. Kans, and La. to Ariz. Var. picta (G. picta) has large heads in different shades.

regalis: a listed name. sanguinea: a listed name.

GALACTITES. Compositæ. Thistle-like herbs native in the Medit. region, with purple heads in corymbs or panicles, the marginal fls. sterile and ray-like; pappus plumose. One species is sometimes grown for ornament. Propagated by seeds.

tomentosa. Ann. or bien. to 2 ft., sts. white-tomentose: lvs. pinnately lobed or parted into very spiny lobes, green and more or less white-marked above, white-tomentose underneath: heads to 1½ in. across, bracts of involucre spiny-tipped.

GALANTHUS. SNOWDROP. Amaryllidacex. Spring-blooming bulbs with 2 or 3 basal lys. and solitary white fls., the perianth-segms. distinct, the 3 inner ones overlapping and appearing tubular and thus differing from the snowflake or Leucojum. Hardy and of easy cult. in usual garden soil. Bulbs should be planted in autumn 3-4 in. deep. Other species than the following are offered abroad.

byzantinus. Lvs. broad, glaucous, with recurved marby surface in the course of th

Élwesii. GIANT S. To 1 ft. and more: lvs. 8 in. long and ¾ in. across, very glaucous: fls. 1¼ in. long, the inner segms, green on sinuses and lower half. Asia Minor.

Ikariæ. Lvs. strap-shaped, to 1 in. across, bright green: fls. green on half of outside of inner segms, white within, lobes of inner segms. square, crisp and longer than stamens. Isl. of Nikaria.

nivalis. Common S. To 1 ft.: lvs. to 9 in. long and 1/4 mivens. COMMON S. 1011C: 198. to 9 in. long and 2 in. wide: fis. 1 in. long, the inner segms. green on snusses. Euto Caucasus. Hort forms offered are flore-pleno with double fis, simplex with single, maximus, large-fid., Schärlokii, with green spot at tip of outer segms., Virideapice, petals tipped with green.

plicatus. Lvs. to 1 ft. long and 1 in. wide, plaited, margins recurved, glaucous: fls. to 1 in. long, inner segms. green with white edge. Crimea.

GALATELLA: Aster dracunculoides.

GÀLAX. Diapensiacex. One stemless evergreen per. herb native from Va. to Ga., G. aphýlla. Lvs. basal and tufted, heart-shaped to nearly orbicular, to 5 in, across, stiff, shining and turning a beautiful bronze color in autumn: fls. small, white, in spike-like racemes on scapes to $2\frac{1}{2}$ ft. high. The lvs. are extensively collected for use in floral decorations, and the plant makes good ground-cover. Sometimes grown in rockgardens and colonized in woods; hardy well N. Propagated by division.

GALAX, FRINGED: Shortia soldanelloides.

GALE, SWEET: Myrica Gale.

GALEÁNDRA. Orchidacex. Trop. American epiphytes or terrestrials with short leafy sts. thickened into a more or less clongate pseudobulb and loose terminal racemes; sepals and petals similar; lip funnel-shaped and spurred. For cultural directions, see Orchids.

lacistris. To about 1 ft. high: lvs. about 6 in. long: racemes pendulous, 2-6-fid.; sepuls and petals whitishgreen and light wine-purple; lip white with purple spots in front and yellow spur to 1 in. long. Jan.—June. Brazil.

GALÈGA. Leguminosæ. Per. herbs with pinnate lvs., blue or white papilionaceous fls. in racemes, and cylindrical pods; grown for ornament. Seeds may be sown in spring where plants are to stand, or roots may be divided.

bicolor. To 3 ft.: lfts. oblong-linear: fls. with deep blue standard and bluish-white wings and keel. W. Asia.

Hártlandii: G. officinalis var.

Heldreichii: listed name.

officinalis. Goars-Rue. To 3 ft.: Ifts. oblong, stipules lanceolate: fls. purplish-blue. Eu, W. Asia; hardy N. Var. álba or albiflóra has white fls., cárnea rose-colored double fls., and Hártlandii has variegated lvs. when young and lilae fls. Vars. nana, nana roseo-lilácina and rosea are listed.

orientàlis. To 4 ft: lfts. ovate, stipules ovate: fls. purplish-blue, nodding. Caucasus.

pérsica: a confused name applied to a white-fld. form; possibly G. officinalis.

GALÈOLA. Orchidacex. Leafless terrestrial branching and climbing orchids native in Asia, Australia and Malaya, with fis. in terminal panicles or racemes; one species has been offered in the trade.

Lindleyana (Cyrtosia Lindleyana). Sts. stout, to 10 ft. high, strict: fls. bright yellow with red blotch on lip, about 1½ in. across, in loose panicles. Himalayas, Sumatra.

GALEÓPSIS. Labiatx. Small genus of annuals of temperate regions allied to Lamium and Stachys and characterized by anther-cells opening by a transverse slit bordered with hairs: adapted to wild-garden.

ochroleùca. To 10 m. with spreading almost decumbent sts. densely covered with soft and somewhat silky hairs: lvs. narrowly ovate to lanceolate, coarsely toothed: fis. yellow, to 1 in. long, in dense whorls. July-Sept. Eu., where treated as a weed of cult. and waste places.

GALEORCHIS: Orchis spectabilis.

GALINGALE: Cuperus.

GALIUM. BEDSTRAW. Rubiaceæ. Slender mostly weak herbs with usually square sts., whorled sessile lvs. and very small deeply 4-parted wheel-shaped fls. in panicles; a few species sometimes grown in rock-gardens, and as cut-flowers to give a filmy effect in bouquets. Propagated by seeds and division; of ordinary cultural requirements.

aristatum (G. Mollugo of hort, at least in part). Strong per. to 3 ft. and more, making clumps, sts. 4-angled: Ivs. narrow, whorled, to 1½ in. long: fls. numerous, very small, white: fr. glabrous. Eu.—One of the plants known as Babys-Breuth, and common in gardens.

atropurpureum: hort, form with purple fls.

aureum: G. firmum.

boreale. Northern B. Per. to 3 ft., stoloniferous: lvs. in 4's, lanceolate, to $1\frac{1}{2}$ in. long: fls. white: fr. somewhat hispid. N. N. Amer.

firmum (G. aureum). Per, erect to 3½ ft.: lvs. linearoblanceolate, in whorls] of 6 or 8, mucronate: fis. deep yellow, in loose panicles, corolla-lobes long-cuspidate: fr. glabrous. E Eu.

longifolium (Asperula longifolia). Glabrous per., st. terete: lvs linear-lanceolate, in whorls of 6-8, acute, mucronate, 1-nerved: fls. white, in lax panicles: fr. glabrous.

maritimum. Per. to 2½ ft., hairy: lvs. in 6-8's, linearoblong or lanceolate, revolute at margins: fts. red. to ½ in. across, the axillary cymes forming a large panicle. S. Eu.

Molligo. White B. False Babys-Breath. Per. to 3 ft.: lvs. in 8's or 6's, oblanceolate to linear, to 1 in. long, bristle-tipped: fls. white. Eu.; nat. in N. Amer.—Often confused with Gypsophila paniculata, although very different; see G. aristatum.

officinale: unidentified trade name.

purpureum. Per. to 1½ ft.: lvs. in 8-10's, linear, glabrous, acute to mucronate: fls. red. Eu.

rùbrum. Per. to $1\frac{1}{2}$ ft.: lvs. mostly in 6's, linear-lanceolate, bristle-tipped: fis. dull red, to $\frac{1}{2}$ in. across: fr. glabrous. S. Eu. Var. måjor is listed.

verum. Yellow B. Per. to 3 ft., sts. often decumbent: lvs. in 8's or 6's, linear, to 1 in. long, bristle-tipped: fls. yellow: fr. smooth. Eu; nat. in N. Amer.

GALPHIMIA: Thryallis.

GALPINSIA: Enothera lavandulæfolia.

GALTÒNIA. Liliaceæ. S. African bulbous herbs with basal lvs. and white or greenish fls. in loose racemes terminating a tall scape, the perianth-segms. partially united.

Galtonias succeed in rich moist soil and in northern regions should be heavily mulched in winter. Propagated by offsets or by seeds.

cándicans (Hyacinthus candicans). Giant Summer-Hyacinth. To 4 ft.: lvs. to 3 ft. long and 2 in. across: fls. white, fragrant, to 1½ in. long, in summer or autumn.

princeps (Hyacinthus princeps). Similar to G. candicans but with shorter raceines and fewer fls. tinged green outside.

GALVÈZIA. Scrophulariaceæ. Shrubs with lvs. opposite or in 3's and corolla with palate more or less closing throat, saccate, gibbous or spurred at base: plants from Peru and Ecuador and from the Calif. region, allied to Antirrhinum.

speciosa (Antirrhinum speciosum). Evergreen shrub to 7 ft., glabrous or pubescent: lvs. in 3's, ovate, entire, to 1½ in. long: fts. scarlet, 1 in. long, saccate at base, in terminal infi. Isls. off Calif., and planted in those parts.

GAMÓLEPIS. Compositæ. S. African small shrubs or herbs with alternate lvs., mostly pinnately cut, and yellow solitary heads of ray- and disk-fls.; pappus none. One species is grown for the fls., sometimes employed in edgings. Propagated by seeds.

Tagètes. Glabrous ann. to 1 ft., very floriferous: lvs. to 1½ in. long, pinnately parted into linear segms.: heads bright yellow or orange, ¾ in. across.

GAMOPETALOUS: corolla of one piece, as in morningglory and snapdragon; petals united.

GARBANZO: Creer arietinum.

GARBÈRIA. Compositæ. One branching shrub to 6 ft., native in Fla. and sometimes used in ornamental plantings. G. fruticôsa (Liatris fruticosa). Lvs. alternate, spatulate or obovate, about 1 in. long, leathery, pale: heads pale purple or pink, about ½ in. long, in dense cymes, of disk-fls.; pappus of bristles.

GARCÍNIA. Guttiferæ. Many species of trees native in the tropics of the Old World, with opposite simple usually thick lvs., polygamous fls., and fr. a hard berry pulpy within; one species is grown for its edible fr. and the juice of others yields the gamboge of commerce; a number of the species give promise as pomological plants for occidental regions.

Mangosteens require a tropical climate and a moist but well-drained soil. Propagated by seeds which should be sown in pots and the seedlings shaded and grown to about 2 feet high before transplanting. As mangosteens root slowly, it is best to inarch on roots of related species of Garcinia. Budding may also be practiced.

of Garcinia. Budding may also be practiced.

Mangostàna. Mangosteen. To 30 ft.: lvs. leathery, glossy, with many cross veins, to 10 in. long: bisexual fls. rose-pink, 2 in across; fr reddish-purple, 2-3 in. across, having 5-7 white crimson-veined segms. resembling an orange. Malay region—Highly prized where it can be grown but it is not yet much planted in American tropics; within the continental U. S., grown only under protection for its general interest. The fruit is highly desirable.

GARDEN. In its historical significance a garden is a plant-growing area of small or limited dimensions, usually inclosed, connected with a residence or having relationships with the family. Ornamental subjects, fruits and vegetables for household use, plantings constituting part of the setting for a home or building, are the essential components of it; and gardening is the rearing, establishing and maintenance of the plants and care of the area devoted to them. In modern time, however, the word garden has taken on an expanded meaning, involving much larger areas and commercial undertakings, and the older more restricted unit is often called the home garden. The kinds of plants or crops now constitute the main distinction between commercial gardening and agriculture, and there is no clear line of demarcation; yet one ordinarily and properly thinks of a home and a pleasure-ground, personal satisfactions, and a particular kind of skilled training, when employing the words garden, gardener, gardening. See Horticulture, Landscape-Gardening.

The home garden should be useful in the degree to which it expresses the sentiments of its maker or proprietor; a garden planned without regard to personality may not fulfill the requisite. To accomplish essential results the garden-maker must be well prepared to meet the requirements of the plants and to defend them against injury, insect and disease; to this end he must be informed by the latest bulletins and books on the

subject.

GARDÈNIA. Rubiaceæ. Shrubs or small trees with lvs. opposite or in 3's and large yellow or white fls. solitary or in corymbs, with salverform or tubular corolla and 5-11-lobed limb; native in warm regions of eastern hemisphere.

Gardenias were formerly very popular greenhouse speci-

mens and are now grown indoors for cut-flowers and out-ofdoors in warm climates. They require a warm close house with a night temperature of about 65°. Buds should be kept pinched off until late in September when they are allowed to set, and will produce bloom for midwinter. Propagated by cuttings containing three or four buds and kept over bottom heat. Frequent syringing is employed.

flórida: G. jasminoides.

Fórtunei: G. jasminoides var. Fortuniana.

grandiflora. Tree: lvs. lanceolate, shining: fls. white, large, fragrant, 6-parted: fr. oblong. Cochin-China.—
The plant cult. under this name is probably G. jasminoides.

jasminoides (G. florida. G. radicans. Warneria or Varneria augusta). CAPE-JASMINE. Evergreen shrub to 6 ft.: lvs. lanceolate or obovate, to 4 in. long, thick: fls. waxywhite, to 3 in. across, often double, fragrant: fr. ovate. China. Var. Fortuniàna (G. Fortunei) has larger fls. Var. prostràta is listed as a low form.

radicans: G. jasminoides.

stricta nana: listed as a very free-flowering form of G. jasminoides.

Thunbérgia. To 10 ft.: lvs. elliptic, to 6 in. long: fls. white, fragrant, 3-4 in. across and long-tubed, calyx spathelike: fr. ovoid, woody, crowned with calyx, 2 in. or more long. S. Afr.

urcellitórmis. Shrub, branches tawny-puberulous: lvs. elliptical-cuneate, to 5 in. long, thin: fis. white, solitary, corolla campanulate, terminal on short branches in forks of longer ones. N. trop. Afr.

Veitchii: hort, name for a form of G. jasminoides.

GARDOQUIA BETONICOIDES: Brittonastrum mexi-

GARLAND-FLOWER: Hedychium coronarium.

GARLIC (Allium sativum). Rather small onion-like plant but with flat leaves and a thinly covered bulb that breaks up into separable parts or "cloves." The plant is native in southern Europe. For relationships, see Onion.

The bulbs are used in cookery. They are often seen in the stores in long braids, held together by their dry tops. The crop grown in the United States is put up for market mainly in 50- or 100-pound mesh bags. Propagated by the cloves or bulblets, which are planted in early spring in any good garden land. Seed is not available, as it is rarely produced.

GARLIC, FALSE: Nothoscordum. Giant: Allium Scorodoprasum. Wild: Allium canadense.

GARRAMBULLA: Myrtillocactus geometrizans.

GÁRRYA. SILK-TASSEL BUSH. The only genus of Garryacee. Evergreen shrubs native in W. N. Amer., having opposite entire lvs., unisexual fls. without petals borne in catkinlike racemes, and fr. a dry berry-like body.

Garryas are grown for ornament but not hardy North. They do best in sunny sheltered positions. Propagated by cuttings of half-ripened wood, by layers, and by seeds.

elliptica. To 8 ft. and more: lvs. elliptic, to 3 in. long, leathery, densely woolly beneath, becoming glabrous and shining above, wavy-margined: staminate catkins to 8 in. long; pistilate spikes dense, to 4 in. long. Ore. to Calif.

Frèmontii. To 7 ft.: lvs. to 2½ in. long, elliptical, acute to obtuse, usually entire, glabrous above and somewhat pubescent below at maturity: fr. ovoid, dark purple. Wash. to Calif.

laurifòlia (G. macrophylla). To 20 ft., shrub or tree-like, branchlets pubescent: lvs. oblong or narrower, to 6 in. long, glabrous or soon becoming so, mostly obtuse: lower bracts resembling the lvs. Mex.

macrophýlla: G. laurifolia.

Thurétii. Hybrid between G. elliptica and G. Fadyenii of the W. Indies: lvs. long and narrow, to 4 in.: pistillate spikes slender.

GAS-PLANT: Dictamnus albus.

GASTERALOE: Gastrolea.

GASTÈRIA. Liliacee. S. African succulents, stemless or nearly so, with long 2-ranked thick lvs. crowded in rosettes and red or rose fls. in loose racemes. For cult. see Succulents; grown as fanciers plants.

acinacifòlia. Lvs. to 14 in. long and 2 in. wide, strongly acuminate, dark green with many small greenish-white spots: infl. 4 ft. high; fis. to 2 in. long. Var. nitens (G. nitens). Lvs. to 18 in. long, less acuminate, very smooth, light green with many confluent spots.

angulata. Lvs. to 10 in. long and 2 in. wide, the edges angularly doubled, with small white dots: infl. 3 ft. high.

Bowieana: G. picta.

brachvphvila: listed name.

brevifòlia. Lvs. to 4 in. long and 2 in. wide, very thick with small white spots: infl, 2 ft, high; fls, 3/2 in. long.

cæspitòsa: listed name of unknown botanical standing.

carinata. Lvs. 5-6 in. long, to 2 in. wide at base, narrowed to horny spine at apex, dull green, rough with many raised white scattered papilla, margin and keel strongly papillose; infl. to 3 ft. high; fis. 1 in. long.

chellophfila. Lvs. to 1 ft. long and 11/2 in. wide, with many confluent white spots and tip with white horny margin, the rosettes much twisted.

colubrina. Lvs. to 14 in. long and 1½ in. wide, bright green or purple with small whitish spots: infl. to 4 ft.; fls. ¾ in. long.

dícta. Lvs. to 5 in. long and 1½ in. wide, one edge often doubled: infl. 1½ ft. high; fls. ¾ in. long.

disticha: G. lingua.

echinăta: catalogue name.

excavata. Rosette of 12-16 lvs. 4-6 in. long, to 1½ in. wide, pale dull green with small indistinct whitish spots, cuspidate at apex, borders tubercled: infl. to 2 ft.

glabra. Lvs. to 9 in. long and 3 in. wide, keeled on Data, with small white spots: infl. to 3 ft.; fls. 1 in. long.

latifòlia: not a valid botanical name; plants so designated in the trade may be G. excavata, G. nigricans, or a var. of G. verucosa.

Lauchii: listed name.

lingua (G. disticha). Lvs. to 10 in. long and 2 in. wide, white spotted: infl. 3 ft. high.

maculata. Lvs. to 8 in. long and 2 in. wide, spotted or white at base: infl. 4 ft. high.

Márlothii: listed name of unknown botanical standing. marmoràta. Lvs. to 6 in. long and 1½ in. wide, with confluent green spots, one edge doubled: infl. 2½ ft. high; fis. ¾ in. long.

mínima: catalogue name.

multipunctata is listed.

nigricans. Lvs. to 8 in. long and 2 in. wide, leathery, shining dark green with whitish spots: infl. 3 ft. high; fis. ¾ in. long.

nitens: G. acinacifolia var.

nitida. Lvs. to 9 in. long and 21/2 in. wide, spotted with whitish infl. 3 ft. high; fis. 1 in. long.

obscura: listed name of unknown botanical standing.

obtusifolia. Lvs. to 6 in. long and 2½ in. wide, broadly rounded at apex, white spotted: infl. 2½ ft.; fts. 1 in. long. pfcta (G. Bowieana). Lvs. to 14 in. long and 2 in. wide, mottled with white, glossy, margins thickened: infl. 3 ft.

high.

planifòlia. Lvs. to 8 in. long and 1 in. wide, glossy dark
green with many confluent white spots: infl. to 6 ft.; fls.

in. long.

prolifera. Very proliferous, forming large tufts: lvs. very thick and 3-cornered, to 1 ft. long and 6 in. wide, spotted with white.

púlchra. Sts. leafy, to 1 ft. and more: lvs. to 1 ft. long and 1 in. wide, white spotted: infl. to 3 ft., branched.

punctata: listed name.

retata. Lvs. to 1 ft. long and 1½ in. wide, one edge doubled: infl. 1 ft. or more high; fls. ¾ in. long.

spiralis. Rosette of 16-28 lvs. 4-6 in. long, glossy dark green, apex cuspidate, many white spots: infl. to 2½ ft. subverrucosa. Lvs. to 6 in. long and 1¼ in. wide, edges with raised tubercles: infl. 2 ft. high; fis. ¾ in. long.

sulcata. Lvs. to 4 in. long and 1 in. wide, with small greenish dots: infl. to 2½ ft.

trigona. Rosette of 12-15 lvs. 6-8 in. long and 1½ in. wide, lanceolate, very smooth with many small white spots, all except the outer ascending: infl. to 2½ ft. high.

verrucòsa. Lvs. arranged in two vertical ranks, 6-9 in. long, lanceolate, apex cuspidate, spots pure white and raised forming roughened surface: infl. 2 ft. high. Var. intermèdia, lvs. greener and with less tubercles. Var. latifòlia, lvs. greener and more mucronate, to 1 ft. long, papill & less crowded, infl. branched. Var. scabérrima, lvs. more strap-shaped, incurved with most of the tubercles greenish-white, nearly same color as lf.

vittàta: catalogue name.

GASTONIA: Trevesia palmata.

GASTROCHÌLUS. Orchidaceæ. Epiphytes with short leafy sts. and fls. in many-fld. racemes springing from the sts.; sepals and petals similar; lip composed of a sac-like lower portion and a flat spreading toothed or fringed apical part. For cult. see Orchids.

bellinus (Saccolabum bellinum). Lvs. strap-shaped, to 12 in long; racemes about 6-fld; fls. to about 1½ in. across; sepals and petals greenish-yellow spotted with reddishrown or purple; lip white spotted with purple and with a central yellow blotch. Nov.-Apr. Burma.

GASTROLÈA (Gasteraloe). Liliaceæ. A genus founded to include hybrids between Gasteria and Aloe. The plants differ from either parent largely in fls. having perianth searcely inflated and segms, longer than perianth-tube.

Béguinii. Lvs. 3-4 in long, rarely over 1 in. wide at base, short-pointed, tubercles of lf. surfaces blunt, those of margins sharp-pointed: infl. to 2 ft. high.

mortolénsis. Lvs. less than 2 in. wide at base, smooth, pale green, spots longitudinally confluent, many marginal teeth, basal offsets numerous; inft. to 2 ft. high.

Nowôtnyi. I.vs. $1\frac{1}{2}$ in, long and nearly as wide at base, silvery-spotted, margins tubercled.

perféctior. Lvs. 3-4 in. long, rarely over 1 in. wide at base, short-pointed; tubercles of lf. surfaces and margins sharp-pointed; infl. to 2 ft. high.

pethaménsis. Lvs. 8-12 m. long, to 2 in. wide at base, short-pointed, lf. tubercles prominent.

smarágdina. Lvs. to 3½ in. wide at base, smooth except at edges, purplish-green, spots transversely confluent, few marginal teeth, basal offsets few: infl. to 2 ft. high.

GAULTHÈRIA. Ericaceæ. Evergreen little shrubs or herb-like, adapted to the rock-garden, having alternate or sometimes opposite lvs., urn- or bell-shaped fls., and bright colored berry-like capsular frs.; an aromatic oil is derived from several species.

Moist sandy or peaty soils and partial shade are desirable. Propagated by seeds, layers, suckers, division, and by cuttings of half-ripened wood.

aden6thrix. Low shrub, sts. terete, ascending: lvs. ovate, short-petioled, margin sharply serrulate: fls. 2-15 in axillary racemes, calyx-tube long-setose, anthers spurred. Japan.

adpréssa: G. antipoda var.

antipoda. Shrub to 5 ft., occasionally procumbent: lvs. usually orbicular, to 3% in. long, persistent: fls. white or pink, fragrant, campanulate, solitary. New Zeal., Tasmania. Var. adpréssa is the procumbent form.

cuneata. Differs from G. Miqueliana in narrower lvs. scattered along sts. and not crowded terminally, ovary hairy not glabrous, and fr. always white, never pink. W. China.

híspida. Waxberry. Erect spreading shrub to 6 ft., sts. pubescent: lvs. lanceolate to oblong, to 2 in. long, somewhat serrulate: fls. white, nunute: fr. white. Australia.

hispídula: Chiogenes hispidula.

humifusa (G. Myrsinites). To 4 in., tufted, procumbent: lvs oval or orbicular, to 34 in. long, entire or crenate: fls. white, 18 in. long, July: fr. scarlet. B. C. to Colo. and Calif.

Miqueliana. Woody evergreen to 1 ft.: lvs. elliptic to obovate, crenate-serrate: fls. white or pinkish, nodding, less than ¼ in. long: fr. white. Japan.

Myrsinites: G. humifusa.

nummularioldes. Probably decumbent or creeping, sts. bristly: lvs. orbicular-ovate, to % in. long, ciliate, pubescent beneath: fls. pale punkish-white, solitary: fr. bluish-black. Himalayan region, W. China.

oppositifolia. To 8 ft., much branched: lvs. opposite, ovate or oblong-ovate, to 2½ in. long, cordate at base, leathery: fls. white, ½ in. long, in mostly panicled racemes. New Zeal.

ovatifòlia. To 8 in.: lvs. ovate, to 1½ in. long, toothed, rather thick. fls. white, ½ in. long, solitary, June-July: fr. scarlet. B. C. to Ore. and Ida.

perpléxa. Suberect or prostrate shrub to 3 ft., much branched: lvs. lanceolate to linear, to ½ in. long, bristly serrate, acute, leathery: fls. solitary or axillary: fr. ½ in. diam. New Zeal.

procumbens. Wintergreen. Checkerberry. Tea-

BERRY. Sts. creeping: lvs. oval, to 2 in. long, shining above: fls. white, ¼ in. long, solitary and nodding, May-Sept.: fr. scarlet. Newf. to Man. and Ga.

pyrolæfòlia: G. pyroloides.

pyroloides (G. pyrolæfola). Low shrub to 1 ft.: lvs. orbicular-ovate, to ½ in. long: fis. white, in lax racemes to 2½ in. long; fi. bluish-black. Himalayan region, W. China. rupéstris. To 4 ft., much branched, rarely prostrates lvs. variable, oblong to ovate, to 2 in. long, leathery: fis. white, in racemes. New Zeal.

Shållon. Salal. To 2 ft: lvs. ovate, to 5 in. long; fls. white or pink, % in long, in panicled racemes, May-June: fr. purple turning black. Alaska to Calif.

trichophýlla. Probably prostrate: lvs. elliptic to oblong, to 3% in. long, chlate, not pubescent: fis. pink, solitary: fr. blue. Himalayan reg on, W. China.

Veitchiana. Evergreen shrub to 3½ ft., sts. occasionally decumbent: lvs elliptic to oblong-obovate, to 3½ in. long, dark glossy-green above, paler and often setose beneath, nucronate: fls. white, nodding, racemes to 2 in. long, axillary and terminal, pedicels shorter than corolla: fr. bright blue, to ½ in. diam. W. China.—Probably hardy as far north as Philadelphia.

GAÙRA. Onagracex. Several N. American herbs with alternate simple lvs., small white or rose fls. in spikes or racemes, and nut-like caps.; sometimes grown in the wild-garden or hardy border. Propagated by seeds and division.

coccinea. Per. to 2 ft.: lvs. oblong or lanceolate, to 1½ in. long: fis. pınk, white or scarlet, to ½ in. across. S. D. to Mex.

Lindheimeri. Per. to 4 ft.: lvs. lanceolate, to 3½ in long: fls. white, ¾ in. long, in loose terminal spikes. La.,

parvifldra. Per. to 5 ft., sts. pubescent: lvs. ovate-lanceolate, to 4 in. long, pubescent. fls. pink, to ½ in. across, in elongated spike fr. sessile. S. D. to Ore. and Mex.

sinuâta. Per. to 3 ft.: lvs. spatulate to linear, to 3 in, long, toothed or pinnatifid: fis. pinkish, $\frac{1}{12}$ in. long. Kans. to Mex.

GAÚSSIA. Palmacex. Two monoecious unarmed tall feather-palms of Cuba and Puerto Rico, little adaptable to cult. in continental U. S.: trunk enlarged at base, tapering above: spadices in the axils of lower lvs., branched, becoming spreading or deflexed; fls. in 2's to 5's on the branches, the lowest commonly pistillate; stamens 6: fr. obovoid-oblong, small. They grow on the summit of limestone ledges.

GAYA. Malvacex. Herbs, shrubs or rarely trees, having alternate simple lvs., yellow or white axillary or terminal fls., and fr. of many carpels; native in S. Amer. and one in New Zeal., the latter planted in S. Calif.

Lyallii (Plagianthus Lyallii). LACEBARK. Deciduous tree to 30 ft., pubescent: lvs. ovate, to 4 in. long, deeply crenate: fls. white, to 1 in. across, in clusters of 3-5 or rarely solutary. New Zeal. Var. ribifòlia has deeply lobed or cut lvs.

GAYFEATHER: Liatris.

GAYLUSSÀCIA. HUCKLEBERRY. Ericaceæ, separated by some authors in Vacciniaceæ. American shrubs with alternate usually entire lvs., white or reddish fls. in axillary racemes in spring, and fr. a blue or black berry-like drupe crowned by the persistent calyx-lobes; distinguished from Vaccinium by the 10-celled ovary instead of usually 4-5-celled in the latter.

Huckleberries should have shady locations in peaty or sandy soil. They do not thrive on limestone lands. Propagated by seeds, layers, division, and the evergreen sorts by cuttings of half-ripe wood under glass.

baccata (G. resinosa). BLACK H. To 3 ft., deciduous, the branches sticky when young: lvs. to 2 in. long: fis. reddish, ovoid, in dense drooping racemes to 1 in. long: fr. black, shming. Newf. to Ga.

brachfera. Box H. To 1½ ft., the st. creeping, evergreen: lvs. to 1 in. long: fls. white or pink, cylindrical, in short racemes: fr. blue. Pa. to Va.

dumòsa. To 1½ ft., the st. creeping and glandular-pubescent, deciduous: lvs. to 2 in. long: fls. white, pink or red, bell-shaped, in loose racemes: fr. black. Newf. to Fla. and La.

frondosa. Dangleberry. To 6 ft., deciduous: lvs. to 2¼ in. long: fls. greenish-purple, bell-shaped, in racemes to 3 in. long: fr. blue, bloomy. N. H. to Fla.

resinòsa: G. baccata.

ursina. Buckberry. To 6 ft.: lvs. to 4 in. long: fls. whitish or reddish, bell-shaped, in racemes to 2 in. long: fr. black, shming. N. C., S. C.

GAZÀNIA (Meridiana). Compositæ. Herbaceous perennials, seldom annuals, with entire or pinnately cut lvs. and solitary heads on long sts.; ray-fls. white, yellow, orange, scarlet, opening in sunshine, closing at night; disk-fls. dark; pappus of scales; native in S. Afr.

Gazanias are grown in the flower-garden and for edgings. Propagated by seeds, division and also by cuttings taken in summer from shoots near the crown of the plants. The kinds in cultivation are not clearly understood.

aurantiaca: listed name for a low form with bright orange

coccinea: a race with fis. in shades of orange, yellow, red and bronze.

longiscàpa. Stemless: lvs. white-woolly below, lanceolate or pinnately cut. heads about 2 in. across, on glabrous peduncles longer than lvs., rays orange with dark spot at base.—May be treated as an ann. if sown early.

oxylòba. Per. to 6 in. with woody crown: lvs. linear-lanceolate, to 4 in. long, white-woolly beneath, acute, occasionally pinnatisect above middle: fl. color not known.

Pavonia. Per., st. short: lvs. lanceolate, to 9 in. long, glabrescent above, white-woolly beneath, entire or pinnatisect, margins revolute: heads to 3½ in. across, rays orange-yellow with basal blackish spot somewhat ringed white.

winite.

pinnatia. Per.: lvs. lanccolate, pinnatisect, hirsute above,
white-woolly beneath: heads to 3 in. across, on hairy peduncles, rays orange-yellow. Var. scabra (G. scabra) has lvs.
stiffly setose above, peduncle short nearly glabrous. Var.
speciosa (G. speciosa) has lvs. glabrous or hispid above,
peduncle long, pubescent; ray-fls. said to be more reddish
than in type.

Pôttsii. Per. to 14 in., stemless or nearly so: lvs. erect, linear to lanceolate-spatulate, to 7 in. long, acute or obtuse, rarely pinnatifid, tomentose beneath: heads to 3½ in. across, rays bright yellow.

rigens. Sts. short and branching, densely leafy or diffuse: lvs. white-woolly below, spatulate or occasionally pinnatifid: heads 1½ in. across, on glabrous peduncles longer than lvs., rays orange with a brown-black whiteeyed spot at base, varying to yellow, blooming throughout the year in warm climates.

scabra: G. pinnata var.

speciòsa: G. pinnata var.

spléndens. Supposed hybrid: to 1½ ft.: lvs. silky-white beneath, linear-spatulate: heads large, rays orange with black and white spot at base.

GEIGER-TREE: Cordia Sebestena.

GEISSORHÌZA. Iridacex. Cormous S. African herbs with fls. of various colors borne in open spikes; perianth with rotate limb and cylindrical tube; something like Ixia. Usually flowered under glass in spring and early summer, or in the open in mild climates.

hirta. To 1 ft.: lvs. linear, to 6 in. long, hairy: fls. 2-6, bright red, 1 in. across.

inæqualis. To 1 ft., corm obconical: lvs. 4, to 8 in. long and ½ in. wide, the 2 lowest longer than upper ones: fls. gray-blue to lavender, to 1 in. long, in spikes of 4-8, 1 stamen much shorter than other 2.

GEITONOPLÈSIUM. Liliaceæ. Somewhat woody twining shrubs, of 1 or 2 species in Australia and Pacific Isls., grown in Calif.: segms. of perianth 6, oblong, distinct, outer ones often hooded.

cymòsum. Lvs. alternate, linear to ovate, to 3 in. long: fls. purplish-green, ¼ in. long, drooping, in loose terminal cymes: fr. a dark blue berry ½ in. across.

GELSÈMIUM. Loganiaceæ. Twining shrubs with commonly opposite entire lvs., fragrant

funnelform fls. solitary or in small cymes, and capsular frs.; grown in the S. as a cover for porches and banks and sometimes under glass. Propagated by cuttings under glass and by seeds. One species in E. Asia and 2 in E. N. Amer.

sempérvirens. Carolina Yellow Jessamine. Evergreen: Ivs. lanceolate, to 4 in. long, shining above, narrowed at base. fls. bright yellow, to 1½ in. long, blooming throughout the season, borne on scally pedicels; callyx-lobes obtuse: fr. ¾ in. or more long, short-beaked. Va. to Fla., Tex. and Cent. Amer.—A second species, G. Rankinii, has recently been distinguished, N. C. to Fla. and Ala., marked by Ivs. rounded at base, pedicels scaly only on lower part, calyx-lobes narrow and acuminate, fr. about ½ in. long and long-beaked.

GEMMINGIA: Belamcanda chinensis.

GENIÓSTOMA. Loganiaceæ. Shrubs ranging from Madagascar to Pacific Isls., with opposite lvs., small fls. in axillary clusters or cymes, and capsular frs.; one species grown in Calif.

ligustrifolium. To 12 ft., glabrous: lvs. ovate, to 3 in. long, entire, paler beneath: fls. greenish-white, $\frac{1}{2}6$ in. across. New Zeal.

GENIP: Genipa. Melicocca bijuga.

GENÎPA. GENIP (see also Melicocca). Rubiaceæ. Trop. American trees with large opposite lvs., white or yellowish large fls. in cymes, the corolla salverform with 5-6 lobes, and fr. a berry which is eaten fresh, made into preserves or drinks in its native lands.

Genipa can be grown only in the tropics without protection or risk, and grows best in rich loam with abundant moisture. Propagated by seeds and by shield-budding.

americana. To 50 ft.: lvs. obovate to oblong, to 1 ft. long: fls. white or pale yellow, 1 in. across, silky: fr. brown, to 3 in. across. Trop. Amer. where it is called "Marmalade-Box" and "Genipap."

GENIPAP: Genipa americana.

GENÍSTA. Broom. Leguminosæ. Ornamental shrubs with simple or trifoliolate lvs., papilionaceous yellow or white fls. in racemes, and flattened pods; they differ from Cytisus in the absence of any appendage or slight callus-like protuberance on seed base.

Brooms are adapted to dry situations and mild climates. Propagated by seeds, layers, and greenwood cuttings under glass. The Genista of florists is Cyteus canariensis.

ethnénsis. To 20 ft., the branches almost leafless: fls. golden-yellow, fragrant, axillary along the branches. July-Aug. Sicily, Sardma.

álba: Cytisus albus.

Andreana: Cytisus scoparius var. Andreanus;

ánglica. To 3 ft., sometimes procumbent, spiny: 1vs. alternate, simple, about 1/2 in. long, bluish-green: fis. in few-fid. racemes. Eu.

Ardolnii: Cytisus Ardoinii.

Beanii: Cutisus Beanii.

canariénsis: Cytisus canariensis.

capitàta: Cytisus supinus.

cinèrea. To 3 ft.: lvs. alternate, simple, lanceolate, to 1% in. long, pubescent: fls. bright yellow, in terminal racemes to 8 in. long. Apr.—June. S. Eu., N. Afr.—Plant not spiny.

Dállimorei: Cytisus Dallimorei.

dalmática: G. silvestris var. pungens.

decúmbens: Cytisus decumbens.

depréssa. Procumbent, with deeply striate branchlets: fis. in short leafy racemes. Tauria.

élegans: hort. name.

ephedroides. Shrub to 3½ ft.: lfts. trifoliolate or partly so, linear-lanceolate, glabrous: fls. in terminal racemes: pods silky-hairy, 1-seeded. Isls. of N. W. Medit.

falcata. To 2 ft. or more, sts. erect and dense: lvs. ovate-oblong to lanceolate, to ½ in. long, branches very spiny: fls. few, in lax racemes: pods strongly curved, to 1 in. long, glabrous. Spain and Portugal.

flórida. To 5 ft., branches striped: fls. yellow, in dense many-fld. racemes. Apr.-July. Spain.

fragrans: Cytisus fragrans.

germánica. To 2 ft., twigs hairy, spiny: lvs. simple, alternate: fis. vellow, in racemes to 2 in, long. June-Juiy.

hirsuta: Cytisus hirsutus.

hispánica. Spanish B. To 2 ft., the branches spiny: lvs. alternate, simple, ovate-lanceolate, to ½ in. long: fls. golden-yellow, in terminal heads or clusters, in May-June. S. W. En. Var. compácta is of denser habit. Var. nāna is a dwarf form.

hôrrida. To 1½ ft., densely branched and with stiff spiny branchlets: ivs. trifoliolate, at least in part, opposite or whorled: fls. few, in terminal heads, summer. France, Spain.

humifusa: a confused name of uncertain application in regard to material so listed in trade.

Ichnstownii: listed name.

iúncea: Spartium junceum.

kewénsis: Cytisus kewensis.

lusitánica. To 4 ft., spiny: lfts, linear-lanceolate, silvery-silky, to 4 in. long: fls. pale yellow, in heads, woolly-to-mentose: pods 3-4-seeded. Spain, Portugal.

maderénsis: Cytisus maderensis.

monospérma. To 10 ft., almost leafless: fls. white, fragrant, in short lateral racemes, in early spring. Spain, N. Afr. Hort. forms are álba and péndula.

multibracteata. Sts. stiffly erect, younger ones angled: multipracteata. Sts. stiffly erect, younger ones angled: lifts. linear-oblong, mucronulate, cliate: fls. yellow, in dense compact terminal spikes: pods short, erect, glabrous. Habitat not known.—Confused in cult. with G. tractora from which it differs in its more slender virgate and pilose sts., paler lifts., denser spikes, and the aggregation of sterile bracts at base of infl.

multiflora: Cytisus multiflorus.

newrevensis: see Cutisus newrevensis.

nigricans: Cytisus nigricans.

ovata. To 4 ft., hairy, the branches striped: lvs. alternate, simple, ovate to lanceolate, hairy: fis. yellow, in short racemes. E. Eu.

palménsis: Cytisus filipes.

pilòsa. Prostrate, spineless: lvs. alternate, simple, obovate to oblong, to ½ in. long, obtuse, hairy: fis. yellow, in short racemes. May-July. Eu.

præcox: Cytisus præcox.

prostràta: Cytisus decumbens.

purgans: Cytisus purgans.

purpurea: Cutisus purpureus.

racemòsa: Cytisus racemosus.

radiàta. To 2 ft., much branched lvs. trifoliolate, at least in part, opposite or whorled: fis. yellow, in 3-10-fid. heads. May-July. S. Eu.—Plant not spiny.

sagittàlis. To 1 ft., the branches broadly 2-winged: fls. yellow, in terminal racemes. June-July. Eu., W. Asia.

schipkaénsis: Cytisus albus.

scopària: Cytisus scoparius.

sessilifòlia: Cutisus sessilifolius.

sibírica: G. tinctoria.

silvéstris. Spiny: lvs. alternate, simple: fis. in racemes to 4 in. long. S. E. Eu. Var. púngens (G. dalmatica) is more spiny.

Spachiana: Cytisus Spachianus.

stenopétala: Cytisus maderensis var. magnifoliosus.

sulphùrea: listed name.

tectòrum: listed name.

tinctòria (G. sibirica). Dyers-Greenweed. To 3 ft. branches striped: Ivs. alternate, simple, mostly elliptic-oblong, to 1 m. long, glabrous, chiate: fis. yellow, in many-fid. racemes panicled at the ends of the branches, in sum-mer. Eu., W. Asia; nat in N. Amer. Var. prostrata is a low-lying form. Var. virgata (var. elatior), to 6 ft., more branched and vigorous than type with fewer-seeded pod.

tricuspidàta. Lvs. lanceolate, glabrous to slightly hirsute, spines trifid: fls. yellow, glabrous, keel nearly twice as long as standard. Algiers.

uralénsis: Cytisus supinus.

Veitchii fragrans: hort. name.

Villarsii. Low suffrutescent spineless per.: lvs. simple, oblong-lanceolate, usually densely silky beneath: fls. vellow, silky outside, 1-3 in. axillary racemes, erect, standard about as long as keel: pods oblong, 2-seeded, silky-villous. S. Cent. Eu.

GENTIAN: Gentiana. Horse: Triosteum. Prairie: Eustoma Russellianum.

GENTIANA. GENTIAN. Gentianaceæ. Small or low per. and ann. herbs with mostly opposite,

simple and entire lys, and blue or purple, rarely yellow or white fls.; corolla 4-5-lobed and with plaits, teeth or appendages in the sinuses.

Gentians are grown mostly as rock-garden subjects. They require good drainage with plenty of moisture and a cool temperature, as the planted kinds are mostly mountain cool temperature, as the planted kinds are mostly mountain plants. Some species require special treatment, determined by personal experience, and are grown only by fanciers. Propagated by seed sown as soon as ripe and which are small and slow in germinatung. The genus abounds in good blues. Some of the plants known as gentians may be Centauruum

acaûlis (G. excisa). Stemless G. Per. to 4 in.: lvs. elliptic or lanceolate: fls. solitary, dark blue spotted inside, 2 in. long. Alps and Pyrenees. Var. gigantêa is listed as a larger form.—By some authors divided into several species.

affinis. Per., clustered, to 1 ft.: lvs. oblong to linear: fls. mostly many in terminal racemes or in whorls, blue, corolla to 1 in. long. Rocky Mts. west and north.

álba: G. flavida.

aligia (G. Romanzovii). Per. to 15 in.: basal lvs. oblanceo-late, to 5 in. long, obtuse, glossy, 3-nerved; st.-lvs. lanceo-late, acutish, to 1½ in. long: fls. yellowish-white often innutely dotted with blue-green, tubular-campanulate, to 2 in. long. E. Asia, W. N. Aner. Var. sibírica is 6-10 in. tall with more linear lvs. and fls. to 134 in. long. E. Siberia to Japan.

altaica. Tufted per, to 4 in.: lvs. mostly radical, linear and acute: fls. single terminating the very short sts., blue, to 2 in. long, long-trumpet-shaped. Siberia.

Amarélia (Amarella plebeya. G. plebeya). Erect ann. to 1 ft.: basal lvs. spatulate, to 1 ¼ in. long; st.-lvs. shotter, more lanceolate: fls. bluish, to ½ in. long, axillary. N. N. Amer., N. Eu., N. Asia.

Andrewsii (Dasystephana Andrewsii). Closed G. Per. to 2 ft. lvs. ovate to lanceolate: fls. purplish-blue, nearly or quite closed, 1½ in. long, in terminal sessile clusters or in upper axils. E. N. Amer. Var. álba is listed,

anguldsa: G. verna var. alata.

angustifòlia. Per., stoloniferous: lvs. linear-oblong: fls. blue spotted with green. Alps.

asclepiadea. Per. to 1½ ft.: lvs ovate-lanceolate: fls. dark blue, 1½ in long, solitary in the axils and resembling leafy racemes. S Eu., Caucasus. Var. álba has white fls.

baicalénsis: listed name for a gentian producing heads of rich blue fls.

barbellåta (Anthopogon barbellatus). Per. to 6 in., sts. angled: basal lvs. oblanceolate, to 2 in long; st.-lvs. more lineur, to 134 in. long; fls. bright blue, to 134 in. long, lobes fimbruate, in 4's. Colo. and Wyo.

bavárica. Per. to 3 1 in. long. Cent. Eu. Per. to 3 in.: lvs. ovate: fls. solitary, deep blue,

Bigelovii (Dasystephana Bigelovii). Per. to 1 ft: lvs. oblong to linear: fls. purple, 1 in. long, solitary in axils and forming a many-fld. spike. Colo. to Ariz.

bisetæa. Decumbent per. with sts. to 16 in. long and more or less ascending: lvs. oval to oblong or upper ones lanceolate, obtuse: fis. soltary, blue, $\frac{1}{2}$ in. or more long, with 2 setæ in sinuses. Coast Mts., Ore.

brachyphýlla. Per., making little clumps or mats, to 3 in.: lvs short and very broad, ¼ in. or less long: fis. single on each st., about 1 in. long, deep azure-blue. Alps.

Bürseri. Per. to 1 ft.: lvs. elliptic-ovate: fls. yellowish, calyx spathe-like. Pyrenees.

cachemirica. Low, spreading, rosette-forming, sts. somewhat ascending, to 8 in. long; lvs. ovate, to ½ in. long, base clasping st.: fls. azure-blue, striped with yellowish-white and darker blue, to 1½ in. long, bell-form. W. Himalayas.

calycosa (Dasystephana calycosa). Per. to 1 ft., sts. procumbent or ascending: lvs. ovate: fls. dark blue spotted with green, to 1½ in. long, solitary, corolla-lobes not entire. Wet meadows, B. C. to Mont. and Calif.

campéstris. Ann. to 6 in.: lws. ovate-lanceolate, to 13 in. long, entire, sessile: fls. bright purple, erect, 1 in. and more long, in abundance. Eu.—Good for the rock-garden.

clausa. Per. to 2 ft.: lvs. ovate-lanceolate: fis. blue, corolla closed, with broad rounded lobes. E. N. Amer.

Clùsii. One of the segregates from G. acaulis but scarcely differing.

corymbosa. Per. to 8 in., simple sts. arising from rosette-like crown: basal lvs. tutted, linear-spatulate; st.-lvs. linear-oblong, about 1 in. long, fleshy, obtuse, glabrous: fls. rose-violet, campanulate, to 3/2 in. long, erect, in um-bellate clusters to 3 in. across. Colombia.

crinita. Fringed G. Bien. to 3 ft., with long slender roots that are broken in ordinary transplanting: lvs. obovate to lanceolate: fls. solitary, bright blue, 2 in. long, the lobes conspicuously fringed. E. N. Amer.

cruciàta. Per. to 10 in.: lvs. ovate-lanceolate: fis. dark blue, 3/4 in. long, in axillary clusters. Eu., N. Asia.

decora. Per to 2 ft. or more: lvs. elliptic or narrower, acuminate: fls. purple, about 1 in. long, calyx-tube pubescent. Va. to Ga.

decúmbens. Per. to 10 in.: lvs. oblong or elliptic: fls. blue, about 1 in. long, in clusters, calyx spathe-like. Himalayas.

depréssa. Per. to 2 in.: lvs. elliptic: fls. solitary, blue, 1½ in. long. Himalayas.

detónsa. Per. to 2 ft.: lvs. oblong: fls. blue, ¾ in. long, in terminal and axillary clusters. Himalayas.

élegans: G. thermalis.

Elliottii: G. parvifolia,

excisa: G. acaulis.

Fárreri. Per., stoloniferous, the sts. ascending: lvs. linear, the pairs connate at base: fls. solitary, blue with white throat and yellowish-white band on the petals, to 2½ in. long. China.

Fetisòwii. Tall per.: lvs. lanceolate: fls. deep blue, 1½ in. long, in terminal and axillary clusters. China.

flávida (G. alba. Dasystephana flavida). Per. to 3 ft.: lvs. ovate-lanceolate: fls. greenish or yellowish-white, to 2 in. long, in clusters. Ont. to Va and Mo.

florenciana: listed as a semi-bog species from S. Ore., having large open blue fls. on 6-10-in. sts.

fragifòlia: listed name of hort. form.

Freyniana: a hort. form of G. septemfida with larger less fringed fls.

frigida. Per. to 6 in.: lvs. spatulate-linear: fls. whitish, few together. Carpathian Mts.

gélida. Per. to 6 in.: lvs. ovate-lanceolate: fls. yellowishwhite, in clusters. Caucasus.

Gentianélla: name for a group of gentians, sometimes maintained as a separate genus.

glauca. Per. to 4 in.: lvs. glaucous, oval, less than ½ in. long; fls. blue, about ½ in. long. Rocky Mts. and far N.; Asia.

gracilipes. Rosette-forming per., sts. ascending to 6 in: rosette-lvs. lanceolate, to 6 in. long; st.-lvs. much smaller: fls. greenish outside, purplish-blue inside, narrowly bell-shaped, to nearly ³⁄₄ in. across, solitary on very short pedicels. Kansu, China—Confused in cult. with G. Pur-

Grisebachii. Ann., sts. slender, decumbent to suberect, to 14 in.: lvs. spatulate, to 1 in. long, obtuse, thm, lower ones long-petioled: fls white, about 1 in. long, terminal, few or solitary, narrowly campanulate. New Zeal.

hascombénsis. Hybrid between G. septemfida var. Lagodechtana and another var. of that species, produced in England: to 2 ft.: fls. 1½ in. across, bright intermediate blue slightly speckled white.

holopétala. Ann. to 1 ft. or more, erect: lvs. mostly toward base, obovate to linear, to 11/2 in. long: fis. to 2 in. long, narrow, blue, single terminating scape, corolla-lobes entire or nearly so. Mts., Calif.

Ingramii: listed name for a plant 8-16 in, high and 2-5 large blue fis, with lobes of corolla speckled greenish-white.

Késselringii. Per. to 8 in.: lvs. lanceolate: fls. whitish dotted violet outside, in terminal clusters. Turkestan.

Kochiana (G. latifolia). Rosette-forming per. to 4 in.: rosette-lvs. elliptic-oval, to 6 in. long; st.-lvs. smaller: fis. dark blue, green spotted within, sometimes white, rose or violet, to 1½ in. across, distinctly stalked. Cent. Eu.

Kurroð. Tufted per. to 7 in.: lvs. lanceolate to linear: fls. blue spotted with white inside, 1-3 together. Himalayas.

Lagodechiàna: G. septemfida var. latifòlia: plants in trade under this name may be G. Rochiana or G. linearis var.

linearis (Dasystephana linearis). Per. to 2 ft.: lvs. linear or linear-lanceolate: fts. blue, to 2 in. long, in terminal clusters. N. B. to Md. and Minn. Var. latifolia (G. latifolia). Lvs. distinctly sessile and not contracted at base, lower ones oblong-linear, upper ovate-lanceolate. N. B., Lake Superior region.

lûtea. Per. to 6 ft.: lvs. ovate: fls. yellow, 1 in. long, in dense umbel-like cymes, calyx spathe-like. Eu., Asia Minor.

Macauleyi. Hybrid of G. sino-ornata and G. Farreri, differing from the latter parent in its larger fls. with more spreading corolla-lobes; free-flowering.

macrophylla. Per. to 1 ft.: lvs. lanceolate, to 1 ft. long: fls. pale blue, in terminal clusters. Siberia.

Mákinoi. Erect per. to 1 ft.; lvs. lanceolate to lanceolateovate, to 2 in. long, 3-5-nerved: fls. pale blue, minutely spotted, tubular, to 1½ in. long, usually in heads at ends of sts. Japan.—Differs from G. scabra in its unequal calyxMénziesii. Erect, to 1 ft.: lvs. oblong-elliptic, to 1 in. long: fis. bluish-purple, 1 in. long, with calyx split down one side. N. W. N. Amer.

Moorcroftians. Ann. to 1 ft. or more: lvs. oblong or elliptic, about 1 in. long: fts. in leafy clusters, pale blue, about 1 in. long. Himalayas.—Probably not in cult. in N. Amer., plants so named being other species.

Néwberryi. Alpine per 2-4 in. high in bloom: lvs. mostly basal, broad-obovate to oblanceolate, to 1½ in. long: fls. single, terminating a lf.-bearing st., 1 in. or more long, white inside, blue outside with brownish lengthwise long, white in bands. Calif.

nivalis. Ann. to 4 in.: fls. solitary, blue, 36 in. long. Eu. ochroleùca: G. villosa.

Olivièri (G. dahurica). Lvs. narrowly lanceolate: fls. dark blue, in umbel-like cymes. Asia.

oregana. Per. to 2 ft.: lvs. ovate to oblong, to 11/4 in. long: fis few clustered at summit, about 11/4 in. long, light blue. Calif. to B. C.

 ${\bf \acute{O}rfordii.}$ Per., slender, to 2 ft.: lvs. linear-lanceolate, to 3 in.: fls. 1 in. or more long, blue, speckled within. Ore.

ornata (G. Vertchrorum). Low rosette-forming per, with short ascending sts.: lvs. narrowly to broadly lanceolate, basal lvs. to 1 in. long, st.-lvs. ½ in. long and almost linear: fls. blue, white-throated, campanulate, to 1 in. across. Nepal.—Confused in cult. with G. sino-ornata.

pannônica. Erect. to 2 ft.: basal lvs. elliptic-cupeate. to 8 in. long, margins rough; st -lvs. ovate to lanceolate. upper ones sessile: fis. brownish-purple, spotted darker, broadly bell-form, to 1½ in. long. Cent. and E Eu.

Párryi (Dasystephana Parryi). Per. to 16 in : lvs linear-lanceolate to ovate: fis. bright blue, about 2 in. long, 1-6 together. Wyo. to Utah.

parvifòlia (Dasystephana parvifolia. G. Elliottii). Per. to 2 ft.: lvs. ovate-lanceolate, to 2 in. long, 3-nerved, margins rough: fls. blue, to 1 in. long. Va. to Fla.—Differs from G. decora in having glabrous calyx tube. Sometimes listed

as G. Catesbar.

phlogifòlia. Per. to 10 in.: lvs. lanceolate-oblong: fis. blue, in terminal 3-7-fid. cymes. E. Eu.

plebèja: G. Amarella.

Pneumonanthe. Per. to 1 ft.: lvs. oblong-lanceolate to linear: fis. deep blue lined outside with green, 1½ in. long, in the axils of upper lvs. forming a raceme-like cyme. Eu.,

Porphyrio (Dasystephana Porphyrio). Per. to 1½ ft.: lvs. linear: fls. bright blue often spotted with brown, 2 in. long, solitary and terminal. Pine barrens, N. J. to Fla.— Has been tenamed G. Stoneana.

prolata. Stoloniferous per., the shoots turning upward at the end and each terminated by purple-striate fl. to 11½ in. long, lobes blue: lvs. thickish, about ½ in. long, lower ones elliptic and others lanceolate to oblong. Himalayas.—Has been grown as G. ornata.

Przewálskii. A few in. high: lvs. oblong to oblong-linear: fls. blue with cream-colored anthers, to 2½ in. long, in terminal clusters of 1-3. China.

pterocalyx. Ann., 1 ft. or more, branched: lvs. 1 in. or less long, cordate-ovate: fls. single or few terminating sts., 2 in. or more long, deep azure varying to yellowish. Yunnan, China.—Listed, but true pterocalyx probably not in cult. in this country, plants so named being apparently forms of G. decumbens or others.

pubérula (Dasystephana puberula). Per. to 1½ ft.: lvs. lanceolate: fis. blue, 1½ in. long, sessile in upper axils and forming a dense spike. Ohio to Sask.

punctata. Per., 1-2 ft., glabrous: lvs ovate or narrower, 3 in. or less long, strongly ribbed: fls. in dense terminal and subterminal clusters, to about 1½ in. long, not opening widely, light yellow and violet-spotted. Alps and eastward.

Púrdomi. Per to 8 in., erect, glabrous: Ivs. linear-lanceolate, 6 in. or less long; st.-lvs. 1 in. long, few, sheaths prominent: fls. 6-8 in terminal bracted cluster, pedicellate, corolla 1 in. or more long, yellowish (when dried) with purple lines. High mts., Kansu, China.—Although listed, G. Purdomi is probably not in cult., plants so named being G. trichotoma, a form of G. decumbens, and perhaps others.

purpurea. Per. to 2 ft., erect: lvs. ovate-lanceolate, 5-nerved: fls. few terminating the sts. and in upper axils, about 1½ in. long, red with yellowish throat. Alps.

pyrenaica. Cespitose per to 3 in.: lvs. many, lance-linear, pointed, less than 1 in. long; fis. single and terminal, to 1½ in. long, violet, corolla-lobes obtuse. Pyrenees, Caucasus.

quinquefòlia. Ann. to 20 in.: lvs. ovate-acuminate, connate, glabrous, entire: fls. pale-lilac, to 1 in. long, erect, usually terminal in clusters of 3-5. E. U. S.

Rôchelii. Low per., with clustered lvs. at base, sts. 2 or 3 in. high: lvs. lanceolate, about 1½ in. long, pointed: fls. single and terminal, about 2 in. long, blue. Hungary.—By some authorities regarded as a var. of G. Clusii.

Romanzóvii: G. alaida.

Saponaria (Dasystephana Saponaria). Per. to 2½ ft.: lvs. lanceolate or oblong: fis. blue, 2 in. long, in terminal and axillary clusters; calyx-lobes linear-oblanceolate. Ont. to Fla. and La.

saxicola. Per, to 1 ft.: lvs. ovate, to 1½ in. long: fls. deep violet-blue, corolla green dotted inside, to 1½ in. long and ¾ in. across, lobes entire and expanding. Dry rocky slopes, Wush.—Related to G. calycosa, differing in its erect sts., wider calyx-lobes and entire corolla-lobes.

saxòsa. Per., sts. many, ascending to 6 in., having rosettes at ends: lvs. spatulate, to 1½ in. long, fleshy, dark green: fls. white with brownish veins, bell-shaped, to ¾ in. across. New Zeal.

scabra. Lvs. ovate, rough-toothed: fls. dark blue, in clusters. E. Asia. Var. Büergeri is a form with narrower fls.

ciusters. E. Asia. Var. Buergeri is a form with narrower fis.

scéptrum. Per. to 4 ft.: lvs. oblong-lanceolate: fis. dark
blue often dotted with greenish, 1 in. long, in clusters.
B. C. to Calif.—Sometimes listed as G. Menziesii.

septémfida. Per. to 1½ ft.: lvs. ovate-lanceolate: fis.
dark blue, to 2 in. long, in terminal clusters. Asia. Var.
Lagodechiàna has slender prostiate sts. with single fis. Var.
procumbens is a low habit form.

setigera. Per., 1 ft., decumbent at base: lvs. nearly orbicular or short-oblong, obtuse: fls. single or few, terminal, about 1½ in. long, blue. N. Calif.

setàsa: listed name.

sikkiménsis. Mat-forming per. to 6 in.: lvs. oblong-cuneate, to 1 in. long: fls. blue, white-throated, to 1 in. across, in terminal clusters. Himalayas, China.

Sikokiàna. Erect per. to 1 ft., sts. 4-angled: lvs. ellipticacute, to 3 m. long: fis. blue or purphsh-blue, funnelform, to 134 m long, terminal. Japan.

sino-ornata. Stolomierous per. with sts. to 7 in. long: lvs in rosettes, linear-lanceolate: fls. yellowish-white marked irregularly with purple, to 2 1/4 in. long, solitary and terminal. Mts., China.

siphonántha. Erect per. to 1 ft.: basal lvs. linear-lanceolate, to 9 in. long; st.-lvs. becoming shorter to top: fis. purphsh-blue, narrowly funnelform, to 1 in. long, terminal and axillary. Tibet and N. W. China.

Stoneana: see under G. Porphyrio.

straminea. Per. to 1 ft.: lvs. linear-oblong: fls. pale yellow, 2 in long, 1 or 2 together. China.

stylophora. Similar to G. Intea, differing in its fewer and much larger fls. with corolla-lobes deeply cut. Nepal, S. E. Tibet.

tenélla. Ann. to 4 in, sts. slender: lvs. spatulate to oblong, 1-nerved: fls. blue, to 3/2 in. long, usually solitary.

Cent. and N. Eu.
thermalis (G clegans, Anthopogon thermalis). Ann. to 1 ft.: lvs obovate: fls. deep blue streaked with lighter, 2 in. long, solitary. Colo. to Ariz.

tianshánica. Differs from G. decumbens in sepals arcuate, plicate and entire, with corolla narrower and acute. E. Asia. tibética. Per. to 1½ ft.: lvs. lanceolate: fls. yellowish-white tinted lilac, crowded in upper axils. E. Himalayas.

trichótoma. Per., erect, 1 ft. or more, sts. mostly 3-forked at apex: lvs. oblong-lanceolate to spatulate: fis. axillary and subterminal usually in 3's, pedicelled, the blue corolla (varying to whitish) 1 in. or more long. W. China.—The name trichotoma does not appear in the N. American trade-lists, but plants cult. as G. Purdoma may belong to it.

tubulòsa. Ann. or bien. to 6 in., sts. slender, erect: lvs. narrowly oblong-lanceolate, to 34 in. long, acute, sometimes clusping at base: fls. bluish-lilac, to 1 in. long, tubular, solitary or rarely in 3-fld. cymes, on pedicels 1½-2 in. long. Argentina.
Veitchiòrum: G. ornata.

vérna. Tufted per. to 3 in.: lvs. ovate: fls. dark blue, solitary, 1 in. long. Eu. Var. alàta (G. angulosa) is taller with winged calyx.

villosa (G ochroleuca). Per., erect, to 18 in.: lvs. obovate, to 3 in long: fls. in a terminal cluster, greenish-white, 1½ in. long. N. J. south.

Waldjewii. Lvs. elliptic or lanceolate: fls. whitish dotted with pale blue, crowded in a terminal cluster. Turkestan.

GENTIANACEÆ. GENTIAN FAMILY. About 70 genera of herbs or rarely shrubs, of wide distribution, with mostly opposite simple and entire lvs. and regular bisexual gamopetalous fls. having 4-12 sepals, petals and stamens, superior 1-celled ovary, and capsular frs. Some of the best blues among fls. are in this family. A few genera are grown for ornament although of minor importance except for special uses, as Centaurium, Chironia, Crawfurdia, Eustoma,

Exacum, Fauria, Frasera, Gentiana, Menyanthes, Nephrophyllidium, Nymphoides, Sabatia.

GENUS (plural, genera). A more or less closely related and definable group of plants comprising one or more species, and the name of which becomes the first word of the binominal employed in horticultural and botanical literature. Thus Citrus is a genus comprising the citrus fruits. and some of the species are Citrus sinensis the sweet orange, C. aurantifolia the lime, C. paradisi the grapefruit. The oaks belong to genus Quercus: the white oak is Quercus alba, Spanish red oak Q. rubra, live oak Q. virginiana. Rosa is the genus of the roses, Pinus of the pines, Lilium of the lilies, Delphinium of larkspurs, Lycopersicon of tomatoes, Mentha of mints, Fragaria of the strawberries. In some cases the technical genus name has become also the common or vernacular name, as Begonia, Petunia, Chrysanthemum, Dahlia, Iris, Grevillea, Gladiolus, Verbena, Crinum, Magnolia, Rhododendron. By bearing in mind that the first of the two words in the Latin or botanical designation of a plant is the generic name, the gardener arrives at the first step in tracing plants in books and indices, as he must know a man's surname to find him in the directory. See Species and Family. Something like 10.000 or more genera are commonly recognized among seed-bearing or flowering plants.

GEONÒMA. Palmacex. Feather-palms or feather-veined, unarmed, stoloniferous, cespitose or trunk solitary, slender but usually not very tall, the sts. ringed and commonly reed-like, monœcious or diœcious, with variable foliage and sometimes lvs. entire and bifid, when pinnatisect the pinnæ or segms. frequently with broad not petiole-like bases: spadices below the lvs. for the most part, the fls. in pits or depressions on the branches; stamens 6, connate: fr. small, globose, oblong or ellipsoid, 1-seeded, dark purple or black. Trop. Amer., about 175 species, mostly woods palms. Some of the species stand in shady protected places in S. Fla., and they are grown under glass making attractive small tub specimens but are little known to planters in U. S. See Palm.

6legans. Graceful palm, caudex to 6 ft. and very thin: lvs. 10-14 in number close together at apex of trunk, dark green, 1½-2½ ft. long, with broad and nurrow divisions intermingled; pinne 3-5, broad-lanceolate, to 10 in. long, 1-nerved and with several secondary nerves, the terminal largest: spadices from the axis of lowermost ivs.; fr. oblong, dark purple, about ½ in. long. Brazil. Var. robústa is a larger plant, with more and broader pinnæ or segms., the narrow ones ½ in. broad and others much broader.

grácilis. Slender, with single st., 4 ft., 1½ in. thick, naked: lvs. in a terminal crown, 2½ ft. long, regularly pinnate; pinna many, 1 ft. long and ½ in. or less broad, long-acuminate, 3-nerved, curving. Probably Costa Rica.

princeps. Slender but stout, 4 or 5 ft., st. naked: lvs. 2½ ft., arching, regularly pinnate but terminal pinnat broader or confluent; pinna about 50, green both sides, strong 3- or more-ribbed, 18-20 in. long, main ones 1 in. or less broad, long-pointed. Peru.

Schottiana. Caudex single, 9-16 ft. and 1 in. thick more or less: lvs long and gracefully curving, regularly pinnate; pinna 30-50 or more, and sharp-pointed, 10-12 in. long and about ½ in. broad, curving fr. ellipsoidal, about ½ in. long. Brazil, in several forms.

GEOPRUMNON: Astragalus.

GEORGINA: Dahlia.

GERÆA. Compositæ. W. American annuals with alternate toothed lvs. and yellow panicled heads of ray- and disk-fls.; pappus of awns joined at base into a crown; sometimes included in Encelia.

canéscens (Encelia eriocephala). DESERT SUNFLOWER. To 2 ft., white-harry: lvs. ovate to lanceolate, to 4 in. long: heads 1 in. or more across, the edges of the involucral bracts white-ciliate. Calif., Nev., Ariz.

GERANIÀCEÆ. GERANIUM FAMILY. Herbs, sometimes semi-wood,, of about 12 genera widely distributed over the world; known to cult. in the ornamental genera Erodium, Geranium, Pelargonium, and Sarcocaulon, and species of Erodium have forage value. The family is Erodium have forage value. The family is characterized by its bisexual mostly regular polypetalous fls., usually 5 sepals and petals and stamens 5, 10 or 15, superior 3-5-lobed ovary, and capsular fruit. The geranium tribes are of simple culture. The true geraniums and the erodiums are mostly hardy plants in the East, but pelargoniums need house treatmen; except in California and similarly mild climates.

GERANIUM. CRANESBILL. Geraniaceæ. Herbs ann. or per., with palmately lobed or divided lvs., pink or purplish fls. 1-2 in the axils, having 10 stamens, 5-celled ovary with 2 ovules in each cell, and long-beaked frs.

Grown in the hardy border or rock-garden. Propagated by seeds and root-division; the cultivated perennials should be transplanted from the seed-bed in early spring. They are mostly hardy plants, and some of them are introduced weeds. See *Pelargonium*, to which the greenhouse and florists geraniums belong.

aconitifolium. Per. to 1½ ft.: lvs. deeply 7-lobed: fls. white, ½ in. or less across. Eu.

albanum. Per, with decumbent to ascending sts.: basal lvs. reniform-orbiculate, to 2½ in. diam., lobes 5-7, much laciniated; cauline lvs. opposite, ovate-lanceolate: fls. rose-purple, to 3¼ in. across. Asia Minor, Persia.

albiflorum. Per. to 1½ ft.: lvs. deeply 7-lobed: fis. white veined with pink, about ½ in. across. S. Siberia.

anemonifolium. Per. to 1½ ft.: lvs. 5-parted, on petioles to 15 in. long: fls. pale purple. Canary Isls.—Perhaps not hardy N.

argenteum. Silver-Leaved C. Per. or bien. to 5 in.: lvs. 5-7-parted, hoary and silky on both sides: fis. pink with darker veins, 1 in. across. N. Italy.

armènum: G. psilostemon.

atropurpureum: probably G. sanguineum var.

bicolor: listed name of uncertain application.

cæspitòsum. Tufted per. with pubescent sts. to 16 in. long: lvs. 3-5-parted: fls. rose-purple, to ¾ in. long. Wyo., Colo., Utah.

carolinianum. Ann. to 1½ ft.: lvs. 5-7-parted: fis. pale pink or whitish, to ¼ in. across. N. Amer.

célticum: listed name.

cinèreum. Per. to 6 in.: lvs. 5-7-parted, glaucous: fls. pink with dark stripes, about 1 in. across. Pyrenees. Var. rôseum is listed. Var. subcauléscens (G. subcaulescens) differs in the calyx harrs spreading or divergent from the sepals and not appressed. E. Eu.

citrioddrum: Pelargonium acerifolium.

collinum. Per. somewhat decumbent, to $1\frac{1}{2}$ ft.: lvs. deeply 7-parted: fls. purplish-violet, the veins deeper, less than $\frac{1}{2}$ in. across. E. Eu.

disséctum. Ann. to 2 ft.: lvs. 5-7-parted: fis. purple, to 34 in. across. S. Eu.; nat. in N. and S. Amer.

Endressii. Per. to 1½ ft.: lvs. deeply 5-lobed: fis. rose, ½ in across. Pyrences.

erianthum. Per. with solitary pubescent sts.: lvs. 5-7-rted: fls. bluish or rose-purple, ¾ in. long. Alaska to B. C., N. Asia.

eriostèmon (G. platyanthum). Per. to 2 ft.: Ivs. deeply 5-lobed: fls. violet-blue, 1 in. across. Siberia to China.

Fárreri. Per. to 9 in., taller in rich soil; rhizome short, roots with enlarged tuberous portions: lvs. reniform, 3-lobed, blade to 1 in. long, petiole to 6 in.: fis. pale illac, usually in pairs, on peduncles to 6 in. long. Yunnan.

fragafórmis: catalogue name.

Fremontii. Per., 1 ft. or more high: lvs. 5-7-parted: fis. rose-purple, 1 in. across. Rocky Mts.

grandiflorum. Per. 1 ft. or more: lvs. deeply 5-lobed: fls. lilac with purple veins, to 1½ in. across. N. Asia. Var. alpinum is said to be a dwarf form.

Grevilleanum. Per. with creeping sts.: lvs. reniform,

5-lobed, lobes deeply serrate but not to midrib, pubescent: fls. rose, often purple spotted, to 2 in, across. Himalayas. Grièvesii: listed name.

gymnocaulon. Per. to 134 ft.: lvs. 5-parted: fis. deep violet, to 34 in. long. W. Asia.

ibéricum. Per. to 1½ ft.: lvs. 7-lobed nearly to base: fis. puryle, 1½ in. long. S. W. Asia. Var. álbum has white fis. Var. platypétalum is G. platypetalum.

inclsum. Per. to 2 ft.: lvs. 3-5-parted, the lfts. often cut: fls. pink or purple, ½ in. long. B. C. to Calif.

japônicum. Per. to 3½ ft., briefly glandular-hispid: lover lvs. kidney-shaped, 5-7-palmately lobed, to 6 in. across, upper ones 3-lobed; fts. usually white, to ½ in. across, on peduncles to 2 in. long. Japan —This plant is imperfectly known and material so named in cult. may not belong here.

lancastriénse: G. sanquineum var. prostratum.

Lòwii: name for a bien, hort form having bright rose fls. with violet center: perhaps allied to G. anemonifolium.

macrorrhizum. Per. to 1½ ft., with long thick root: lvs. 5-7-lobed nearly to base: fls. magenta. S. Eu.

maculatum. Per. to 2 ft.: lvs. dceply 3-5-lobed: fis. rose-purple, 1 in. across. N. Amer. Var. album has white fis.

napulgerum. Per. to 15 in , sts. slender, decumbent to ascending: lvs. cordute-orbicular, blade to 2 in. across, long-petioled, 5-lobed, lobes strongly incised: fls. rose, 1 in. or more across. China and Korea.

nepalénse. Per. with decumbent or ascending sts. to 1½ ft. long: lvs. deeply 5-lobed: fls. rose-purple, to ¾ in. across. Mts. of Asia.

nervosum. Per. to 2½ ft.: lvs. deeply 5-7-parted: fls. pale violet or nearly white streaked with purple, ¾ in. long. Wyo., Colo., Ore.

nodôsum. Per. to 2 ft., sts. slender, ascending: lvs. cordate-reniform, to 3 in. across, petroled, 5-lobed, lobes dentate: fls. few, to 1 in. across. Mts. of S. Eu.

oreganum. Per. to 2 ft.: lvs. 5-7-parted: fls. purple. ½ in. long. Ore.

Páryi. Per. to 2 ft., sts. tufted: lvs. to 2¼ in. across, 3-5-lobed, lobes usually incised: fls. pinkish-purple, to 1¼ in. across. Mts. of Wyo., Colo. and Ariz.

pectinatum: listed name.

phæum. Per. to 2 ft.: lvs. deeply 5-7-lobed: fls. dark blue or almost black, with white spot at base of each petal.

platyánthum: G. eriostemon.

platypétalum. Per. to 2 ft.: lvs. 5-lobed beyond middle: fis. dark purple, 1/4 in. long. China.

praténse. Per. to 3 ft.: lvs. 7-parted: fls. purple, about ½ in. across. Eurasia. Var. álbum has white fls.

prostràtum: G. sanguineum var.

psilostèmon (G. armenum). Per. to 2 ft.: lvs. deeply 5-lobed; fis. dark red. spotted with black at base, about 1½ in. across. Armenia.

pusillum. Prostrate much branched ann.: lvs. 5-9-rted, the lfts, 3-lobed: fis. blue-purple, 1/2 in. across. Eu. to Himalayas.

Pylzowianum. Per. to 1 ft: lvs. 5-parted, the lfts. 3-lobed: fls. purple, 1½ in. across. China.

pyrenàicum. Per. to 2 ft., soft-pubescent: lvs. 5-7-lobed: fls. blue-violet, 1/2 in. across. Eu.

Richardsonii. Per. to 3 ft.: lvs. 3-5-parted: fls. white, 1 in. across. W. N. Amer.

Robertianum (Robertiella Robertianum), HERB-ROBERT. Red Robin. Ann. or bien. to 1½ ft.: lvs. 3-parted, the lfts. deeply cut: fls. red-purple, about ¼ in. long. N. Amer, Eurasia, N. Afr., mostly in woods or coppices.

sanguineum. Per. to 1½ ft., covered with spreading white hairs: lvs. 5-7-parted: fls. reddish-purple. Eurasia. Var. álbum has white fls. Var. atropurplierum, fls. dark red-purple. Var. nanum, of low compact habit. Var. prostratum (G. lancastriense, G. prostratum) is a dwarfer form with lighter colored fls. Var. roseum has paler fls.

sessiliflorum. Per. to 4 in.: lvs. all basal, deeply 5-7-parted: fis. white, to ½ in. across. Andes of S. Amer.

striatum. Per to 18 in.: lvs. reniform-orbicular, palmately 5-lobed, to 3 in. wide, pubescent: fls. white veined rose-red, petals emarginate, clusters of 3-10, pedicels and peduncle pilose. Cent. Eu.

subcauléscens: G. cinereum var.

sylváticum. Per. to 214 ft.: lvs. deeply 7-lobed: fls. violet, about 1 in. across. Eu., Asia.

Tráversii. Per. to 1½ ft., gray-pubescent: lvs. 7-parted to about the middle: fls. rose or white, 1 in. across. Chatham Isl. (New Zeal.).

tuberdsum. Erect per, to 15 in., with fleshy ovoid tubers 5% in thick: basal lvs. with 5-7 pinnately incised lobes, long-petioled; cauline lvs. sessile: fis. deep rose-purple to violet, large, peduncle 1-2-fid. S. Eu.

viscosissimum. Per to 2 ft., sts sticky: lvs. 3-5-parted: fls. pinkish-purple, ¾ in. long. S. D. to Calif.

Wallichianum. Prostrate per: lvs 3-5-parted, the lfts. deeply toothed: fls. purple, to 2 in. across. Himalayas.

Wilfordii. Procumbent ann.: lvs. 3-parted, the lfts. deeply toothed: fls. white striped with rose, 1/2 in. across. Manchuria.

Willardii. Per. to 11/2 ft.: fls. rosy-red. Botanical position unknown

zonale: Pelargonium zonale.

GERANIUM, BEEFSTEAK-: Begonia Rex-cultorum. California-: Senecio Petastes. Feather-: Chenopodium Bo-trys. Florists: Pelargonium. Mint-: Chrysanthemum Balsamita Strawberry-; Saxifraga sarmentosa.

GERÁRDIA Scrophulariacex. (Agalinis). American ann. and per. herbs with mostly opposite sessile lys. and showy slightly irregular fls.; somewhat planted.

flava: Aureolaria flava.

hybrida: Penstemon campanulatus.

pedicularia: Aureolaria pedicularia.

purpurea (Agalans purpurea). Ann. to 4 ft.: lvs. linear, entire, to 1½ in. long; fls. rose-pink with 2 yellow lines in throat and red-purple spots, 1 in. long, in 6-14-fld. racemes. July-Sept. N. Amer.

tenuifòlia (Agalinis tenuifòlia) Ann. to 2 ft.: lvs. narrow-linear, entire, to 1½ in. long: fis. light purple, spotted, to ¾ in. long. Aug.-Oct. Que. to Ga. and Tex.

virginica: Aureolaria virginica.

GERBÈRIA (Perdicium). Compositæ. Several herbaceous perennials with lvs. in basal tufts, the solitary pink, yellow or orange heads on scapes, with 1 or 2 rows of ray-fls.; pappus of bristles; native in S. Afr. and Asia.—Name commonly but not originally spelled Gerbera.

Gerberia is grown in a temperate greenhouse and out-of-doors in mild or protected places. It may survive the north-ern winters if given a protection of leaves and decomposed manure. Propagated by seeds or by cuttings of side shoots.

anándria. Differing from G. Kunzeana in the woolly involucral bracts and pale pappus. China.

Jamesonii. Transvaal Daisy. Barberton Daisy. To 1½ ft., hary: lvs. very woolly beneath, to 10 in. long, pinnately lobed or parted: heads orange-flame color, to 4 in. across. Transvaal Var. hýbrida is listed as an improved form with white, pink, orange, salmon, ruby-redviolet fis.—Not hardy in northernmost states; sometimes bloomed under glass. bloomed under glass.

Kunzeana. Diactious: lvs. oblong or ovate, lobed or lyrate-pinnatifid, very woolly beneath: bracts of involucre glabrous; pappus brown. Himalayas.

GERMANDER: Teucrium

GESNERIA: see Corytholoma, Smithiantha.

GESNERIÀCEÆ. GESNERIA FAMILY. Mostly trop. herbs, rarely shrubs or trees, of about 84 genera, having simple lvs. which are frequently colored above or underneath, tubular usually 5-lobed showy gamopetalous often irregular corolla, 4 stamens, superior or inferior ovary, and commonly fleshy frs. Plants of several genera are grown for ornament chiefly under glass, as Achimenes, Alloplectus, Chirita, Colum-nea, Conandron, Corytholoma, Episcia, Haber-lea, Isoloma, Mitraria, Nematanthus, Oreocharis, Ramondia, Rhabdothamnus, Saintpaulia, Sinningia, Smithiantha, Streptocarpus, sporum, Tussacia. Tricho-

GESNOUÍNIA. Urticaceæ. Canary Isl. shrubs or trees with alternate entire lvs. and unisexual fls. borne 3 together in an involucre in spikes or panicles; sometimes grown in the open in S. Calif. for ornament and interest. Propagated by cuttings.

arbòrea (Parietaria arborea). Tree to 20 ft.: lvs. lanceo-late, to 5 in. long and 2 in. wide, white-tomentose beneath: fls. in large terminal panicles.

GÈUM, Avens, Rosacca, Per, erect berbs. often with runners, with pinnate basal lvs. and small st.-lvs., yellow, white or red fls. in corymbs or solitary, and fr. an achene with long persistent style; native in temp. and cold regions and adapted to rock-gardens, and the taller ones for rear borders; some of them are good flower-garden subjects. Of easy cult. Propagated by seeds and by division.

aléppicum. To 5 ft.: lvs. with large rounded terminal lft and 4-6 lateral lfts.: fls. yellow, to ¾ in across: body of achene long-villous. Cent. and E. Eu. Var. stríctum (G. strictum) has the body of achene smooth except on the margin and summit, or only short-pilose, and the terminal lft. more acutely and deeply dissected. N. Amer., E. Asia.

alninum harbáricum: unidentified trade name.

atrococcineum: probably G. chiloense.

atrosanguíneum: G. chiloense.

aurantiacum. Hybrid between G. rivale and G. aleppicum var. strictum: fls. golden-yellow.

Bòrisii. Hybrid between G. reptans and G. bulgaricum: fls. bright yellow.

bulgaricum. To 2 ft.: lvs. with very large heart-shaped terminal lft. and numerous small lateral lfts.: fls. nodding, bright yellow or orange. Bulgaria.

calthifolium. To 1 ft: basal lvs. with a large round-cordate terminal lft. and few very small lateral lfts.: fls. 1-few, bright yellow, 1 in. or more across W. N. Amer. south to B. C., E. Asia. Var. dilatatum is listed.

campanulatum (Steversia campanulata). Similar to G. triflorum but shorter, fis reddish-purple, the petals much longer than sepals. Wash., Ore.

canadénse. To 2½ ft.: lvs 3-5-parted into toothed or lobed lfts: fls. white, about ½ in. across. N. S. to La.

chiloénse (G. atrosangumeum). To 2 ft.: lys. with large terminal toothed lft. and many smaller lateral lfts, hairy; fis. searlet, to 1½ in. across. Chile Var plenum has double fis. A favorite garden form is Mrs. Bradshaw.

ciliatum: G. triflorum

coccineum. Lvs. with large heart-shaped terminal lft. and smaller lobed lateral lfts: fls. bright red, 1 in. across. S. Eu, Asia Minor—The plants commonly grown under this name are G, childense.

depréssum (Acomastylis depressa). To 4 in : radical lvs. pinnate and appressed-silky, the lfts crowded and 3-cleft: fls. yellow, 1 to a st. Wash.—Probably a geographical var. of G. Rossu.

dryadoides: Cowania mexicana; also, by other authors, G. pentapetalum.

Èwenii: hort. name for a form with light orange fis.

gracilipes (Acomastylis gracilipes). To 3 in.: radical lvs. pinnate and appressed-silky, the lits. not crowded and 3-cleft at apex or entire: fls. yellow, 1 to a st. Ore.—Probably a geographical var. of G. Rossii.

Heldreichii: hort. name for a form with orange-red fis.: 8 in. Said to be a form of *G. montanum*; also has been referred to *G. coccurum* Varietal names listed are magnificum, spléndens, supérbum.

hybridum; probably a form of the hybrid between G. montanum and G. rivale.

Iánkæ. Hybrid between G. coccineum and G. rivale: fls. large, yellow.

japónicum. To 3 ft.: lvs. with a large heart-shaped 3-5-lobed terminal lft, and small lateral lfts.: fls. yellow. Japan. Kolbianum: G. rhæticum.

macrophfilum. To 3 ft.: lvs. with large 3-7-lobed terminal lft. and 3-6 main lateral lfts.: fls. yellow, to ¾ in. across. N. Amer., N. Eu.

magellánicum. To 2 ft.: basal lvs. with very large lobed terminal lft. and small lateral lfts., hairy: fls. yellow, to 1 in. across. S. S. Amer.

magnificum splendens is listed as having orange-red fis.; probably a form of G. chiloense.

montanum (Scrersia montana). To 1 ft.: lvs. with large terminal heart-shaped lft. and much smaller lateral lfts.: fls. golden-yellow, to 1½ in. across. S. Eu. Var. máximum is advertised.

Péckii (Sieversia Peckii). To 2 ft.: lvs. with large orbicular toothed terminal lft. and few or no lateral lfts.: fls. yellow, to 1 in. across. Me., N. H.

pentapétalum. To 6 in., with ascending or decumbent

branches. lvs. with 5-7 obovate-oblanceolate serrate lfts.: fls. white, about 1 in. across. Aleutian Isls., E. Siberia,

pyrenaicum. To 1½ ft.: lvs. with large heart-shared toothed terminal lft. and smaller lateral lfts.: fls. yellow, nodding. Pyrenees.

réptans (Sieversia reptans). To 6 in., with long runners: lfts.: fls. yellow, to 1 1/2 in. across. Eu.

rhæticum (G. Kolbianum). Hybrid between G. montanum and G. reptans. fls golden-yellow.

rivale. To 3 ft.: lvs. with terminal and 2 upper lateral lfts. much larger, toothed and lobed: fls. purplish, nodding, to 1 in. across. N. Amer., N. Eu., Asia.

Róssii (Sieversia Rossii). To 7 in.: radical lvs. interrupted-pinnate and glabrous, the lfts. 3-lobed: fls. yellow, 1 to a st. Arctic regions.

rubéllum: name sometimes applied to hybrid between G. rwale and G. urbanum, with petals salmon-pink.

sibfricum: hort, name: fls. bright red, copperv: to 10 in. strictum: G. aleppicum var.

sylváticum. To 2 ft.: radical lvs. with few lateral lfts. and a large cordate elongate-ovate terminal lft: sts. 1-, rarely 2-fld; fls. yellow, to 1 in. across. Ibernan Peninsula,

Morocco. tirolénse. Reported as a hybrid between G. montanum

triflorum (G. cılıatum. Sieversia ciliata). To 1½ ft.: lvs. of numerous lfts. deeply cut into linear-lanceolate silkyciliate segms: fls. purplish, to ¾ in. across. N. Amer.

turbinatum (Acomastylis turbinata). To 1 ft.: lvs. pinnate into 11-33 segms. fls. yellow, ¼ in. long. Mont. to Ariz.-Probably a geographical var. of G. Rossii.

urbanum. To 2 ft: lvs. with coarsely toothed often 3-parted lfts.; fls. yellow, about 1/2 in. across. Eu., Asia.

GEVUINA (also but not originally spelled Guevina). Proteacex. One evergreen tree native in Chile and occasionally grown in S. Calif. G. Avellana. Chilean Nut. Chile Hazel. To 40 ft.: lvs. alternate, odd-pinnate, shining: fls. white, in axillary racemes: fr. coral-red, about size of cherry, the seed with edible kernel.— Propagated by seeds or cuttings of green wood under glass.

GHERKIN: Cucumis.

GIBBÆUM. A Mesembryan-Aizoaccæ. themum segregate comprising tufted succulents having an ovoid or globose body unequally lobed or notched and bearing stalked fls. in the fissure; petals numerous; stigmas 6-7. S. Afr.

álbum. Growths crowded, of 2 lvs. pressed together to form an ovoid body to $1\frac{1}{2}$ in. long, 1 in. wide and $\frac{3}{4}$ in. thick, whitish and velvety; fis. white, 1 in. across.

Comptonii (Rimaria Comptonii). Plant-body 1 in. long and 1/4 in. thick, united about half way, glaucous: fis. rose, 1 in. across.

dispar. Growths of 2 unequal lvs. pressed together to form an obliquely globose body to ¾ in. long and 1 in. across, densely grayish-pubescent: fis. lilac-pink, ⅓ in.

geminum. Branches prostrate, to 3 in. long: growths cylindrical, to 1 in long and $\frac{1}{4}$ in. thick, with a fissure below middle, velvety, whitish-green: fis. magenta, $\frac{1}{4}$ in.

gibbòsum (M. gibbosum). Sts. prostrate, 1 in. long: lvs. semi-terete, yellowish-green: fls. reddish, ½ in. across.

Hèathii (M. Heathii. Rimaria Heathii). I.vs. pressed together into an obovoid body to 1¾ in. high, 1¼ in. wide and ¾ in. thick, whitish-green: fls. white, 1½ in. across.

Lickhoffii. Plant-body about ½ in. long and thick, united about half way, glaucous: fls. rose, ¾ in. across.

mölle. Plant-body 1 in. wide and ¾ in. thick, with small notch, light green, soft: fls. rose, 1 in. across, stamens white.

Nélii. Forming dense clumps: lvs. about 1 in. long and $\frac{1}{2}$ in. wide and thick, gray-green: fis. red, 2 in. across.

pachypodium (M. pachypodium). Growths to 4 in. long and $\frac{1}{2}$ in. thick, covered with soft gray pubescence; fis. pale rose, 2 in. across, on stalks to 4 in. long.

perviride (M. perviride). Forming clumps, sts. short, prostrate: plant-body 1½ in. long and about ¼ in. wide and thick, deep green: fis. red.

petrénse (Argeta petrensis). To $1\frac{1}{2}$ in.: lvs. short and thick, to $\frac{1}{2}$ in. long and wide and $\frac{1}{2}$ in thick, whitishgreen: fis. solitary, nearly sessile, rosy-purple, 1 in. across; stigmas 6. filiform.

pilósulum (M. pilosulum). Growths to 1½ in. long and 1½ in. thick, unequally lobed in upper part, pubescent: fls. rose-pink, ½ in. across, stamens white with yellow anthers.

pubescens (M. pubescens). Growths to 1½ in. long and 1½ in. thick, unequally lobed, silvery-pubescent: fis. rosepink, 1½ in. across, stamens white.

velitinum (M. relutinum. Mentocalyx velutinus). Lvs. pressed together and erect when young, becoming spreading, of unequal size, to 2½ in. long, 1¾ in. broad and 1 in. thick, dull green and velvety: fis. white or pinkish, fragrant, to 2 in across.

GÍLIA. Polemoniacex. Herbs with alternate entire or divided lvs. and blue, yellow, pink or white funnelform or salverform fls.; grown in the flower-garden, mostly annuals. Of easy cult. Seeds are sown where plants are to grow, in sunny open places. As treated here the genus includes Hugelia, Leptodactylon, Linanthus and

abrotanifòlia. Ann. to 2 ft.: lvs. 3-pinnately dissected into very narrow segms.: fls. pale blue, in dense terminal clusters. Calıf.

achilleæfðlia. Ann. to 2 ft., glandular-pubescent: lvs. 2-pinnately dissected into linear segms.: fls. blue, in dense terminal clusters. Calif.

aggregata. Scarlet G. or Skyrocket. Per. or bien. to 21g ft.: lvs. 1-2-pinnately dissected into linear segms.: fls. scarlet varying to white, in a long thyrse. W. N. Amer. Var. Bridgesii is a low form, to 6 in. high. Mts, Calif.

androsacea (Linanthus androsaceus). Ann. to 1 ft.: lvs palmately divided, segms. filiform: fls. white, pink, violet or yellow, salverform, to 1 in. long, in dense heads. Calif.

attenuata. Per. to 3 ft.: lvs. with linear-mucronate divisions, upper ones glandular-pubescent: fts. white, corolla-tube often pinkish, to 134 in long, with acuminate lobes, infl. thyrsiform. Wyo., Colo.

aureus). Ann. to 8 in.: lvs of 3-5 palmate oblong lobes, opposite: fls yellow, throat brownish, to 14 in. long, in cymes. Calif., Nev., N. Mex.—A form with white to violet fls. is known.

califórnica (Leptodactylon californicum). PRICKLY-PHLOX. Shrub to 3 ft.: lvs. palmately divided into 5-9 rigid linear lobes 1/2 in. long; fis. rose or lilac, 11/2 in. across, in few-fid. clusters. Calif.

capillaris (G. leptalea). Much branched erect ann. to 6 in., glandular-puberulent: lvs. linear-lanceolate, to ¾ in. long: fls. white to pale pink, about ¼ in. long, solitary in axils, funnelform. Wash. to Calif. and Nev.

capitata. Ann. to 2½ ft.: lvs. 2-3-pinnately dissected into linear segms.: fis. light blue, in heads about 1 in. across at end of naked peduncles. Wash, to Calif.

coccinea: Collomia biflora.

congésta. Per. to 8 in., webby-hairy: basal lvs. simple, to 2 in. long, st.-lvs. pinnately divided: fls. white, to ½ in. long, leafy-bracted, in head-like infl. S. D. to Sask., Wyo. and B. C.

coronopifòlia: G. rubra.

densifiora (Linanthus grandiflorus. Leptosiphon densiflorus). Ann. to 2 ft.: fis. lilac or pink to white, funnelform, to 1 in. long, in dense heads, corolla-lobes broadly obovate, tube short and tapering. Calif.

densifòlia (Hugelia densifolia). Per. to 2 ft., woollytomentose when young: lvs. linear and rigid, entire or lobed: fls. deep blue, in dense clusters, corolla-lobes linear-oblong, tube slender. Calif.

diantholdes (Fenzlia dianthiflora. Linanthus dianthiflorus). Ground-Pink. Ann. to 6 in., tufted: lvs. entire, thread-like, to 1 in. long: fls. lilae or pink varying to white, funnelform, \$4 in. long, in few-fld. clusters, corolla-lobes toothed. S. to Lower Calif.

dichôtoma (Linanthus dichotomus). Evening-Snow. Ann. to 1 ft.: fls. white with brownish-purple throat, tubular-funnelform, to 1¼ in. long, in few-fld. clusters. Calif.

globularis. Per. to 6 in , sts. densely woolly: lvs. entire pinnatifid, linear to oblong, to $2\frac{1}{2}$ in. long: fls. white. Mts., Colo.

grandiflora: Collomia grandiflora; see also G. densiflora.

lacinièta. Ann. to 8 in.: lvs. 2-pinnately dissected into linear segms.: fis. rose, blue, pale lilac to white, in few-fid. clusters. Peru, Chile, Argentina.

leptalea: G. capillaris.

leptomèria. Ann. to 8 in.: lvs. linear-oblong, to 2 in. long, pinnately lobed or toothed, mostly basal, glandular-pubescent: fis. white to pale rose, to ½ in. long. Ore., Calif., Colo. and N. Mex.

linearis: Collomia linearis.

liniflora (Leptosiphon liniflorus. Linanthus liniflorus and phirnaceoides). Ann. to 1½ ft.: fis. white or blush, funnelform, ½ in. long, in a panicled cyme. Calif.

longiflora. To 20 in.: lvs. entire or pinnatifid with filiform lobes: fig. white to somewhat bluish, to 1% in. long. Neb. to Utah, south to Ariz. and Tex.

Neb. to Utan, south to Ariz. and Tex.

litea (Leptosphon and Linanthus parviforus. G. micrantha). Erect often bushy ann. to 5 in.: Ivs. palmately divided into 3-7 linear lobes: fls. yellow, white or rose-pink with yellow center, salverform, tube about \(^3\lefta-1\)\/\text{in. long, corolla \(^1\)\/\text{in. across, in heads, calyx-lobes linear and pungent. Calif —Forms of this species are sold as Leptosiphon aureus, hybridus, luteus and roseus.

micrántha: G. lutea.

montana (Linanthus montanus). Per. to 10 in., base usually woody, much branched, sts. erect or ascending: lvs. palmately lobed or divided, webby-hairy: fis. white, to ½ in. long. Utah to Ida., Calif. and Ore.

multicaulis. To 1½ ft., branching from base: lvs. pinnately parted into linear segma.; fls. blue or pinkish, in few-fld clusters. Calif.

multiflora. Plant many-stemmed, to 2 ft., sts. gray-hairy: lvs. usually pinnately 3-7-parted, lobes linear, upper ones sometimes entire: fts. purplish or bluish, about ½ in. long. W. Tex. to Ariz.

nivalis: a white-fld, form of G. tricolor.

nudicaulis (Gymnosters nudicaulis). Ann. to 4 in.: bracts under fls. lanceolate, to ¾ in. long: fls. white or yellowish, ½ in. long. Ore., Ida., Nev.

Nútallii (Leptodactylon Nuttallii). Per. to 9 in., with woody base: Ivs. simple or palmately divided into 3-7 linear or lanceolate lobes, to ¾ in. long; fls white, rarely rose, ¼ in. long, in clusters or sometimes solitary. Calif.

parviflòra: see G. lutea.

pulchélla. Skyrocket. Per. to 2 ft.: lvs. pinnately dissected into linear segms.: fls. crimson to white, in a narrow panicle. Mont. to Wash.

pringens (Leptodactylon pungens). Per. to 6 in., with woody base, densely leafy: lvs. palmately divided into 3-5 lobes, to ½ in long: fls. white, pink or yellowish, ¾ in. long, solutary. Ore. to Calif. and Nev.

rigidula. Per. to 1 ft.: lvs. pinnately divided into linear rigid segms.: fls. blue, rotate, scattered. Tex. to Mex.

rubra (G. coronomfolia. Ipomopsis auarantiaca, elegans and sanguinea). Standing-Cypress. Bien, or per. to 6 ft.: lvs pinnately dissected into needle-like segms.: fls. scarlet, yellow dotted with red inside, in a narrow terminal paniele. S. C. to Fla. and Tex.

squarrosa (Navarretia squarrosa). Skunkweed. Ann. to 1 ft: lvs. to 1½ in. long; fls. blue, ½ in. long, the calyx-lobes spine-tipped. B. C. to Calif.

tenuiflora. Ann. to 3½ ft.: lvs. mostly basal, 1-3-pinnatifid into narrow segms to 10 in. long: fls. lilac to magenta, to ¾ in. long, in open panicles, corolla tubular-funnelform with broad lobes. Calif.

tricolor. Birds-Eyes. Ann. to 21/2 ft.: lvs. 2-pinnately dissected into linear segms.: fls. with lilac or violet lobes, yellowish tube and throat marked with purple, borne in loose clusters. Calif. Var. rosea has rose fis.

virgàta (Hugelia virgata). Ann. or bien. to 15 in.: lvs. filiform, the upper 3-parted, to 1 in. long: fis. blue with yellow throat, to 33 in. long. Calif.

GILIBÉRTIA. Araliacex. Shrubs or trees with simple, entire or 3-lobed lvs., small fis. in umbels, and berry-like frs.; grown under glass or in the open far S. For cult. see *Polyscias*.

japónica (Dendropanax japonicum). Lvs. entire or 3-lobed, about 3 in. long: fis. in umbels about 1 in. across. Japan.—Planted in Calif.

GILLÈNIA (Porteranthus). Rosaceæ. N. American per. erect branching herbs with 3-lobed or -parted lvs. and white or pinkish long-stalked fis. in terminal panicles; grown in the wild- or about rock-gardens and of easy cult. Propagated by seeds and by division.

stipulàta. American Ipecac. To 4 ft.: lfts. cut-lobed, the stipules broad and leaf-like: fls. to ½ in. across. N. Y. to Ga. and La.

trifoliata. Indian Physic. Similar to preceding but

lfts, toothed and stipules small and awl-shaped. Ont. to Ga. and Mo.

GILLIFLOWER: Mathiola incana.

GILL-OVER-THE-GROUND: Nepeta hederacea.

GINANNIA: Holeus.

GINGER: Zingiber. Wild: Asarum.

GÍNKGO. Ginkgoaceæ. One deciduous resinous tree native in China, G. bíloba (Salisburia adiantifolia), the Maidenhair-Tree. To 120 ft.: lvs. fan-shaped, long-stalked, cut or divided in middle: staminate fls. in catkins: frs. drupe-like, long-stalked, yellowish. Hort. forms are: aurea with bright yellow lvs.; fastigiata of pyramidal habit; laciniata with deeply divided lvs.; macrophylla with larger lvs.; pendula with pendulous branches; variegata with lvs. variegated yellow.— Grown as a street or ornamental tree, hardy N. and of easy cult. in good soil. Propagated by stratified seeds, layers, cuttings, and named vars. by grafting and budding. The pistillate tree is undesirable because of the strong-smelling frs., and propagation by cuttings rather than by seeds is, therefore, sometimes advised.

GINKGO FAMILY. Only GINKGOÀCEÆ. 1 genus of 1 species, Ginkgo, grown for ornament. The family was founded in 1897; the genus had theretofore been placed in the Coniferæ. In geologic times the ginkgoes were widespread in several species.

GINSENG. Two woods species of Panax (which see) grown for the roots which are much prized by the Chinese for medicinal uses. The native American species is chiefly grown or gathered in the United States and Canada for export. The plants are readily raised when provided with shade and constant moisture, but in land well drained of surface water. Slat or lath sheds afford good sun protection. The soil should be fertile and deep for the production of the best roots. The plant is grown from seeds that are commonly stratified or buried about a year and then sown in beds; but a good proportion may germinate the first year if sown as soon as ripe and not allowed to become dry. Autumn or spring are proper times for transplanting to permanent quarters, where the plants may stand 4 or 5 inches apart in either direction. The root matures for market in about five years; but some of the profit in ginseng culture has come from raising seeds, which should be produced rather freely at three years and abundantly at five years and thereafter; and seedlings may be sold at one and two years old.

GIRASOLE is the plant commonly known as Jerusalem artichoke but it is not an artichoke and has nothing to do with Jerusalem: it is supposed that Jerusalem, in this relation, is a corruption of the Italian name girasole. The plant is a stout tall-growing perennial, Helianthus tuberosus (which see), hardy throughout the country. The "artichokes" are the subterranean potato-like tubers which are nutritious alike to man and beast. It persists and becomes a weed unless the ground is completely cleaned of tubers when the crop is harvested. Propagation is by the tubers, planted in autumn or spring. On good ground the crop needs little attention except to keep down the competing weeds. The yield is heavy and should be valuable.

GLABROUS: not hairy or pubescent or tomentose; incorrectly used in the sense of smooth (not rough).

GLADIOLUS. GLADIOLUS, GLADIOLI. Iridacex. Cormous plants of perhaps 200 species, abundant in S. Afr. and others in trop. Afr. and Medit. region, now very popular for summer and autumn bloom and also for earlier flowering under glass. Many specific names are known to be in the country, as recorded below, but the common garden or hortulan gladiolus does not now represent a single species in its original form, but a modification or probably a series of blends of a few species that were early introduced to cult, or that have proved to be specially useful for horticultural purposes. It is probable that G. blandus, G. cardinalis, G. dracocephalus, G. psittacinus, G. purpureoauratus, G. oppositiflorus, G. Saundersii, G. primulinus have mostly contributed to the origin of the common hortulan gladioli. One of the early forms, a reputed hybrid, was G. gandavensis; and subsequently as the complexion of the modified hortulan kinds began to assume its present character, such names as G. hybridus, G. Lemoinei, G. Nanceianus, G. Childsii, G. Froebelii, G. turicensis and G. princeps were current but they are of little interest to contemporaneous growers. The kinds of hortulan gladioli are numerous now and of great excellence, the merits residing particularly in the shape of the flower, its size and color and markings, substance, season, keeping qualities, size and character of spike. With the exception of G. primulinus, in various degrees of modification, one does not now recognize straight botanical species in the common garden gladioli. In recent years many species have been intro. from Afr. by seeds. This important group of plants is represented in the American Gladiolus Society and the New England Gladiolus Society.

The flower of the gladiolus is borne from a green spathe of two leaves or valves. The perianth has 6 colored parts all united below into a tube which is mostly curved; the 3 upper parts or segments are larger than the 3 lower and often arched or hooked over them. The stamens are 3, attached deep in the tube, and the anthers are long and slender. Stigmas are 3. The ovary is inferior, 3-celled, ripening into a 3-valved

many-seeded capsule.

Gladioli are tender and should be grown between the spring and autumn frosts, although the corms often persist even in northern states if well protected with ground covering. Open sunny exposure is best. Strong corms set in good earth the first of May yield plants that should begin to bloom by late July or the first of August. The ground should be well prepared and have good drainage. The use of stable manure the year previous should produce The use of stable manure the year previous should produce good results, but it should not be applied with the corms. The corms are planted as soon as the ground becomes warm, or in succession for later bloom, 3 to 6 inches deep; the greater depth is advisable only on warm open land and with strong corms; the plants usually stand up better with the deeper planting. For strong specimen spikes the plants may go 5 to 8 inches apart, but for mass effects they may be grown twice as thick. Planted 5 inches deep and 3 to 5 inches apart, the plants probably will not require staking. If considerable quantities are to be grown, the plants may be in rows that are wide enough apart to allow of easy tillage by hand or horse.

Before freezing weather the plants are lifted, the tops

tillage by hand or horse.

Before freezing weather the plants are lifted, the tops are removed, and the corms are stored in a cool dry place until spring. See that the corms are firm, clean and dry and well cured before being put away.

Named varieties or particular colors are propagated by means of the cormlets that form around the old corms or bulbs. The cormlets are planted in drills in spring, taken up in autumn and stored as are the regular flowering corms. In the second or third year the plants should bloom. New varieties or strains are grown from seeds, which are sown and plants handled as are the cormlets. The gladiolus is well adapted to use as cut-flowers.

The flowers open in the morning, and then the spike may be cut before it has bloomed much, with a long stem. Remove the old flowers. Provide fresh cool water daily, cut off a little of the stem end, and all the buds on the spike will open.

Ackermanii: listed name of unknown botanical standing.

alâtus. Little plant, to 1 ft. or less: lvs. linear and rigid, basal or 2 or 3 on st.: fls. 3-5, dark red and pink, segms. very unequal, lower segms. green and pink, upper segm. to 1½ in. long. S. Afr. Var. namaquensis G. namaquensis) is somewhat more robust with flame-colored fls.

aléppicus. To 3 ft.: lvs. grass-like: fls. dark purple or violet, on a one-sided 5-7-fld. spike. Palestine.

anatólicus: listed name.

angústus. Sts. simple, 2-3 ft.: lvs. linear, to 2 ft. long and ½ in. or less broad: fis. 2-6, long-tubed, white, 3 lower segms. purple-marked. S. Afr.

blandus. Sts. to 2 ft. long, sometimes branched: lvs. about 4, to 1 ft. long and ¾ in. wide: fts. 4-8, white and red-tinged, sometimes pure white and sometimes pink, segms. acute, upper one ¾ in. broad and others narrower. S. Afr.

brenchleyénsis: a hort, form closely allied to G. gandanensis

brevifolius. St. to 2 ft.: lvs. mostly basal, linear, to 2 ft. long: fls. 4-12, pink or lilac, the curved tube ¾ in. long and about equalling segms., lower segms. marked purple in throat. S. Afr.

byzantinus. Resembling G. communis but more robust, with larger dark purple fls., lower segms, with white central line. Medit. region.

callistus. Stout, to 3 ft. and more; allied to G. blandus, callistus. Stout, to 3 ft. and more; allied to G. blandus, but differs in greater size, more robust branched infl., 3 upper segms. blotched at throat, anthers declined and violet: lvs. plane, glabrous, ensiform: pernanth-tube somewhat curved, segms. white with pale rose tint, the 3 upper ones with red spots. Cape Province.

cardinalis. Sts. to 4 ft. long: lvs. 2-3 ft., glaucous-green; fis 5-10 or more, bright scarlet and crimson, upper segm, lurgest and hood-shaped, lower ones white-blotched. S. Afr., sometimes hanging from cliffs.—Early intro. to cult. and supposed to be one of the parents of G. gandavensis. Var. élegans is a hort. form.

carmineus. St. to 1½ ft.: lvs. linear, to 8 in. long: fls. 3 in. across, carmine, tube white outside, two of inner segms. with dark pale-centered spot. S. Afr.

Cólvillei. Rather small, very early flowering, spikes short: fls open or flaring with pointed segms., scarlet with oblong blotches at base. Hybrid G. tristis var. concolor with pollen of G. cardinalis, one of the earliest garden forms. Var. álbus, The Bride, has white fls. This old strain is still in cult.; hardy in the middle S. There are several forms of it.

communis. St. to 2½ ft.: lvs. 3 or 4, about 1 ft. or less long: fis. 4-8, about 1½ in. long, narrow, bright purple, segms, nearly equal in length, anther shorter than filament. France, Germany; hardy in middle sections.

Cooperi. Much like G. psittacinus, but perianth-tube longer and segms. more acute. S. Afr.

crassifolius. St. to 3 ft.: lvs. 6, to 2 ft. long, stiff, with thick ribs: fls. numerous, bright red, 1 in. long, curved tube and segms. nearly equal. S. Afr.

cuspidatus. St. simple, 2-3 ft.: lvs. 3 or 4, linear and rigid, to 2 ft.: fls. 4-8, white or pale pink, tube 2-3 in. long and segms. shorter, 3 lower segms. purple-blotched. S. Afr.

Davisonies. Lvs. sword-shaped or linear-lanceolate, sparingly minutely pubescent, 10-12 in. long and to ½ in. or more broad, mostly basal: spike simple, to 10 in. long, 7-11-fid., the fis. nearly erect, rose-colored, the 3 inferior segms, somewhat lined and spotted and about 1 in. long. Cape Province.

debilis. Very slender, simple, to 1½ ft.: lvs. 3, with long point, one of them equalling or exceeding the st.: fls. 1-3, white, two of segms. with lilac or red spot, segms. about ½ in. long. S. Afr.

dracocéphalus. St. simple, 2 ft. or less: lvs. to 1½ ft. long and 1 in. broad: fls. few, yellowish-green and spotted dull purple, tube much curved and 2 in. or less long, upper segms. hooded and to 1 in. broad. S. Afr.

formosus. St. to 2½ ft.: lvs. narrow-linear, to 1 ft. long: fis. mauve-purple, tube ½ in. long, segms. to 1½ in. long. S. Afr.

gandavénsis. An old garden form that long persisted and plants of similar character are yet seen: sturdy late-blooming plant with broad lvs.: spike dense and rather long; fls. of medium size, bright red and red-yellow, streaked and pencilled, the upper segms. honzontal or hooded. Hybrid, G. psittacinus being stated as one parent and G. cardinalis the other, but G. oppositifolius may be involved; important foundation of much later breeding.

grácilis. St. very slender, to 2 ft.: lvs. 2-3, linear and

apparently terete, rigid: fls. 2-5, fragrant, pale blue or hlac, segms. unequal, limb to 1½ in. long, the lowest longest and prominently cuspidate. S. Afr.

grandis. St. slender and terete, to 2½ ft.: lvs. 2-3, linear, strongly ribbed, to 1½ ft. long: fis. 1-5, fragrant, yellowish and tinged purphish-brown, tube to 2½ in. long and segms. shorter. S. Afr.

hirsûtus. St. hairy, simple, to 2 ft.: lvs. 4-6, rigid and very strongly ribbed, short, hairy: fls. 3-6, bright red, tube 1½ in. long and segms. of similar length. S. Afr.

1½ in. long and segms. of similar length. S. Afr. hortulanus. Hortulan or Garden Gladioli. An inclusive group, for the prevailing cult. kinds of gladiolius to which no recognized botonical specific name will now apply, which cannot be included in any of the species. They are perhaps descendants more or less directly from G. psitacanus, variously obscured and modified. They are large strong very floriferous plants of sturdy growth, and heavy soikes of fls. in many shades and markings, but most of them with tints of Illac and violet, the upper segms. Sometimes hooded and often the fl. spread wide open. There are hundreds of named vars, or seedlings.

ignescens. Much like G. psittacinus in fl., but with very long narrow lvs. which are 5 or 6 and nearly or quite basal: st. 2-3 ft.: spikes 2-4-fld., very open: pernanth scarlet, 3 m long, the upper segm. horizontal. Madagascar.

ill fricus (G. Reuteri). To 1½ ft. or more: 1vs. 6-10 in. long, slender, sheaths 2-edged: fls. 4-8, reddish changing to bluish, the basal segm somewhat acute and exceeding the obtuse lower lateral segms., anthers shorter than filaments. Eu.

imbricatus. To nearly 3 ft.: lvs. 2 or 3, one of them developed into a rather broad ribbed blade about equalling st: fls. 6-10, purple-red, opening wide, lower segms. with lighter marks, anther shorter than the filament. Eu.

inflatus. Lvs. 3, very narrow or subterete and rigid, the longest exceeding the st.: fls. 1-4, pink, the curved tube to 1 in. long, and the limb of equal or somewhat greater length, 3 upper segms. to 34 in. broad. S. Afr.

Leichtfinii. St. 2 ft.: lvs. 4, about 12 in. long and less than 1 in broad: fls. 6-8, bright red, the 3 lower smaller segms. red at tip, then yellow, and bearing nunute red spots. Transvaal.

Mûrielise (Acidanthera Murieliæ of hort.). To 3½ ft.: lvs to 2 ft long and 1½ in. wide, erect: fls. cream-white suffused pink toward base, corolla-tube to 5 in. long, curved, slightly fragrant. Abyssima.

namaquénsis: G. alata var.

nanus: Babiana pygmæa.

odoratus. Hybrid between G. hirsutus and G. Spofforth-

oppositifiorus. St. 3·4 ft., sometimes branched: lvs. about 4, to 1½ ft. long and 1 in. broad: fis. many in a 2-sided spike, white, about 3 in. long, segms, acute. S. Afr.

orchidiflorus. St. mostly simple, to 1½ ft.: lvs. 3 or 4, linear, to 1 ft. long: fls. 4-6, greenish-yellow, tube ½ in. long, upper segm. hooded and 1 in. long, 3 lower ones de-

rong, upper segm. noorded and 1 in. long, 3 lower ones decurved. S Afr.

paláster (G. triphyllus). To 1½ ft.: lvs. about 3, lowest one rather broad, ribbed, and about equalling the st.: fls. 3-5, purple-red, with short curved tube and lower segms. rather longer, perianth not flaring, anther shorter than filament. Eu

permeábilis. St. to 2 ft.: lvs. 3-4, to 1 ft. long: fls. pink or hlac, curved tube ½ in. long, segms. ¾ in. long. S. Afr.

præcox: Anapalina revoluta

primctinus. St. 24 ft., stout: lvs. about 3, to 1½ ft. long and 1 in. broad: fls. 3-5, primrose-yellow throughout, upper segms. hooded and 2 in. long and more than 1 in. broad, 3 lower much smaller and deflexed, central upper segm. drooping like an eye-lid. Rain-forests, trop. Afr.—Now entering into horticultural kinds with notable results. See G. Quartinanus.

princeps: listed name of unknown botanical standing.

psittácinus. St. 3-4 ft.: lvs. about 4, rigid, to 2 ft. long and 2 in. broad: fts. several or many, 3 in. or more long, upper segms. hooded and dark crimson, lower much smaller mixed red and yellow. S. Afr.—Early cult.

Quartinianus. St. 2-3 ft., strong: 1vs. 3 or 4, rigid, to 1½ ft. long and ¾ in. broad: fls. 6-9, blood-red to pale yellow, 3 in. or more long, upper segms. hooded, lower ones deflexed and much smaller. Trop. Afr.—G. primulinus is thought by some to be a color form of this species.

recurvus. St. slender, to 2 ft.: lvs. 3, middle one 1 ft. or more long, lowest little more than a sheath: ffs. 3-6, fragrant, about 3 in. long, 3 upper segms. broad and lilac, lower segms. yellow with mauve or lilac markings. S. Afr.

Reuteri: G. illyricus.

Saundersii. St. 2-3 ft.: lvs. 4-6, strongly ribbed, to 2 ft. long and 1 in. broad: fls. 6-8, bright scarlet with large white blotch on 3 lower shorter segms., upper segms. acute and 1 in. broad. S. Afr.

ségetum. Cornflag. St. 2 ft. and more: lvs. 3 or 4, about 1 ft. long: fls. bright purple, open or flaring, the segms. obovate-obtuse, anther longer than filament. Medit. region: sometimes seen S.

Stánfordiæ. Fls. delicate pink with yellowish-white on lower segms., 2 in. long, tube very short, lower side segms. shorter than middle one. S. Afr.

triphýllus: G. paluster.

tristis. St. simple, to 2 ft.: lvs. 3, terete, to 1½ ft. long, 3-5-ribbed: fls. 3 or 4, fragrant, yellowish-white with purplish on the keels, the curved tube to 2 in. long. Var. concolor. Fls. nearly or quite white. S. Afr.

undulatus. Little plant, 1 ft. high: lvs. 4-6, to 1 ft. long and ¾ in. broad: fis. 4-6, about 3 in. long, milk-white with red keels. S. Afr.

villosus. St. simple, to 2 ft.: lvs. 3, the lower without blade, the others to 1 ft. long and linear, sheaths hairy: fls. 3 or 4, bright red or lilac, about 2 in. long. S. Afr.

Watsonius. St. very slender, to 1½ ft.: lvs. about 3, one of them with blade to 1 ft. long, the others little more than sheaths: fis. 1-4, bright red, the curved tube to 2 in. long, wide open, the segms acute. S. Afr.

GLAND: properly a secreting part or prominence or hair or appendage, but often used in the sense of gland-like.

GLASSWORT: Salicornia

GLAUCÍDIUM. Ranunculacex. herbaceous genus native in Japan and China. having alternate lvs., solitary fls. with 4 petal-like sepals, no petals, and numerous stamens, and fr. a follicle. One species is sometimes grown in the rock-garden.

palmatum. Per. to 2 ft, and more: lvs. palmately lobed, maple-like: fls. rich violet, large. Japan.

GLAÚCIUM. HORNED-POPPY. SEA-POPPY. Papaveracex. Glaucous herbs with orangecolored juice, lobed or dissected lvs., and large yellow or red solitary fis.; grown as annuals in the flower-garden. They thrive in any garden soil in sunny locations. Propagated by seeds.

anatalyénsis: listed name of unknown botanical standing. corniculatum (G. phaniceum). Ann. to 11/2 ft.: fls. red with black spot at base of each petal: fr. bristly-hairy, linear. Eu

Fischeri: an invalid name of no known botanical stand-

flavum (G. luteum). Per. or bien. to 3 ft: fls. golden-yellow or orange, 2 in. across. fr. linear, to 1 ft. long. Eu; nat. in E. N. Amer Var. Seuperi (G. Seuperi) has violet spots at base of yellow petals. Var. tricolor has particolored fls.

leiocárpum. Per. to 11/2 ft.: fls. yellow: fr. to 4 in. long. Medit. region.

lûteum: G. flavum.

phœniceum: G. corniculatum.

rubrum: probably a hort. form of G. corniculatum

Seuperi: G. flavum var.

squamigera. Ann. to 1½ ft.: basal lvs. lyrate-rinnatifid, petioled, st-lvs usually trifid, sessile: fis. orange: fr. bristly-hairy. Caucasus, Russia.

tricolor: G. flavum var.

GLAUCOTHEA: Eruthea armata.

GLAUCOUS: covered with a "bloom" or a whitish substance that usually rubs off. See Prunose.

Primulacex. One succulent but not showy closely lvd. per. herb native in saltmarshes and sea-coasts of the northern hemisphere. G. maritima. To 1 ft., pale or glaucous: lvs. opposite, oval or oblong, to $\frac{1}{2}$ in. long: fls. with purplish cr white calyx and no petals, very small, solitary in the axils; sometimes planted in brackish places.

GLAZIOVA: Syagrus.

GLECOMA: Nepeta hederacea.

GLEDÍTSIA. HONEY LOCUST. Leguminosæ. Large broad-headed deciduous usually spiny trees with pinnate lvs., small greenish polygamous fls. mostly in racemes, and large flattened pods.

Honey locusts are planted as specimens and for shade; they are adapted to most soils, but G. sinensis and G. japonica are not hardy North. Propagated by seeds which should previously be soaked in hot water, or rare varieties may be grafted on G. triacanthos.

aquática (G. monosperma). WATER OF SWAMP LOCUST. To 60 ft., with simple somewhat flattened spines to 5 in. long: pods oval, 1-2 in. long, usually with 1 seed. S. C. to Fla. and Tex.

cáspica. To 40 ft., very spiny: pods to 8 in. long, curved. W. Asia.

elegantissima: a bushy unarmed form of G. triacanthos, horrida: G. taponica.

japónica (G. horrida). To 70 ft., with simple or branched somewhat flattened spines to 4 in. long; pods to 1 ft. long, twisted. Japan, China.

koraiénsis: listed name, probably referable to G. iaponica.

macracántha. To 50 ft., with large spines: pods to 1 ft. long, somewhat convex. China.

monospérma: G. aquatica.

sinensis. To 40 ft., with conical often branched spines: pods to 7 in. long, almost straight. China.

texàna. Hybrid between G. triacanthos and G. aquatica: pods to 5 in. long, straight.

triacánthos. Sweet Locust. To 140 ft., with simple or 3-branched spines to 4 in. long, unarmed in var. inermis: pods to 1½ ft long, becoming twisted Pa. to Fla. and Tex. Var. Bujótii has drooping branchlets.—In the Middle West pods are ground into livestock feed, being highly nutritious; heavy bearing hort. vars. have been developed.

GLIRICÍDIA. Leguminosæ. Trees and shrubs native in trop. Amer., with pinnate lvs., papilionaceous fls. in racemes, and flat pods with thickened margins; grown for ornament in warm regions and along roadsides and boundaries.

maculàta: G. sepium.

sèpium (G. maculata). MADRE. To 30 ft.: fls. pink, or lilac, and white, in profusion in spring before the lvs.: pods to 5 in. long. Cent. Amer., Colombia.

GLOBE-FLOWER: Trollius europæus.

GLOBULÀRIA. Globulariaceæ. Herbs and subshrubs with alternate lvs. and small fls. in globular heads; native mostly in the mts. of S. Eu. and Asia. Adapted to the rock-garden where they need partial shade and well-drained soil. Propagated by seed or division.

Alfpum. To 2 ft., shrubby: lvs. oblong, 3-toothed at apex or entire: fis. violet-blue, the heads to 3/4 in. across. S. Eu.

bellidifòlia. Much like G. cordifolia but lvs. not notched at tip; perhaps a var. of that species.

cordifolia. Prostrate subshrub to 4 in.: lvs. obovate or spatulate, about 1 in. long, notched only at tip: fis. blue, the heads about ½ in. across. S. Eu.

incanéscens. Per. to 4 in.: lvs. nearly orbicular, notched at apex: fis. blue, upper lip undivided, the heads about ½ in. across. Italy.

nàna: G. repens.

nudicaulis. Per. to 10 in.: lvs. obovate, to 3 in. long, entire: fis. blue, the heads to 34 in. across. S. Eu.

rèpens (G. nana). Prostrate, sts. woody: lvs. club-shaped, entire, ½ in. or less long: fls. bluish, the heads ½ in. across. S. Eu —Much like a dwarf G. bellidifolia; variable in cult., and the tiny plant is not frequent.

trichosántha. GLOBE-DAISY. Per. to 8 in.: lvs. spatulate, to 1 in. long, finely toothed: fis. blue, the heads about ½ in. across. Asia Minor.

vulgăris (G. Willkommii). Per. to 1 ft.: lvs. obovate or lanceolate, nearly entire: fls. blue, rarely white. S. Eu., Caucasus.

Willkommii: G. rulgaris.

GLOBULARIACEÆ. GLOBULARIA FAMILY. Three genera of herbs and shrubs native in S. Eu. and S. W. Asia, with alternate simple lvs., bisexual fis. in dense bracted heads, having 5-parted calyx, 2-lipped gamopetalous corolla,

4 stamens, superior 1-celled ovary, and fr. a nutlet inclosed in the calyx. The family is placed near Acanthaceæ in the natural sequence. Only Globularia is grown for ornament.

GLOCHÍDION. Euphorbiaceæ. Trees and shrubs of trop. Asia and Pacific Isls.: lvs. alternate, simple, usually entire: fls. solitary or in clusters, axillary, staminate of 3-8 overlapping sepals and pistillate with short stout stigmas: carpels 2-ovuled: fr. a caps. Sometimes cult. in warmer parts of Calif.

áibum (Phyllanthus albus). Shrub or small tree: lvs. large, entire, villous beneath: fis. small, in axillary clusters: fr. white. Philppines.

GLOMERATE: in dense or compact cluster or clusters.

GLORIÒSA. GLORY-LILY. Liliaceæ. Climbing herbs with tuberous roots, lvs. prolonged into tendrils, and red or yellow lily-like fls. solitary in the axils of the upper lvs., the perianth-segms. distinct and reflexed or spreading.

Glory-lilies are grown under glass, and out-of-doors in the South. Tubers should be potted from January to March for bloom in summer and autumn. Propagated by offsets or division of the tuber.

Plántii: G. virescens.

Rochrsiana: a garden plant; probably a form of G. Rothschildiana

Rothschildiana. Lvs. broadly lanceolate: fls. crimson, yellow and whitish at base, to 3 in. long, the pernanthsegms. broadly lanceolate and sometimes wavy-margined, strongly reflexed. Trop. Afr.

simplex: G. virescens.

supérba. Lvs. lanceolate: fls. yellow changing to red, to 3 in. long, the perianth-segms. narrowly lanceolate and much crisped, usually reflexed. Trop. Afr. and Asia. Var. grandiflora is a hort. form.

virescens (G. Plantii. G. simplex). Lvs. usually ovate: fis. bright red or yellow, to 2 in. long, perianth-segms. oblanceolate, acute, not crisped. Trop. Afr.

GLORY-BOWER: Clerodendrum. -Bush: Tibouchina. -Flower: Eccremocarpus. -of-the-Snow: Chionodoxa.

GLOSSOCOMIA: Codonopsis clematidea.

GLOTTIPHÝLLUM. Aizoaceæ. Stemless very succulent perennials, separated from Mesembryanthemum: lvs. many, tongue-shaped to nearly cylindrical: fls. solitary, sessile or short-stalked, large, yellow; stigmas 7-10. S. Afr.

bigibberatum: G. semicylindricum.

compressum. Lvs. erect, of unequal size, to 4 in. long and $\frac{3}{4}$ in. wide, compressed at apex: petals to 2 in. long.

depréssum $(M.\ depressum)$. Lvs. pressed to ground, to 3 in. long and $\frac{3}{4}$ in. wide, apex incurved: fls. to $3\frac{1}{2}$ in. across.

Haagei. Lws. of unequal size, to 4 in. long and ¾ in. wide at base, grayish-green: fis. golden-yellow, paler at base, shining, to 4 in. across.

latum (M. latum). Lvs. of unequal size, to 3½ in. long and 1 in. wide, incurved: fls. 2 in. across. Var. cultratum (M. lucidum) has longer-stalked fls. and lvs. not incurved.

linguiforme (M. linguiforme). Lvs. tongue-shaped, recurved, to 2½ in. long and 1½ in. wide, upper edge very acute and cartilaginous: fls. to 2½ in. across.

10ngum (M. longum. M. pustulatum). Lvs. tongue-shaped, erect, to 4 in. long and ¾ in. wide, often pustulate or blistered at base: fls. to 3 in. across, long-stalked.

Nellii. Lvs. to 3 in. long, 13/4 in. wide and 1/4 in. thick, square to oblong, chalky-green or tinged purple: fis. 2 in.

parvifolium. Lvs. ascending or erect, usually of unequal size, to $1\frac{1}{2}$ in. long and $\frac{1}{2}$ in. thick, glaucous: petals 1 in. long.

propinguum. Lvs. tongue-shaped, to 3 in. long, ¾ in. wide and ¼ in. thick, pale: fls. 2 in. across.

semicylindricum (M. bigibberatum. M. bidentatum). Sts. prostrate: Ivs. half-cylindrical, to 4 in. long and ½ in. wide, with 2 teeth on each side: fls. 1½ in. across.

GLOU-GLOU: Acrocomia aculeata.

GLOXINIA: Sinningia.

GLUME: a small chaff-like bract; in particular, one of the two empty bracts at the base of the grass spikelet.

GLYCÈRIA (Panicularia). Manna-Grass. Gramineæ. Mostly tall per. grasses with flat lvs. and spikelets borne in terminal panieles; native in wet places in Eu., Asia and N. Amer. They are coarse meadow grasses of moist lands, and sometimes planted for ornament in wettish places. See Grasses.

aquática: Catabrosa aquatica.

grandis. Reed Meadow-Grass. To 5 ft.: lvs. to 1 ft. long and ½ in. wide, rough above; panicles 1 ft. or more long, the spikelets usually purple. N. Amer.

spectábilis: Catabrosa aquatica.

GLYCINE. Leguminosæ. Herbs twining or erect, with pinnate lvs., papilionaceous not showy fls. in axillary racemes, and narrow long pods which are constricted between the seeds; native in Old World tropics.

One species is grown as a forage and cover-crop, green-manure, and the seeds sometimes for human food. Seeds should be sown in drills 18-20 mehes apart in rows 2½-3 feet apart after danger of frost is over.

Apios: Apios americana.

floribunda: Wisteria floribunda.

híspida: G. Max.

Måx (G. Soja. G. hispida. Soja Max). SOYBEAN. Hairy ann. to 6 ft., erect: lvs of 3 ovate lifts: fls white or purple, not conspicuous: pods to 3 in long, brown and hairy, hanging. China, Japan —Much grown.

sinénsis: Wisteria sinensis.

Sdia: G. Max.

GLYCÓSMIS. Rutacex. Small spineless evergreen trees or shrubs, one of them a good ornamental under glass and in the open in Fla.: lvs. pinnate: fls. small, white and fragrant, in panieles; stamens 10: fr. berry-like. G. pentaphýlla (G. cochinchinensis), India, Malaya and Philippines, is a bush: flts. mostly 5–7 but sometimes only 1, long lance-oblong, to 6 in. long: fr. about ½ in. diam., pinkish and translucent, with 1 or 2 seeds.

GLYCYRRHÌZA. Leguminosæ. Per. herbs or subshrubs with pinnate lvs., papilionaceous fls. in axillary racemes or spikes, and short flattened pods; G. glabra is grown for economic purposes, the roots furnishing licorice.

Licorice should be grown in rich moist soil. Propagated by division of the roots as well as by seeds.

glàbra. Licorice, Liquorice. To 3 ft.: lfts. elliptical to oblong, obtuse: fls. pale blue, small: pod glabrous or nearly so Medit. region and Cent. Eu.

lepidota. WIID LICORICE. To 5 ft.: lfts. oblong-lanceolate, mucronate, to 2 in. long: fls. yellow, to ½ in. long: pod densely covered with hooked prickles, B. C. to Mo. and Ark.

GLYPTOSTRÒBUS. Taxodiaceæ. One small Chinese tree differing from the genus Taxodium chiefly in the elongated rather than peltate cone-scales. G. pénsilis (G. sinensis. G. heterophylla). Lvs. deciduous, linear and 3-ranked or imbricated and scale-like on the fruiting branches: cones ovoid, 34 in. long. Planted in warmer parts of U. S.

GMELINA. Verbenaceæ. Trees and shrubs of Asia and Australia, sometimes planted on our southern borders: lvs. opposite: fls. yellow or brownish, irregular, 2-lipped, in panicled cymes or racemes: fr. a fleshy drupe.

arborea. Deciduous tree to 60 ft.: lvs. cordate-ovate, to 9 in. long, entire, pubescent beneath: panicles to 1 ft. long: fr. ¾ in. long. India, Malaya.

GNAPHALIUM. Compositæ. Woolly herbs of wide distribution, having alternate lvs. and

heads of small obscure disk-fls.; pappus of bristles; somewhat on the order of everlastings. Sometimes planted for ornament.

decurrens. Ann. or bien. to 3 ft.: lvs. lanceolate, to 3 in. long, decurrent on st., white-woolly beneath: heads ½ in. long, in corymbose clusters of 2-6, bracts of involucre yellowish-white or brownish. N. Amer.

fctidum: Helichrysum fætidum,

lanatum: Helichrysum petiolatum.

Leontopodium: Leontopodium alpinum,

palástre. Ann, low-spreading, to 8 in, loosely woolly: lvs. broadly spatulate to oblong, to ¾ in, long: heads leafy-bracted, bracts of involucre brownish with white tips. Neb. to New Mex, B. C. and Calif.

sylváticum. Per to 1½ ft.: lvs. linear, to 2 in long: heads ¼ in. long, in spikes, bracts of involucre yellowish with brown spot toward tip. Eu , N. Asia, N. E. N. Amer.

GNETACEÆ. GNETUM FAMILY. Three widely distributed genera, of which only Ephedra is occasionally cult., although this genus has recently been segregated in a separate family, Ephedraceæ. It includes the remarkable Welwitschia (or Tumboa) of S. W. trop. Afr. The family is one of the gymnosperms (with the conifers). Trees or shrubs with large or scale-like lvs., unisexual fls., and fleshy or winged frs. The plants have little ornamental value.

GOAT-NUT: Simmondsia californica.

GOATS-BEARD: Aruncus, Tragopogon.

GOATS-RUE: Galega officinalis.

GOBO: Arctium Lappa.

GODÈTIA. Onagracex. Ann. flower-garden herbs related to Œnothera, commonly erect, with narrow alternate lvs., showy bright red, lilac, purple or white diurnal fls. in leafy racemes or spikes, and capsular frs.

Godetias should have light soil and sunny exposure. Propagated by seeds sown where wanted or under glass for transplanting.

amcha. FAREWELL-TO-SPRING. Slender to 3 ft., mostly an open grower, with scattered fls: ivs linear to lanceolate, to 2 in. long: fls. lilac-crimson or red-pink varying to white, to 2 in. across, often double: caps 1½ in or more long, slender. Calif. to B. C. Var. Lindleyi has a large spot in center of petals.

azaleafiòra is a double-fid. bright carmine form of G. grandiflora.

Bôttiæ. Slender, to 3 ft: lvs. linear to lanceolate, to 2½ in. long: fls. pink or light crimson, to 2 in. across. S. Calif.

carmínea: probably G. grandistora var. densistòra: Boisduvalia densistora.

Góddardii. To nearly 2½ ft.: lvs. obovate to linear, to 1½ in. long: fls. pink- to purple-crimson, with or without dark "eye," in short dense spikes: caps. sessile, terete, to ½ in. long. Calif.

grandiflora ((Enothera Whitneyi). Stout, to 1 ft., compact and very leafy: lvs. oblong, to 1½ in long: fts aggregated, rose-red varying to white, with darker blotch in center of petals, to 5 in across: caps. sessile, less than 1 in. long Calif. Var. carminea is a carmine-red form.—Known in several dwarf or condensed cult. forms.

16pida. Rather tall, erect, branched, the st. flattened above: lvs. oblong- to ovate-lanceolate: fls. rather close together near ends of branches, about 1½ in across, petals pale purplish with darker spot in middle at end: caps. short and thick, gray-hairy. Calif.—Little known in cult.

lilácina: hort. name.

Lindleyi: G. amæna var.

parviflora. Branching from base, the sts. a few in. to 2 ft. or more long: lvs. narrow-lanceolate to linear, to 1 in. long: fls. rose-red, to 3/4 in. long. Calif.

quadrivaluera. Simple or branched, to 18 in.: lvs. obovate or oblong, the upper ones much narrower: fls. scattered or separated, lilac or pule crimson with darker spot near apex of more or less dentate petals, about ¾ in. across: caps. sessile, 4-sated, ½-1 in. long. Calif. to Columbia River—Lattle seen in cult.

ròsea: hort. name.

rubicúnda is a lilac-crimson color form of G. amæna.

Schwaminii is a more or less double-fld. pink form of G. amæna.

viminea. Strict, short-branched, to 3 ft., sts. whitish: lvs. linear to lanceolate, entire: fis. purple or crimson with dark center, petals to 1 in. long. Calif., Ore.

Whitnevi: G. grandiflora.

GOLDBÁCHIA. Cruciferæ. One species, G. lævigāta, from Persia and Asia Minor. Erect ann. to nearly 4 ft., glabrous, glaucous: lvs. obovate to ovate-oblong, entire or nearly so: fls. violet, small, in elongate racemes: silique 4-sided, usually 2-3-celled with conspicuous constrictions between each.—Allied to Raphanus but differing in shape and nature of the silique or pod.

GOLD-DUST: Alyssum saxatile. -Tree: Aucuba japon-ica var. variegata.

GOLDEN-BELLS: Emmenanthe pendulifora, Forsythia.
-Chain: Labunum anapyroides. -Club: Orontium aquaticum.
-Cup: Hunnemanna fumarixfolia. -Eardrops: Dicentra
chrysontha. -Eggs: Enothera outa. -Fleece: Thymophylla
tenuiloba. -Glow: Rudbeckia laciniata var. hortensia.
-Shower: Cassua Fistula. -Star: Chrysogonum virginianum.
-Stars: Bloomeria crocca. -Top: Lamarckia aurea. -Tuft:
Alyssum saxatile. -Wave: Coreopsis Drummondvi.

GOLDENRAIN-TREE: Kalreuteria paniculata.

GOLDENROD: Solidago

GOLDENSEAL: Hydrastis canadensis.

GOLDFIELDS: Baeria.

GOLD-FLOWER: Hypericum Moserianum.

GOLDILOCKS: Linosyris vulgaris.

GOLDTHREAD: Coptis.

GOMÈSA. Orchidacex. Brazilian epiphytes with 1–3-lvd. pseudobulbs and yellow or yellowish-green fls. in pendulous axillary racemes beneath the pseudobulb, the dorsal sepal and petals similar, the lip shorter than the sepals. They grow best in the temperate house; see Orchids.

planifòlia. Pseudobulbs to about 3 in. high: racemes many-fid, to 10 in. long, fragrant; lateral sepals partially united, the hp with 2 crests. Aug., Oct.-Feb.

GOMPHOCÁRPUS. Asclepiadaceæ. Per. herbs or subshrubs differing from Asclepias in the hoods without crests or appendages; one species grown out-of-doors in Calif.

téxtilis. To 3 ft.: lvs. opposite, linear-lanceolate, about 3 in long: fls white with violet-lobed crown: fr. bladdery, pale green with bristly hairs, to 4 in. long. Habitat unknown.

GOMPHOLÒBIUM. Leguminosæ. Australian shrubs with simple or compound lvs., yellow or red papilionaceous fls., and ovoid or globular inflated pods; one species may be planted in S. Calif.

latifolium. Large glabrous shrub: lvs. digitate, of 3 linear or linear-lanceolate lfts. to 2 in. long: fls. yellow, 1 in. or more across, in loose racemes, the keel densely fringed.

GOMPHRÈNA. Amaranthaceæ. Erect or prostrate per. and ann. herbs, G. globosa grown as an "everlasting," having clover-like, white, red or violet heads; useful for bedding, for cutfls. and for winter decoration. For cult. see Everlastings; grown readily from seeds.

adrea: G. globosa var.

decümbens. Ann., prostrate or decumbent, the muchbranched sts. to 2 ft. long: lvs. oblong or oval, to 3 in. long: heads subtended by 2 bracts, white, 1/2 in. or less across. Tex., Mex. to S. Amer.

globosa. Globe Amaranth. Ann., erect, branching, somewhat stiff, to 1½ ft.: lvs. oblong to elliptic, to 4 in long, cliate on edge: heads subtended by 2 leafy bracts, purple, orange, rose, white, variegated, about 1 in. across, not as papery as most everlastings. Old World tropics. Color forms include álba, altrea, cárnea, ròsea, ràbra. Var. nàna is listed as growing to 8 in. and of compact habit.

Haageana. Per. to 21/2 ft. but grown as ann.: lvs. ob-

lanceolate to oblong-linear, to 4 in. long: heads subtended by 2 bracts, light red with yellow florets, 1 in. across. Tex., Mex.

nàna: G. alobosa var.

nítida. Ann. to 2½ ft, usually erect: lvs. obovate to oval, to 2½ in. long: heads subtended by 2 lvs., bracts white, ½ in. across. Ariz. to Mex.

epiphytes having pseudobulbs which bear usually 2 plaited upright-spreading lvs. and a pendulous raceme from near the base, the fls. with the dorsal sepal and the small petals attached to the column, the lateral sepals spreading and the lip with a pair of erect and variously horned or bristle-bearing side lobes and more or less compressed mid-lobe. Grown in the temperate greenhouse; for cult. see Orchids.

armeniaca. Pseudobulbs ovoid, to 2½ in long: lvs. lanceolate-elliptic: scapes drooping, to about 20-fld.; sepals apricot-colored or salmon with reddish-purple spots, reflexed; petals very small; lip inflated, yellow and fleshy, fragrant. Cent. Amer.

atropurpurea. Pseudobulbs 2-4 in. long, grooved: lvs. 2: racemes pendulous, many-fid.; fls. 1½-2 in. across, dark purplish-brown, fragrant. Venezuela, Trinidad, British Guiana.

Charlesworthii. Scape arching, to 1½ ft. long, 16-20-fld.; fls nearly white, sepals barred with light brownish-purple. Hab.?

galeata (Acropera Loddigesii). Pseudobulbs about 1% in. long: lvs. to 1 (t. long and 1% in. wide: fis. brownishyellow or wine-colored, on arching pedicels, in racemes to 8 in. long. June-Sept. Mex.

maculata: G. quinquenervis.

quinquenérvis (G. maculata). Pseudobulbs ovoid-oblong, 2-lvd., furrowed: lvs. oval to elliptic-lanceolate: fls. yellow spotted with dark red, in loose racemes to over 2 ft. long. Jan.-Sept., Nov.-Dec. Trop. Amer.

Scaphéphorus. Pseudobulbs ovoid: scape arching, up to 32-fid., to nearly 2 ft. long; sepals and petals reddishbrown or yellowish-white spotted with dark purple; lip yellow and rose. Peru.

speciosa: Coryanthes speciosa.

GONIOLIMON: Limonium.

GONIOPHLEBIUM: Polypodium subauriculatum.

GONÓLOBUS. Asclepiadaceæ. Mostly trop. herbaceous or woody plants of Amer., chiefly trailing or climbing: lvs. opposite, mostly heartshaped: fls. in clusters or umbel-like cymes, usually dark colored, corolla rotate or campanulate, 5-lobed, anthers short, stigma flattopped.

gonocárpos (G. lævis). Sts. high-climbing: lvs. broadly ovate, 4-8 in. long, acuminate, basal auricles overlapping, petioled: fis brownish-purple, conical in bud, few, in cymes. Va. to Ala. and Tex.

lèvis: G. gonocarpos.

GOOBER: Arachis hypogwa.

GOODENIACEÆ. GOODENIA FAMILY. Herbs, subshrubs or rarely shrubs of 12 genera mostly in Australia, characterized by bisexual fls. with very small calyx, 5-lobed corolla, 5 stamens, inferior or partially superior 1-2-celled ovary, and fr. a caps., drupe or nut. Brunonia and Leschenaultia may be planted.

GOÒDIA. Leguminosæ. Australian shrubs with compound lvs. of 3 entire lfts., papilionaceous fls. in racemes, and flat pods; one species is grown in S. Calif. for ornament.

lotifòlia. Tall, much branched: Ifts. ovate, to $\frac{34}{4}$ in. long: fis. yellow, the standard purple at base, in racemes to $\frac{4}{4}$ in. long: pods to $\frac{1}{4}$ in. long.

GOOD KING HENRY: Chenopodium Bonus-Henricus.

GOODYÈRA (Peramium). Orchidaceæ. Terrestrial herbs with creeping rhizomes and lvs. (clustered near the base) commonly variegated;

fls. in terminal spikes with dorsal sepal and petals connivent into a helmet and lip entire, saccate. Grown in shady places out-of-doors; see Orchids.

Dawsoniana: Hamaria discolor var.

decipiens (G. Menziesii. Epipactis decipiens). To 17 in. talli lvs. to 4 in long, dark green veined centrally with white: fls. white, in dense spikes. Summer. N. Amer.

Manziesii: C decimens

pubéscens (Epipactis pubescens). Downy Rattlesnake Plantain. To 16 in. high: lvs. to 3 in. long, dark green with white reticulations: fls. white, in dense cylindrical spikes. Summer. E. N. Amer.

rèpens (Empactis repens). Lesser Rattlesnake Plantain. To 12 in. tall: lvs to about 1¾ in. long, dark green, self-colored or with indistinct white veins: fls. white, in one-sided spikes. July-Aug. N. Eu., N. Asia, Japan, N. N. Amer. Var. ophioides with distinctly white-veined lvs. is the more common American representative. Newf. to N. C., west to Alaska and Minn.

tesselâta (Epipacus tesselata). Loddiges Rattlesnake Plantain. To about 14 in. tall: lvs. to 2½ in. long, dark green veined with lighter green: fis whitish, in loosely subsecund or spiral spikes. July-Sept. E. N. Amer.

GOORA NIIT: Cola acuminata.

GOOSEBERRY: Ribes; see Currant. Barbados-: Pereskia aculenta. Cape-: Physalis peruviana and pruroosa. Ceylon-: Dovyalis hebecarpa. Hill-: Rhodomyrtus tomentosa. Otaheite-: Phyllanthus acudus. -Tree: Phyllanthus aculus.

GOOSEFOOT: Chenopodium.

Theaceæ (Ternstræmiaceæ). Trees or shrubs in warm Asia and 2 in the U.S., with alternate simple lvs., showy white fls. solitary in the axils, and capsular frs.; the American species below are hardy in the southern states and succeed in moist peaty or sandy soil. Propagated by seeds, layers or greenwood cuttings under glass.

alatamáha (Franklinia alatamaha, G. pubescens). alatamana (Franklinia alatamana, G. pubescens). The specific name is commonly but not originally spelled altamaha Tree to 20 ft., deciduous: lvs. to 6 in. long, bright green and shining above, pale beneath, turning scarlet in autumn: fls. 3 in. across, very short-stemmed. Ga., but now known only in cult.; hardy to Mass.; blooms in autumn.—The name Franklinia is now preferred by some authors.

anômala: G. axillaris.

axillàris $(G.\ anomala)$. Large evergreen shrub: lvs. to 6 in. long, dark green above: fls. to 3 in. across, nearly sessile. S. China.

Lasianthus. Loblolly Bay. To 60 ft., evergreen: lvs. to 6 in. long, dark green and shining above: fls. 2½ in. across, long-stemmed. Va. to Fla. and La.

pubéscens: G. alatamaha.

GORMANIA: Sedum. GORSE: Ulex.

GOSSÝPIUM. Cotton. Malvaceæ. Many trop. shrubs, or woody herbs, sometimes treeform, of eastern and western hemispheres, with alternate lvs. which are palmately lobed or ribbed, large white, yellow or purplish fls. in an involucel of bracts, and capsular frs. or "bolls" whose seeds bear fleece or lint furnishing the cotton of commerce, and sometimes with an additional fuzz or wool. The different species and races are supposed to be extensively hybridized, and the botany of the genus is difficult. The origin of the cult. cottons is not well under-

Cotton is grown as an annual field crop in the southern United States. It requires a long season and plenty of moisture throughout the growing period, and dry weather for harvesting. About 1 bushel of seed is customary to plant an acre. The rows should be 3-4 feet apart and the plants in the row 1-2 feet apart. It is rarely grown as an ornamental plant, and it usually does not thrive in economic collections under glass; it is strictly not a horticultural subject and is not further discussed in this Hortus. Cotton is grown as an annual field crop in the southern

arboreum. Tree C. of India. To 10 ft., with trailing branches: ivs. 3-7-lobed 34 or more their depth; fis. purplered, the bracts of involucel united at base; seeds with persistent fuzz. Old World.

barbadénse. Sea-Island or Tree C. To 8 ft.: lvs. 3-5-lobed half or more their depth: fls. yellow tinged purple, bracts of involucel nearly or quite distinct: seeds without persistent fuzz, bearing a long stuple. Trop. Amer.

brasiliénse. Closely resembling G. barbadense but with larger lvs. and fis.: lvs. glabrous, cordate, lobes 5 and acuminate and the middle one longest. Trop. Amer.

herbaceum. Levant C. Ann. herb: lvs. 5-7-lobed less than half their depth: fls. yellow with purple center, bracts of involucel joined at base, seeds with persistent gray fuzz. Arabia, Asia Minor.

hirsûtum. UPLAND C. Ann. or mostly so, to 5 ft.: lvs. 3-lobed about half their depth: fls. white or light yellow, becoming pink or purple, the involuced bracts not united: becoming pink or purple, the involuced braces not united; seeds with persistent greenish fuzz. Trop. Amer; probably the principal source of American upland cottons. Varreligiosum is of trailing or climbing habit, with pubescent lvs. and rust-colored fuzz.

indicum. Chinese or Indian C. Small ann. or per.: lvs. 3-lobed to about half their depth: fls. yellow, involucel bracts united at base: seeds with persistent reddish fuzz. E. Asia.

mexicanum. Mexican C. Shrubby; lvs. 3-5-lobed to about ½ their depth: fls. pale yellow or white tinged pink, bracts of involucel not joined: seeds with persistent gray fuzz. Mex.

obtusifòlium. Ceylon or Oriental C. Shrub: lvs. 3-5-lobed to less than half their depth: fls. yellow with purple center, involucel bracts united: seeds with pubescent gray or reddish fuzz. Ceylon.

peruviànum. Peruvian C. Lvs. divided ½ or ¾ their depth: fls. yellow, involucel bracts distinct; seeds with persistent gray, rusty or greenish fuzz. Cent. and S. Amer.

punctatum. Jamaica C. Woody: lvs. divided ½ their depth: fls. yellow with brown center, involucel bracts distinct: seeds with persistent gray or rusty fuzz. Trop. Amer.,

Stúrtii. Medium-sized shrub: lvs. broad-ovate, to 2 in. long, entire, glaucous: fis. lavender with dark center, about 3 in. across. Australia.

vitifolium. Closely resembling G. barbadense but the lvs. harry beneath and fls. often thrice longer than involucel. Trop. Amer.

GOURD. A general or indefinite name applied to various fruits of cucurbits, plants allied to the pumpkins, cucumbers and melons, usually to those with hard and durable shells. The yellowflowered gourds of American gardens are Cucurbita Pepo var. ovifera; the white-flowered gourds are Lagenaria siccraria. The snake or serpent gourds are either Lagenaria siceraria or Trichosanthes Anguina. White or wax gourd is Benincasa hispida. Dishcloth gourds are Luffas. mostly L. cylindrica. The maté gourd of Paraguay, used as a utensil, is a small form of Lagenaria siceraria. Gooseberry gourd is Cucumis Anguria, hedgehog gourd C. dipsaceus, and ivy gourd Coccinia cordifolia. Calabash gourds are Lagenaria siceraria, but the calabash itself is not a gourd but the fruit of a tropical tree, Crescentia Cujete. Sometimes the word gourd is applied in a general way to all the cultivated species of Cucurbita. In North America the word is employed for fruits grown as ornaments or curiosities rather than for food.

All the gourds denoted above are annual plants (or treated as such) of the simplest cultivation, requiring the treatment accorded pumpkins, cucumbers and melons. Seeds are commonly sown where the plants are to stand, as soon as the weather is warm and settled. If wanted earlier, they may be started in pots or boxes, but they do not transplant readily if the roots are disturbed. All of them are frost tender. The vines make good screens and covers if given

support. See Cucurbita, Pumpkin.

GOURLIEA. Leguminosæ. Probably only one species, native of Chile. G. spinosa (G. chilensis. G. decorticans and var. subtropicalis. Lucuma spinosa). Small spiny tree to 12 ft.:

lys. of 3 pairs of small ovate lfts.; fls. orangevellow streaked red, in short loose racemes: fr. about 1 in. diam., brownish. In S. Calif.

GOUTWEED: Agopodium Podagraria. GOVERNORS-PLUM: Flacourtia indica.

GRABÒWSKIA. Solanaceæ. Spiny shrubs with entire sometimes fleshy lvs., small funnelshaped violet, pale blue or whitish fls. with exserted stamens, and fr. a berry; native in S. Amer., one grown in Calif. for ornament.

boerhaavisefolia (G. glauca). Lycium-like shrub with graceful drooping habit, axillary spines ½ in. long; lvs. oval to oblong, to 1½ in. long, gray-green: fls. white or pale blue, inconspicuous, in clusters or solitary: fr. to ½ in. long. Peru.

glauca: G. boerhaavixfolia.

GRAFTAGE (French greffage) comprises the general subject of propagating or growing plants by means of a cutting or part taken from one plant and inserted on another. The reasons for the operation are chiefly two: to perpetuate a variety, clon or variation (as Fameuse apple or Caractacus rhododendron) that does not come true from seed and is not readily raised from cuttings; to propagate a species that does not produce seed in its adopted country and does not grow acceptably from cuttings. It differs from the making of cuttings in the fact that the severed part, or cion, grows on another plant, or stock, rather than in the soil: the particular

variety or species does not grow on its own root.

There are two general kinds of grafting, differing in practice but not in principle,—one of which inserts a piece of branch in the stock (grafting proper), and one that employs only a bud surrounded with adjacent bark with little or no wood attached (budding). In both cases the success of the operation depends on the growing together of the cambium of the cion and that of the stock. The cambium is the new and growing tissue which lies underneath the bark and on the outside of the wood. Therefore, the line of demarcation between the bark and the wood should coincide when the cion and stock are joined. The greater part of grafting and budding is performed when the cion or bud is nearly or quite dormant, that is, usually in winter and early in spring, and budding may be undertaken then, or late in summer when the buds have nearly or quite matured but the bark is still slipping.

When the parts are joined, the wounded or exposed surfaces are securely covered with wax or waxed cloth to prevent evaporation as well as to hold the cions and surfaces securely in place. A good wax for covering the exposed parts is made as follows: Resin 4 parts by weight; beeswax, 2 parts; tallow, 1 part or raw linseed oil 1/2 part. In making the wax, the materials are first broken up and melted together. When thoroughly melted the liquid is poured into a pail or tub of cold water. It soon becomes hard enough to handle, and it is then pulled and worked over until it becomes tough or "gets a grain," at which stage it attains the color of very light colored manila paper. When wax is applied by hand, the hands must be well greased. If much grafting is to be done a melted wax consisting of 6 pounds resin, 1 pound beeswax and 1 pint raw linseed oil is an advantage because of more rapid application. This wax is kept liquid in a heater and applied with a brush. Watersoluble asphalt emulsion may be used instead of wax and requires no heater.

As the prime object of grafting is to perpetuate a kind of plant that does not reproduce itself from seed or of which seed is very difficult to obtain, cions or buds are therefore taken from this plant and set into whatever kind of stock is available on which they will grow. Thus, if one wants to propagate the Fameuse apple, one does not for that purpose sow seeds of it, but takes cions or buds from a Fameuse tree and grafts them into some other apple tree. The stocks are usually obtained from seeds. In the

case of the apple, young plants are raised from seeds obtained mostly from cider mills, without reference to the variety from which they came. Toward the end of the second growing season they are budded or grafted; and thereafter they bear fruit like that of the tree from which the cions were taken. In this example the cion and stock are of the same species, Malus sylvestris, but in other cases the two may represent quite different kinds of plants; and in that case one must make sure that the two parts are congenial the one to the other. Thus, the pear is made dwarf by grafting it on the quince: Magnolia Soulangeana varieties may be grown on M. acuminata; spruces of different species may be successfully grafted on the Norway spruce.

Grafting proper, as we have seen, is the insertion of a small branch (or cion), usually bearing more than one bud. In grafting on small stocks, it is customary to employ the whipgraft (Fig. 1). Both stock and cion are cut across diagonally. and a split made in each, so that one fits into the other. The graft is tied securely with a band, and then, if it is above ground, it is also carefully

about 3 inches in diameter out-

waxed. and con ready to be joined. Left, the parts put together In larger limbs or stocks up to and tied. of-doors the usual method is the cleft-graft. This consists in cutting off the stock, splitting it from the top for a short distance and inserting a wedge-shaped cion in one or both sides of the split, taking care that the cambium layer of the cion matches that of the stock. The exposed surfaces are then securely covered with wax. Grafting in the open is usually performed early in the spring, just before the buds swell. The cions should have been cut before this time, when they were perfectly dormant. Strong terminal growth or vigorous suckers make the best cions. Cions may be stored in sand in the cellar or in the ice house, or they may be buried in the field. Cold storage at 32° F. is satisfactory. The object is to keep them fresh

If it is desired to change the top of an old plum, apple or pear tree to some other variety,

and dormant until they are wanted.

Fig. 1. Whip-graft. At right, the stock

it is usually accomplished by means of the cleftgraft (Fig. 2). On large limbs (2 inches in diameter or larger) the inlay- or bark-graft is an

advantage because the stubs of the stock do not have to be split. In this graft (Fig. 3) two parallel slits are made in the bark of the stock, their width apart just equal to the diameter of the cion. The bark is then removed as shown in the figure, A, and the cion, A, cut with one flat face, is fitted in the slot and secured with two small wire nails. All cut surfaces are covered with wax If the tree is very

young, budding or whip-grafting may be employed. On an old top the cions should begin to bear when three or four years old. All the main limbs should be grafted. It is important to keep down the suckers or watersprouts from around the grafts, and part of the remaining top should be cut away each year until the top is entirely changed over (which will result in two or four vears).

Fig. 2. Cleft-graft. Stock in center, with one cron set and another one to be set on the right; at the left, to show how the cion is shaped.

For grafting small mostly pot-grown material under glass the veneer-graft is commonly employed (Figs. 4, 5). The cion is cut to a slant at the lower end and one face shaved or champered to correspond with a matrix in the stock. The two are bound together, with raffia or waxed

ner, with rama or waxed cord, and as the subjects are usually kept close in a frame to prevent drying out, the work is not sealed with wax. Many woody ornamental plants are grafted in this fashion.

Budding consists in inserting a bud underneath the bark of the stock, and the commonest practice is that shown in the illustration. Budding is mostly performed in July, August and early September, when the bark is still loose or will peel. Twigs are cut from the tree which it is desired to propagate, and the buds are cut off with a sharp knife, a shield-shaped bit of bark (with possibly a little wood) being left with

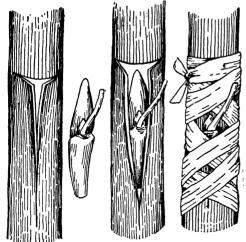

Fig. 4. Veneer-graft, or side-graft; method of making these cuts is shown in the detail.—Norway spruce.

them (Fig. 6). The bud is then shoved into a slit made in the stock, and it is held in place by tying with raffia or rubber ties. In two or three weeks the bud will have "stuck" (that is, it will

have grown fast to the stock), and the tie is cut to prevent its strangling the stock. Ordinarily the bud does not grow until the following spring, at which time the entire stock or branch in which the bud is inserted is cut off an inch above the

Fro. 6. Budding. Left: the bark opened to receive the bud; the bud; the bud inserted; tied.

bud; and the bud thereby receives all the energy of the stock. Budding is the commonest grafting operation in nurseries. Seeds of peaches may be sown in spring, and the plants which result will be ready for budding the same August. The following spring, or a year from the planting of the seed, the stock is cut off just above the bud (which is inserted near the ground), and in the fall of that year the tree is ready for sale; that is, the top is one season old and the root is two seasons old, but in the trade it is known as a one-year-old tree. In apples and pears the stock is usually two years old before it is budded, and the tree is not sold until the top has grown one or two years. Budding may be performed also in

the spring, in which case the bud grows the same season. Budding is usually undertaken in young branches or parts, preferably in those not more than one year old.

Many other fashions of preparing the stock and cutting the cion are employed for particular plants and to satisfy the preference of the grafter. The consultant interested in the subject may consult the Standard Cyclopedia of Horticulture and other more detailed writ-

Inarching, sometimes called "grafting by approach,"

Fig. 7. The inarch. Stock at left, as it will be headed back; cion or inarch at right, which will be severed from its own root when union is complete.

is a special method when union between cion and stock takes place slowly and with difficulty and the cion must therefore be kept active until the two are grown together. In this case the cion is joined to the stock while it is still attached to its parent plant, much as a layer is not severed until roots are well established in the ground. The parts may be joined by the tongue of a whip-graft or by some other method (some-

times the attached surfaces of cion and stock being only cut away to young wood) and then tied together securely and waxed. When union has taken place, the cion is cut back at the top and it is severed from its own branch; it is then permanently transferred to the stock. Fig. 7 illustrates the method.

Bridge-grafting is not a method of propagation but only a means of healing or overcoming wounds. Oftenest it is employed when a tree is girdled as by mice or by winter injury. The wound is trimmed away on either edge to fresh clean bark and wood. and long cions nailed in exposed channels as detailed in Fig. 8. This is essentially the same as the inlay-graft except that both ends of the cion are inlayed. The grafts should be placed about 2 inches apart over the injured areas. The work is then waxed over to protect wound and cions alike. Shoots should be

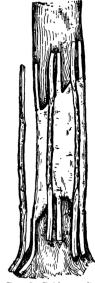

Fig. 8. Bridge-grafting, in which the cions are inlaid in slots cut in the bark.

prevented from growing from the cions. In due time the wound is bridged by the ring of cions, and eventually should be completely covered by a new solid growth of wood.

GRAHAMIA: Helenium aromaticum. GRAM: Phaseolus aureus and Mungo.

GRAMINEÆ: see Grasses.

GRAMMATOPHÝLLUM. Orchidaceæ. Epiphytes having pseudobulbs or thickened sts., thick strap-shaped lvs., and showy fls. in loose many-fld. racemes from the base, the sepals and petals nearly equal, the lip smaller. For cult. see Orchids.

speciòsum. Sts. stout, 6-10 ft. long, bearing above numerous two-ranked elongate lvs.: scapes to 6 ft. high, bearing as many as 100 ffs.; ffs. 3-6 in. across, yellow thickly spotted with brown. Burma, Indo-China, Malaya, Philippines.

GRANADILLA: Passiflora.

GRAPE. Species of Vitis (which see) grown for the berry-like edible or ornamental fruits. The grape in some of its many species, hybrids and races is grown over the greater part of North America except the regions of extreme cold. Of the native species, the Fox grape type (Vitis Labrusca) is of greatest importance and with its hybrids is the mainstay of grape growing east of the Rocky Mountains, reaching its greatest perfection in the fruit regions of the Hudson Valley and in proximity to the Great Lakes. The Old World grape (V. vinifera) grows to advantage only in the mild climate of the Pacific coast and

adjacent parts, particularly California where it is grown very extensively, making up nearly seven-eighths of the commercial grape crop of the United States. The native Muscadine grape (V. rotundsfolia) is grown in the cotton-belt as a home and local fruit but has little general commercial importance. These groups comprise three cultural classes. To these classes may be added the growing of grapes under glass, for which a separate discussion is required.

Soils of various kinds yield good grapes provided they are fairly deep and well drained. Sandy or gravelly clay loams are most desired. Usually better success results in soils not too fertile, as the resulting over-vegetative condition is likely to be non-fruitful and difficult to control. Grapes are naturally drought-resistant.

Propagation of most of the eastern-grown varieties of grapes is by stem-cuttings about one foot in length, usually with 3 buds, made from prunings. These are taken in winter and are stored in moist sand or sawdust to callus. The cuttings are planted out in the nursery-row in early spring, placing the top bud level with the surface of the ground; they make marketable vines at the end of the first or second season. New and rare varieties are sometimes propagated by single-eye hardwood cuttings in a frame or under glass. Muscadine cuttings cannot be rooted easily, so that propagation of this species Muscadine cuttings cannot be is mainly by stem-layers, a method adapted also to the other species. Old World grapes must be grafted on cuttings or young plants of native American stocks, usually Vitis riparia and V. rupestris, otherwise the vines are likely to be destroyed by the grape root-louse (Phylloxera), in regions where the pest has been introduced. If the viniferas are grown on their own roots, propagation is by means of cuttings of dormant one-year-old canes.

Planting and distance vary with region and variety. Either one-year or two-year-old rooted cuttings may be planted, usually in early spring. In the East rows are commonly 8-10 feet apart with vines 8-10 feet apart in the rows which should extend north and south except on steep slopes where contour planting is desirable to control erosion. On arbors and against buildings a vine may occupy more space. Muscadine grapes are planted 12 x 12 feet, or even 15 x 20 feet with vigorous varieties on rich ground.

Tillage is a prime requisite. The most successful cultural method is to plow or disk the vineyard in late autumn or early spring and till continuously throughout the growing season or until the middle or last of July when a cover-crop of oats, rape, buckwheat, millet, or a mixture of some of them is sown. Home plantings may be successful in sod provided the vines are mulched with manure or straw to keep down the grass and if they receive nitrate. Nitrate of soda at the rate of 1 pound to the vine applied in early spring helps to stimulate growth on poorer soils. A complete fertilizer may also benefit the vines indirectly by its effect on the cover-crop.

Pruning of the vine is essential to success in grape-growing. To understand the pruning of American vineyard grapes, the operator must grasp this principle: Fruit is borne on shoots of the present season, which arise from wood of the previous season called a cane. To illustrate: A growing shoot of 1940 makes buds. In 1941 a shoot arises from each bud; and near the base of

this shoot the grapes are borne (1 to 4 clusters on each shoot). While every bud on the 1940 shoot may produce shoots in 1941, only the strongest of these new shoots bear fruit. The skilled grape grower can tell by the looks of his cane (as he prunes it in winter) which buds will give rise to the best grape-producing wood the following season. The larger and stronger buds usually give best results; but if the cane itself is very big and stout, or if it is very weak and slender, he does not expect good results from any of its buds. A hard well-ripened cane the diameter of a man's little finger is the best size. Another principle to be mastered is this: A vine with limited space in a vineyard should bear only a limited number of clusters,—say 30 to 60.

A shoot bears clusters near its base; beyond these clusters the shoot grows on into a long leafy cane. An average of two clusters may be reekoned to a shoot. If the vine is strong enough to bear 60 clusters, 30 good buds must be left at the pruning (which is December to late February).

The essential operation of pruning a grape vine, therefore, is each year to cut back a limited number of good canes to a few buds, and to cut off entirely all the remaining canes or wood of the previous seasons growth. If a cane is cut back to 2 or 3 buds, the stub-like part that remains is called a spur. Present systems, however, cut each cane back to 8 to 12 buds (depending on variety and vigor of vine), and 3 or 4 canes are left.

The top of the vine does not grow bigger from year to year, after it has once covered the trellis, but is cut back to practically the same number of buds each year. Since these buds are on new wood, it is evident that they are each year farther and farther removed from the head of the vine. To obviate this difficulty, new canes are chosen each year or two from near the head of the vine, and the two-year or three-year-old wood is cut away.

At planting the vine is cut back to 2 or 3 good The hole in which the plant is to be set should be large enough to allow a full spreading of the roots. Fine soil should be worked around the roots and firmed with the feet. If the season should be dry, a mulch of coarse litter may be spread around the vine. If all the buds start, the strongest one or two may be allowed to grow. The canes arising from these buds should be staked and allowed to grow through the season; or in large plantations the first-year canes may be allowed to lie on the ground. The second year the weaker cane is removed and the stronger cut back to 2 buds. The two shoots arising from these may be grown to a single stake through the second summer, or they may be spread on a trellis. These are the canes which form the permanent arms or trunk of the vine. From them start the shoots which, in succeeding years, are to bear the fruits. With vigorous varieties under good cultural conditions a cane strong enough to form the trunk may be grown the first season after planting.

Training of the grape must be distinguished from pruning, although one is dependent on the other. A dozen systems of training may be practiced on the same trellis and from the same style of pruning,—for training is only the disposition or arrangement of the parts. On arbors, it is best to carry one permanent arm or trunk from each root over the framework to the peak.

Each year the canes are cut back to short spurs (of 2 or 3 buds) along the sides of this trunk.

In the East grapes are grown mostly on twowire trellises; the lower wire is $2\frac{1}{2}$ feet above the ground and the second wire $2\frac{1}{2}$ feet higher. The wires are attached to 7-8-foot posts at intervals of every three vines. There are various systems of training. In one of the best, known as the four-cane Kniffin system, a single trunk is brought to the top wire. From this trunk four canes are chosen, two at the level of each wire, one being tied along the wire in each direction at each level. These four canes are renewed every year, using the new canes that arise from spurs near the trunk or from new canes arising from the base of the cane itself. In this and in other systems of trellis pruning it is aimed to leave about 30 to 50 buds to the vine. On arbors more buds are left as the vines have more room. In pruning arbor vines about half or three-quarters of the previous seasons growth is removed, always leaving the more vigorous wood.

The vinifera grapes require much the same mode of pruning as the others except that in field culture with some varieties they are usually not trained on wires or even to posts. The old trunk is kept short and stump-like, by constant pruning forming a head of short branches and spurs. The canes are cut back every year nearly to this head. A mature head after four or more years will bear 5 to 20 spurs, depending on variety, vigor, distance of planting and other

In harvesting table grapes the mature clusters are cut carefully from the vines with a knife or shears and placed in shallow boxes or lugs which are hauled to the packing-house. A large part of the eastern crop is packed in climax baskets and sold either in the local or general market. Grapejuice factories take large quantities of grapes in some districts, as do the wineries of central New York and particularly California. Much of the

California crop is dried for raisins.

Yields vary greatly. In the East vines trained on trellises may be expected to yield at the rate of 10 to 20 pounds (25-60 bunches) of fruit to the vine, or $1\frac{1}{2}$ -4 tons an acre depending on the variety and the vigor of the vines. Individual vines on arbors may yield more than this. Some long-keeping varieties, as Catawba, can be held in common storage at about 40° F. for three to five months. At 30° F. an even longer storage season is possible. In California the acre yields are usually much greater than in the East.

Because of the great variation in hardiness. ripening season, and resistance to disease the planter, in choosing varieties, should be sure that they are adapted to his particular region. Many varieties are self-sterile so that two or more should be planted near together. Varieties are listed below in order of their ripening. Commercial varieties are starred.

Short-season varieties for the East of more than average hardiness: Moore Early, Winchell, Champion, Fredonia, Portland, Ontario, Lucile.

Varieties adapted to fruit regions of New England, New York and Michigan: Seneca, Portland, Fredonia, Diamond, *Worden, *Delaware, *Concord, Herbert, *Niagara, Agawam, Barry, *Catawba, Sheridan.

Varieties requiring a long season to be grown only in regions south of New York: Iona, Missouri Reisling, Sheridan, Catawba, Golden Muscat, Jefferson, Goethe.

Varieties recommended for Florida: Csaba, Brilliant. R. W. Munson, Ives, *Carman, *Ellen Scott, Armalaga, Fern, Herbemont.

Muscadine varieties for planting in the South: Eden, Scuppernong, Thomas, Flowers, James,

Varieties of bunch grapes successful in the southern states: Moore Early, Winchell, Diamond, Brighton, Delaware, Ives, Carman, Catawba, Jefferson, Herbemont.

Vinifera varieties grown as table grapes on the Pacific Coast: Mission, Muscat of Alexandria, Malaga, Thompson's Seedless, Flame Tokay, Purple Cornichon, Emperor.

Varieties of good keeping quality: Seneca, Vergennes, Catawba, Mills, Herbert, Barry, Agawam, Keuka, Canandaigua, Dutchess, Lind-

ley.

In many parts of the East, grapes yield sufficient fruit for home use without spraying of any kind. Under some conditions the diseases blackrot and downy-mildew may largely destroy fruit and foliage. Control of both is possible by thorough spraying with bordeaux mixture, 4 pounds copper sulfate, 4 pounds slaked lime, 50 gallons water. This should be applied just before the plants are in bloom and several times later at two- to three-week intervals. The grape rootworm is often a destructive pest. Spraying the foliage with powdered lead arsenate 3 pounds to 50 gallons water, when the injury is first seen on the leaves, will help control the insect.

Under glass, or in "the grapery," various kinds of Vitis vinifera may be grown successfully either with heat or without it. With careful choice of varieties and the protection that may be given both vine and fruit, and the skill that is likely to be applied by the gardener in such circumstances, superior grapes for the table may be produced; it is an old and accepted method in horticultural annals, although it has fallen into relative disuse.

The grapery may be a glass lean-to against a building or wall, or a separate independent structure. The method of growing is the same in either case. The vines are set about 4 feet asunder in a single row or line in the space between the central walk and the side of the structure. The roots are supposed to feed both inside and outside the house, openings being left in the founda-tion to allow them to reach the outer border. A good deeply prepared outside border several feet wide is required, and it has been customary to underlay this with a sloping cement, brick or rubble bottom to insure quick drainage of surface water; much of course depends on the particular place and climate. Weeds and bushes should not be allowed to grow on the border. One strong cane is trained up under the glass roof but hanging some 18 inches below it. This vine is pruned to spurs. The number of clusters is controlled by pruning to reduce the number of buds or by thinning in which unwanted fruitclusters are removed soon after the berries have set. If the grapery is heated, clusters may be left to ripen on the vines till November and December. Usually the vines are laid down and covered for the winter, the heat being discontinued. The leading variety for growing under glass is Black Hamburg, particularly for the cold grapery. Alexandria, Barbarossa, Chasselas Musque, Gros Coleman, Muscat Hamburg, are among those more particularly adapted to the warm grapery or long-ripening season.

GRAPEFRUIT: Citrus paradisi; see Citrus Fruits (page 183).

GRAPE, OREGON: Mahonia nervosa. Sea: Coccolobis unitera. Tail: Artabotrus.

GRAPTOPÉTALUM. Crassulaceæ. Segregate from the American species formerly included in Cotyledon, native in Ariz. and Mex., distinguished particularly by rotate corolla with petals united at base and illustrated with dots or transverse bands: stemless or nearly so, with thick lvs. forming a small rosette as in Echeveria. Eight species are known.

ameth stinum (Echeveria amethystina. Pachypytum amethystinum). Short-stemmed, to 4 in. high, with rosette of very thick flattened lys., oblanceolate and obtuse, 1½ in. long, ¾ in. wide: nnfl. few-fld.; petals pale greenish-yellow marked with red. Mex.

Orpetii. Rosettes to about 3 in. diam., lvs. relatively thin, acuminate and cuspidate, glabrous: fl.-sts. about 3 in. tall; fls. about ½ in. across, yellow marked with red. Ariz.

paraguayense (Cotyledon paraguayensis. G., Echeveria, Byrnesia, Sedum Weinbergii). Per with rosette of thick brond lvs. obtusely keeled beneath, glaucous, to nearly 2 in. long, either basal or borne on a st. to 7 in. long; fls. white spotted with red, in cymes from axils of upper lvs. seldom produced. Mex.—Of easy cult. from plantings of lvs.

Weinbergii: G. paraguayense.

GRAPTOPHÝLLUM. Acanthacex. Shrubs with opposite often colored lvs. and red or purple tubular 2-lipped fls. in short cymes or panieles; native in Australia and Polynesia. One is grown in the greenhouse and is now a common shrub in trop. Amer. Propagated by cuttings.

horténse: G. pictum.

pictum (G. hortense). To 8 ft.: lvs. oval, to 6 in. long, entire, purplish or green marked with yellow: fls. purple or crimson, 1½ in. long, stamens exserted. New Guinea.

GRASS: see Grasses. Aleppo:: Sorghum halepense. Barnyard: Echinochloa Crus-galli. Basket: Oplismenus compositus. Beach:: Amnophila. Beard:: Andropoon, Polyon. Bent:: Agrostis. Bermuda-: Cynodon Dactylon. Billion-Dollar:: Echinochloa Crus-galli var. frumentacea. Blue:: Poa. Blue-eyed: Sisyrinchium. Bottle-brush:: Hystrix patula. Brome:: Bromus. Brook:: Catabrosa aquatica. Canary: Phalaris. Carpet: Axonopus compressus. Centipede:: Eremochloa ophiuroides. Citronella:: Cymbopogon Nardus. Cloud:: Agrostis nebulosa. Colorado:: Panicum teranum. Cotton:: Errophorum. Crab-: Digitaria sanguin-alis. Dog:: Agropyron. Dune:: Elymus arenarius. Eel:: Vallismera. Esparto:: Stipa tenacissima. Feather:: Stipa. Finger:: Chloris. Fish:: Cabomba caroliniana. Fountain: Pennisetum Ruppelii. Guinea:: Panicum maximum. Hair: Agrostis hiemalis, Deschampsia. Hares-tail:: Lagurus ovatus. Herds:: Phleum pratense. Hungarian:: Setaria talica var. nigofruda. Johnson: Sorghum halepense. June: Poa matensis. Lawn., Korean: Zoysia japonica. Lemon:: Cymbopogon citratus. Lyme:: Elymus. Manila:: Zoysia Matiella. Manna:: Glyceria. Mascarene:: Zoysia tenurfolia. Meadow:: Poa. Meadow:: Reed: Glyceria grandis. Means:: Sorghum halepense. Melic:: Melica. Napier:: Pennisetum purpureum. Natal:: Tricholama rosea. Oat., Tall: Arthenatherum elatius. -of-Panassus: Parnassia. Orange:: Hypericum gentianoides. Orchard:: Dactylis glomerata. Palim:: Setaria palmifolia. Pampas:: Cortaderia. Para:- Panicum purpurascens. Peoper: Lepidum. Plume:: Eianthus. Quack:: Agropyron. Quake:: Bromus brizzeformis. Quaking:: Briza. Rabbit-tall:: Lagurus ovatus. Ravenna:: Erianthus. Ravenna:. Reed:: Phragmites maxima. Rescue:: Bromus unicloides. Rhodes:: Chloris Gayana. Ribbon:- Phalaris arundinacea var. picta. Rice:- Oryzopsis. Ruby:: Tricholana rosea. Rye:: Lolium. St.-Augustine:: Stenotaphrum secundatum. Scury: Cochlearia. Silk:- Agrostis hiemalis. Spear:: Poa alpina, Stipa. Spike:: Desmuzeria sicula, Leptochloa fascicularis. Squirrel-tail:- Hordeum jubatum. Star:: Aletris, Hypori

GRASSES. Graminex. Horticultural grasses are the kinds grown for ornament and interest in distinction from the pasture and meadow grasses, the forage or fodder kinds, and the cereal grains. Two general purposes are served by the ornamental grasses,—the flower-garden interest, and the lawn-planting interest.

The grasses that find place in the flower-garden are mostly hardy annuals, prized for their feathery or otherwise ornamental sprays which are employed as greenery in living bouquets or dried and used in winter bouquets being prepared as are the other "everlastings" (which see). These annual grasses are grown readily from seeds, usually sown where the plants are to stand in open sunny places. Sometimes the smaller kinds are grown to maturity in pots for table decoration, the little brizas and the delicate kinds of aira and agrostis being well adapted to the purpose. The leading annual grasses listed as ornamentals are in Agrostis, Aira, Anthoxanthum, Avena, Brachypodium, Briza, Bromus, Chloris, Coix, Deschampsia, Desmazeria, Digitaria, Echinochloa, Eleusine, Eragrostis, Euchlæna, Festuca, Holcus, Hordeum, Koeleria, Lagurus, Lamarckia, Oryza, Oryzopsis, Panicum, Paspalum, Pennisetum, Phalaris, Polypogon, Scleropoa, Sceale, Setaria, Sorghum, Triticum, Zea, Zizania.

The grasses adapted to yard, landscape or border planting are mostly large-growing per-ennial species; and some of them also yield excellent material for dry bouquets, as the bottle-brush-grass (Hystrix), eulalia (Miscanthus), and pampas-grass. In warm countries the bamboos are commanding examples. See Bamboo. The perennial grasses are usually multiplied by division of the clumps or by the stolons or offsets that may arise; seeds (when procurable) should give blooming plants the second year. Important perennial grasses are Agropyron, Agrostis, Alopecurus, Ammophila, Ampelodesma, Anatherum, Andropogon, Anthoxanthum, Aristida, Arrhenatherum, Arundinaria, Arundo, Axonopus, Bambusa, Brachypodium, Briza, Bromus, Catabrosa, Cephalostachyum, Chimonobambusa, Chloris, Chusquea, Cortaderia, Cymbopogon, Cynodon, Cynosurus, Dactylis, Dendrocalamus, Deschampsia, Elymus, Eragrostis, Eremochloa, Erianthus, Euchlæna, Festuca, Glyceria, Gynerium, Holcus, Hordeum, Hystrix, Koeleria, Leptochloa, Lolium, Melica, Melinis, Miscanthus, Molinia, Neyraudia, Notholcus, Oplismenus, Oryzopsis, Panicum, Paspalum, Pennisetum, Phalaris, Phleum, Phragmites, Phyllostachys, Pleioblastus, Poa, Pseudosasa, Saccharum, Sasa, Semiarundinaria, Setaria, Saccharum, Sasa, Semiaruminan, Shibatæa, Sinarundinaria, Sorghum, Th Shibatæa, Sinarundinaria, Sorghum, Stenotaphrum, Stipa, Thamnocalamus, Thysolæna, Tricholæna, Trisetum, Uniola, Vetiveria, Zoysia.

A third class of grasses comprises the sodforming kinds employed in the making of sward for lawns, but in this case the plants are not raised and treated separately and need not be separately listed here. See Lawn. The meadow and pasture grasses are of the same or similar nature and often the same species, but these kinds are not directly within the purview of this work, although entered botanically.

A fourth set of grasses comprises the large forage kinds. These are not specially discussed in this book, although the species are entered. Important fodder and forage grasses are entered under the genera Echinochloa, Eleusine, Euchlæna, Panicum, Pennisetum, Setaria, Sorghum, Zea, as well as the herbage of the small grains in the genera Avena, Hordeum, Oryza, Secale, Triticum.

A fifth group includes the cereal grains and sugar-cane, not included here beyond brief accounts of the species under their generic headings, as Avena, Hordeum, Oryza, Saccharum, Secale, Sorghum, Triticum, Zea.

GRASS-NUT: Brodizea laza.

GRASSWORT, STARRY: Cerastium arvense.

GRATIOLA. Scrophulariaceæ. Herbs with opposite sessile lvs., white or pinkish fls. solitary in the axils, having entire or 2-lobed upper lip and 3-lobed lower lip, and fr. a caps.; rarely cult.

officinalis. Per. to 1 ft., with creeping rhizomes: lvs. lanceolate, toothed: fls. pink or white, with yellow throat, to 3/4 in. long, pedicelled. Eu., Asia.

GREASEWOOD: Salvia apiana, Sarcobatus. In the West applied also to other plants that are not horticultural subjects and not included here.

GREENBRIER: Smilax.

GREENHOUSE. A glasshouse or structure in which plants are maintained or grown. Originally the word was applied to those houses in which plants are merely preserved or kept green in the winter, but this signification is now little known in America. Special types of glasshouses are the conservatory, in which plants are kept or displayed; stove or hothouse, in which plants are grown in a high temperature; the propagating pit, in which the multiplication of plants is carried forward; forcing-house in which special plants are made to yield their products far out of their natural period or sequence; and the houses of various temperatures, as cold, cool and intermediate.

GREENÒVIA. Crassulacex. Tufted per. herbs native in Canary Isls., formerly included in Sempervivum: lvs. in dense rosettes, entire, fleshy: fls. yellow, with many narrow petals.

diplocycla. To 8 in.; rosette to 10 in. across, always single, without offsets: lvs. spatulate, densely cilate, to 3 in. long: fis. ½ in. across, in a large rather dense infl.

dodrentalis (G. gracules). To 10 in., with many long-stemmed offsets: lvs. spatulate, in rosettes to 2 in. across. fls. ¼ in. long, in a flattish 12-fld. infl.

grácilis: G. dodrentalis.

holochrysum: probably Æonium holochrysum.

rosulària pestalózzæ: listed name.

GREENS. Pot-herbs are sometimes known as "greens," particularly those that come in early spring when green food is specially welcome. Such greens may be spinach, kale, dandelion, dock, pigweed and other plants grown or gathered that make acceptable eating when cooked in a pot. Accounts of the most important of these plants will be found under their appropriate alphabetic entries.

Christmas greens, or "green," are various kinds of plants that hold their foliage and color in winter and can be employed in decoration. Some of these plants are grown for the purpose, but the larger part of the durable ones are gathered from the wild including such kinds as holly, laurel, galax, smilax. The indiscriminate and destructive gathering of such wildings is to be discouraged, and other means of Christmas decoration should be developed for the large

undertakings. It is more important to the education and the sentiment of the people that wild life be protected than that showy temporary public displays of this nature, of growths unrelated to plant-growing and environment, be multiplied.

GREGORIA: Douglasia Vitaliana.

GREÌGIA. Bromeliaceæ. S. American terrestrial herbs with stiff lvs. in rosettes and rose-colored fls. in a simple infl. For cult. see Bromeliaceæ: sometimes grown for ornament and oddity.

sphacelata. To 3 ft.: lvs. spreading or recurving, spiny-margined: fls. rose, in dense axillary heads, bracts spiny.

vulcánica. St. very short: lvs. 2 ft. or more long, spiny-margined, white-scaly beneath: fts. with white tube and red spreading segms., in heads to 3 in. across. Colombia.

GREVÍLLEA. Proteaceæ. Many shrubs and trees with alternate lvs., bisexual fls. borne in pairs in a raceme and having long filiform showy styles, and fr. a leathery follicle; native in Australia and New Caledonia.

Grown for ornament and avenue trees in warm regions and sometimes as juvenile pot-plants in the greenhouse. Propagated by seeds.

Bánksii. Shrub or tree to 20 ft.: lvs. with 3-11 linear or lanceolate segms. to 4 in. long, margins revolute, silky-tomentose beneath: fis. red, in dense terminal secund racemes to 4 in. long. Queensland. Vars. álba and Fórsteri are listed.

bipinnatifida. Shrub to 4 ft., sometimes prostrate: lvs. to 4 in. long, pinnately cut into 9-21 oblong or pinnatifid segms.: fls. red, in loose secund racemes to 4 in. long, sometimes panicled. W. Australia.

crithmifòlia. Shrub to 4 ft.: lvs. to 1 in. long, pinnately cut into 3-5 narrow-linear segms.: fis. in short dense sessile racemes. W. Australia.

Endlicheriana. Shrub to 7 ft.: lvs. linear, to 4 in. long, silvery-pubescent on both sides. fls. in dense racemes to ¾ in. long, said to be mauve. W. Australia.

eriostachya. Shrub to 6 ft.: lvs. narrow-linear, to 8 in. long, usually pinnately cut into 3-5 segms.: fls. in dense secund terminal tomentose racemes to 6 in. long. W. Australia.

Hilliana. Tree to 60 ft.: lvs. entire, deeply divided at end into 2 or 3 lobes, or pinnatifid into 5-7 lobes, to 1 ft. long, silvery-pubescent beneath. fls. red varying to pink and white, in dense cylindical axillary racemes to 8 in. long. Queensland, New S. Wales.

juniperina (G. sulphurea). Small shrub: lvs. spreading, linear, suff and pungent-pointed, to 1 in. long, margins revolute, silky-pubescent beneath fls. pale yellow or tinged with red, in very short sessile racemes. New S. Wales.

leucópteris. Shrub to 8 ft.: lvs. 1 ft. or more long, pinnate into narrow-linear segms. to 10 in. long, tomentose beneath: fts. in loose many-fld. panicled racemes to 4 in. long, said to be white. W. Australia.

obtusifòlia. Spreading or procumbent much branched shrub: lys. oblong-linear, margins revolute, rusty-pubescent beneath: fls. in short loose secund racemes. W. Australia.

oleoides. Shrub: lvs. linear or lanceolate, to 4 in. long, margins recurved, tomentose beneath. fls. bright red, in short nearly sessile racemes. New S. Wales, Victoria.

ornithópoda. Glabrous shrub: lvs. to 3½ in. long, divided into 3 lanceolate lobes: fls. small, in short axillary racemes, said to be white. W. Australia.

paniculata. Shrub to 8 ft.: lvs. 1-2-divided into 3 terete pungent-pointed segms.: fls. small, in axillary short racemes. N. Australia.

polybótrya. Tall shrub: lvs. oblong or oblong-lanceolate, to $1\frac{1}{2}$ in. long: fis. in dense cylindrical panieled racemes or spikes to 2 in. long. N. and W. Australia.

punicea. Small shrub: lvs. oblong or nearly oval, to 2 in. long, margins recurved, tomentose beneath: fls. bright red, in short dense racemes. New S. Wales.

no short dense racemes. New S. Wales.

robūsta. Silk-Oak. Tree to 150 ft. but sometimes grown as a decorative pot and florists plant: lvs. fern-like, 2-pinnate into lanceolate entire or lobed segms. with recurved margins: fts. orange, in secund racemes to 4 in. long on short leafless branches. Queensland, New S. Wales.—Formerly much grown from seeds in pots under glass as a decorative subject.

rosmarinifòlia. Shrub to 6 ft.: lvs. linear, to 114 in. long, margins revolute, silky-pubescent beneath: fls. reddish, in short dense sessile racemes. New S. Wales.

sulphurea: G. juniperina.

Grevillea.

Thelemanniana. Shrub to 5 ft.: lvs. to 2 in. long, divided into many linear segms.: fis. pink tipped with green, in secund terminal racemes to 1½ in. long. S. and W. Australia

Wilsonii. Glabrous shrub to 5 ft.: lvs. 2-3-ternately divided into linear stiff pungent-pointed segms. to 1 in. long: fls. in loose racemes. W. Australia.

GRÈWIA. Tiliacex. Trees and shrubs native to warm regions in the Old World, with alternate simple lvs., small fis. solitary or cymose, and fr. a drupe; sometimes planted for ornament.

biloba (G. parviflora var. glabrescens). Shrub to 8 ft., twigs glabrous: lvs. ovate, to 5 in. long, doubly serrate or sometimes remotely 3-lobed, glabrous: fis. pale yellow, about \(^{1}\xi_{0}\) in. across: fr. orange to red. N. and Cent. China; stands in S. New England. Var. parviflora (G. parviflora) has tomentose twigs and lvs. densely stellate-pubescent beneath. China and Korea.

cáffra. Shrub or small tree: lvs. oblong, to 3 in. long, finely toothed: fis. purple. S. Afr.; grown in S. Calif. and similar regions.

occidentalis. Shrub: lvs. ovate, to 2 in. long, toothed: fls. purple. S. Afr.; to be grown in mild climates.

parviflora: G. biloba var.

GRÈYIA. Melianthaceæ. Small S. African trees and shrubs with alternate simple lvs., showy fls. in axillary racemes, and fr. a leathery caps.; one showy species is planted for ornament in the S. and Calif. or sometimes under glass. Propagated by seeds or cuttings of half-ripened wood.

Sútherlandii. Small tree but blooming as a little bush: lvs. or becular to oblong, to 3 in. long, heart-shaped at base, coarsely and irregularly toothed: fls. bright scarlet, petals about ½ in. long, in dense racemes to 10 in. long, the showy stamens long-exserted.

GRINDÈLIA. Gum-Plant. Compositæ. Coarse per. herbs native in W. N. Amer., with alternate lvs. and rather large solitary heads (usually gummy) of yellow ray- and disk-fls.; pappus of deciduous awns or bristles.

Sometimes grown for ornament in the regions where they grow, succeeding on poor land. Propagated by division, cuttings or seed.

cuneifòlia: G. humilis.

hirsūtula. Per. to 1½ ft., sts. pubescent: lvs. oblong to oblong-spatulate, to 3 in. long, pubescent, acute or obtuse, toothed or entire: heads to 2½ in. across, ray-fis. bright yellow, tips of involucral bracts erect. Calif.

hamilis (G. cuneviolia). Per. to 5 ft., st. becoming woody: lvs. lanceolate to spatulate, to 3½ in. long, glabrous, remotely serrulate, leathery: heads to 1¾ in. across, ray-fis. orange-yellow. Calif.

integrifòlia. To 3 ft.: lvs. spatulate to lanceolate, basal to 1 ft. long, entire or toothed: heads to 2½ in. across. B. C. to Ore.

lanceolàta. Bien. to 4 ft., several sts. from woody base: lvs. linear to lanceolate-oblong, usually to 2½ m. long, rarely to 4 m., acute, margins serrate: heads to 1½ in. across. Tenn. to Ala., Tex. and Mo.

latifòlia: G. robusta var.

nàna. To 1½ ft.: lvs. oblanceolate, to 2½ in. long: heads to ½ in. across. Wash. to Wyo. and Calif.

oregàna. To 3 ft.: lvs. oblanceolate or lanceolate, to 8 in. long, entire or slightly toothed: heads ¾ in. across. B. C. to Ore. and Ida.

robústa. To 2 ft.: lvs. ovate to lanceolate, to 2 in. long, toothed: heads 11/2 in. across, involucre with conspicuous leafy bracts. Calif. Var. latifolia (G. latifolia) has larger clasping lvs.

rubicallis. Per. to 3 ft., sts. hairy above middle: lvs. oblong-spatulate, to 4 in. long, obtuse, dentate to entire: heads to 2 in. across, ray-fls. bright yellow, tips of involucral bracts recurved. Calif.—The material under this name in the trade may be G. hirautula.

squarrosa. To 2 ft., per. or bien.: lvs. oblong-ovate or ovate, toothed: heads to 3/4 in. across. Man. to Mex.

GRISELÍNIA. Cornaceæ. Evergreen shrubs or trees native in New Zeal. and Chile, allied

to Aucuba, with alternate leathery shining lvs., small diceious fis. in panicles or racemes, and fr. a berry; grown out-of-doors in Calif.

littoràlis. To 50 ft.: lvs. ovate or oblong-ovate, to 4 in. long: panicles to 3 in. long. New Zeal. Var. variegàta is listed.

lùcida. To 25 ft.: lvs. ovate or oblong, to 7 in. long, very unequal at base: panicles to 6 in. long, the pistillate fls. without petals. New Zeal.

GRISLEA: Combretum coccineum.

GROMWELL: Luthospermum. False: Onosmodium.

GROSSULARIA: Ribes.

GROUND-CEDAR: Lycopodium complanatum. -Cover: see Lawn. -Pine: Lycopodium obscurum. -Pink: Phlox subulata, Gilia dianthoides.

GROUNDNUT: Apios americana, Arachis hypogæa, Panax trifolium.

GROUNDSEL: Senecio. -Bush: Baccharis halimifolia. Giant: Lyularia Wilsoniana.

GRU-GRU: Acrocomia.

GRUMIXAMEIRA-TREE: Eugenia Dombeyi.

GRUSÒNIA. Cactaceæ. Two species allied to Opuntia but differing in the longitudinally ribbed cylindrical joints.

Bradtiana (Opuntia Bradtiana). Thicket-forming, to 7 ft. tall, joints to 3 in. diam.; ribs 8-10, somewhat tuber-culate; spines 15-25, to 1½ in. long, yellowish-brown becoming white: fis. bright yellow, to 1½ in. across. Mex.

santamaria. Plants spreading, to 2 ft. high, joints to 1½ ft. long and 1½ in. dam.; ribs 8-9; spines about 20 and to ½ in. long and plum-colored; fis. rose-red, vellow toward center, 1 in. long. Magdalena Isl., Lower Calif.

GUABA: Inga vera.

GUAÎACUM. LIGNUM-VITÆ. Zygophyllaceæ. A half dozen trop. American trees and shrubs with very hard resinous wood, pinnate lvs. and small blue or purple fls., fr. a strongly angled caps.; sometimes planted for ornament and interest in S. Calif. and S. Fla. One species natively reaches the keys of Fla.

guatemalénse. Small tree to 16 ft.: lfts. 4-6 pairs, linearoblong: fls. before the lvs., several together from the axils, azure-blue, petals glabrous: fr. reddish or orange, obovate, about ½ in. or more long. Guatemala.

officinale. Tree to 15 or 30 ft.: Ifts. 2-3 pairs, to 2 in. long, oval to broad-obovate: fis. blue or rarely white, ½ in. long, in clusters at ends of twigs, petals slightly tomentose at least at tip: fr. yellow, broadly obcordate or unequal-sided, to ¾ in. long. W. Indies, N. S. Amer.

GUAJILOTE: Parmentiera edulis.

GUAMA: Inga laurina.

GUANABANA: Annona muricata.

GUAVA: Psidium. Chilean: Myrtus Ugni. Para: Britoa acida.

GUAYMOCHIL: Pithecellobium dulce.

GUAYULE: Parthenium argentatum.

GUEVINA: Geruina.

GUILANDINA: Cæsalpinia Bonduc.

GUILIÉLMA. Palmaceæ. A few species in trop. Amer., of monœcious spiny feather-palms, allied to Bactris: tall, cespitose or trunk solitary, ringed, gray, very spiny: petiole and rachis spiny: spadix from lowermost axils or just beneath the crown, the peduncle spiny; fls. thickish, the staminate (stamens 6) and pistillate intermixed but ends of branches staminate: fr. ovoid, oblong or ovoid-conic, drupe-like with edible flesh; seed 1. For cult. see Palm.

Gasipäës (Bactris Gasipaës, G. speciosa, G. utilis is probably the same). Pribaye or Gachipaes. Peach Palm. An important fruit-tree in Cent. and S. Amer., known under many vernacular names: trunks mostly few or several, sometimes single, to 60 ft., carrying attractive

crown of arching-drooping foliage: lvs. 8-12 ft. long, deep green above, somewhat lighter underneath; pinnæ many, strongly ribbed, bird at apex, setose on ribs and margins: fr. 1-2 in. long, ovoid to inverted top-shaped, yellow, orange, brownish-red, in heavy hanging clusters, of superior quality, very attractive; a seedless form is known. An important food fruit in parts of the American continental tropics. Little known in U. S.

speciòsa: G. Gasipaës. ùtilis: see G. Gasivaës.

GUINEA-HEN WEED: Petiveria alliacea.

GUIZÒTIA. Compositæ. Trop. African herbs with opposite sessile lvs. and yellow heads of ray- and disk-fls., solitary or clustered; pappus none. One species is sometimes cult, for the seeds, which yield oil.

abyssinica (G. oleifera). Ann. to 5 ft.: lvs. lanceolate, to 9 in. long, toothed: heads 3/4 in, across, in corymbs. oleffera: G. abyssinica.

GUM: Nyssa. Arabic Tree: Acacia nilotica. -Plant: Grindelia. Sweet: Liquidambar Styraciflua. -Tree: Eucaluntus

GUMBO: see Okra.

GUMI: Elæagnus multiflora.

GUNNÈRA. Haloragidaceæ. Per. herbs with creeping rhizomes, radical lvs., small mostly unisexual fls. in spikes or panicles, and drupaceous frs

Some of the kinds are grown for the bold foliage effects of large clumps. Rich moist soil is necessary, and preferably a sunny position. Winter protection should be provided, and they are not hardy in the North. Propagated by divi

chilénsis (G. scabra). Lvs. palmately lobed and cut, to 6 ft. across, the fleshy petiole to 6 ft. long and covered with stiff hairs: fls. in spikes to 3 ft. high: fr. red. Chile, Ecuador, Colombia.

manicata. Differs chiefly in the lvs. being peltate and the petiole covered with reddish spiny hairs. S. Brazil.

scabra: G. chilensis.

GUTENBERGIA: Erlangea cordifolia.

GUTIERRÈZIA. Compositæ. Herbs or subshrubs native mostly in W. N. Amer., allied to Grindelia, having alternate linear entire lvs. and small heads of yellow ray- and disk-fls.; pappus of chaffy scales.

Sarothræ. Matchweed. To 2 ft., many-stemmed: heads in panicled cymes, ray- and disk-fls. each 3-7. Man. to Calif.

GUTTA-PERCHA: Palaquium; also other plants not mentioned in this book.

GUTTIFERÆ (incl. Clusiaceæ). Family. Woody plants in the tropics of both hemispheres, a few of which are planted in our southernmost parts: lvs. mostly opposite or whorled and simple, often thick and mostly evergreen: fls. regular, polypetalous, sometimes bisexual but plants for the most part diocious or polygamous, solitary or cymose, the stamens prevailingly many and distinct or somewhat united: fr. drupe-like, berry-like or sometimes capsular, 2-celled or more, the styles more or less united. Hypericaceæ is sometimes united with this family. With us the genera Calophyllum, Clusia, Garcinia and Mammea are planted.

GUZMANIA. Bromeliaceæ. Trop. American terrestrial or epiphytic herbs with stiff lvs. in basal rosettes and yellow or white fls. in spikes borne amongst the lvs., often showily bracted; grown under glass. Cult. as for *Bromelia* and *Tillandsia*.

lingulata. Epiphytic with stout st.: lvs. to 1½ ft. long and 1 in. wide: fis. with yellowish tube and purplish limb, in dense drooping heads, the bracts red. Trop. Amer. Var. cardinalis is listed as having more vivid red bracts.

musaica. Terrestrial, rarely epiphytic, stemless: lvs. to 20 in. long and 3 in. wide, transversely lined above with dark green and beneath with purple: fls. yellowish, the bracts golden-yellow striped with rose. Colombia.

Záhnii. Stemless or nearly so, to 20 in.: lvs. in rosettes of 20-30, to 2 ft. long, spreading: scape red, erect, slightly shorter than lvs., bracts scarlet, corolla bright yellow. Panania.

GYMNADENIA: Habenaria.

GYMNADENIOPSIS: Habenaria.

GYMNOCALÝCIUM. Cactacex. A genus of the Echinocactus subtribe, of more than a score of S. American species, known by the naked axils of scales on ovary and fr., ribs usually broad and tubercled, spines stout and mostly awl-like, fls. white, yellow or pink, with a definite but short tube and borne from upper arcoles: plant simple or cespitose, mostly globular. Cult. as for Echinocactus. See *Cacti*.

Anisitsii (Echinocactus Anisitsii). Cylindrical, 4 in, long; ribs 11 and strongly tubercled; spines 5-7 and all radial, to 2 in. long: fis. white, greenish outside, 1½ in. long. Paraguay.

Baldianum: G. platense var.

Bodenbenderianum (Echnocactus Bodenbenderianus). Globular, to 3 in. diam., gray-green; ribs 11-14 and tubercled, areoles woolly when young; spines usually 3 and ½ in. long and bent backwards: fls. pink with brownish central stripe, to 1½ in. long. Argentina.

cæspitòsum: listed name.

chubuténse. Solitary, depressed-globose, to 4 in. high and 6 in. diam., gray-green; ribs 15, low, wide; radial spines 6-7, stout, to 1½ in. long; central 1, if present: fls. red, to 2 in. long. S. Argentina.

Dámsii (Echinocactus Damsii). Globular, flattened top; ribs 10-12, wide, straight, tubercled; spines alike, white, tipped brown, usually 6-8; fls. white, outer segms, green tipped red; fr. red, oblong. Paraguay.

Delaètii: G Schickendantzu var

denudatum (Echinocactus denudatus). Somewhat globose or depressed, to 6 in. diam.; ribs 5-8; spines 5 or 8 and all radial, appressed: fls. white or pale rose. S. Brazil to

Froehlichianum: Pyrrhocactus Froehlichianus.

gibbòsum (Echinocactus gibbosus). Usually taller than broad, to 8 in. high, but sometimes depressed; ribs 12-14; spines 7-12 and all radial, brown: fls. white to pinkish, something over 2 in. long. Argentina. Var. fèrox has spines more numerous, flexible. Var. nigrum has very dark spines. Var. Schlümbergii (G. Schlumbergii) has spines more numerous stiff vinkish red to ambervallow. numerous, stiff, pinkish-red to amber-yellow.

Hôssei (Echinocactus Hossei). Nearly globose or depressed at top; ribs 13 and tubercled, areoles white-woolly; spines usually 7 and ½ in. long and spreading or somewhat bent: fis. rose. Argentina.

hybopleurum. Solitary, depressed-globose; ribs about 13, obtuse, areoles gray-brown-woolly; spines 3-4, grayish-white, to 1½ in. long, central 1: fls. white to greenish outside, pinkish within. N. Argentina.

Knèbelii: probably Mammillaria Knebeliana.

Kurtzianum (Echrnocactus Kurtzianus). Depressed-globose, to 6 in. across; ribs 10-18 and tubercled; radial spines 8 and spreading; central spine 1 and 1 in. long; fis. white with reddish base. Argentina.

lafeldénsis. Clump-forming, sts. globular, to 1½ in. across, top spiny; ribs 12, tubercled; spines white, brown at base, bristly, radials 12-15, divergent, to ½ in. long, central 1, if present; fls. violet-pink with darker stripe on reverse center, to 1½ in. long. Argentina.

Leeanum (Echinocactus Leeanus). Depressed-globose; ribs 11-14, low, indistinct, tubercled; spines slender, radials usually 10, curved, to ½ in long, central 1, straight: flayellow, outer perianth-segms, purplish, to 2 in. long or more. Argentina, Uruguay.

leptánthum: Echinocactus leptanthus.

mazanense (Echinocacius mazanenses and E. rhodan-therus). Solitary, globular; ribs 10-11, low, obtuse, tuber-cled; spines curved, radials 6-8, pink to gray, central 1, to 1½ in. long; fls. white to pink, reddish center. Argentins, Vars. brevifolium and ferox are listed.

megalothèlos (Echinocactus and Thelocactus megalothe-los). Cespitose, depressed-globose, to 6 in. wide; ribs 9-12, wide, notched; spines alike, 7-10, to ½ in. long, yellow to gray: fis. reputedly pinkish, but not seen. Paraguay.

michòga: listed name.

Mihanovichii (Echinocactus Mihanovichii). Depressed-globose, to 2 in diam.; ribs 8, triangular, strongly tubercled; spines alike, usually 6-8, yellow, curved, to ½ in. long: fls. yellowish-white with dark red outer perianth-segms., to 2 in. long. Paraguay. Var. stenogonum is listed.

Mônvillei (Echnocaclus Monvillei). Depressed-globose, to 12 in wide and 4 in. tall; ribs 13-17, tubercled, to 34 in. high; spines all radial, 7-13, subulate, yellow, to ½ in. long; fis white to pale pink, to 3 in long. Argentina, Paraguay.

Móstii (Echnocaclus Mostu). Depressed-globose, 2 in. or more high and about twice as thick; ribs 11-14; radials 7-9, central 1, all brownish: fls. bell-shaped, pale red, to 3 m. long. Argentuna.

multiflorum (Echinocuctus multiflorus. E. Ourselianus). Simple or cespitose, depressed to globular to short-columnar, 3½ in. or more high; ribs 10-15; spines 7-10 and all radial: fls. about 1½ in. long, pinkish to nearly white. Brazil to Argentina.

Netrelianum (Echinocactus Netrelianus). Globose, to 2 in. diam. or more; ribs 14, obtuse, tubercled; spines radial, usually 5-8, to ½ in. long, bristly, yellowish-brown: fis. pale yellow tipped red, to 1½ in. long. Argentina.

nídulans. Globose, to 4½ in. diam., brownish-gray; ribs about 17, areoles to ½ in. apart; spines about 6, flexible, one usually erect, others deflexed; fls. pink, campanulate. N. Argentina.

nigriareolatum. Globose, to 6 in diam; ribs usually 10, obtuse, wide; spines pale pink, curved, radials 6-8, to about 34 in. long, central 1, to 114 in. long; fls. white with green throat, campanulate, to 114 in. long. Argentina.

occúltum: probably Neoporteria occulta.

Ochoterènai. Depressed-globose, glabrous to woolly on top, olive-green; ribs about 16, to 1/4 in. wide, areoles white to yellow-woolly; spines 3-5, all radial, gray to yellowish-white: fis pale pink, to 1/4 in. long, tube short Argentina. Var cinèreum is brownish-gray with triangular tubercles

oenanthemum. Globose, to 3½ in diam; ribs 10-12, obtuse, to ¾ in wide, acutely tubercled; spines all radial, usually 5, to ¾ in long, reddish: fls. light copper-red, to 2 in. long. Argentina.

Pflánzii (Echinocactus Pflanzii). Globose, to 1 ft. across; ribs 13-32 and with large low tubercles; spines 3-6, to 1½ in. long, brown or black; fls. white to pinkish, about 1¾ in. long. Argentina.

platense (Echinocactus platensis). Depressed, partly hidden in ground, to 3 in. across, bluish-green or purple; ribs 8-12 and tubercled; spines 3-6 and ½ in. long, brown tipped white: fls. bluish-green outside, white within, 3 in. long. Argentina. Var. Baldianum is a more depressed form and approaches G. Quehluanum.

proliferum. Depressed-globose, to 2 in. diam., green tinged red; ribs usually 12; spines 12-14, to $\frac{1}{2}$ in. long: fis. rose-red. Argentina.

Quehlianum (Echinocactus Quehlianus). Depressed-globular, to 6 in. diam. and 134 in. tall; ribs 8-13, with rounded tubercles; spines all radials, usually 5, to ½ in. long, yellow to brownish-yellow; fis. white with red center, to 214 in. long. Argentina.

rhodántherum: G. mazanensc.

Saglione (Echnocactus Saglionis). Globular, to 1 ft. across; ribs 13-32 and with large low tubercles, are oles 1^14 in. apart; spines $8\cdot 10$ or more, 1^14 in. long, brown or black; fls. white or pinkish, 1^14 in long. Argentina.

Schickendántzii (Echinocactus Schickendantzu). Usually simple and sometimes depressed, to 4 in diam.; ribs mostly 7; spines 6 or 7 and all radial; fls. white or pinkish, 2 in. long Argentina. Var. Delaêtii (Echinocactus Delaetu) has more rounded tubercles and longer fls. which are reddish in bud.

Schlúmbergii: G. gibbosum var.

Sigeliànum. Depressed-globose, to nearly 3 in. diam., smooth on top; ribs 10, low; spines radial, 3, to ½ in. long, very stiff: fls. not known. Argentina.

Spegazzinii (Echinocactus loricatus). Depressed-globular, 2½ in. high and 6 in. across; ribs 13 and rounded; spines usually 7 and flattened to ribs, 1 in long: fls. tinged rose, 3 in. long. Argentina.

stellatum: probably a form of G. Bodenbenderianum, having fis. with a more cylindrical tube and expanding to 2 in. across.

Stückertii (Echinocactus Stuckertii). Globose, to 2½ in, across and 1¾ in. high; ribs 9-11; spines all radial and to 1 m. long, pinkish or brown: fls. white, 1¾ in. long. Argentina.

Sutterianum (Echinocactus Sutterianus). Globose; ribs 10 and tubercled, areoles white-woolly when young; spines usually 5 and ½ in. long and grayish-white: fis. pink with red throat. Argentina.

Urselianum: probably Echinocactus Urselianus.

Velendwskyi. Depressed-globose, to 4 in. high and 6 in.

across; ribs more than 20, to ½ in. high, tubercles rounded, white-woolly when young; spines yellowish, radials 9-12, to ½ in. long, centrals 1-4, to 1 in. long, bulbous and reddish at base: fis. golden-yellow, to 2½ in across, stigma red. Argentina.

Weissianum. Depressed-globose, to $3\frac{1}{2}$ in. high and nearly 6 in. diam., pale gray-green; ribs about 19, to $\frac{1}{2}$ in. high, areoles to $\frac{3}{4}$ in. apart; radial spines 4 or more, to $\frac{1}{4}$ in. long, spreading; central 1, erect: fls. pink, campanulate. Argentina.

GYMNÓCLADUS. Leguminosæ. Two deciduous trees, one from E. Asia and the cult. species native in E. N. Amer. from N. Y. south. G. dioca (G. canadensis). Kentucky Coffee-Tree. To 100 ft.: lvs. bipinnate, the lfts. ovate: fls. regular, greenish-white, the racemes of the pistillate tree to 1 ft. long and of the staminate to 4 in.: pods to 10 in. long, red-brown. Var. fölia-variegāta has variegated foliage.—Propagated by seeds and cuttings.

GYMNOGRAMMA: Pityrogramma; also Coniogramme japonica.

GYMNOSPERMS: see Conifers. Cucads.

GYMNOSPÒRIA. Celastraceæ. Trees and shrubs bearing alternate simple leathery lvs., small greenish or yellowish fls. in axillary cymes, and capsular frs.; a few species may be planted in warm regions. Propagated by seeds and cuttings.

cassinoides (Catha and Celastrus cassinoides). Erect glabrous evergreen shrub: lvs. ovate, acute, serrate pedicels very short, 2 or 3 in the axils; fls. white. Canary Isls.

serrata. Evergreen shrub to 6 ft. or more, sometimes spiny: lvs. ovate to oblanceolate, finely toothed, to 3 in. long. fls. whitish. Abyssinia.

GYMNOSTERIS: Gilia nudicaulis.

GYMNOTHRIX: Pennisetum.

GYNANDRÓPSIS (Pedicellaria). Capparidaceæ. Cleome-like herbs, differing in the fact that the torus is prolonged beyond the insertion of petals and sepals into a stem-like part or androphore on which the stamens are borne, making a pedunele-like base for the gynophore (or pistil-bearing extension). Native in warm parts of the world, one of them sometimes cult. as a Cleome and by some authors referred to that genus.

pentaphfila. Ann. to 2 ft. or less: lvs. 3-5-foliolate, lfts. obovate to oblanceolate, somewhat pubescent when young, acute or obtuse, entire or toothed fs. white to purplish. N. Afr. and India, nat. throughout tropics.

speciòsa (Cleome speciosa). Ann. to 2 ft. or more, grown for ornament in warm countries: very like Cleome spinosa but glabrous or at least not glandular and not spiny, the androphore ½-1½ in. long and beyond the insertion of stamens the very long gynophore projects: petals pink or white. Mex., Cent. Amer.

GYNÈRIUM. Gramineæ. Tall per. grasses with long flat lvs. and diœcious spikelets borne in large terminal plume-like panicles; differs from Cortaderia, the true pampas-grasses, in technical characters of the florets; native in trop. Amer. One is sometimes planted for ornament in warm countries. See Grasses.

argénteum: Cortaderia Selloana.

jubătum: Cortaderia rudiuscula.

saccharoides: G. sagittatum.

sagittatum (G. saccharoides). UVA-GRASS. To 40 it.: lvs. to 6 in. long and 3 in. wide, edges finely toothed: panicles to 3 ft. long, the branches drooping, pistillate very silky. Trop. Amer.

GYNOPOGON: Alyxia.

GYNÙRA (Crassocephalum). Compositæ. Trop. herbs or rarely subshrubs with alternate entire

or lobed lys., solitary or clustered heads of diskfls. and not very showy; pappus of white bristles.

Gynuras are grown under glass as foliage plants. They need plenty of light to bring out the color in the foliage; the soil and moisture requirements are similar to those for coleus or geraniums. They are easily grown from cuttings of growing shoots, also from seeds if obtainable.

aurantiaca. VELVET-PLANT. Stout, branching, to 3 ft., densely velvety with violet or purple hairs: lvs. ovate, jagged-toothed: heads to ¾ in. across, in loose terminal clusters, yellow or orange. Java; escaping in warm regions.

auriculata (Senecio ovalis). Stout per: lvs. obovate to ovate-oblong, auriculate, somewhat clasping, few-toothed, the veins black-lined on both surfaces: heads in lax corymbs on elongate pedicels. China.

GYPSÓPHILA. Caryophyllaceæ. Ann. and per. herbs, usually hardy N., very branching or spreading, slender, with scant foliage when in bloom: fls. small and numerous, axillary or paniculate, rosy or white; native in Eu., Asia and N. Afr.

A few species are grown for the dainty mist-like effects in rock-gardens, in the border, and as trimming in bouquets. Propagated by seeds, division and sometimes by cuttings.

acutifòlia. Per, tall and much branched, the infi. glandular: lvs. narrow-lanceolate and acute, to 5 in. long and 1 in. or more broad, obscurely 3-nerved: fls. larger than in G. paniculata, white. Caucasus.

alpigena: listed name.

altíssima. Per. to 2 ft.: lvs. to 3 in. long and 1/4 in. wide: fls. white, in many-fld. panicles. E. Eu. to Cent. Asia.

arenària: G. fastigiata.

cerastioides. Mouse-ear G. Per., downy, creeping, to about 4 in. high: lvs. obovate, soft-hairy on both sides: fls. to 3/4 in. across, white with pink veins. Himalayas.

collina. Subshrubby, to 1 ft. or more: lvs. linear, rather fleshy: fls. white or pink, in panicles. E. Eu.

Ehrlei: a double-fld. form of G. paniculata.

élegans. Ann. to 1½ ft., with upright forking sts.: lvs. lanceolate fls. white or rosy. ¼ in. or more across. Caucasus. Color vars. are ròsea, alba grandiflòra, atrosanguínea, and carmínea.—Good bouquet plant; grown somewhat

fastigiàta (G. arenaria). Per. to 1½ ft. or more: lvs. linear, to 1 in. long, acute, somewhat fleshy, usually pubescent: fls. pale pink, in many-fld. panicles. Eu.

fratensis: hort. name for a pink-fld. creeping or ascending form to 8 in. high.

glabrata: hort, name for dwarf mat-forming pink-fld.

Gmélinii. Per., glabrous: lvs. linear, somewhat fleshy and 3-sided in cross-section: fls. purplish-pink, in lax panicles. Russia.

grandifiòra álba: G. elegans var.

libanotica. Per. to 1 ft., much branched, glaucous: lvs. stiff and fleshy, about 1/2 in. long and 1/2 in. wide: fls. pink. Acia Minor

Mánginii. Per., roots thick, fleshy: lvs. smooth, glaucous: fls. rather large, light rose, in small panicles. Siberia.

multiflora: hort, name, probably form of G. elegans.

muralis. Ann., diffusely branched, to 1 ft.: lvs. very small and narrow: fis. solitary, axillary, rosy. Eu.; adventive in E. U. S. Var. alba, fis. white.

Oldhamilana. To 2½ ft.: lvs. lanceolate to linear, to 2½ in. long: fis. in terminal cymes to 1½ in. across. Japan.

pacifica. Per. to 3 ft., much branched: lvs. fleshy, ovate-oblong, sessile: fls. pale rose or purple. Siberia.

ovate-coiong, sessile: ils. pale rose of purple. Siberia.

paniculāta. Babra-Brath. Per, with large root, diffusely branched, to 3 ft. or more, glaucous: lvs. linearlanceolate, to 4 in. long and ½ in. broad, sharp-pointed:
fis. white, in loose panicles. Eu., N. Asia; escaped in N.
Amer. Var. flore-pleno has double fis. Other varietal
names are álba, compácta and grandiflora. See Galium
Mollugo and G. aristatum.

perfoliata (G. scorzonerifolia). Per., tall, usually smooth but sometimes hairy near top: lvs. perfoliate: fls. purplish. Medit. region.

prostràta: G. repens.

rèpens (G. prostrata). Per. to 6 in., trailing or prostrate, not glaucous: Ivs. linear: fls. white or rosy, in few-fld. panicles. Alps and Pyrenees. Var. álba, fls. white. Var. Bédgeri is said to be of more compact habit with double pink fls. blossoming about two weeks earlier than other forms. Var. monstròsa is larger and var. ròsea has rose fls.

Rokejèka. Per. to 2 ft., slightly glaucous, much branched: lvs. fleshy, oblong- or linear-lanceolate: fls. pink or violet. Egypt. Asia Minor.

ròsea: hort. name for G. viscosa.

scorzonerifòlia: G. perfoliata.

silenifòlia: hort. name for form said to be trailing with white to pink fls.

Stèvenii. Per. to 1 ft., somewhat glaucous: lvs. linear, keeled: fis. white. Caucasus.

Strúthium. Per. to 15 in., glabrous: lvs. narrowly awlshaped, to 1½ in. long, fleshy, glaucous, obtuse to mucronate: fls. pink, in globose and condensed head-like structures. Spain.

Súndermannii: listed name.

transsylvánica (Banffya petrea). Erect: lykeeled: fis. in clusters, with colored calyx. E. Eu. Erect: lvs. linear.

trich \acute{o} toma. Erect, glaucous: lvs. broad-oblong: fls. very small, in branching panicles. Asia Minor.

viscòsa (G. rosea of hort.). Per. to 10 in., glabrescent below and viscid above: lvs. oblong-lanceolate, to 1 in. long, acuminate: fis. pink, on pedicels 3-4 times as long as calyx. Asia Minor.

GYROTHECA: Lachnanthes.

HAAGEA: Porfiria.

HAAGEOCEREUS, Cactaceæ, A genus of nocturnal cacti from Peru and Chile which are closely allied to Borzicactus but whose fls. are larger than those of the latter genus, are borne near the top of the st. and have a much longer tube.

acránthus. Cespitose, erect, slender; ribs 10-12, thick, obtuse, tubercled; radial spines usually 20-30, brown; centrals 1-2, longer: fis. white or pale pink, to 5 in. long.

australis: listed name.

chosicensis (Cereus and Binghamia chosicensis. Cereus, Cephalocereus, Binghamia and Pseudoespostoa melanostele). Similar to H. pseudomelanostele but with pale rose to purplered fis.—There is much doubt as to the application of the name melanostele.

decúmbens (Cereus and Borzicactus decumbens).
Branches procumbent or ascending, forming clumps; ribs
20; radual spines about 30; central spines to 1¾ in. long:
fils. white, 2 in. across, fragrant: fr. pink.

laredénsis. Cespitose, erect, to 3 in. high, reddish-green; ribs about 18, narrow, low; spines 40-45, awl-shaped, yellow, erect: fls. white.

Olwinskianus: listed name.

pacalaénsis. Cespitose, tall, erect, to 21/2 in. diam.; ribs about 15; spines amber-colored: fls. bright pink.

platinospinus: Borzicactus platinospinus.

pseudomelanostèle (Cereus and Binghamia pseudo-melanostèle). To 3 ft.; ribs 18-22, arcoles close together, bearing many white and yellow spines to 1 in. or more long: fts. white, 2 in. long.

versicolor (Cereus and Cephalocereus versicolor). To 5 ft. high and 3 in. diam., in clumps branched from base; ribs about 12, rounded, low; spines straight, yellow with reddish-brown zones, radials 15-30, to 1/4 in. long, centrals 1-2, to 11/4 in. long; fts. white or cream-colored within, to 4 in. long; fr. yellow. Var. aureispinus, spines golden-yellow. Var. spindsior is listed.

HAÁSTIA. Compositæ. Tufted New Zeal. alpine woolly perennials with low much branched sts. covered by the persistent lys.: fls. all discoid, in large flattened solitary heads borne on very short peduncles or sessile and sunk among the uppermost lvs.

recurva. Tufts to 10 in. across and 4 in. high, covered with a dense orange-red to brownish-red wool: lvs. obovate to broadly spatulate, to 34 in. across, slightly overlapping, strongly recurved at the middle and covered with long straight hairs which extend through a dense mat of wool: heads to 34 in. across.—A form with white tomentum (var. Wallii) is known but may not be in cult.

HABENARIA. REIN OF FRINGED ORCHIS. Orchidacex. Terrestrial orchids with tuberous roots, mostly leafy simple sts., and fls. of various sizes and colors in terminal racemes or spikes, 2 petals usually smaller than the sepals, the lip entire or lobed, often fringed, spurred at base. There are various interpretations of the group resulting in several generic names. Grown in bog-gardens or moist places out-of-doors; see Orchids.

blepharigiottis. White Fringed O. To about 31 in, high: lvs. to 8 in. long and 1½ in. wide: fls. pure white, the lip fringed. July-Sept. Newf. to Fla. and Miss.

bracteata: H. viridis var.

ciliaris (Platanthera and Blephariglottis ciliaris). YELLOW FRINGED O. To 40 in. high: lvs. to 1 ft. long and 2½ in. wide: racemes to 8 in. long; fts. orange or yellow, lip deeply fringed. July-Aug. Vt. to Fla., west to Mich. and Tex.

clavellata (Gymnadeniopsis clavellata). SMALL GREEN WOOD O. To 1½ ft. high: lvs. to about 7 in. long: racemes to 3½ in. long; fls. greenish or yellowish-white. June-Sept. Newf. to Fla. and Tex.

conópsea (Gymnadenia conopsea). Fragrant O. To about 33 in. high: lvs. linear: racemes dense, many-fld.; fls. rose or purple-violet, fragrant, with spur always surpassing the ovary. Eu., Asia, Japan.

cristata (Platanthera and Blephariglottis cristata). To

3 ft. high: lvs. to about 81/2 in. long and 1 in. wide: racemes dense, to 6 in. long; fls. orange, lip fringed. Mass. to Fla. and La.

and La.

dilatata (Limnorchis and Platanthera dilatata). TALL
WHITE BOG O. To about 43 in. tall: lvs. to 1 ft. long and
1½ in. wide: racemes commonly many-fld.; fls. white, the
spur about as long as the entire lip. June-Sept. N. N.
Amer. Var. leucóstachys (H. leucostachys), Sierra Rein O.,
differs only in the spur being longer than the lip. Alaska to Calif. and Ariz.

élegans (H. Michaelii. Psperia Michaelii). To about 30 in. high: lvs. (commonly withered at flowering time) to about 8 in. long and 2 in. wide: racemes long, commonly dense, to 14 in. long; fls. greenish-white or white, very small; lip simple, spur slender and much longer than the lip. B. C., Mont., Ida., Wash., Ore., Calif.

fimbriata: H. psycodes var. grandiflora.

flava (Perularia flava). To 2 ft. high; lvs. few. to about 9 in. long and 2 in. wide: racemes commonly dense, to about 81/4 in. long; fls. yellow-green, lip with a tubercle near base. Apr. (in S.)—Sept. N. S. to Fla. and Tex.

grandiflora: H. psycodes var.

Hookeri (Lysias Hookerana). Hookers O. To 16 in. high, with 2 basal oval or rounded lys. to 7 in. long: fls. yellowish-green, lip simple with spur about ¾ in. long. June-Sept. N. S. to Pa. and Ia.

hyperborea (Limnorchis hyperborea). Tall Northern Green O. To over 3 ft. tall: lvs. to 1 ft. long and 1¾ in. wide: spikes loose or dense; fls. greenish, spur about as long as lip. June-Aug. Newf. to Alaska, south to Pa., Utah and Ore.; also Greenland and Iceland.

Itah and Ore.; also Greenland and Iceland.

Integra. SMALL SOUTHERN YELLOW O. To about 2 ft. high, sts. angled, with 1-3 linear-lanceolate lvs. along basal third: racemes dense, many-fid., to about 4 in. long; fts. orange-yellow, lip scalloped or entire, spur straight and longer than lip. July-Sept. Pine barrens from N. J. to Fla. and Tex., Tenn.

Keiskei. Plant small: lvs. 1-3, oblong, to 1½ in. long, acute, base somewhat cuneate: fls. few, in lax racemes; sepals ovate, to ½ in. long; lip 3-lobed, to ½ in. long and as wide, the mid-lobe obcordate with lateral lobes ovate-oblong. Japan.

Iscera (Blenharialottis lacera). Raggen or Green

Sapan.

lácera (Blephariglottis lacera). RAGGED or GREEN
FRINGED O. To 30 in. high: lvs. to about 8½ in. long and
2 in. wide: racemes loose or dense; fis. yellowush- or whitishgreen; lip 3-lobed, deeply fringed or lacerate, spur nearly
1 in. long. June-Aug. Newf. to Ga., Miss., Ark. and Minn.

leucophea. Prairie White Fringed O. To 4 ft. tall, sts. angled: lvs. lanceolate, to 8 in. long; racemes loose, to 8% in. long; fls. white; lip 3-lobed, fringed, spur longer than lip. June-Aug. N. S. to Me. and N. Y., Ohio to Minn, and Tex.

leucóstachys: H. dilatata var.

Michaelii: II. elegans.

nivea (Gymnadeniopsis nivea). Southern Small White O. Sts. to 3 ft. high, slender: lvs. 2-3 near base, linear-lanceolate, to about 10½ in. long, becoming longer toward the base: fls. in loose racemes to 6 in. long, white; lip entire, shorter than spur. May-Sept. Pine barrens of N. J. south to Fla., Ala. and Tex.; also Cuba.

odoratissima (Gymnadenia odoratissima). SMALL FRA GRANT O. Similar to *H. conopsea* but more slender, with spur equal to the ovary or shorter. Eu.

orbiculata (Lysias orbiculata). To 22 in. high, sts. with or Diction (Lystas oroculata). To 22 in. high, sts. with several bracts: lvs. 2, basal, orbicular to oblong-elliptic, to 10 in. long and 7½ in. across, silvery beneath, green and shining above: racemes loose; fis. greenish-white with simple lip and spur to 1½ in. long. Newf. to Alaska, south to W. Va., west to Wash.

to W. Va., west to Wash.

psycodes (Platanthera and Blephariglottis psycodes).

SMALL PURPLE FRINGED O. To about 3 ft. high: Ivs. to
nearly 9 in. long and 234 in. wide: racemes many-fld; fls.
purple, lilac or rarely white, fragrant; lip 3-lobed, fringed,
the spur to 34 in. long, June-Aug. Newf. to Ga., Tenn.
and Minn. Var. grandiflora (H. grandysora. H. fimbriata.
Blepharyslottis grandysfora. Platanthera fimbriata). LARGE
PURPLE FRINGED O. To about 32 in. high: Ivs. to 9 in. long
and rarely 4 in. wide: racemes loose or dense; fls. lilac or
rarely white, fragrant; lip 3-lobed, fringed to about the
middle. June-Aug. Newf. to N. C. and Tenn.

radiata. To 2 ft. high, slender, leafy below: racemes 1-few-fld; sepals green; petals white; lip white, 3-lobed with the lateral lobes broad and fringed and the mid-lobe narrow and entire. July-Aug. Japan.

viridis var. bracteata (H. bracteata. Cæloglossum bracteatum). Satyr O. To about 17 in. high: lvs. rarely to 6 in. long: spikes to 5 in. long, with leafy bracts commonly much exceeding the small green fis. May-Aug. N. Amer., Eu., Asia.

HABÉRLEA. Gesneriaceæ. A few herbaceous tufted perennials with basal lvs., and nodding tubular irregularly 5-lobed fls. borne on scapes; native in the Balkans.

Ferdinandi-Coburgii. Differs from H. rhodopensis in smaller size, lvs. glabrous above, smaller dark blue fls. with upper lip twice as broad as long.

rhodopénsis. To 6 in., soft-hairy: lvs. obovate- or ovateoblong, to 3 in. long, coarsely toothed, thick: fis. pale hlac, 1 in. long and broad.

HABRÁNTHUS. Amaryllidaceæ. Bulbous herbs with linear lvs.: scape in most species single-fld., in a few 2-4-fld.; spathe tubular below, unilateral and bifid above; fls. pink, yellow, red, declinate, perianth-tube short, segms. unequal, stamens declinate, of four lengths: caps. trilobed. S. Amer., Brazil to Argentina.

Andersonii (Zephyranthes Andersonii). To 6 in.: lvs. narrowly linear, to 6 in. long: fls. yellow veined with red outside, 1½ in. long, tube nearly wanting. S. Amer.

brachyándrus (Hippeastrum brachyandrum). Bulb ovoid, 1 in.: lvs. few. to 12 in. long: scape to 12 in., tapered upward; fls. single, funnelform, 3 in. across, orchid-pink above shading to dark reddish-purple below. S. Amer.

praténsis: Hippeastrum pratense.

robústus (Zephyranthes robusta). To 9 in.: lvs. linear, recurved-spreading, appearing after fls.: fls. rose-red, to 3 in. long, with short greenish tube. Argentina.

texànus (Zephyranthes texana). To 8 in.: lvs. narrowly linear, to 4 in. long: fls. yellow, coppery and striped with purple outside, 1 in. long in summer. Tex.—Perhaps the same as H. Andersonii.

HABROTHAMNUS: Cestrum elegans and fasciculatum. HACKBERRY: Celtis.

HACKMATACK: Larix laricina.

HACQUÈTIA. Umbelliferæ. One European per. herb sometimes grown in the rock-garden and propagated by division. H. Epipáctis. To 8 in.: lvs. basal, deeply palmately lobed: fls. yellow, polygamous, in short-stalked umbels subtended by large involucral lvs. Apr.-May.

HÆMÁNTHUS. Blood-Lily. Amaryllidaceæ. African low bulbous herbs with broad basal lvs. and red or white fls. in dense heads terminating the solid scape, the perianth-tube short; grown for the summer and autumn bloom.

The plants should have a night temperature of 50-55°. Bulbs should be rested over winter and started into growth in spring. Propagated by offsets.

álbiflos. To 1 ft.: lvs. thick and fleshy, to 8 in. long and 4 in. wide, ciliate on edges: fls. white, ¾ in. long, in heads 2 in. across. S. Afr.

coccineus. To 10 in.: lvs. thick and fleshy, to 2 ft. long and 8 in. broad: fls. red, 1 in. long, in heads to 3 in. across. S. Afr.

Kátharinæ. To 1 ft.: lvs. thin, to 14 in. long and 6 in. broad: fls. bright red, $2\frac{1}{2}$ in. long, in heads to 9 in. across. S. Afr.

multiflorus. To 1½ ft.; lvs. to 1 ft. long arising from special st., with short petiole, usually 3-4 in number: fls. blood-red, to 1 in. long, in dense umbels 3-6 in. across: berry scarlet. Trop. Afr.

puniceus. To 15 in.: lvs. thin, to 1 ft. long and 4 in. wide: fis. pale scarlet to white, 1 in. long, in heads to 4 in. across. S. Afr.

HÆMÀRIA. Orchidaceæ. Terrestrial Asiatic orchids with creeping rootstocks, lvs. near the base and small fls. in terminal spikes or racemes, the lip adnate to the column, with a sac at base. Grown for the attractive foliage; for cult. see Orchids.

discolor. Lvs. ovate to elliptic, to 3 in. long and 1½ in. wide, dark green above and bright purplish beneath: fls. Oct.-Feb. Malaya, China, Philippines. Var. Dawsoniana (Goodyera Dawsoniana) has lvs. beautifully veined with red.

HÆMATÓXYLUM. Leguminosæ. One species is employed for the heartwood which is used in

making dyes and for medicinal purposes; sometimes planted in warm countries for ornament. H. campechianum, Logwood, Bloodwood Tree, is a tree to 45 ft. high, with pinnate lvs. of 2-4 pairs of obovate usually emarginate lfts. to 1 in long, bright yellow fragrant fls. in axillary racemes, and flat pods narrowed at both ends, to 1½ in. long. Cent. Amer. and W. Indies.—Propagated by seeds.

HÆMODORÀCEÆ. BLOODWORT FAMILY. Small family sometimes included in Amaryllidaceæ or distributed in that family and Liliaceæ but distinguished by woolly perianth that is not wholly adnate to or free from the more or less inferior ovary. There are 9 genera, mostly of the southern hemisphere but one or two in the E. U. S. They are per. usually stoloniferous non-bulbous herbs with equitant lvs., and a persistent perianth inclosing the caps. Conostylis, Lachnanthes, Lophiola, Tecophilæa and Wachendorfia are listed.

HAKEA. Proteacex. Australian evergreen shrubs or low trees with alternate lvs., bisexual fls. borne in pairs in short axillary racemes or clusters, and woody capsular frs.; differs from Grevillea chiefly in the long terminal wings on the seeds.

Hakeas are grown out-of-doors in southern United States and withstand slight frost. They are drought-resistant and do best in light well-drained soil. Propagated by seeds in winter or early spring and the seedlings kept in boxes for the first year. As the capsules are very hard, they must be dried for some time before discharging the seeds. Hakeas may also be propagated by cuttings. Well adapted to California.

acicularis (*H. sericea*). Tall shrub, similar to *H. gibbosa* but with nearly glabrous instead of harry branchlets, and differing from *H. pugnoniformus* in the glabrous perianth. New S. Wales, Victoria, Tasmania.

auriculata. Shrub to 2 ft. or more: lvs. cuneate, to 3 in. long, prickly-toothed or -lobed, auriculate at base: fls. in clusters. W. Australia.

cristata. Shrub to 8 ft.: lvs. broad-obovate to oblong, to 3 in. long, prickly-toothed, stiff and glaucous: fls. white, in short racemes. W. Australia.

cucullata. Shrub to 14 it.: lvs. cordate-orbicular, to 4 inacross, entire or prickly-toothed, sessile, stiff: fis. in clusters.

W Australia

dactyloides. Tall shrub: lvs. linear- or oblong-lanceolate, to 4 in. long, prominently 3-nerved, stiff: fis. numerous. New S. Wales.

ellíptica. Shrub to 10 ft.: lvs. oval, to 4 in. long and 2 in. wide, parallel-veined, wavy-margined, rusty-pubescent when young. fls. white, in sessile clusters. W. Australia.

erinàcea. Shrub to 3 ft.: lvs. to 1 in. long, of 3-5 cylindrical stiff segms, which are entire or divided: fls. in sessile clusters. W. Australia.

eucalyptoides: H. laurina.

gibbosa. Shrub to 10 ft.: lvs. needle-like, to 3 in. long, entire, stiff and spiny-tipped: fls. white, in sessile clusters. New S. Wales, Victoria.

glabélla. Shrub to 15 ft.: lvs. obovate or oblong, to 3 in. long, usually prickly-toothed, auriculate at base: fis. white. W. Australia.

ilicifòlia: H. varia.

incrassata. Shrub to 3 ft.: lvs. linear-lanceolate or oblong-linear, to 2 in. long, entire, thick: fls. in sessile clusters. W. Australia.

laurina (H. eucalyptoides). SEA URCHIN. Shrub or tree to 30 ft.; lvs. lanceolate or narrow-elliptic, to 6 in. long and 1 in. wide, parallel-veined, entire: fls. crinson, in sessile globose clusters, with long yellow styles. W. Australia.

marginata. Shrub to 8 ft.: lvs. lanceolate, to 1½ in. long, with prominent midrib and margins, thick and stiff. W. Australia.

multilineata. Tall shrub: lvs. linear-lanceolate to oblong, to 8 in. long, with many small nerves, pubescent, thick: fls. in spike-like racemes to 3 in. long. S. and W. Australia.

pectinata: II. suaveolens.

platysperma. Lvs. cylindrical, to 5 in. long, thick and stiff: fls. in sessile clusters. W. Australia.

propinqua. Tall shrub: lvs. needle-like, to 1½ in. long, rather thick and smooth, crowded: fls. very small, clustered. New S. Wales.

pugioniformis. Shrub to 8 ft.: lvs. needle-like, to 2 in. long, stiff and spiny-typped: fls. white, in sessile clusters, the styles long, differing from H. gibbosa in the pubescent pernanth. New S. Wales, Victoria, Tasmania.

ruscifòlia. Shrub to 8 ft.: lvs. ovate-oblong to lanceolate, to 1 in long, entire and spiny-tipped: fis. white, small, in dense clusters. W. Australia.

saligna. Shrub to 8 ft.: lvs. oblong or lanceolate, to 6 in. long, entire, pale or grayish-green: fis. white, small, in dense clusters, the styles long. Queensland, New S. Wales. serices: H. acıcularıs.

speciosa is listed in the trade, but the name is not known

speciosa is listed in the trace, but the name is not anown to have any botanical standing.

suavèolens (*H. pectinata*). Shrub to 10 ft.: lvs. needle-like, to 4 in. long, usually branched into stiff spiny-tipped segms: fis. white, fragrant, in dense racemes. W. Australia.

trifurcata. Shrub to 10 ft., much branched: lvs. cylindrical, to 3 in long, divided into 3 segms., stiff; sometimes with few flat oblong lvs.: fls. in sessile clusters. W. Australia.

vària (H. zhezfolm). Shrub to 8 ft.: lvs. to 2 in. long, prickly lobed or pinnatifid: fls. small, in clusters. W. Australia.

HALERPESTES: Ranunculus Cumbalaria.

(Mohrodendron), SILVER-BELL. SNOWDROP-TREE. Styracacex. Attractive deciduous shrubs or trees with alternate toothed lys., white bell-shaped drooping fls. in axillary clusters on branchlets of previous year in spring, and fr. a dry winged drupe.

Only II. carolina and II. monticola are hardy North. The species prefer rich well-drained soil with some shelter. They transplant readily. Propagated by seed as soon as ripe or stratified, by layers, root-cuttings or cuttings of green wood from forced plants.

carolina (H. tetraptera). To 40 ft.: lvs. ovate to ovate-oblong, to 4 in. long: fls. to 3½ in. long, with shallow corolla-lobes: fr. 4-winged, to 1½ in. long. W. Va. to Fla and Tex. Var. Meèhanii has smaller wrinkled lvs. and smaller fls.

diptera. To 30 ft.: lvs. oval or obovate, to 5 in. long: fls. 1 in. long, corolla deeply lobed: fr. 2-winged, to 2 in. long. S. C. to Fla. and Tex.

hispida: Pterosturax hispida.

monticola. To 100 ft.: lvs. oval or oblong, to 11 in. long: fls. to 1 in. long, with shallow corolla-lobes: fr. 4-winged, 2 in. long. N. C. to Ga. and Tenn.

tetráptera: H. carolina.

HALÍMIUM. Cistacex. Old World herbs formerly united with Helianthemum but distinguished by fls. having short straight styles, and from the related genus Crocanthemum in lvs. opposite and in the absence of cleistogamous fls. For cult. see Helianthemum.

alyssoides (Helanthemum alyssoides). Lvs. ovlanceolate: fis. bright yellow, 1½ in. across. S. W. Eu. ovate-

formosum: II. lassanthum,

halimitòlium (Cistus halimifolius. Helianthemum hali-mifolium). To 2 ft: lvs. oblong to lanceolate, white-tomentose when young: fls. yellow with dark spots on petals, 1½ in. across. S. Eu., N. Afr. Var. multiflòrum is listed as an orange-pink form.

lasianthum (H. formosum. Helianthemum formosum and lasianthum). To 3 ft.: lvs. oval to lanceolate, to 1½ in. long: fls. yellow blotched with purple at base, 1½ in. across. Portugal. Var. cóncolor is listed as having clear

canary-yellow fls.

Libanotis (Helianthemum Libanotis). Shrub to 1½ ft., sts erect or ascending: lvs. linear, to 1½ in. long, smooth above, gray-hairy beneath: fls. white, center yellowish, about ¾ in. across, usually in terminal clusters of 1-3 on lateral brunchlets. W. Medit. region.—Distinguished from H. umbellatum in lvs. glabrous above and calyx smooth.

ocymoides (Cistus algareensis. Helianthemum ocymoides).
To 3 ft.: lvs. oblong-lanceolate, about ½ in. long, graypubescent: fls. bright yellow with purple base, 1 in. across.
Spain, Portugal.

umbellatum (Helianthemum umbellatum). lvs. linear or linear-lanceolate, to $1\frac{1}{4}$ in. long, gray-tomentose beneath: fis. white, 1 in. across, calyx short-hairy, often sticky. Eu.

HALIMODÉNDRON. SALT TREE. Leguminosæ. One deciduous ornamental shrub from salty plains of Cent. Asia. H. halodéndron (H. argenteum). To 6 ft.: lvs. of 2-4 oblanceolate lfts. to $1\frac{1}{2}$ in. long, the petiole becoming spiny: fls. papilionaceous, pale purple, in lateral 2-3-fld. racemes: pods inflated, to 1 in. long.—Hardy N.; propagated by seeds, layers, cuttings over bottom heat, or by grafting on laburnum or caragana.

HALORAGIDÀCEÆ. WATER MILFOIL FAM-ILY. Widely distributed herbs, mostly aquatic, of about 8 genera, of which Gunnera, Hippuris and Myriophyllum are grown for the ornamental foliage and habit. The family is very diverse in character of lvs., has regular often very small bisexual or unisexual fls., the calyx with 2-4 lobes. 2-4 separate petals or none, 1-8 stamens, inferior 1-4-celled ovary, and fr. a small nut or drupe. Three genera are represented by native species in N. E. U. S. and many of them are in the southern hemisphere.

HAMAMELIDACEÆ. WITCH-HAZEL FAMILY. Shrubs and trees of about 20 genera mostly in warm temp. regions, evergreen or deciduous: lvs. alternate, simple: fis. bisexual or unisexual. in heads or racemes, with 4-5 sepals and separate petals, or petals lacking, 4 or more stamens, and 2-celled ovary: fr. a 2-beaked woody caps. The Corylopsis, Disanthus, Distylium, Fothergilla, Hamamelis, Liquidambar, Loropetalum, Parrotia, Parrotiopsis, most of them hardy N.

HAMAMÈLIS. WITCH-HAZEL. lidaceæ. Deciduous small trees or shrubs with simple toothed lvs., yellow fls. in axillary nearly or quite sessile clusters blooming in autumn or very early spring, and capsular frs. ripening in the late season or autumn following; native in N. Amer. and E. Asia and hardy N.; sometimes planted for ornament and screens.

They thrive in rather moist soil. Propagated by seeds which require two years to germinate, by layers, or by grafting on stock of *H. virginiana*.

arbòrea: H. japonica var.

japónica. To 30 ft.: lvs. to 4 in. long, becoming glabrous beneath. fls. to 3/4 in. long, Jan.—Mar. Japan. Var. arbòrea (H. arbòrea) has larger lvs. and calyx deep purple inside. Var. flàvo-purpuráscens, petals reddish near the base, sepals deep purple within. Var. rubra is listed. Var. 73 restals deep purple Zuccariniana is tree-like, with calyx greenish-yellow inside.

möllis. To 30 ft.: lvs. to 6 in. long, gray-tomentose beneath: fls. to ¾ in. long, Jan.-Mar., the calyx red inside. China.

populifidrus: catalogue name.

vernalis. To 6 ft., bearing suckers: lvs. to 5 in. long, nearly glabrous beneath: fls. to ½ in. long, Jan.-Mar., calyx dark red inside. Mo. to La. and Okla. Var. rabra has petals reddish, at least near the base. Var. tomentélla, lvs. more or less pubescent beneath.—Considered more fragrant than most other species, but with less showy fls.

virginiana. To 15 ft.: lvs. to 6 in. long, pubescent only on veins beneath: fls. to 3/4 in. long, Sept.—Oct., calyx brownish-yellow inside. E. N. Amer. to Tex.—A tenacious common coarse bush, very attractive for its late autumn bloom.

HAMATOCÁCTUS. Cactaceæ. A small genus, known from Echinocactus by its thin ribs, funnelform fl. and naked axils of fl.-scales, small red berry and tuberculated seeds. See Cacti.

hamatacánthus (Echinocactus hamatacanthus. E. longi-matus. Ferocactus longihamatus. Brittonia Davisi). hamatacanthus (Echinocactus hamalacanthus. E. longi-hamatus. Ferocactus longihamatus. Brittonia Davisis). Globular to cylindrical, to 2 ft. tall; ribs about 13, high, notched; spines red to yellow or white, radials 8-12, to 2½ in. long, centrals 4, half-round, lower one to 5 in. long and hooked: ffs. yellow, to nearly 3 in. across, stigma yel-low, 15-18-lobed. S. Tex., New Mex. and Mex. Var. crassispinus has radials angular, more numerous and thicker than type. Var. papyracanthus has slender white spines. Var. sinuatus is a smaller plant with slenderer and hooked spines. setispinus (*Echinocactus setispinus*). Globose to short-cylindric, to 6 in. high; ribs commonly 13; radial spines 12-16 and slender; centrals longer and 1-3: fls. yellow with a red throat, between 2 and 3 in. long, tube not longer than limb, scales fimbriate. S. Tex., Mex.

nmb, scales nmbriate. S. 1ex., Mex. uncindtus (Echinocactus uncinatus. Ferocactus uncinatus). Ovold to briefly cylindrical, to 8 in. tall and 3 in. diam., dark blue-green, slightly glaucous; ribs 9-13, rounded, straight, wide; spines red to creamy-white, radials 7-8, the lower ones hooked, centrals 1-4, to 5 in. long, often half-round, hooked: fis. dark reddish-brown, to 1 in. long, segms. narrow, often edged pink, stigma pink, 10-lobed. W. Tex. to Cent. Mex. Var. Wrightii has longer more intense red spines.

HAMÈLIA. Rubiaceæ. Evergreen shrubs native in warm parts of Amer., with opposite or whorled entire lvs., tubular 5-lobed red or yellow fls. in terminal branching cymes, and fr. a small berry.

A few species are grown out-of-doors in southern United States. Propagated by seeds and cuttings of half ripe wood under glass.

erécta (H. patens). Scarlet-Bush. To 25 ft., gray-pubescent: lvs. oval or ovate, to 6 in. long: fis. scarlet or orange, to 34 in. long: fr. dark red or purple, 14 in. long, ovoid. Fla. to Brazil.—It has been confused in cult. with Lyong.

pàtens: H. erecta.

sphærocárpa. To 12 ft., hairy: lvs. oblong, to 4 in. long, undulate: fls. orange-yellow, 1 in. long: fr. purplish-black, globose. Peru.

HAMOSA: Astragalus quetrinus

HAPLOPÁPPUS. Compositæ. Per. herbs with many-fld. heads of yellow ray- and disk-fls.; pappus of bristles.

Lyallii (Tonestus Lyallii). To 4 in.: lvs. oblanceolate or spatulate, entire: heads ½ in. across. Mts., B. C. to Colo. rubiginosus: Sideranthus rubiginosus.

HARBINGER-OF-SPRING: Erigenia bulbosa.

HARBOÙRIA. Umbelliferæ. One per. herb with ternately decompound lvs., small yellow fls. in long-stalked umbels, and compressed ribbed frs.; sometimes grown in sunny places in the rock-garden. H. trachypleura. To 2 ft.: ultimate lf.-segms. thread-like. Mts., Colo., Wyo.

HARDENBÉRGIA. Leguminosæ. Australian vines with pinnate lvs. of 3–5 lfts. or sometimes reduced to 1, small papilionaceous fls. in long racemes, and linear pods; differs from Kennedia in its smaller fls. and obtuse keel shorter than the wings.

Grown in the greenhouse or in the open in the South; common in southern California. They require peaty well-drained soil if grown under glass. Propagated by seeds, and by greenwood cuttings in spring under glass.

Comptoniana (Kennedia Comptoniana). Lits. 3 or 5, ovate to narrow-lanceolate: fls. blue or violet: pods to 2 in. long. Var. álba has white fls.

monophfila (H. ovata. Kennedia bimaculata. K. monophylla. K. ovata). Lit. 1, ovate to lanceolate: fis. violet or rose. Var. 41ba has white fis., var. lilácina lilac fis., and var. rôsea pink.

ovata: H. monophylla.

rubicúnda: see Kennedia rubicunda.

HARDHACK: Spiræa tomentosa.

HARDHEADS: Centaurea nigra.

HAREBELL: Campanula rotundifolia and others.

HARICOT: Phaseolus vulgaris.

HARIOTA: Hatiora.

HARPALIUM: Helianthus rigidus.

HARPEPH ILLUM. Anacardiacex. Directions trees with pinnate leathery lvs., fls. in compact axillary panicles, 10 stamens, 4-celled fr. with 2 of the cells small and sterile; 2 species in S. Afr., now and then planted in warm climates.

cáffrum. KAFIR-PLUM. Attractive tree to 30 ft. with glossy lvs.: lfts. lanceolate, to 2½ in. long: fls. white or greenish: fr. dark red, size and shape of large olive, edible.—Grown in S. Calif. and S. Fls. for ornament.

HARPÚLLIA. Sapindaceæ. Trees with alternate pinnate lvs., diocious or polygamous fls. and leathery inflated capsular 2-lobed frs.; one species intro. in Fla. and Calif.; related to Xanthoceras and Ungnadia.

arbòrea (H. imbricata. H. cupanioides). To 35 ft. or more: lvs. of 4-5 pairs of oblong-lanceolate entire lfts. to 6 in. long, shining: fls. in drooping axillary panicles: fr. bright orange, broader than long, about 1⅓ in. wide, having large smooth black seeds. India, Malaya, Philippines.

cupanioldes: H. arborea. imbricata: H. arborea. HARRIMANELLA: Cassiope.

HARRÍSIA. Cactaceæ. Arching or vine-like night-blooming cacti with angled or fluted branches, areoles bearing slender needle-like spines: fls. large and showy, funnelform, white or pinkish, borne singly at areoles near end of branches, the tube scaly. Near a score of species, Fla. to Argentina. See Cacti.

aboriginum. Erect or reclining to 20 ft., sometimes branched; ribs 9-11, obtuse; spines radial, 7-9, to ½ in. long, gray with brown tips: fls. white, to 6 in. long, fiagrant: fr. yellow, globose, to 3 in. diam. W. Fla.

adscéndens (Cereus adscendens). Erect or somewhat prostrate, to 7 ft. long and 2 in. diam.; ribs 7-10, low, tubercled; spines about 10, to 1½ in. long, reddish-brown to gray: fls. white, to 10 in. long. Brazil.

Bonplandii (Cereus and Eriocereus Bonplandii). Erect at first, becoming arching or clambering, to 10 ft. and more, sts. to 3 in. diam. and strongly 4-angled; spines 6-8 fls. white, closing soon after sunrise, to 8 or 9 in. long. Brazil, Paraguay, Argentina.

Brookei (Cereus Brookei). Erect, branched, to 25 ft., sts. dark green; ribs 9-11, obtuse, low; spines 9-12, to 1 in. long, mostly white: fl. color not known: fr. yellowish, to 3 in. across Bahamas.

Earlei. Usually prostrate or pendent, to 10 ft. long and 2½ in. diam., 5-7-angled when young, becoming obscurely so or smooth with age; spines gray, usually 5-8, to 2 in. long: fis. white, to 8 in. long: fr. yellow, to 2½ in. diam. Cuba.

eri6phora (Cereus eriophorus). To about 1 ft. high, main st. 1½ in. or more diam.; ribs 8 or 9; spines 6-9, with dark tips: fis. white inside and pale pink outside, to 7 in. long. Cuba.

Férnowii (Cereus pellucidus). To 10 ft. tall, branched, sts. to 1 in. diam.; ribs about 9, inconspicuous; spines 8-11, to 2½ in. long, light brown with darker tips: fls. white, to 8 in. long. Cuba.

fràgrans. To 15 ft., the sts. 10-12-ridged and erect or clambering; spines 9-13 and to $1\frac{1}{2}$ in. long: fis. white or pinkish, fragrant, to 8 in. long. Fla.

grácilis (Cereus gracilis. C. repandus). Much branched, to 20 ft.; ribs 9-11; spines 10-16 and black-tapped fls. white, corolla 8 in. long, tube nearly 1 in. with hairs in the axils of its scales. Jamaica.

Ghelichii (Eriocereus Guelichii). Sts. prostrate and straggling, branched, to 2 ft. long and 1 ½ in. diam., pale green; ribs 3-4, acute, furrows flattened, arcoles 1-3 in. apart; spines reddish becoming gray with black tip, radials 4-5, to ½ in. long, central 1, to 1 in. long, stouter: fls. white within and greenish outside, to 10 in. long: fr. red, globose, scaly, spineless. Argentina.

Júsbertii (Cereus and Eriocereus Jusbertii). Sts. 2 in. diam., branched; ribs 6; radial spines 7 and very short; central 1 and red or brown: fls. white, brownish-green outside, 7 in. long. Perhaps a hybrid.

Már inii (Cereus and Eriocereus Martinii). Much branched and clambering, 6 ft. or more; radials short; central I and about 1 in. long, old sts. terete and spineless: fls. about 8 in. long, white or tinged pink. Argentina.

Náshii (Cereus Nashii). Erect, to 10 ft., much branched, sts. to 1½ in. diam.; ribs 9-11, obtuse; spines 3-6, gray: fls. probably white, to 8 in. long. Hispaniola.

pomanensis (Cereus and Eriocereus pomanensis). Sts. prostrate or arched, glaucous; ribs 4-6; radial spines 6-8; central spine 1 and to 34 in. long: fls. white, 6 in. long. Argentina.

portoricénsis (Cereus portoricensis). To 10 ft. high and 1½ in. diam., branched; ribs 11; spines 13-17 and 1 in. long: fis. white, to 6 in. long. Puerto Rico.

Règelii. Perhaps a form of *H. Martinii* with longer spines and pale pink fis. white within.

rostrata: possibly Selenicereus hamatus.

Simpsonii. To 18 ft., erect or reclining, simple or branched; ribs 8-10; spines 7-14 and to 1 in. long: fis. white, to 7 in. long. S. Fla.

tortuosa (Cereus and Errocereus tortuosus). Erect but soon arching, branches to 1½ in. diam.; ribs commonly 7; spines 6-10 and awl-l ke: fls. white to pink, dull outside, to 6 in, long. Argentina.

HARTMANNIA. Ginothera

HARTOGIA: Agathosma.

HARTWÈGIA. Orchidacex. Trop. American epiphytes with pseudobulbs or fleshy sts. bearing 1 lf. and fls. in racemes, the lip saccate at base. Grown in the warm greenhouse; see Orchids.

purpurea. To 1½ ft. high, slender: lvs. to 4 in. long, very fleshy, green mottled with red-purple: fl.-cluster short, racemose or paniculate at the summit of a long naked scape much longer than the lvs.; fls. purple-red. Apr.-Oct. Cent. Amer

HASHISH: see Cannabis.

HASTATE: of the shape of an arrow-head but the basal lobes pointed or narrow and standing nearly or quite at right angles; halberd-shaped.

Cactace x.HATIORA (Hariota). spineless cacti of the Rhipsalis group, the fls. without tube and rotate and petals erect, the fls. and terete slender branches always terminal; fls. open only in sunlight, blooming in winter and early spring under glass in U. S. Employed and cult. the same as Rhipsalis. See *Cacti*.

salicornioldes (Rhipsalis salicornioldes). Epiphyte: sts. to 6 ft. or more, cylindric, much branched and diffuse, the branchlets 1 in. long more or less and club-shaped with pedicel-like base: fls. about 1/2 in. long, salmon-colored. S. E. Brazil.

HAW, BLACK -: Viburnum prunifolium and rufidulum. -Medlar: Ciatxgomespilus Possum-: Ilex decidua.

HAWKS-BEARD: Crepts.

HAWKWEED: Hieracium. Golden Yellow: see Tolpis barbata

HAWÓRTHIA. Liliaceæ. S. African succulent plants without sts., the thick lvs. in dense rosettes which are sometimes elongated, and small white or greenish fls. in simple or panicled racemes on scapes. For cult. see Succulents: fanciers plants.

aloefòlia: catalogue name, probably for H. cymbiformis. arachnoides. Lvs. to 2 in. long and 5% in. across at middle, oblong-lanceolate, pale green, pellucid, long awned at tip, margin with cuspidate teeth, on short leafy st.: fis. few in lax racemes.

atrôvirens. Lvs. to $\frac{3}{4}$ in long and $\frac{1}{3}$ in. wide, 30-40 in a dense rosette, with 3-5 vertical green lines: fis. in loose racemes 6 in. long.

attenuata (Aloe attenuata). Lvs entire, to 3 in. long and 3/4 in. across, in rosettes of 30-40, lanceolate-deltoid, covered with white tubercles running together in a series of regular transverse bands: fis. rose, to 3/4 in. long, in lax racemes to 2 ft. long. Var. claripéria, lvs. with larger tubercles.

Cassytha. Leafy st. to 4 in. long: lvs. to 1 1/4 in. long and 3/4 in. across, ovate, dull green, somewhat tubercled on upper surface and whitish along margin, all ascending with strongly raised white tubercles on reverse.

Chálwinii. Lvs. to about 1 in long and ½ in. across, ovate-deltoid, fleshy, tubercles small, whitish in definite transverse bands

coarctata. St. elongated to 8 in.: lvs. to 2½ in. long and in. across, white-warty: fis. lined with red, in simple in. across, wh infl. to 1 ft. high.

Cooperi. Lvs. to 1¾ in. long and 5% in. across, oblong-lanceolate, pale green, pellucid spots on upper half, margin and keel finely toothed fis. to ¾ in. long, in simple racemes to 11/2 ft high.

cuspidata. Lvs. to 1 in. long and 1/4 in. across, obovate-cuneate, pale green, strongly recurved, smooth and awned, to 1/4 in. thick in center: fls. to 5/6 in. long, in lax racemes to 11/5 ft. high

cymbifórmis. Lvs. to 1½ in. long and ¾ in. across, very thick, entire, pale and glaucescent: fis. very pale pink striped with green, in a simple infl. to 1 ft. high

denticulata. Lvs. to 11/2 in, long and 1/2 in, across, oblong-lanceolate, pale green, margins denticulate, short apical awn: fis. to % in. long, in simple lax racemes.

fasciata. Lvs. to 1½ in. long and ½ in. wide, glaucous, with transverse bands of white tubercles: fis. in loose racemes 6 in. long. Var. cæspitôsa is listed as a dwarf and more compact form.

glabrata. Lvs. to 5 in. long and 1 in. across, lanceolatedeltoid, no tubercles on face, reverse with scattered tubercles, upper margins white-lined: fis. to % in. long, in racemes to 3½ ft. high. Var. cóncolor, lvs. scabrous on reverse, covered with minute uniformly colored tubercles; considered to be a probable hybr d with H. scabra. Var. pervíridis has crowded greenish-white tubercles.

Kraŭsii: listed name.

lætévirens. Rosette of 20-30 oblanceolate-oblong lys. to 1½ in. long and ⁵§ in. across, pale green becoming reddish with age, tipped with pellucid awn, margins and keel denticulate: fis to ¾ in. long, in simple lax racemes to 1 ft.

lineats: listed name of unknown botanical standing.

meata: usted name of unknown botanical standing.
margaritffera. Lvs. to 3 in. long and 1½ in. across,
lanceolate-deltod, both sides covered with large white
tubercles, in rosettes of 30-40: fls. to ½ in. long, in dense
racemes to nearly 2 ft. high. Var. corallina, lvs. to 2½ in.
long, tubercles on face sparse, and those on reverse in irregular transverse bands Var. erécta, lvs. smaller than
type with more crowded and smaller tubercles. Var.
granata, lvs. to 2 in. long, deltoid, smaller and more crowded
tubercles. Var. semimargaritffera, lvs. similar in size and
shape to type, facial tubercles more or less confined to
faint keel.

metállica: name of unknown botanical standing, listed as having dark lvs. with irridescent spots.

pentagona: A picra pentagona.

pilifera: listed name of unknown botanical standing.

pseudorígida: H. tortuosa var.

radula. Lvs. to 3 in. long and ¾ in. wide, with minute white tubercles on both sides: fis. lined with green and rose, infl. 11/2 ft. high.

recurva. Lvs. stiff, to 1½ in. long, much recurved, lined with deep green: fis. lined with red.

Reinwardtii. Sts. to 6 in., stoloniferous: lvs. to 1½ in. long and ½ in. wide, with rows of white tubercles: fls. lined with rose, infl. 1½ ft high.

Resendeana: listed name of unknown botanical standing.

reticulata. Lvs. to 1¼ in. long and less than ½ in. wide, oblong-lanceolate, smooth, pale green, more or less flaced, margin minutely scabrous: fls. to ¾ in. long, in few-fld. lax racemes to 1 ft. high.

retusa. Lvs. to 11/2 in. long and 3/4 in. broad, deltoid, curved, mooth face and not scabrous on back, very recurved, mooth face and not scabro thick. fis. to 3/4 in. long in lax racemes.

rigida. Sts. to 4 in.: lvs. to 2 in. long and 34 in. wide, recurved, rough: fls. striped with brownish-green, infl. 2 ft.

rugòsa. Lvs. to 4 in. long and 1 in. w.de, rough on both les with whitish tubercles: fls. rose verned with green, infl. to 3 ft. high.

Schmidtiana. To 16 in.: lvs. broadly ovate-lanceolate. to % in long, tip recurved, strongly convex beneath: fis. white with green stripes, 3s in long, limb 2-lobed, few in racemes on an unbranched peduncle.

semifasciata: listed name of unknown bo anical standing.

semiglabrata. Lvs to 3½ in. long and 1 in. across, lanceolate-delto d, bright green with few tubercles on face and many white tubercles in irregular transverse bands on reverse: fis. to ¾ in long, in dense racemes to 2 ft. high

setàta. Lvs. to 1¼ in. long and ¾ in. across, oblong-lanceolate, pale green and tipped with long pellucid awn, margin with fine spreading teeth: fis. to ¾ in. long, in racemes to 1 ft. high.

Skinneri: listed name of unknown botanical standing.

subfasciàta. Lvs. to 4 in. long and 1 in. wide, with transverse bands of white tubercles beneath: infl. to 2 ft. high.

subrigida. Lvs. to 2 in. long and ¾ in. across, ovate-lanceolate, dark green, very rough w th large white-tipped tubercles: fls. to ¾ in. long, in lax racemes

subulata. Lvs. to 4 in. long and 1 in. wide, very acuminate, in dense rosettes rough with white-tipped tubercles: fls. with green nerves, infl. 3 ft. high.

tessellata. Lvs. to 1½ in long and 1 in. across, deltoid and recurved, face dark green marked with 6 anastomosing

pale green lines, reverse dull green roughened by tubercles, margin with fine teeth: fls. to ¼ in. long, in few-fld, racemes to 1 ft. high. Var. Éngleri is listed. Var. incûrva, lvs. with inflexed margins, dull purplish-green. Var. parva, lvs. shorter and in smaller rosettes. Var. recûrva is probably H recurna

tortudsa. Sts. to 6 in.: lvs. to 2 in. long and ¾ in. wide, rough on both sides: fis. lined with rose, infl. 1 ft. high. Var. pseudorígida is larger, rougher and more succulent.

translûcens. Lvs. to 2 in. long and 1/2 in. across, lanceolate, ascending, pale green sometimes purple-tinged, face pellucid on upper third, margins with fine pellucid teeth: fls. to $\frac{5}{8}$ in long, in few-fld. simple lax racemes to 1 ft. high.

turgida. Lvs. to 1 in. long and 1/4 in. broad, 20-30 in dense rosettes, rounded and somewhat keeled underneath, lined with paler green toward top on upper side: fls. on very short pedicels in a few-fld. raceme.

vittata. Lvs. to 1½ in. long and ½ in. across, oblong-lanceolate, pale green, upper half of face lineate, tipped with long awn, margins finely toothed: fls. to ¾ in. long, in simple dense racemes to 1 ft. high.

HAWTHORN: Cratægus. HAWTHORN: Cratægus. India-: Raphrolepis indica. Water-: Appnogeton distactivus, Yeddo- Raphrolepis umhellata.

HAZÁRDIA. Compositæ. Small Calif. shrubs or per. herbs with leathery lvs. and heads in spikes or panicles, ray-fis. inconspicuous or wanting; pappus of reddish bristles; kin to Solid-

cana. Large shrub: lvs. obovate or oblanceolate, to 8 in. long, entire or toothed, white-tomentose: heads in panicles, ray-fls. yellow turning purple. Isls. off Calif

HAZEL, CHILE: Gevuina Avellana. Winter: Corylopsis. Witch: Hamamelis.

HAZELNUT: Corylus; see Filbert.

HEAD: a short dense spike about as broad as long; capitulum.

HEAL-ALL: Prunella vulgaris.

HEARTSEASE: Viola tricolor var. hortensis.

HEART-SEED: Cardiospermum,

HEART-SHAPED: cordate; ovate in general outline but with 2 rounded hasal lobes; has reference particularly to the shape of the base of a leaf or other expanded part.

HEATH: Erica. Irish Bruckenthalia spiculifolia. Irish-: Daboecia cantabrica. Snike-:

HEATHER. Calluna Beach -: Hudsonia. Mock-Ericameria ericoides.

HÈBE. Scrophulariaceæ. Many shrubs or small trees of the southern hemisphere, mainly native in New Zeal., formerly united with Veronica but differing in the mostly evergreen and woody character, leathery always opposite lys., fls. white to pink, in axillary racemes or spikes or small heads, and in technical characters of the caps. They should no longer be called Veronicas. With the exception of H. formosa, the names here listed are of New Zeal, species or derivatives from them.

Several New Zealand names have recently been listed in Several New Zealand names have recently been haved in California but it is not known whether they have come into general cultivation. Those now named in Hebe are H. Carsei, divergens, evenosa, Haastii, Matthewsii, Merziesii, pubescens, rigudua, subalpina. Others are Veronica acutifora, monticola, Muelleri. Some of the names of hebes may sent horticultural forms.

Hebes are extensively grown out-of-doors in mild climates, as in California, and sometimes under glass in the North. Several kinds are used as evergreen hedges. Propagated by seeds and by cuttings, those taken from mature plants in autumn blooming the following summer.

albicans (Veronica albicans). To 4 ft., much branched: lvs. imbricated, to 1 in. long and ½ in. across, glaucous, entire: fls. white, in many-fld. racemes. By some considered a hybrid; much like H. amplexicaults.

amábilis (Veronica amabilis). To 15 ft. or more: lvs. to 4 in. long and 1 in. across, entire: fls. white, 1/4 in. across, in racemes to 6 in. long. Considered to be a hybrid race issuing from H. elliptica and H. salicifolia.

amplexicaulis (Veronica amplexicaulis). To 3 ft., sometimes decumbent: lvs. imbricated, to 1 in. long and 3/4 in.

across, glaucous, entire, very thick; fls. white. 1/2 in. across. in spikes to 11/2 in. long.

Andersonii (Veronica Andersonii). Regarded as a garden hybrid between H. salicifolia and H. speciosa: fis, white tipped with violet. Var. variegata has lvs. variegated with creamy-white.

angustifòlia (Veronica angustifòlia). To 8 ft., much braiched: lvs. to 3½ in. long and ½ in. across, keeled beneath, entire: fls. pale lilac, ½ in. across, in racemes to

anomala (Veronica anomala). To 5 ft., much branched: lvs. to ¾ in. long and ½ in. across, keeled and shining: fls. white or pale pink. ¼ in. across, in spikes forming short panicles.—Very like H. buxilolua.

Balfouriana (Veronica Balfouriana). To 3 ft.: lvs. ovate, to 3/2 in. long, entire, shining above: fls. pale blue, 3/2 in. across, in racemes to 3 in. long.

Bárkeri (Veronica Barkeri). Shrub: lvs. to 2 in. long and $\frac{2}{3}$ in. across: fls. pale lilac, $\frac{1}{3}$ in. across, in racemes to 2 in. long. Cultigen.

Bóllonsii (Veronica Bollonsii). To 5 ft., much branched: lilac, 1/4 in. across, in racemes to 4 in. long.

Buchánanii (Veronica Buchananu). To 1 ft., much branched: lvs. imbricated, about 1/2 in. long and broad: fis. white, 1/3 in. across, in short spikes.

buxifòlia (Veronica buxifolia). To 5 ft.: lvs. imbiicated, to ½ in. long and ¼ in. across, stiff and thick, entire: fls. white, ¼ in. across, in spikes to 1 in. long.

cárnea (Veronica carnea). Apparently a garden hybrid with H. speciosa as one parent: fis. rose.

carnósula (Veronica carnosula). To 3 ft., often decumbent: Ivs. imbricated, to ¾ m. long and ½ in. across, glaucous: fls. white, ¼ in. across, in dense spikes.

chathámica (Veronica chathamica). To 1½ ft., with prostrate or trailing sts.; lvs. oval, to 1 in. long; fls. purple, ¼ in. across, in racemes to 1 in long. Var. erécta is listed.

Colensoi (Veronica Colensoi). To 1½ ft.: lvs. to 1½ in. long and ½ in. across, nearly entire, glaucous beneath. fls. white, ¼ in. across, in racemes about 1½ in. long.

cupressoides (Veronica cupressoides). To 6 ft.: lvs. scale-like, 1/15 in. long or to 1/2 in. on young plants: fis. pale purple or rarely white, 1/6 in. across, in small terminal heads.

Darwiniana (Veronica Darwiniana). Small shrub: Ivs. to ¾ in. long and ⅓ in. across, entire, glaucous: fis. white, ⅓ in. across, in dense racemes to 1⅓ in long.

decúmbens (Veronica decumbens). To 3 ft., decumbent and much branched: Ivs. to ¾ in. long and ⅓ in. across, margins bright red: fis. white, ¼ in. across, in lacemes to 1 in long.

Dieffenbachii (Veronica Dieffenbachii). To 4 ft., much branched; lvs. to 4 in long and 1 in. across; fls. hlac, 1/4 in.

diosmæfòlia (Veronica diosmæfolia). To 5 ft. or more, much branched: lvs. to 1 in. long and 16 in. across. fls. white or pale blue, 1/4 in. across, in corymbose racemes 1 in. long.

Dorrien-Smithii (Veronica Dorrien-Smithii). Small straggling shrub: lvs. to 3 in. long and 1½ in. across, ciliate at margins: fis. white or lavender, ½ in. across, in racemes as long as lvs.

elliptica (Veronica elliptica, V. decussata). To 20 ft., much branched, lvs. to 1½ in. long and ½ in. across: fls. white or veined purple or pale blue, ¾ in. across, in racemes to 1½ in. long. Variegated forms are listed.

epacridea (Veronica epacridea). Prostrate half-hardy shrub: lvs. obovate-oblong, to 1/2 in. long, leathery, glabrous, keeled, mostly obtuse: fls. white, in dense terminal

formòsa (Veronica formosa). To 4 ft., evergreen: lvs. oval to lanceolate, to 1 in. long, nearly entire: fls. pale lilac, in short racemes. Tasmania.

Gibbsii (Veronica Gibbsii). To 1½ ft.: lvs. imbricated, to ¾ in. long and ½ in. across, glaucous, white-ciliate: fls. white, ½ in. across, in dense-fld. spikes.

gigantèa (Veronica gigantea). Tree to 50 ft.: lvs. to 5 in. long and $\frac{1}{2}$ in. across, coarsely toothed when young: fis. white, $\frac{1}{2}$ in. across, in racemes to 5 in. long.

glaucophýlla (Veronica glaucophylla). Similar to H. Trasersii, but lvs. much narrower, linear, glaucous and not keeled: fis. white, in slender tapering racemes.—V. Colensoi var. glauca belongs here.

gracillima (Veronica gracillima). Much branched shrub: lvs. to 2½ in. long and ½ in. across fis. ¼ in. across, in racemes to 5 in. long. Probably a hybrid between H. angustifolia and H. salicifolia.

Héctori (Veronica Hectori). To 1 ft.: lvs. densely imbricated, pairs united to middle, orbicular-oblong, to ½ in. long, very thick: fis. white, ¼ in. across, in small terminal heads.

Hulkeana (Veronica Hulkeana). To 3 ft.: lvs. ovate, to 2 in. long, toothed: fis. pale lilac, to ½ in. across, in panicles to 1 ft. long.

lævis (Veronica lævis). To 5 ft.: lvs. to ¾ in. long and ¼ in. across, stiff, entire: fls. white, ¼ in. across, in racemes to 11/2 in. long.

leiophylla (Veronica leiophylla). To 12 ft.: lvs. to 1½ in. long and ½ in. across: fis. white, ½ in. across, in racemes to 4 in. long. Var. strictissima differs in more acute lvs. and more upright racemes.

Lawisii (Veronica Lewisii). To 6 ft., the branches gray-pubescent: lvs. to $2\frac{1}{2}$ in. long and 1 in. across, margins with white line: fls. pale blue, $\frac{1}{2}$ in. across, in racemes to $2\frac{1}{2}$ in. long.

loganioides (Veronica loganioides). Shrub to 14 in., sts. decumbent, grayish: lvs. ovate-lanceolate, to ½ in. long, acute, sessile, keeled: fis. white or white with pink venns, to ¼ in. across, in racemes forming a small corymblike head.

macrántha (Veronica macrantha). To 2 ft.: lvs. to 1 in. long, toothed: fls. white, ¾ in. across, in 3-8-fld. racemes.

macrocárpa (Veronica macrocarpa). To 8 ft.: lvs. to 6 in. long and 1 in. across: fls. white, to ½ in. across, in racemes to 7 in. long. Var. latisépala (Veronica latisépala) has shorter racemes and fls. deep violet.

macroura (Veronica macroura). To 5 ft.: lvs. to 3 in. long and 1¼ in. broad: fls. white or bluish, ¼ in. across, in dense racemes to 4 in. long.

obtushta (Veronica obtusata). To 3 ft.: lvs. to 2 in. long and 1 in. across, with white-hairy margins: fis. bluish-white, 1/5 in. across, in racemes to 21/2 in. long.

parviflora (Veronica parviflora). Shrub or tree to 20 ft.: lvs. to 2½ in. long and ½ in. across, entire: fls. white, ½ .n. across, in racemes to 3 in. long.

pimeleoides (Veronica pimeleoides). To 1½ ft., often prostrate, much branched: lvs. to ½ in, long, glaucous: fls dark purple-blue, ¼ in. across, in spikes to 1 in. long.

pinguifòlia (Veronica pinguifòlia). To 4 ft., often decumbent: lvs. imbr cated, to ¾ in. long and ⅓ in. across, glaucous. fls. white, ⅓ in. across, in dense spikes longer than lvs.

rakaiénsis (Veronica rakaiensis). To 6 ft.: lvs. linear-lanceolate, to 1 in. long, entire, shining above: fls. white, ¼ in. across, in racemes to 2 in. long.—Close to H. Traversii.

rotundata (Veronica rotundata). To 6 ft.: lvs. to 4 in. long and 1½ in. across, fis. purple or lilac, ½ in. across, in racemes to 6 in long.—Much like H. macrocarpa, but caps, almost orbicular and rounded at top.

rupicola (Veronica rupicola). To 4 ft.: lvs. to 1 in. long and $\frac{1}{2}$ in. across, entire: fls. $\frac{1}{2}$ in across, in racemes to 2 in. long.

salicifolia (Veronica salicifolia). To 12 ft., much branched. lvs. to 6 in. long and 34 in. across: fls. white tanged lilac, 1/6 in. across, in racemes 6 in. or more long. Var. communis does not differ from the type. In var. longiracemosa the racemes are 1 ft. or more long.

speciòsa (Veronica speciosa. V. imperialis is a garden name). To 5 ft.: lvs to 4 in. long and 134 in. across, entire, shining: fls. dark reddish- or violet-purple, 1/4 in. across, in racemes about 4 in. long.

Townsonii (Veronica Townsonii). To 6 ft.: lvs. to 3 in. long and 1/4 in across: fls. white, 1/4 in. across, in racemes to 6 in. long.

Traversii (Veronica Traversii). Small shrub: lvs. to 1 in. long and 1/8 in. across, entire: fls. white, 1/4 in. across, in racemes to 3 in. long. Var. 6legans is a slender form with narrower lvs.

vernicosa (Veronica vernicosa). To 3 ft., often decumbent: lvs. to $\frac{2}{3}$ in. long and $\frac{1}{3}$ in across, entire: fis white, $\frac{1}{3}$ in. across, in racemes to $\frac{1}{3}$ in. long

HEBECLINIUM: Eupatorium macrophyllum,

HEBENSTRÈTIA. Scrophulariaceæ. Many kinds of herbs or shrubs with narrow lvs. and yellow or white fls. in dense terminal spikes, the corolla split and 4-lobed, calyx spathe-like; mostly from S. Afr.

Seed should be sown outside in April or inside if earlier results are desired; treated as annuals

comòsa. Per. to 4 ft., with woody sts.: lvs. lanceolste, to 2 in. long, toothed: fls. yellow or white with orange-red blotch on limb, 14 in. long, in spikes to 6 in. long, fragrant at night.

dentata. Similar to H. comosa but to 4 ft. high, with lvs. linear and toothed only above middle.

HÉCHTIA. Bromeliaceæ. Succulent terrestrial diœcious herbs with long stiff spiny-toothed lvs. in dense rosettes and small white fls. in terminal panicles.

argéntea. Fl.-sts. to 3 ft.: lvs. to 2 ft. long and 1 in. wide, silvery: fis. $\frac{1}{2}$ ft. long, in many sessile spikes forming a loose panicle to $\frac{1}{2}$ ft. long. Mex.

rosea. Lvs. to 2 ft. long and 1 in. wide, tinged with brown: fls. bright red, ½ in. long, in loose panicles to 4 ft. long. Mex.

texénsis. Fl.-sts. to 4 ft.: lvs. to 1½ ft. long and 2 in. wide: fts. ½ in. long, solitary and sessile on branches of panicle, subtended by brownish bracts. Rio Grande, Tex.

HEDEÒMA. Labiatæ. Ann. or per. American herbs with opposite small lvs. and small blue or purple 2-lipped fls. in axillary clusters.

camporum. Per., sts. decumbent or ascending: lvs. linear-lanceolate to oblong, to 34 in. long, gray-hairy: corolla blush-purple, to ½ in. long. S. D. to Kans.

Drümmondii. Sts. to 16 in.: lvs. linear to oval, to ¼ in. long: fls. pinkish, to ¼ in. long. Tex.

pulegioldes. American Pennyrgoyat, Mock P. Ann. to 18 in., erect, much branched, hairy: lvs. ovate to ovate-oblong, to 11/2 in. long, petioled: corolla bluish-purple, to 1/2 in. long. N. S. to Fla. west to Minn. and Ark.

HÉDERA. Ivy. Araliacex. Evergreen shrubs climbing by rootlets, with alternate entire or lobed lvs., small greenish fls. in umbels which are panicled or racemed, and fr. a berry; planted as a wall cover, for borders of shrubberies and for ground-cover in shady places, and sometimes as a house and conservatory subject.

Ivy thrives best in rich moist soil. Propagated by cuttings, layers, and seeds which usually do not germinate until the second year. Slow-growing species or forms are sometimes grafted on common stocks.

algeriénsis: H. canariensis.

ánglica: listed name.

arbòrea: II. Helix var. arborescens.

azórica: II. canariensis, báltica: H. Helix var.

canariénsis (*II algeriensis*. *H. azorica*. *H. maderensis*). Lvs. ovate, to 6 in. across, entire or shallowly 3-7-lobed, heart-shaped at base: fr. black. Canary Isls., N. Afr; adapted to Calif. Var. variegāta has lvs. edged with yellowish-

concinca (H. coriacea and Roegneriana). Lvs. broadly ovate, to 10 in. long, entire or slightly lobed, heart-shaped at base: fr. black. Caucasus, Persia; for southern states. Var. dentata has lvs. remotely toothed.

conglomeràta: H. Helix var.

cordata: hort. name, probably for H. colchica.

coriàcea: H. colchica. dentàta: II. colchica var. digitàta: H. Helix var.

donerailénsis: II. Helix var. minima.

Háhnii: listed name of no botanical standing.

Håhnii: listed name of no botanical standing.

Hèlix. English I. Lvs. usually 3-5-lobed and margins entire, to 4 in. long, on fruiting branches ovate and unlobed, often with light colored venns: fr. black. Eu. Asia, N. Afr.; stands in protected places in N. Y. and New England but does not attain great size. Runs into many forms, a few of which are: arboréscens (H. arborea), erect, not climbing; argénteo-variegàta, lvs. variegàted or edged with white; aùreo-variegàta, lvs. variegated or edged with white; aùreo-variegàta (var. chrysophylla), lvs. yellow or variegated with yellow; bâltica, small-lvd. hardy form; Caenwoodiàna, with small blackish-green lvs. and white veins; canéscens chrysocárpa is var. poetica; conglomeràta, with small crowded lvs.; coriacea is H. colchica; deltoidea (var. hastata), lvs. with only 2 basal lobes; digitàta, lvs. digitately 5-lobed; discolor has smaller variegated lvs; elegantissima is var. tricolor; erécta, probably a form of var. tately 5-lobed; discolor has smaller variegated lvs; elegantissima is var. tricolor; erécta, probably a form of var. arborescens; glomerâta is var. conglomerata; grácilis, lvs. rather small, turning bronzy; hastâta is var. delloiden; hibérnica, lvs. to 6 in. across, with short lobes; Howardii, lvs. to 2 in. across, 3-lobed, dark green dotted, marbled or blotched cream-white; lobâta is listed; maculâta, similar to var. hibernica, but has lvs. spotted and striped with yellowish-white; marmorâta, lvs. blotched with yellowish-white; marmorâta, lvs. blotched with yellowish-white; minima (var. donerailensis), lvs. small, purplish-brown in winter; nigra, small very dark green lvs.; palmāta, with dull green digitately lobed lvs.; pedāta, lvs. pedately 5-lobed with long middle lobe; peltāta is listed as having small deeply cut lvs.; poética (var. chrysocarpa) fr. yellow; Roegneriana is H. colchica; rhombofdea is listed in the trade and may be intended for H. rhombea; stricta, an erect form perhaps not distinct from var. arborescens; tortuòsa, lvs. nearly entire, curled and twisted; trícolor (var. elegantissima) has edges of lvs. red in autumn; plants listed as variegata may be vars. argenteo-variegata or aureo-variegata.

hibérnica: H. Helix var. himalàica: H. nepalensis. japónica: H. rhombea. lùcida: listed name. maderénsis: H. canariensis. mínima: H. Helix var.

nepalénsis (*H. himalaica*). Climbing vine, with scaly young sts.: lvs. 2-5-lobed on a side in case of sterile sts. and unlobed on flowering branches: pedicels of umbels stout; fr. yellow. Himalayas; stands only far S.

palmàta: H. Helix var.

rhômbea (H japonica of cult.). Climbing vine, distinguished from H nepalensis in lvs. typically 3- rarely 5-lobed on non-flowering sts., umbels on slender peduncles and black fr. Korea, Japan.

Roegneriana: H. colchica.

HEDGE. A hedge is a dense permanent row or line of living plants, ordinarily trimmed into more or less formal shape, answering the purpose of a fence, a screen or a windbreak. It is comprised of durable woody plants that make a thick intertangled or impenetrable growth and that withstand shearing. Hedges proper are to be distinguished from edgings, which are low and sometimes temporary lines about walks, flower-beds and borders.

For evergreen hedges the most serviceable plant in general in North America is probably the arbor-vitæ. For choice hedges about the grounds, particularly outside the northern states, some of the retinosporas are useful; also yews. One of the most satisfactory of coniferous plants for hedges is the common hemlock, which stands shearing well and makes a very soft and pleasing mass. Other plants that hold their leaves and are good for hedges are the common box and the privets. The dwarf variety of box can be kept down to a height of 6 inches to a foot for any number of years and is useful for edgings. The larger-growing varieties make excellent hedges 3, 4 and 5 feet high. The ordinary privet or prim holds its leaves well into the winter in the North. The so-called Californian privet holds its leaves rather longer and stands better along the sea-shore, but it is less hardy than the other. In the southern states, nothing is better than Citrus (or Poncirus) trifoliata. Some of the barberries are excellent hedge plants, particularly Berberis Thunbergii with its good autumn color (B. vulgaris is a host of wheat rust). Native plants of the region often make acceptable

For hedges of deciduous plants, the most common species are the buckthorn, the European thornapple or cratægus, osage-orange, and various kinds of roses, particularly Rosa rugosa. Near the sea in California, Lavalera assurgentiflora is employed as a wind-break.

To obtain a good hedge, it is necessary to have a thoroughly well-prepared deep soil, to set the plants close, and to shear them at least twice every year. Arbor-vitæ may be set 1-2½ or 3 feet apart, and hemlock spruce much the same; and these distances may be taken as a

general guide for many other plants.

The hedge should be trimmed the year after it is set, although it should not be cut very closely until the plants reach the desired or permanent height. Thereafter it should be sheared into the desired form in spring or autumn. If the plants are allowed to grow a year or two

without trimming, they lose the lower leaves and become open and straggly. Osage-orange and some other plants are plashed—that is, the plants are set at an angle rather than perpendicularly, and they are wired together in such a way that they make an impenetrable barrier just above the surface of the ground.

Hedges are much less employed in North America than in Europe, and for several reasons. The climate is relatively dry, and most hedges do not thrive as well here as there; labor is high-priced, and the trimming is likely to be neglected; farms are so large that much fencing is required; timber and wire are usually cheaper than live hedges. However, they are grown with good effect about home grounds.

cet about nome grounds.

HEDGE-THORN: Carissa Arduina.

HEDRÆANTHUS: Edraianthus.

HEDYCÁRYA. Monimiaceæ. Trees or shrubs sometimes planted in Calif.: lvs. opposite: fls. diœcious, in axillary cymes or racemes: fr. composed of several drupes borne on the receptacle: native in New Zeal., Australia and Pacific Isls.

arborea. To 40 ft.: Ivs. oblong or obovate, to 5 in long, coarsely toothed, leathery: fis to 1/2 in. across: drupes bright red, 1/2 in. long. New Zeal.

HEDÝCHIUM. GINGER-LILY. Zingiberacex. Robust trop. per. herbs with strong rootstocks and leafy sts., the fls. borne in bracts on terminal spikes or panieles and having 1 broad petal-like staminode or lip and prominent but smaller lateral ones.

Grown in the greenhouse or frostless countries out-ofdoors; prized for the showy flowers and fragrance. They require rich soil and plenty of water or may even be immersed up to the crown. Propagated by division of the roots. See Zingiberacew.

aurantiacum. To 10 ft: lvs. to 1½ ft. long and 1 in. wide: fis. orange, the corolla-tube ¾ in. and segms. 1 in. long, filament bright red, in spikes to 6 in. long. India.

aûreum. Dwarf: lvs. lanceolate, to 8 in. long, acuminate, slightly pubescent beneath: fls. golden-yellow, to 34 in. long, in dense spikes to 2 in. long, stammodes linear, about 1/2 in. long, filament as long as lip. India.

chrysoleùcum (H. coronarium var. chrysoleucum). Differs from H. flavescens in the base of lip and lateral stammodes deep orange-yellow. India.

coccineum. To 6 ft.: lvs. to 20 in. long and 2 in. wide: fis red, the corolla-tube 1 in and segms. 1 in. long, filament pink, in dense spikes to 10 in. long. India. Var angustifolium has shorter lvs. and brick- or salmon-red fis.

coronàrium. Garland-Flower. To 6 ft.: lvs. to 2 ft. long and 5 in. wide: floral bracts large and firm and closely imbricated with 4-6 white very fragrant fls under each one; perianth-tube 2-3 in. long; lip large and broud, nearly 2 in. long and 1½ in broad, 2-lobed and sometimes with smaller lobes, sometimes tinged yellow on lower part; filament with anther shorter than lip: spike somewhat ovate, to 1 ft. long. Trop. Asia, nat. extensively in trop. Amer

elatum. To 12 ft. or more: lvs. to 2 ft. long and 2½ inwide: fls. yellowish-white, the corolla-tube 1 in. and segms. ¾ in. long, filament pink, in loose spikes to 1 ft. long. India.

ellipticum. To 5 ft.: lvs. to 14 in. long and 5 in. wide: fls. yellowish-white, the corolla-tube to 3 in. and lobes 1 in. long, filament purple, in dense spikes 4 in. long. India.

flavéscens (II. coronarium var. flavescens). Fls. to 5½ in. long, yellowish, with color deeper in basal part; lip obovate-orbicular, 2-lobed, narrowed to claw, filament with anther slightly exceeding lip, yellow. India, Mascarene Isls.

flàrum. To 5 ft.: lvs. to 14 in. long, slender-pointed; spike oblong, the imbricate bracts oblong-ovate and nearly obtuse, 2½ in. long and 2 in. broad; lip obcordate, suddenly narrowed into a short claw, yellow with orange patch in center and below, filament and anther about as long as lip. India.—Other plants have been known as H. flarum.

Gardnerianum. Lvs. to 1½ ft. long and 6 in. wide: fls. light yellow, the corolla-tube 2 in and segms. 1½ in. long, with long-exserted red filament, in spikes to 1½ ft. long. India.

glaucum ($H.\ gracile\ var.\ glaucum$). To 5 ft.: lvs. to 10 in. long and 3 in wide, glaucous beneath: fls. white, the corollatube 1 in. and segms. $1\frac{1}{4}$ in. long, filament red, in loose spikes to 8 in. long. India.

grácile. To 2 ft.: lvs. to 5 in. long and 1½ in. wide, glaucous beneath: fis. greenish-white, the corolla-tube 1 in. and segms. ¾ in. long, filament ied, in spikes to 4 in. long.

Greènei. To 6 ft.: lvs. to 10 in. long and 2 in. wide: fls. with corolla-tube 1½ in. long and dark red lip 1½ in. long, the linear lobes lighter red, filament red, in dense spikes to 5 in. long. India.

máximum (*H. coronarium* var. maximum). Differs from *H. coronarium* in the broader lvs., chate bracts, large fis. with lateral staminodes frequently bearing a lobe or tongue from the center, filament tinged pink, hip nearly 2¾ in. long and 1¾ in. broad. India.

spicatum. To 3 ft.: lvs. to 16 in. long and 4 in. wide: fls. yellow, the corolla-tube 3 in. and segms. 1 in. long. flament reddish, in loose spikes to 8 in. long. India. Var. acuminatum has lvs. tomentose beneath and puiple corolla-

thyrsiforme. To 6 ft.: lvs. to 14 in. long and 5 in. wide: fls. white, the corolla-tube 1 in. and lobes 1 in. long, filament white, in dense spikes to 4½ in. long. India.

villosum. To 8 ft. lvs. to 14 in, long and 4 in, wide: fls. value and 4 in. wide: fis. with white corolla-tube to $2\frac{1}{2}$ in. long and yellow segms. $1\frac{1}{2}$ in. long, filament purple, in loose spikes to 10 in. long. India.

HEDÝSARUM. Leguminosæ. or subshrubs native in the north temp. zone, with pinnate lvs., showy papilionaceous fls. in axillary racemes, and flat pods which separate into joints.

Of easy cultivation in sunny well-drained soil. gated by seeds and division. Sometimes planted in borders for ornament.

alpinum: II. boreale.

americanum: H. boreale.

boreale (H. alpinum. H. americanum). To 2½ ft.: lts. 5-10 pairs, oblong, to 1 in. long; fls. violet or rarely white, to ¾ in. long, in summer. Lab. to Wyo. Var. ròseum, with pink fls., is listed.

coronarium. French-Honeysuckle. Per. or bien. to 4 ft.: lfts. elliptic, 3-7 pairs: fis. deep red, fragrant, in summer. Eu. Var. album has white fis.

gangéticum: Desmodium gangeticum.

grandiflorum. Lfts. 3-4, elliptic, silky beneath: fls. pale yellow, wings shorter than keel: pods 5-jointed, white-villous. Rumania.

multijugum. To 5 ft.: lfts. obovate, to $\frac{1}{2}$ in. long, 10–20 pairs: fls. violet or purple, in summer. Mongolia.

negléctum: H. obscurum.

obscurum (H. neglectum). To 1 ft.: lfts. oblong, 5-9 pairs: fls. purple, in summer. Eu.

occidentale. To 2 ft.: lfts. 6-10 pairs, oblong or lanceolate: fls. purple. Wash.

pabulare. To 2½ ft.: lfts. oblong, 4-7 pairs, to ¾ in. long: fls. purple, ½ in. long, in early summer. Mont. to New Mex.

sikkiménse. To 6 in.: lfts. 10-13 pairs, linear-oblong, to ½ in. long, somewhat leathery: fls. bright red, ½ in. long, in dense heads to 2 in. long. Himalayas.

utahénse. To 2 ft.: lfts. oval or oblong, 5-8 pairs, to 1 in. long. fls. rose-purple, to ¾ in. long. Utah, Ida.

HEDYSCÈPE. Palmace x.One unarmed attractive monœcious feather-palm of Lord Howe Isl. in the S. Pacific. From Howea the genus differs in having flexuosely branched spadices, the fls. hardly in pits; ovule attached on wall: fr. larger, about 2 in. long with obliquelateral stigmatic point, and other technical differences. H. Canterburyana (Kentia Canterburyana). Tall stout palm with a dense crown of arched recurving lvs.: pinnæ numerous, green both sides, narrow-lanceolate and acuminate, drooping at ends. Planted somewhat in Fla. and S. Calif.

HEERIA: Schizocentron elegans, Heterocentron roseum.

HEIMIA. Lythraceæ. Two trop. American glabrous shrubs with small opposite or whorled lys., vellow solitary fls. having horn-like appendages at base of calvx-lobes and capsular frs.: sometimes planted in S. Calif

myrtifòlia. To 3 ft.: lvs. linear or lanceolate, to 2 in. long: fls. ½ in. long. Brazil. salicifòlia. To 10 ft.: lvs. linear-lanceolate or lanceolate, to 3½ in. long: fls. to ¾ in. long. Mex. to Argentina.

HELÈNIUM. Sneezeweed. Compositæ. Coarse erect herbaceous annuals and perennials with alternate, toothed or entire lvs. and yellow or brownish heads, mostly radiate, either solitary or in flat-topped clusters in summer and fall; pappus of scales; native in N. and S. Amer.

Heleniums thrive well in fairly rich soil and a sunny situation; they may be propagated by seeds, cuttings and division. They are useful for rear borders and wild-gardens.

aromáticum (Grahamia aromatica). Glaucous, much branched: lvs. linear-lanceolate, upper entire, lower pinnately cut: heads of yellow disk-fis. Chile.

autumnāle (H. grandiforum). Per. to 6 ft.: lvs. lanceolate or ovate-lanceolate, to 5 in. long, mostly toothed, decurrent on st.: heads to 2 in. across, numerous, rays lemonyellow to bright yellow, disk yellow. Que. to Fla. and Ariz. Var. grandiflorum has large fis. Var. minor, dwarf form to 2 ft. in mixed colors yellow and red. Var. nanum præcox is dwarf and early blooming. Var. pumilium grows to 2 ft. high. Var. rūbrum, fis. deep red. Var. striatum has rays striped with crimson. Var. supérbum, fis. large.

Bígelovii. Per. to 4 ft.: lvs. lanceolate, to 10 in. long, decurrent on st.: heads to 2½ in. across, rays yellow, disk brown or brownish-yellow. Calif. Var. aurantiacum is heted

bruneum coccineum is listed as a plant 1 ft. high with bronzy-brownish-red fls.

califórnicum: H. puberulum.

gaillardiæflorum: form of H. autumnale with bronzyred rays tipped with golden-yellow.

gigantèum: listed name, probably of a form of H. autumnale.

grandicéphalum striàtum: H. nudiflorum var.

grandiflorum: H. autumnale.

Hoopesii (Dugaldia Hoopesii). Per. to 3 ft.: lvs. oblong-lanceolate, to 10 in. or more long, entire, not decurrent: heads 1 to several, 3 in. across, yellow. Rocky Mts. to Ore. and Calif.

Mderheimii: hort. name for a dwarf red-fld. form, probably of H. autumnale.

montanum. Per. to 3½ ft.: lvs. lanceolate, to 4 in. long, finely toothed to entire, decurrent: heads golden-yellow, to 1¾ in. across, ray-fls. about ¾ in. long and puberulent beneath. Kans. to New Mex. north to Mont. and B. C.

nanum: H. autumnale var

nudiflorum. Per. to 3 ft.: lvs. lanceolate to linear-lanceolate, to 6 in. long, nearly entire, decurrent on st.: heads to 1½ m. across, in clusters, rays drooping, yellow, brown-purple or striped, disk brownish or purplish. N. C. to Fla. and Tex. Var. grandicéphalum striatum, to 5 ft., heads 2 in. across.

peregrinum: listed name of form said to have mahogany-red ray-fis. faintly edged yellow.

polyphfilum. Per. to 2½ ft., upper sts. conspicuously winged: lvs. linear-spatulate, to 4 in. long, entire: disk-fls. purplish, ray-fls. yellow, heads corymbose, to 1¼ in. across. Tenn., Ga.

præcox: H. autumnale var. nanum præcox.

pubérulum (H. californicum). Per. to 5 ft.: lvs. lanceo-late or linear, decurrent: heads solitary, globose, red-brown, ½ in. across, rays reflexed and inconspicuous. Calif.

pùmilum: H. autumnale var.

rubrum: H. autumnale var. striatum: H. autumnale var.

tenuifòlium. Ann. to 2 ft., very leafy: lvs. thread-like, to 1½ in. long, entire, often whorled: heads to 1 in. across, clustered, yellow. Va. to Fla. and Tex.; northward as a

HELEOCHARIS: see Eleocharis.

HELIÁMPHORA. Sarraceniaceæ. One insectivorous per. native in British Guiana, rarely seen in greenhouse collections. The plant requires much moisture and does best in pots plunged in moss under a bell-glass. Propagated by single crowns. H. natans. To 2 ft.: lvs. or pitchers basal, tubular, winged in front, with very small lid, veined with red: fls. white or pale rose, nodding, several together.

HELIANTHÉLLA. Compositæ. Per. herbs with alternate or opposite lvs. or sometimes the scape leafless, and long-stalked solitary heads of yellow ray-fls. and yellow or brownish disk-fls.: pappus of scales; native in W. N. Amer. Propagated by seeds or division.

Douglasii. To 3½ ft.: lvs. oblanceolate or lanceolate, to 5 in. long: disk 1 in. across, rays 1 in. long. B. C. to Wyo.

Párrvi. To 1 ft.: lvs. oblanceolate. to 4 in. long: disk to 3/4 in. across, rays 1/2 in. long. Colo. to Ariz.

quinquenérvis. To 2 ft.: lvs. ovate-lanceolate, to 9 in. long: disk to 2 in. across, rays 1 in. long. S. D. to New Mex.

uniflora. To 2 ft.: lvs. oblong-lanceolate, to 5 in. long: disk purple, rays 1 in. long. Mont. to New Mex.

HELIÁNTHEMUM. SUN-Rose. Evergreen or half-evergreen suffrutescent herbs or diffuse low subshrubs adapted to border planting and rock-gardens or for ground-cover, mostly native in the Medit, and adjacent regions, having small simple lvs. with the lower ones mostly opposite and upper alternate, and white. yellow, rose or purple fls. in many terminal few-fld. racemes in summer. Recent cytogenetic and taxonomic studies have recognized as valid 3 other genera usually treated here; they are the European Fumana and the New World genera Crocanthemum and Halimium; from all of these Helianthemum is distinguished by its clongated and curved styles.

In the North winter protection is advisable. They thrive in a sunny exposure on dry limestone soil. Propagated by division, greenwood cuttings and seeds. One of the sun-roses (*H. nummularium*) is hardy and common in the North.

alpéstre. To 6 in.: lvs. ovate-lanceolate, to 3/4 in. long: fls. yellow, 1/2 in. across. Mts. of S. Eu.

alyssoides: Halimium alyssoides.

amábile: listed hort, form with orange fis, tinged pink. apenninum (H. polyfolium, H. pulverulentum). To 15 in. or sts. procumbent: lvs. oblong, to 1½ in. long, graytomentose; fls. white, 1 in. across. Eu., Asia Minor. Var. roseum (H. rhodanthum) has reddish fls

atrosanguíneum: listed name of hort. form.

aureum: H. hirtum var. erectum or H. nummularium var. bicolor: H. glaucum.

californicum: listed name of a plant properly belonging to the genus Crocanthemum.

canadénse: Crocanthemum canadense.

cárneum: hort, name,

Chamæcistus: H. nummularium. citrinum: II. nummularium var.

coccineum: listed name. crdceum: H. glaucum var. Croftianum: hort. name. cùpreum: H. grandiflorum var. formdsum: Halimium lasianthum.

glaucum (H. bicolor). Little tufted subshrub: lvs. nearly orbicular to oblanceolate, ½ in. long, tomentose: fis. yellow or white, ¾ in. across. S. Eu., N. Afr. Var. croceum (H. croceum), fis. bright yellow.

grandiflorum. Similar to *H. nummularium*, differing in lvs. scattered, stellate-hairy and green beneath, and inner sepals puberulent to nearly glabrous between the pilose veins. Eu., W. Asia. Var. cüpreum has fls. copper-colored, often variegated with yellow, with a double-fld. form multiplex.

guttatum. To 6 in.: lvs. oblong-lanceolate, to 3 in. long: yellow, often with red spot at base of petals. Medit.

halimifdlium: Halimium halimifolium.

hirtum. Tufted subshrub to 1 ft. tall, sts. procumbent: lvs. ovate to linear-lanceolate, to ½ in. long, margins somewhat revolute: fis. white or yellow. Medit. region. Var. eréctum, sts. erect and fastigiate, lf. margins strongly revolute, fis. usually yellow:

icelándicum: listed name, perhaps referable to H. ælandicum

lasianthum: Halimium lasianthum.

Libanòtis: Halimium Libanotis.

lunulatum. Low dense subshrub to 1 ft.: lvs. ellipticoblong, to 1/2 in, long; fls. vellow. Cent. Eu.

liteum: probably not distinct from the typical form of H. nummularium.

macránthum: H. nummularium var.

multiflorum: Halimium halimifolium var.

mutábile: H. nummularium var.

mutabile: H. nummularium var.

nummularium (H. Chamæcistus. H. vulgare. H. variabile). To 1 ft.: lvs. ovate to lanceolate, to 2 in. long, gray-tomentose beneath: fls. yellow. 1 in. across, inner sepals usually loosely tomentose between the pilose veins. Medit. region; hardy N. and the common species in cult. Var. álbo-plènum, fls. double white; aureum, fls. deep yellow; citrinum, fls. golden-yellow; cupreum, a form of II. grandiforum; grandifforum is H. grandiforum; macránthum, fls. white blotched with yellow at base; múltiplex, a form of H. grands flowers; mutsbille (H. mutabile). G. prese phaneire to white blotched with yellow at base; multiplex, a form of H. grandthorum; mutfabile (H. mutabile), fls. rose changing to lilac or nearly white; roseum, fls. pale rose and roseo-plènum with double fls.; rubro-plènum, fls. red, double; speciosum, fls. large; stramineum, lvs. whitish beneath, fls. with dark yellow spot at base; tomentosum, not distinct from the typical form. the typical form.

ocymoides: Halimium ocymoides.

celándicum. Low tufted subshrub: lvs. oblong-lanceolate to lanceolate, ½ in. long, fleshy: fls. yellow, ¼ in. across, petals about as long as sepals. Eu.

perfoliatum: listed name of unknown botanical standing. pilòsum. Low subshrub: lvs. linear to oblong, ¾ in. long. fls. white with yellow spot at base of petals, 1 in. across. S. W. Eu., N. Afr. Var. purpùreum is listed.

polifòlium: H. apenninum.

præcox. Lvs. ovate-lanceolate, to 11/2 in. long: fls. yellow, spotted at base. Medit. region.

procúmbens: Fumana nudifolia.

pulveruléntum: H. apenninum.

rhodánthum: H. apenninum var. roseum.

roseum: probably H. nummularium var.

rosmarinifolium: Crocanthemum rosmarinifolium. rotundifòlium: name of uncertain application.

scoparium: Crocanthemum scoparium.

speciosum: H. nummularium var.

sulphureum. Hybrid between H. nummularium and H. apennium: lvs. linear-lanceolate, to ¾ in. long, gray-tomentose beneath: fis. sulfur-yellow.

tigrinum: listed name.

Tuberària. Per.: lvs. oval-lanceolate, to 3 in. long, gray-tomentose beneath: fis. yellow, 1½ in. across. S. Eu.

umbellatum: Halimium umbellatum.

variábile: H. nummularium. vulgàre: H. nummularium.

HELIÁNTHUS. Sunflower. Compositæ. Erect mostly tall coarse ann. and per. herbs with solitary or clustered heads of yellow ray-fls. and yellow, brown or purple disk-fls., blooming in late summer and autumn; pappus of deciduous scales or awns; native in the western hemisphere, mostly N. American. Several species are grown in borders and masses for the showy bloom and one for the edible underground tubers; seeds of the common annual sunflower are sometimes used for poultry-feed, oil and other purposes.

No special culture is required for sunflowers. ordinary ground and exposure suits them well. Seeds of annuals are sown where the plants are to stand as soon as the weather is settled, or they may be started under glass two to four weeks in advance if earlier results are desired. Perennials should bloom the year following seed-sowing; they may also be divided, and some species are propagated by root-stolons or offsets.

acutifòlius: listed name.

angustifòlius. Swamp S. Per. to 7 ft., sts. rough: lvs. linear, to 7 in. long, entire: heads solitary or few, to 3 in. across, disk purple. Swamps, N. Y. to Fla. and Tex.

ánnuus (H. lenticularis). Common Garden S. 12 ft.: lvs. ovate, to 1 ft. long, toothed, rough on both sides: heads 1 ft. or more across, disk brownsh-purple. Minn. to Wash. and Calif. Var. citrinus, rays prinrose-yellow. Var. nanus, dwarf, fis. mostly double. Var. globosus fistulòsus, heads globular and very large. Var. purpùreus is listed as a small-fld. form with wine-red ray-fis. Var. variegàted.

argophfilus. Silveriear S. Ann. to 6 ft., gray-silky-pubescent: lvs. ovate to lanceolate, to 6 in. long, slightly toothed: heads 3 in. or more across, disk brownish-purple. Tex.

atrorubens (II. sparsifolius). Darkeye S. Per. to 5 ft., rough-hairy: Ivs. ovate or oblong-lanceolate, to 10 in. long, toothed, petioles margined: heads clustered, 2 in. across, disk purple. Va. to Fla. and La.

Bismarckianus: hort. name of golden-yellow rayed plant to 10 ft., probably a form of H, annuus.

califórnicus. Per. to 11 ft.: lvs. oblong to lanceolate, to 9 in long, pubescent, entire: heads clustered, to 3 in. across, disk yellowish. Calif.

across, disk yellowish. Calif.

chrysanthemiflorus: hort. name, probably of form of H. annuus; double yellow fls. with laciniated rays; to 6 ft.

Coolidgei: advertised as a per. to 6 ft., with numerous golden-yellow fts. 3 in. across.

cucumerifòlius: H. debilis.

débilis (H. cucumerifolius). Cucumber-leaf S. Ann. to 4 ft., rough-hairy, branches sometimes mottled purple and white. Ivs. ovate or triangular, to 4 in. long, toothed: heads solitary, to 3 in. across, disk brown or purplish. Fla. to Tex. Var. cupreatus has coppery-red heads. Var. purpureus has pink to purple ray-fls. Var. roseus has rose-punk ray-fls.

decapétalus (H. multiforus). THINLEAF S. Per, to 5 ft.: lvs. ovate to ovate-lanceolate, to 8 in. long, toothed, pubescent beneath: heads numerous, to 3 in. across, disk yellowish. Que. to Ga. and Mo. Double forms are vars. flore-plèno and grandiflòrus. Var. máximus has large fis. with pointed rays.

divaricatus. Per. to 7 ft.: lvs. lanceolate or ovate-lanceolate, to 8 in. long, toothed, pubescent beneath, rough above: heads solitary or few, 2 in. across, disk yellow. Me. to Fla. and La.

doronicoides. Per. to 7 ft.: lvs. oblong to ovate, to 8 in. long, toothed, rough on both sides: heads numerous, to 4 in. across, disk yellow. Ohio to Ark.

Dowellianus. Per. to 2 ft.: lvs. ovate or ovate-lanceolate, to 5 in. long, toothed, slightly pubescent: heads to 2½ in. across, disk yellow. D. C. to Ga.

erectus: advertised as per. to 4 ft., with large yellow fls.: the name is not known botanically.

floridànus. Per. to 6 ft., showy: lvs. lanceolate, revolute, 2-3 in. long, nearly or quite entire, almost sessile: heads few in a panicle, disk yellow or brownish, rays yellow about 1 in. long. Fla.

gaillardiflorus: hort. name of form of *H. annuus*, ray-fls. zoned chestnut-red.

gigantèus. Giant S. Per. to 12 ft., rough-hairy: lvs. lanceolate, to 6 in. long, toothed: heads several, to 3 in. across, disk yellowish. Me. to Fla. and La.

globdsus fistuldsus: H. annuus var.

graciléntus. Per. to 3 ft.: lvs. lanceolate or linearlanceolate, to 4 in. long, entire, rough-harry; heads to 2 in. across, long-stalked, rays and disk yellow. Calif.

grósse-serràtus. Per. to 10 ft., sts. glaucous: lvs. lanceolate, to 8 in. long, toothed, pubescent beneath, rough above: heads several, to 3 in. across, disk yellowish. Me. to Tex.

lætiflòrus. Showy S. Per. to 8 ft., rough-hairy: lvs. ovate-lanceolate, to 10 in. long, toothed: heads several, to 4 in. across, disk yellow. Pa. to Minn.

lenticulăris: H. annuus.

macrophýllus: H. strumosus.

Maximilianii. Per. to 12 ft.: lvs. lanceolate, to 7 in. long, toothed or entire, rough on both sides: heads to 3 in. across, disk yellowish. Minn. to Tex.

microcéphalus (*H. parviflorus*). Per. to 6 ft.: lvs. lanceolate or ovate-lanceolate, to 7 in. long, toothed, rough above, pubescent beneath: heads several, to 1½ in. across, disk yellow. Pa. to Ga. and La.

möllis. Ashy S. Per. to 5 ft., white-pubescent: Ivs. ovate to lanceolate, to 5 in. long, toothed: heads solitary or few, to 3 in. across, disk yellowish. Mass. to Ga. and Tex. Var. grandiflorus is listed.

multifldrus: II. decapetalus.

orgyàlis: II. salicifolius.

parvifidrus: see H. microcephalus; the true species not known to be cult.

perénnis: a hort. name.

persicæfðlia: plant listed as 6 ft. high, with semi-double fls.

petiolaris. PRAIRIE S. Ann. to 3 ft., rough-hairy: lvs.

ovate to ovate-lanceolate, to 3 in. long, entire or toothed: heads 3 in. across, disk brown. Minn. to Ore. and Calif.

pùmilus. Per. to 2 ft., crown woody: lvs. ovate-lanceolate, to 4 in. long, entire or nearly so, veins hispid: heads to 2 in. across, disk-fls. yellowish. Wyo. to Colo.

purpureus: hort. name referable to either H. annuus var. or H. debilis var.

questifòlius: a hort. name.

rigidus (II. scaberrimus. Harpalium rigidum). Stiff S. Per. to 8 ft., rough-hairy: lvs. ovate to lanceolate, to 1 ft. long, toothed: heads solitary or few, to 3 in. across, disk purple or brown. Ill. to Ga. and Tex.—In garden forms somewhat double.

salicifòlius (H. orqyalis). Per. to 10 ft.: lvs. linear, to 16 in. long, nearly entire, rough, drooping: heads numerous, 2 in. across, disk brown or purplish. Mo. to Colo. and Tex.

sanguineus: hort. name for red-fld. form of H. annurs.

scabérrimus: H. rigidus.

sparsifòlius: H. atrorubens.

stellatus: hort. name, advertised as having small heads with white to light yellow ray-fis., to 3 ft.

strumòsus (*H. macrophyllus*). Per. to 7 ft.: lvs. ovate or ovate-lanceolate, to 8 in. long, toothed, rough above, pubescent beneath: heads several, to 4 in. across, disk yellow. Me. to Ga. and Ark.

tuberosus. Girasole. Jerusalem Artichoke. Per. to 12 ft., producing edible subterranean potato-like tubers: lvs. ovate to ovate-oblong, to 8 in. long, toothed, rough above, pubescent beneath. heads several, to 3½ in. across, disk yellow. N. S. to Ga. and Ark.—See Girasole.

HELICHRYSUM. EVERLASTING. Compositæ. Herbs or shrubs native in the eastern hemisphere, with usually alternate entire lvs. and solitary or clustered heads of yellow disk-fls., involucral bracts imbricated and often petallike and bright colored; pappus of bristles.

A few species are grown in the flower-garden and for everlastings to use in the winter bouquet. Propagated by seeds sown out-of-doors or started under glass for earlier bloom, and the last species also by cuttings.

anatólicum: II. plicatum.

angustifòlium. Whiteleaf E. Per. to 1 ft., woody at base. lvs. linear, margins revolute, white-tomentose: heads yellow, ½ in. across, in corymbs. Medit. region.

apiculàtum. Per. to 2 ft., silvery-white-tomentose: lvs. oblong, to 2 m. long, lower ones petioled: heads to ½ in. across, in dense terminal corymbs, usually golden-yellow, occasionally white to pinkish. Australia.

bellidioides. Per. somewhat woody, trailing lvs. ovate-spatulate, to ½ in. long, white-woolly beneath and green above, flat: heads solitary, to ½ in. across, silvery-white. New Zeal.—Probably not hardy north of Philadelphia.

bracteàtum. Strawflower. Ann. to 3 ft.: lvs. oblong-lanceolate, green: heads solitary, to 2½ in. across, yellow, orange, red or white, as indicated by varietal names álbum, bícolor, lùteum, purphreum, ròseum. Australia. Var. monstròsum (H. monstrosum) has double fis. Var. nànum is dwarf.

diosmæfòlium (Ozothamnus rosmarinifolius). Shrub to 20 ft.: lvs. nairow-linear, to ½ in. long, margins revolute: heads white, in dense corymbs. Australia.

fætidum (Gnaphalrum fætidum). Bien. 2-4 ft., sts. erect, hairy, simple or paniculately branched: lvs. cordate-clasping, scabrous above, woolly beneath, ill-scented: heads cream-white to bright yellow, to ¾ in. across or more, many in loose or contracted panicles. S. and Cent. Afr.

frigidum. Per., sts. to 10 in. long, prostrate or ascending, white-tomentose: lvs. linear-oblong, to ½ in. long, dense, woolly on both sides: heads solutary, to ½ in. across, silvery-white. Corsica, Sardinia.

glomeratum. To 1½ ft., woody: lvs. lanceolate, ciliate: heads lemon-yellow, in crowded corymbs. Mts., S. Afr

lanatum. To 15 in., woody at base: lvs. obovate, white-woolly: heads bright yellow, in corymbs to 4 in. across. S. Afr.

monstrosum: H. bracteatum var.

petiolatum (Gnaphalium lanatum). To 2 ft. or more, woody at base, the sts. flexuose and decorative in hanging-baskets: lvs. ovate, white-woolly: heads cream-white, in corymbs to 2 in. across. S. Afr.—Commonly propagated by cuttings and fls. may not be produced.

plicatum (H. anatolicum). Prostrate per., sts. ascending to 15 in., woody at base: lvs. oblong to linear-spatulate, flat, gray-pubescent: heads in terminal corymbs, pale golden-yellow. Asia Minor, Persia.

scutellifòlium. Shrub to 10 ft. or more, tomentose: lvai

scale-like, ovate, less than $\frac{1}{16}$ in. long, thick with revolute margins: fis. in glomerules of 3-5 in small heads, bracts pale brown. Australia.

Selago. Much branched shrub to 15 in.: lvs. ovatetriangular, to ½ in. long, close-appressed and imbricated, woolly on inner side, glossy on outer: heads solitary, terminal, to ¼ in. across, pale yellow. New Zeal.

semipapposum. Per to 1½ ft.: lvs. narrowly oblong-lanceolate, to 1¾ in. long, woolly becoming glabrous: heads many, densely corymbose, golden-yellow, about 3s in. across. Australia.

thianschánicum. White-woolly per. to 2 ft., usually much branched: lvs. linear-lanceolate, acute, entire: heads yellow to orange, in corymbs, bracts oblong, obtuse, somewhat woolly. China.

HELICODÍCEROS (Megotigea). Araceæ. One species native in the Medit. region, sometimes grown under glass as a curiosity; the fls. have a very offensive odor. H. muscívorus (Arum crinitum). Twist-Arum. Tuberous herb to 1½ ft.: lvs. pedately parted: spathe contracted at throat and bent horizontally, the limb pale purple covered with long white hairs, the tube spotted.

HELICÒNIA (Bihai). Musaceæ. Stout trop. American herbs with large banana-like lvs., bisexual fls. clustered in the axils of large stiff boat-shaped or conduplicate often woody bracts, and fr. a caps. which breaks up into berry-like parts.

Heliconias are sometimes grown in the greenhouse, or out-of-doors in warm regions for the foliage effects, making large clumps if given room. The plants thrive well in rich loam with plenty of water. Propagated by division of the roots, and by seed when available.

aureo-striata. Sts. striped green and yellow: lvs. with transverse veins striped bright yellow. Native country unknown: probably a form of H. Bihai.

Bihái. WILD PLANTAIN. BALISIER. To 18 ft.: lvs. to 3 ft. and more long and 1 ft. wide, long-petioled: fls. greenish or greenish-yellow, inclosed in the scarlet ovate-lanceolate deeply boat-shaped bracts to 6 in. long. Trop. Amer.

late deeply boat-shaped bracts to 6 in. long. Trop. Amer. caribæa. Differs from H. Bihai by the lvs. rounded at base and the larger and more numerous yellow bracts.

Edwardus-Rex. Hort. form to 4 ft. or less: lvs. lanceolate, rich crimson below and paler above.

illústris. Lvs. with midrib and transverse veins marked with pink. S. Sea Isls. Botanical position uncertain. Var. rubricaùlis has red sts.

psittacorum. To 4 ft. or less: lvs. to 1½ ft. long and 2 in. wide, long-petioled: fls. greenish-yellow, inclosed in shining-red narrow-lanceolate deeply boat-shaped bracts to 3 in. long. Trop. Amer.

Sánderi. Resembling H. illustris but lvs. marbled with pink. New Guinea, but botanical identity doubtful.

HELIOCÈREUS. Cactacex. A small group of Mexican and Cent. American bushy cacti differing from Cereus, among other things, in having a scaly or spiny ovary: sts. usually procumbent or clambering but sometimes e ect under cult., branches strongly angled or ribbed, spines all alike: fls. diurnal, funnelform, mostly scarlet. They hybridize with other cacti. See

amecaménsis (Cereus amecamensis). Ribs 3-5; spines many: fls. white, greenish outside, the tube nearly 1½ in. long, segms. nearly 3 in. long. Mex.

elegantissimus (Cereus coccineus). Sts. to 8 in. high and branches often decumbent and to 2 in. broad and commonly 3- or 4-angled; spines needle-luke: fls. scarlet, to 6 in. broad, style red, stigma-lobes white. Mex.

Schränkii (Cereus Schrankii). Sts. to 1¼ in. wide, usually 3- or 4-angled, green with reddish tips; spines about 7-11, to ½ in. long: fls. scarlet to maroon, to 6 in. long.

speciosus (Cereus speciosus. C. speciosussimus). Branching at base; ribs 3-5 and undulate; spines numerous and becoming yellow or brownish fls. scallet, 6-7 in. long, stigma-lobes red. Mex., probably Cent. Amer.

supérbus (Cereus superbus). Similar to H. speciosus, considered by some to be a sport of it; differing in its thicker

and 7-ribbed st. whose apex is bright red and whose spines are shorter and more slender; fis. glossy cinnabar-red. Cent. Mex.

undatus: Hylocereus undatus.

HELIÓPHILA. Cruciferæ. S. African herbs with yellow, white, pink or blue fls. in long leafless racemes; siliques flattened or cylindrical.

leptophýlla. To 1½ ft., blue-green: lvs. filiform, to 2 in. long: fls. blue with yellow base: pods drooping, moniliform.

linearifòlia. To 3 ft., shrubby: lvs. linear, 1 in. long, entire: fis. blue with yellow claws: pods linear, sharply 3-nerved, to 2 in. long.

HELIÓPSIS. Compositæ. Herbaceous sunflower-like perennials blooming in summer, with opposite coarsely toothed lvs. and showy heads of long yellow ray-fls. and disk-fls. partly inclosed in chaffy bracts; pappus none or a toothed border; native to N. Amer. Cult. as for Helianthus.

helianthoides (H. lævis). Per. to 5 ft., nearly glabrous: lvs. ovate, to 6 in. long, sometimes roughish above: heads to 2½ in. across, numerous. Ont. to Fla. and Tenn. Var. Pitcheriana (H. Pitcheriana), fls. deeper yellow.

lævis: H. helianthoides.

Lemdinei: hort, name.

Mandianum: trade name; similar to H. helianthoides var. Pitcheriana but with clear yellow fis.

Pitcheriana: H. helianthoides var.

scabra. Differs from H. heltanthoides chiefly in being rough-harry and the heads few or solitary. Me. to N. J. and New Mex. Vars. are excélas, chrome-yellow, nearly double; formòsa; gratíssima, pale yellow; imbricàta, dwarf, fls. 3 in. across, golden-yellow; incomparábilis, golden-yellow, fls. 3 in. across, double; mãjor, larger than type; vitellina, golden-yellow, double-fld.; zinniæflðra, double-fld.; zinniæflðra, double-

HELIOSPERMA: Silene.

HELIOTROPE. Heliotropium. Garden-: Valeriana officinalis. Winter-: Petasites fragrans.

HELIOTRÒPIUM. HELIOTROPE. Boraginaceæ. Herbs or shrubs with mostly alternate simple lvs. and small often very fragrant violet, purple or white fls. in coiled racemes and cymes, corolla naked in the throat; some of them are popular in greenhouses and borders and others are weedy plants.

The greenhouse heliotropes are treated as annuals and require abundant heat and light rich soil. Propagated by cuttings and seeds; the latter may be sown indoors and the seedlings transplanted. Strong plants may be set out and the new growths pegged to the ground where they will form roots.

amplexicaule (H. anchusæfolium). Per., yellowishhay: lvs. lanceolate to linear-lanceolate, sessile: fls. violet, ½ in. across. Argentina.

anchusæfòlium: H. amplexicaule.

arboréscens (II. peruvianum). Common H. Per. to 4 ft.: lvs. oval or oblong-lanceolate: fls. violet or purple varying to white. ½ in. long, vanilla-scented. Peru.—Common under glass and sometimes planted out.

convolvulàceum: Euploca convolvulacea.

corymbosum. Perhaps a form of *H. arborescens* but by gardeners thought to be distinguished by its longer narrower lvs. distinctly narrowed at base. fls. violet or purple varying to white, 1/4 in. long, narcissus-scented. Peru.

europæum. Ann. to 1 ft., pubescent: lvs. oval, long-stalked: fls. white, 1/6 in. across. Eu.; nat. in E. U. S. peruviànum: H. arborescens.

regale is listed as an early free-flowering form.

HELÍPTERUM. EVERLASTING (which see). Compositæ. Flower-garden annuals, often cut early and dried for winter bouquets, with mostly alternate entire lvs. and solitary or clustered heads of yellow disk-fls., the involucral bracts often petal-like and colored; pappus plumose; native in S. Afr. and Australia.

Culture is simple. Seeds usually are sown where plants are to grow but may be started indoors for earlier results. Plants may stand 6-12 inches apart.

album; hort, name, probably a white-fld, form of H. roseum

anthemoides. To 1 ft., with per, rootstock, glabrous: lvs. linear, heads to 1 in, across, solitary, the bracts white. tinged brown. Australia.

corymbifdrum. To 1 fts, white-woolly: lvs. linear or lanceolate: heads small, in corymbs, bracts white. Australia.

Humboldtianum (H. Sandfordn). To 1½ ft.: lvs. linear, white-tomentose: heads small, in clusters, bracts yellowishgreen. Australia.

Mánglesii (Rhodanthe Manglesii). SWAN RIVER E. Slender, to 1½ ft., glabrous: lvs. ovate: heads not clustered, to 1½ in. across, bracts white to bright pink. Australia. Var. maculatum, bracts spotted red.

roseum (Acroclinium roseum). Stout, to 2 ft., glabrous: lvs. linear to lanceolate: heads not clustered, to 2 in. across. bracts rose or white Australia.

Sándfordii: H. Humboldtranum.

HELLEBORE: Helleborus, False: Veratrum.

HELLÉBORUS. HELLEBORE. Ranunculaceæ. Per. herbs with thick fibrous roots, mostly basal palmately divided lvs., large fls. with 5 petal-like sepals, inconspicuous petals and many stamens. and fr. a follicle; native in Eu. and Asia.

Hellebores bloom in early spring or in winter in mild climates, although *H. nyer* is very hardy and persistent. They thrive in partially shaded moist situations in good soil. Propagated by division of roots, preferably in late summer or fall; also by seeds. Hellebores may also be forced under glass.

abchásicus. To 1½ ft.: basal lvs. with 5-11 lfts.: fls. white, saucer-shaped, 1½ in. across. Caucasia.

atropurpureus: H. odorus.

atrorubens: H. orientalis var.

caucásicus. Similar to and perhaps a form of *H. orientalus* differing in lvs. entirely glabrous and fls. somewhat darker colored. Caucasus.

córsicus: H. lividus cùpreus: H. odorus.

cycloph#llus. Similar to *H. viridis* but taller, lfts. broader and pubescent beneath, fis. larger with broader sepals. Greece.

fétidus. To 1 ft.: lvs. leathery, borne on st.: fls. green or marked purple, to 1 in. long. W. Eu.

hybridus. To 14 in.: a hort, hybrid between H. niger and H. caucasicus: fls. of all shades of red, pink, white, spotted and veined, to 2½ in. across. Dec.-Feb.

If vidus (H. corsicus). To 1½ ft.: lvs. 3-parted, toothed, borne near bottom of plant: fls. pale green, in a cluster. Corsica.

niger. Christmas-Rose. To 1½ ft.: lvs. basal, pubescent beneath, divided into 7 or more oblong evergreen lfts., the st. with few small lvs.: fls. white or purplish with green petals, to 2½ in. across, solitary. Eu. Var. altifolius (var. major), to 2 ft., petioles green mottled with purple, fls. to 3½ in. across. Var. angustifolius, fls. smaller. Var. præcox, fls. smaller. Sept.—l'eb. Var. atrorubens, fls. dark red.

odòrus (H. cupreus. H. atropurpureus). Per. to 15 in.: lvs. pedately 7-16-lobed, pilose and conspicuously veiny beneath: fis. green to purple. Cent. Eu.—Differs from H. orientalis in carpels coalesced at base.

orientalis. Differs from *H. niger* in having branched fl.-sts. without lvs. and fls. green to dark purple, 2-6 together, carpels free at base. Asia Minor. Var. atrôrubens (*H. atrorubens*), fls. dark purple outside, greenish-purple

purpuráscens: form of H. viridis.

rubra: hort. name, probably a form of H. niger or H.

viridis. To 2 ft.: lvs. divided into 7-11 oblong lfts.: fls. yellowish-green, 1 in. long, drooping, subtended by lvs. Eu.; nat. in E. N. Amer.

HELÒNIAS. Liliaceæ. One per. springblooming herb with tuberous roots, native in bogs from N. J. to N. C. H. bullata. Swamp-Pink. To 2 ft.: lvs. basal, to 15 in. long and 2 in. wide: fls. pink or purplish, ¼ in. long, in dense racemes to 3 in. long terminating the hollow scape.—Suitable for bog-gardens and also a good pot-plant for late winter and spring. Easily propagated by division.

HELONIÓPSIS. Liliacex. A small genus of E. Asiatic plants characterized by the presence

of a basal rhizome, a short st. bearing a rosette of basal lvs. with large nodding campanulate fls. in lax infl.; fr. a woody 3-valved caps, and seeds small and oblong. Propagated by seeds or division and prefers a cool moist but welldrained soil

breviscapa. Lvs. oblanceolate to spatulate, abruptly acuminate: fis. carmine-red, to ½ in. long, segms, obovate, twice as long as pedicels. May. Korea.

japónica. Lvs. oblanceolate, acute, to 3½ in. long, flat, green, usually flushed reddish-purple beneath: fls. carminered, to ½ in. long, segms. oblanceolate, spreading, as long as pedicels, usually 3-10 in umbellate racemes. Japan.

HELWÍNGIA. Cornacex. Asian shrubs, one of which is sometimes grown as a curiosity and ornamental: lvs. alternate, toothed: fls. diœcious, small, borne in clusters on upper surface of lvs.: fr. a berry-like drupe. Propagated by cuttings of green wood under glass.

japonica. To 5 ft.: lvs. ovate, to 3 in. long: fls. greenish-white: fr. black, ¼ in. across. China, Japan; hardy in north-central parts.

HELXINE. BABYS-TEARS. Urticacex. One creeping moss-like little herb from Corsica and Sardinia, used as a ground- and pot-cover in greenhouses and in rock-gardens in mild climates, making dense mats. H. Soleirollii. Lvs. nearly orbicular, 1/4 in. or less across: fls. unisexual, minute, solitary in the axils.—Thrives best in partial shade. Propagated by cuttings of the rooting sts. Generic name is three syllables.

HEMEROCÁLLIS. DAY-LILY. Liliaceæ. Per. herbs with cord-like or more or less tuberous roots, linear or sword-shaped basal lvs. and showy yellow, fulvous or orange fls. in clusters at the ends of leafless scapes, the perianth-segms. partially united below to form a tube of varying length; stamens and style prominent.

An important group of hardy spring- and summer-blooming herbs with lily-like flowers, of simple cultural requirements in any good garden soil. Propagated by division, and sometimes by seeds if available. Some of the species do not produce seeds in ordinary garden conditions. The foliage, forming mats, is useful as ground-cover. There are many good named horticultural varieties. The day-lilies fall into two groups as determined by the mode of flower-bearing, the forking kinds in which the flowers are flower-bearing, the forking kinds in which the flowers are borne in a more or less open or branched cluster terminating the scape, the involucrate kinds in which the flowers are close together and practically sessile in a head-like cluster subtended by broad short bracts resembling an involucre. To the latter group belong H. Dumortieri and H. Maddendorffii, all the other species being of the dichotomous or forking group. Certain garden kinds are probably hybrids between the two groups. Recently the day-lihes have been made a special subject of study and improvement, with many new varieties.

álba: a synonym of Hosta plantaginea.

Amarýllis: hort, strain reported to have large yellow fis. tipped with deeper color, to 3 ft. July.

aurantiaca. Golden Summer D. To 3 ft., with spreading rhizomes, main roots enlarged: lvs. to 3 ft. long and 1 in. or more across, coarse, evergreen: fls. with orange throat and outer portions of sepals and petals tinged with copperred, reticulations absent, not fragrant, scapes ascending and not strictly erect. July, Japan. Var. måjor, fls. larger, to 6 in. across, without fulvous coloring, less hardy.

Baronii. A hybrid, one parent being *H. citrina* from which it differs in being night-blooming and having a fuller fl.

chrysoldra. Garden form to 2½ ft.: fls. sulfur-apricot, deeper in throat, reaching nearly 5 in. across when broadly open. July.

citrina. Long Yellow D. To 4 ft., with fleshy main roots which are elongated and tapering: lvs. to 3½ ft. long, coarse, usually erect but sometimes bending abruptly, dying in autumn: fls. light lemon-yellow, to 6 in. long, very fragrant, not open broadly in full sunlight, usually nocturnal, on stiff erect scapes, midsummer. China.—H. Thunbergii is often called by this name.

dísticha: H. fulva.

Dumortièri (H. graminea. H. rutilans. H. Sieboldii).

NARROW DWARF D. To 1½ ft., main roots very fleshy: lvs. to 1½ ft. long and ½ in. across, dying in autumn: fls. pale orange, to 2½ in. long, tube very short, outer segms. lanceolate-acute, fragrant, 2-4 in close head or cluster on unbranched spreading scape which is shorter than lvs., spring. Japan.

Earliana: catalogue name.

flava. TALL YELLOW D. To 3 ft., rhizomes spreading, roots enlarged: lvs. to 2 ft. long and ½ in. across: fls. yellow, to 4 in. long, fragrant, on weak more or less lopping scapes which are longer than lvs. and branched above, spring. Siberia to Japan; Eu. Var. minor, plants reported to be shorter.—Common early yellow day-fily.

flavina: a garden form, reported to grow to 1 ft.; fls. lemon-yellow. May-June.

Forestii. To 16 in., roots fleshy: lvs. to 1½ ft. long and ½ in. across, ascending and recurving: fls. clear cadmumyellow, segms. ½ in. wide or less, bracts conspicuous and herbaceous, 4 or more fls. borne on slender ascending scape which does not exceed lvs., spring S. W. China.

which does not exceed lvs., spring S. W. China.

fúlva (H. disticha). Tawny or Fulvous D. To 6 ft.,
crown with spreading rhizomes, main roots fleshy: lvs. to
2 ft. long and 1½ in. across: fls. fulvous or rusty orangered, to 5 in. long, not fragrant, to 3½ in. across when fully
expanded, usually with darker lines and stripes, on erect
scapes, summer. Eu., Asia; nat. in E. U. S.—The commonest day-lily of midsummer. Var. cypriàna is listed.
Var. Kwánso has double fis.: plant usually stouter and
blooms somewhat later: lvs. white-striped. Var. longituba
has longer persanth-tube and narrower persanth-segms. has longer perianth-tube and narrower perianth-segms.

Góldenii: garden race, to 3 ft.: fls. deep golden-orange. grácilis: garden race to 2 ft.: lvs. ½ in. across or less: fls. lemon-yellow to golden-yellow, early summer,

gramines: plants in the trade under this name are probably *H. minor*, although the name is also a synonym for *H. Dumortieri*.

graminifòlia: H. minor. Kwánso: H. fulva var. lùtea: probably H. luteola.

lutea: probably H. luteola.

luteola. A hybrid of questionable parentage, but probably H. Thunbern: and H. auraniuaca var. major: to 3 ft.; lvs. to 30 in. long: fls. golden-yellow, to 5 in. across when fully expanded, segms. broad. Var. grandiflora, large fls. with margins of perianth-segms. wavy. Var. major, lvs. wider: fls. larger, scapes shorter and more widely branched. Var. pállens, listed as a hybrid of H. luteola and H. cutrina with pale yellow fls. 5 in. across when fully expanded.—All of these so-called varieties are merely garden races and should be propagated only by vegetative methods.

Mahanii hert varie from garden race mere proposities.

Meèhanii: hort, name from garden race more properly known as "Meehan's hybrids."

Middendórffii. Broad Dwarf D. To 1 ft. or so, main Middendormi. Broad Dwarf D. 10 I It. or so, main roots cylindrical and slender: Ivs. to 1½ ft. long and 1 in. across: fls. pale orange, in close cluster or head, to 2½ in. long, the segms. broad and mostly obtuse and recurving at full bloom, scape slightly longer than Ivs., unbranched with fls. sessile or nearly so. May—June. Siberia. Var. major, plant more robust with more erect and taller scapes.

minor (II. graminea. II. graminifolia). DWARF YELLOW D. To 18 in., roots slender and fibrous, compact crown lvs. to 20 in. long and ½ in. across fls. yellow, mostly 2 or 3, 4 in. long, fragrant, on scape which is forked or branched at top and thereby differing from II. Middendorffit or its hybrids, spring. E. Siberia to Japan.

Mûlleri (also spelled Muellert). Garden hybrid of H. Thunbergu and H. cutrana: to 4 ft., vigorous grower: lvs. erect, dark green: fls. yellow, to 4 in. across when fully expanded, petals narrow, produced in abundance.

multiflora. MANY-FLOWERED D. To 3 ft., roots fleshy, crown compact: lvs. to 30 in. long and ¾ in. across, strongly recurving: fls. very numerous, golden-yellow within, sepals reddish tinged on outside, to 2½ in. long and 3 in. across when fully expanded, petals about ¾ in. wide, scape much branched and taller than foliage, late summer and autumn.

nana. To 18 in., roots usually fleshy at some distance from crown. lvs. to 15 in. long and ½ in. across, expanded, sparse: fls. orange within often reddish-brown without, to 3 in. across when fully expanded, segms. narrow, bracts inconspicuous, scapes shorter than foliage or nearly so, branched unless fls. are solitary. China.

nocerénsis: a garden form to 4 ft.: lvs. reported to be large and coarse: fis. lemon-yellow, fragrant, about 5 in. long and 6 in. across, summer.

ochroleùca. Listed as a hybrid of H. Thunbergii and citrina: lvs. somewhat erect, dark green: fls. sulfuryellow, fragrant, opening in evening.

plicata. To 1½ ft., roots fleshy: lvs. to 20 in., somewhat folded lengthwise: fls. golden-yellow, rarely fulvous, solitary to few on scapes usually shorter than foliage or nearly so.

China.—Although listed, the presence of this plant in the trade may be open to question as is also its specific distinction from *H. nana*, which it closely resembles.

rùtilans: H. Dumortieri.

semperflorens. Garden hybrid of undetermined parentage, to 3½ ft.: lvs. erect, recurved, coarse, evergreen: fls. cadmum-yellow, to 4½ in. across when fully expanded, scapes coarse, ascending, June.

serótina: H. Thunbergii. Siaholdii: II Dumortieri

Spréngeri: probably H. citrina.

Thünbergii (H. serotina). LATE YELLOW D. To 3 ft.: lvs. to 2 ft. long and 34 in. across: scapes stiff and erect, more or less 3-angled; fis. lemon-yellow, 3 in. long, slightly fragrant, summer. Japan.—Sometimes grown erroneously as H. citrina; the prevailing yellow summer day-hly.

Tódmordenii: listed name of unknown botanical standing, probably a garden form or hybrid.

HEMIÁNDRA. Labiatæ. Shrubs from W. Australia, with opposite narrow lvs. and white or pink 2-lipped fls. solitary in the axils; one species intro, in Calif.

pungens. To 2 ft., stiff: lvs. linear or linear-lanceolate, pungent-pointed: fls. with dark spots.

HEMICÝCLIA. Euphorbiaceæ. Trees and shrubs with alternate entire leathery lvs., small dioccious fls. solitary or clustered, and fr. a 1-seeded drupe; native E. Indies to Australia, one intro. in warm regions.

australásica. Tree to 40 ft.: lvs. ovate, to 3 in. long, obtuse: fr. ovoid, ½ in. long, red and succulent. Australia,

HEMIÈVA. Saxifragaceæ. One per. herb native in mts. from B. C. to Calif. H. ranunculifòlia (Saxifraga, Boykinia and Suksdorfia ranunculifolia). To 8 in., glandular-pubescent: lvs. ternate, the middle segm. 3-lobed, the lateral 4-lobed, on long petioles: fls. white or yellowish, 1/4 in. long, in corymbs.

HEMÍGRAPHIS. Acanthaceæ. Asian herbs or shrubs with opposite lvs. and tubular 5-lobed fls. subtended by large bracts and borne mostly in terminal heads; one species grown in S. Fla. as a basket or cover plant, but must be pro-tected or kept in the greenhouse in winter. Propagated by cuttings.

colorata. Prostrate rooting per.: lvs. ovate-cordate, to 3 in. long, purplish, toothed, bullate: fis. white, 3/4 in, long.

HEMIONÌTIS. Polypodiacex.Small trop. ferns with palmately or pinnately lobed fronds, fertile stiff and long-stalked, sterile short-stalked; sori naked, borne along the veins. Sometimes grown in fern-cases, making attractive little subjects. Propagated by buds and spores. See Ferns.

palmata. STRAWBERRY-FERN. Fronds palmate, to 6 in, long and wide, with 5 triangular divisions, pubescent. W. Indies, Mex., S. Amer.

HEMIPTÈLEA. Ulmaceæ. One small muchbranched deciduous spiny tree native in N. E. Asia. H. Davidii (Zelkova Davidii). Lvs. alternate, elliptic, to 2 in. long, coarsely toothed, very short-stalked: fls. in clusters on young branchlets: fr. a small winged nutlet.—Hardy N. and sometimes planted for hedges. Propagated by seeds, layers, and grafting on the elm.

HEMLOCK: Tsuga. Ground:: Taxus canadensis. Poison:: Conium maculatum. Water:: Cicuta.

HEMP: Cannabis sativa. Bowstring -: Sansevieria. Sansevieria. Indian: Apocynum cannabinum. Manila: Musa textilis. Sisal: Agave sisalana. Sunn: Crotalaria juncea. -Tree: Vitex Agnus-castus.

HEMPWEED, CLIMBING: Mikania scandens.

HEN-AND-CHICKENS: Sempervirum tectorum.

HENBANE: Hyoscyamus.

HENEOUEN: Agave four croydes.

HENNA: Lawsonia inermis.

HEPÁTICA. LIVERLEAF. Ranunculaceæ. Little per. hardy woods herbs with long-stalked, basal, 3-lobed, evergreen old lvs. and white or purple fis. solitary on the end of a scape, the sepals petal-like, the apparent calyx being an involucre of 3 small lvs.; native in north temp. zone. blooming in early spring.

Hepaticas prosper in rich well-drained soil. They are woods plants, useful for colonizing. Propagated by seeds and division of roots.

acutiloba. To 9 in., differing from H. americana chiefly in the lobes of the lvs. and involucre being acute. Me. to Ga., and Mo. Var. álba is a white-fld. form.

americana (H. triloba and Anemone Hepatica as to the American plant). To 6 in., with petioles and scapes shaggy-harry: lvs. with 3 rounded or obtuse lobes: fis. ½-1 in. across, lavender-blue but passing into white and rose-colored forms. N. S. to Man. and Fla.

angulòsa (Anemone angulosa). To 6 in., hairy: lvs. 3-5-lobed, the lobes often toothed: fis. about 11/4 in. across. Hungary.

marmorata: listed as having dark marbled lvs. and • blue fis.

nobilis (H. triloba and Anemone Hepatica as to the European plant). Much like H. americana but petioles and scapes less hairy and fis. 1 in. or more across, blue, rose, whitish, cult. also in double forms. Continental Eu.

trîloba: H. americana and H. nobilis.

HERACLÈUM. Cow-Parsnip. Umbelliferæ. Coarse per. herbs with large ternately compound lvs., white or pinkish fls. in compound umbels, and flattened frs.; planted in wildgardens for bold effects and sometimes as specimen plants. They thrive on rich moist soil. Propagated by seeds and division.

gigantèum: H. villosum. japónicum: listed name.

lanatum. To 8 ft. lfts. broad-ovate, lobed and toothed, tomentose beneath umbels to 1 ft. across. N. Amer.

Mantegazzianum. To 9 ft.: lvs. to 3 ft. long, deeply cut: fls. white, the umbels to 4 ft. across. Caucasus.

pubéscens (H. Wilhelmsii). Sts. purplish, becoming villous above: lvs. ternate; lfts. palmately lobed, oblong, acute, toothed, pubescent beneath. fls. white, in large umbels of many villous rays: fr. elliptic, villous. Caucasus.

villosum (H. giganteum). To 12 ft. lfts. deeply cut and toothed, woolly-tomentose beneath: fls. white. Caucasus. Withelmsii: H. pubescens.

HERALDS-TRUMPET: Beaumontia grandiflora.

HERB: plant naturally dying to the ground; without persistent living stem above ground; lacking definite woody firm structure. It may be annual, bennial or perennial. -Christopher: Activa spicata. -Mercury: Mercurialis annua. -Paris: Paris quadrifolia. -Patience: Rumex Patienta. -Robert: Geranium Robertianum.

HERBARIUM: a permanent collection of pressed dried specimens, together with properly preserved fruits and other parts, representing the kinds of plants, for record and critical study.

HERBÉRTIA. Iridacex. Bulbous herbs with mostly basal lvs. and blue or lilac fugitive fls. borne in a terminal spathe; perianth of 6 spreading segms., the inner 3 much smaller; native Tex. to Chile and Brazil. Propagated by seeds and offsets.

cærùlea: H. Drummondiana.

Drummondiana (H. cærulea). To 1 ft.: lvs. narrowlinear, equalling st.: fls. blue with white claw spotted violet, 2 in. across, spathes to 2 in. long. Tex.

HERCULES-CLUB: Aralia spinosa, Zanthoxylum Clava-Herculis.

HERERÒA. Aizoaceæ. Separated on technical characters from Mesembryanthemum:

plant stemless or nearly so: lvs. entire, rather elongated and soft, with large dark dots, opposite in four rows: fls. yellow or rose, several in an infl. S. Afr.

dolabriformis: Rhombophyllum dolabriforme.

grācilis. Lvs. graceful, to 2 in. long and ½ in. wide: fis. in cymes, bright yellow, 1 in. across.

granulata (M. granulatum). Lvs. crowded, united, to 2 in. long and 1/2 in. wide and thick, rough: fis. 1-3, light yellow. I in. across.

Hérrei. Closely resembling H. granulata but with smaller frs.

hesperantha (M. hesperanthum). To 8 in.: lvs. to 1½ in. long and ½ in. thick: fis. in 4's, golden-yellow, about ½ in. long.

odorata: listed name.

Puttkammeriana (M. Puttkammerianum). Lvs. spreading, united at base, obtusely 3-angled, to 3 in. long and 1/4 in. wide, glaucous: fls. in 3's, orange, 1/4 in. across. Var. glabrior is listed.

Stánleyi: see Mesembryanthemum Stanleyi.

vàrians: listed name.

HERMESIAS: Browned

HERMODÁCTÝLUS. SNAKES-HEAD IRIS. Iridacex. One tuberous plant closely allied to Iris but differing in having a 1-celled ovary; cult. as for tuberous irises. H. tuberòsus (Iris tuberosa). To 1 ft. or more: lvs. 2-3, 4-angled, to 2 ft. long, glaucous: fls. black-purple, inner segms. green, 2 in. long. Apr.-May. S. France to Greece.

HERNÁNDIA. Hernandiaceæ. About 14 species of monœcious trees of wide distribution throughout the tropics, having entire alternate lvs. and unisexual fls. in large panicles. One species, H. ovígera (H. pellata), is grown in Fla. Tree to 40 ft., bark smooth: lvs. broadly ovate, peltate, to 8 in. long, entire, base usually cordate, apex acute to obtuse: fls. greenish-yellow, of the 3 in each involucre the central one is pistillate and sessile, the lateral ones staminate and pedicelled: fr. compressed-ovoid, black and dry, about 1¼ in. across, surrounded by a much inflated whitish involucel producing a pear-shaped structure to 2½ in. long having a large opening at the distal end leading into the so-called "seed" or true fr.

HERNANDIÀCEÆ. About 4 genera of tropical trees and shrubs allied to Lauraceæ but differing from that family in fls. having an inferior ovary without true petals and the female fl. surrounded at base by a fleshy cupshaped involucel which ultimately envelops the fr. Only one genus, Hernandia, is grown in this country.

HERNIÀRIA. HERNIARY. RUPTURE-WORT. BURST-WORT. Illecebraceæ. Ann. or per. trailing mat-forming little herbs, with roots of short duration: lvs. small and sessile: fls. small, green and crowded in axillary clusters: native in sandy places, usually near the sea; in Eu., W. Asia, N. Afr. and the Canaries and 1 in S. Afr. Grown for carpet-bedding, rock-gardens and for covering graves.

cinèrea. Light gray hairy ann., sts. ascending: lvs. oblong-linear: fis. sessile, in 7-10-fid. clusters. Medit. region, Canary Isls.

glàbra. Per. 4-6 in., sts. with swollen joints, spreading along the ground several inches: lvs. oblong, usually bronzyred in winter: fls. sessile, in axillary 7-8-fld. clusters on the lateral branches, making a leafy spike. Eu., Asia.

hirsuta. Hairy per. to 6 in., sts. prostrate: lvs. elliptic-oblong: fls. sessile, in 7-10-fld. clusters. Eu.

incana. To 10 in., gray-velvety-canescent, sts. woody

at base: lvs. obovate-oblong to spatulate, to nearly ½ in. long: fis. solitary or 3-6 in head-like cluster, pedicelled. E. Eu., Asia Minor.

latifòlia. Per. to 1½ ft., velvety: lvs. elliptic, ciliate: fis. short-pedicelled. in 3-6-fid. clusters. Spain. Portugal.

HERNIARY. Herniaria

HERONSBILL: Erodium.

HERPESTIS AMPLEXICAULIS: Hudrotrida carolin-

HERPETICA: Cassia alata

HERPOTHAMNUS: Vaccinium crassifolium.

HERREÁNTHUS. Aizoaceæ. Per. succulent growing in tufts, one species in S. Afr., allied to Mesembryanthemum. H. Meyeri. Lvs. 3-angled, to 1¾ in. long, ¾ in. wide and ½ in. thick, united at base, bluish-green, slightly spotted: fls. solitary, terminal, sessile, white, fragrant, 1 in. across; stigmas 6, filiform.

HESPERÁLOE. Liliacex. Stemless herbs similar to Yucca but with greenish or reddish fls. opening by day; native Tex. to Mex.

Éngelmannii: H. parviflora var.

parvifiòra (H. yucczfolia). To 4 ft.: lvs. to 4 ft. long and 1 m. wide, the margins thread-bearing: fts. rose, 1½ in. long, nodding. Tex. Var. Éngelmannii (H. Engelmannii) has more bell-shaped fts. about 1 in. long.

rubriflòra: hort, name for red-fld, form.

vuccæfòlia: H. parviflora.

HESPERÁNTHA. Iridaceæ. African herbs allied to Schizostylis and Ixia, having grass-like lvs. which arise from a basal corm and fls. in simple lax spikes. Propagated by seeds or cormlets

Bauri. To 2 ft., corm about ½ in. diam.: lvs. 3, to 1 ft. long and ¼ in. wide, strongly ribbed. fls. bright rose-red, to 1¼ in. long, tube cylindrical, straight and not longer than surrounding green spathes, segms. slightly reflexed or ascending. Transvaal.

Stanfordiæ. To 15 in.: basal lvs. 3, falcate, to 3 in. long, subobtuse, st.-lf. 1, to 4 in. long: fis. bright yellow, in spikes of 2, erect, to 2 in. across, segms. broadly ovate. S. Afr.

HESPERETHÙSA. Rutacex.One spiny bush or small tree, H. crenulata, NAIBEL, native India to Indo-China, grown somewhat in the citrus country for ornament and curiosity, allied to Feronia: evergreen: lvs. odd-pinnate, with small crenulate lits. and very broadly winged rachis and petiole: fls. small, white, fragrant: fr. $\frac{1}{2}$ in. or less diam., globose, with very bitter pulp. A good pot-plant; grows on Citrus stocks.

HÉSPERIS. ROCKET. Crucifera. Bien. and per. erect branching herbs of Eu. and Asia: lvs. narrow, entire or toothed, mostly undivided fls. white to rose, mauve-purple, often showy, in long terminal mostly paniculate racemes, sometimes fragrant: fr. an elongated pod or silique.

alpina. Lvs. lanceolate, dentate, long-acuminate, glabrous: fls. white to rose-purple, with pedicels equal in length to calyx: pods erect. Mts., Cent. Eu.—Perhaps an alpine race of H. matronalis.

dinárica. To 3½ ft., densely glandular-pilose: lvs. ovate-lanceolate to lanceolate, mostly sessile, dentate: fls. white, to 1½ in. across: fr. to 4 in. long. S.-Cent. Eu.

frágrans. Bien. to 2 ft. or more: basal lvs. lanceolate, petiolate, villous-hispid, upper lvs. sessile, ovate, all dentate to entire. fls. dull purple with darker veins, to ¾ in. across, in elongated villous racemes, fragrant, petals oblong, undulate, calyx and pedicels villous: pods villous-hispid. Siberia.

lùtea. Per. to 4 ft., sts. hairy: basal lvs. oblong-runcinate, dentate; st.-lvs. ovate to lanceolate, base cuneate to trun-cate, dentate, acuminate: fls. yellow, petals spatulate-obovate, to 1/2 in. long: pods to 5 in. long, briefly stipitate. matronalis (H. nivea). Dames-R. or Dames-Violet. Rather coarse per. or sometimes bien. to 3 ft., hirsute to glabrous, much branched: lvs. lanceolate to lance-ovate, to 4 in. long, toothed: fls. large, ½ in. and more across, fragrant, llac or light purple, varying to white and to double forms, late spring, early summer. Eu.; nat. in N. Amer. Vars. lapsanifolia and purpurea have large deep mauve fls. Var. sibrica has entire petals, not emarginate, and st.-hairs simple and retrorse, not forked and porrect. Siberia. White-fid. forms are alba and nana candidissima.

—Proported by weed sown a season in advance of blooming. -Propagated by seed sown a season in advance of blooming.

nivalis. Per., 1 ft., green or minutely pubescent: lvs. lance-oblong, entire, to 2 in. long and 34 in. broad: fls. pale lead-color, in a lax raceme. Near snow-line, mts. of Persia.—Plants grown under this name may be white forms of *II. matronalis*.

nívea: H. matronalis.

Steveniàna. Bien, or per, to 3 ft. or less, hairs on lower part of st. retrorsely bristly: lvs. oblong-lanceolate, incised-dentate: fls. pale purple: pods very slender. Asia Minor

tristis. Bien, or per, to 20 in.: lvs. ovate-lanceolate, to 2 in. long, acuminate, entire, glabrous or sparsely hany; fls. yellowish-green with rose-violet veins, petals lanceolate to oblong-spatulate, to 1 in. long or more: pods erect or ascending, to 5 in. long. Cent. Eu.

HESPEROCÁLLIS. Liliacex. Bulbous leafystemmed herb native in the deserts of S. Calif. and sometimes planted; of the Hemerocallis group. H. undulata. DESERT-LILY. To 2 ft.: basal lvs. to 2 ft. long and 34 in. wide, wavy-margined: fls. white with broad green band on back, to 23/4 in. long, funnelform, segms. about twice as long as tube.

HESPEROCHIRON. Hydrophyllacex. Low W. American perennials with lvs. in basal rosettes and fls. solitary on naked peduncle; ovary 1-celled; style 2-cleft. Propagated by seeds.

californicus. To 2 m.: lvs. ovate to oblong-spatulate, to 1½ m. long, many, gray-pubescent: fls. white, veins tinged pink, corolla oblong-campanulate, lobes shorter than tube. Wash, south to Utah and Cahf.

pùmilus. To 1½ in.: lvs. few, to 1¾ in. long, mostly glabrous: fls. white veined pink, corolla saucer-shaped, lobes longer than tube. Calif.

HESPEROSCORDUM HYACINTHINUM: Brodizea lactea

HESPEROYÚCCA. Liliacex. One S. Californian plant with very short woody caudex and basal rosette of narrow lvs. H. Whipplei (Yucca Whipplei). Lvs. to 1¾ ft. long and ¾ in. across, rigid, finely toothed and terminating in sharp spine: fls. creamy-white, to 2 in. long, fragrant, nodding, in panicles on scapes to 12 ft. high, the perianth-segms. distinct. Hardy only in warm climates. Cult. as for Agave.

HETERISIA: Sarifraga.

HETEROCÉNTRON. Melastomaceæ. Herbs or subshrubs native in Mex. and Cent. Amer., having entire lvs., white, rose or purple fls. in panicles, and capsular fr.; grown out-of-doors in warm regions or under glass for the numerous small pleasing fls. Propagated by cuttings.

álbum: H. roseum var.

élegans: Schizocentron elegans.

mexicanum: the plant cult. under this name is H.

ròseum (Heeria rosea). To 2 ft., the branches 4-angled: lvs. oblong, to 2 in. long: fis. rose or white in var. álbum, ¼ in. long. Mex.

HETEROMÈLES. Rosaceæ. One evergreen shrub native in Calif. and Lower Calif. and much planted there for ornament and employed in holiday decorations. H. arbutifolia (Photinia arbutifolia). Toyon. Christmas-Berry. 15 ft.: lvs. oblong, to 4 in. long, sharp-toothed, thick, dark green and shining above: fls. white,

14 in. across, in panicles to 3 in. high: fr. bright red or yellow, 14 in. long, persistent through winter. Var. chrysocarpa has yellow fr. and var. macrocárpa is listed.—Not hardy N. Propagated by seeds, cuttings, and by layers.

HETEROPÁPPUS. Compositæ. Hardy Asiatic perennials adapted to the hardy border, allied to Boltonia but differing in pappus made up only of short chaffy bristles and not supplemented by 2-4 long awns.

híspidus. To nearly 2 ft. or more, sts. rough and scabrous: basal lvs. broadly spatulate to lanceolate, often coarsely serrate; st.-lvs. linear, acute, ciliate. ray-fis. blue, disk-fis. yellow, in heads to 1½ in. across. Japan, Mongolia,

HETEROSPATHE. Palmaceæ. Several species of monœcious unarmed feather-palms, native in Philippines and S. Sea Isls., one of which is sometimes planted in S. Fla. and S. Infl. among the lys., much branched: fls. in 3's. 2 outer ones staminate or in 2's and both staminate on upper part of branches; stamens 6: fr. globular, size of a pea, stigmatic point near or toward the apex; seed 1. For cult. see Palm.

elata. Graceful ringed palm to 30 ft. with deep green arching lys. on long petiole and many drooping strongly nerved pinns 2-3 ft. long and 1½ in. or less broad with thickened margins and narrowed to a long point: fr. about ¼ in. across, slightly rugose, becoming white.

HETEROSPÉRMUM. Compositæ. herbs from Mex. to S. Amer., with opposite lvs. and small heads of yellow fls. with few rays; pappus none or of awns. Grown in flower-garden.

pinnatum. To 1 ft.: lvs. 1-2 pinnate into linear segms.: heads ¼ in. long. W. Tex., Ariz., Mex.

HETEROTHÈCA. Compositæ. Ann. or bien. American herbs allied to Chrysopsis but differing in having achenes of ray-fls, thickened and not flat.

subaxillàris. To 3 ft.: lvs. ovate-oblong to oblong, to 3 in. long, somewhat coarsely serrate, basal ones petioled and upper ones sessile and often clasping, usually acute: 1ay- and disk-fls. yellow, heads to 1 in. across, involucre nearly hemispherical with linear bracts. Del. to Fla. west to Kans and Mose to Kans. and Mex.

HEUCHERA. ALUM-ROOT. Saxifragaceæ. Herbaceous perennials with a tuft of rounded or broad 5-9-lobed toothed lvs. cordate at base. from which spring many slender scapes, over-topping foliage, with small cup-shaped, urnshaped or saucer-shaped, greenish, white, red or purplish fls. in narrow panicles or racemes; native in N. Amer., largely in the western part.

One (H. sanquinea) is common in the perennial border one (II. sanjuneu) is common in the perennial border and a few others are sometimes grown in rockeries and wild-gardens. They thrive in the average garden soil, preferably in an open situation. Propagated by division of the clumps in spring or in autumn, or by seed. These plants are native mostly on cliffs, hills and mountains.

álba: H. pubescens; much of the material in the trade, however, is H. sanguinea var. or garden hybrids of it.

americana. To 3 ft.: fls. greenish-white, petals about length of calyx-lobes, stamens much exserted: foliage mottled when young, becoming plan green Ont. to Ga., La., Mo, Ill. and Mich. Var hirsuticaulis has densely hirsute petioles, the fls. about ½ in. long with petals oblanceolate. Ind. to Mo.

bractelta. Densely tufted, to 6 in.: petals very narrow, slightly longer than calyx-lobes, the infl. spike-like, stamens slightly exserted. Colo., S. Wyo.

brizoides. A garden hybrid whose probable parentage is H. sanguinea × H. micrantha infl. a narrow diffuse long panicle of small pink fils, about ½ in. long. It has been confused with H. trarelloides which differs in having 7-8 stamens instead of 5.

chlorántha. Tufted, to 3 ft.: under side of lvs. and petioles with whitish hairs: fls. greenish, infl. spike-like, the petals very small or wanting, stamens included, scapes corrsely villous. B. C. to Ore. and Ida.

convallària. A garden hybrid whose probable parentage is H. pubescens X H. sanguinea: infl. a narrow panicle of small greenish fis. tipped with pink, scape and fis. with scattered glandular hairs. The following hort forms or segregates of it are listed: álba, fis. white often faintly tipped pink; cárnea, fis. pink; hirta, more densely glandular-pubescent; nàna, a dwarf form; nívea, fis. white.

cylindrica. To 2½ ft.: petioles densely hirsute: infl. spike-like, fls. yellowish-green to cream-colored, petals munte or sometimes lacking, bracts of infl. ¾ in. long or more. Ore., Ida. and Mont. Var. glabélia (H. glabella) differs from type in glabrous petioles and infl. bracts less than ¾ in lower. than 3/8 in. long.

glabélla: H. cylindrica var.

glabra. To 20 in., the fl.-sts. 1-3-lvd., glabrous: all lvs. cordate or round-cordate and deeply 5-7-lobed: fls. panieled, with white petals. Ore. north.

gracillima: H. sangunea var.

grandiflòra: H. sanguinea var.

Hállii. Tufted to 12 in.: infl. a narrow panicle to nearly 3 in. long, cymules 2-4-fld.: fls. greenish-white, sometimes suffused with red, petals to twice as long as sepals, stamens included. Colo.

hirsuticaulis: H. americana var.

hispida. To 4 ft., sts. white-hairy: fls. in narrow panicles, the petals as long as or slightly shorter than sepals. Mts., Va., N. C.

hvbrida: H. sanguinea var.

lithóphila: H. rubescens var. glandulosa.

longiflora. Stemless tufted plant to 2½ ft.: infl. a wide panicle, becoming very open at maturity; fls. yellow, large, petals slightly longer than sepals, both purple-tipped. N. C. to Ala. and Ky.

micrantha. To 2 ft.: fis whitish, in loose panicles, petals about length of calyx. Calif. to B. C.

ovalifolia (H. cylindrica var. ovalifolia. H. ovalifolia var. alpna). Acaulescent, the rounded-oval lvs. basal: fl.-sts. naked, glandular-pubescent; fls. in dense cluster 3 in. more or less long, yellowish. Rocky Mts., Nev., Ore.

parvifòlia. Acaulescent, cespitose: lvs. small, kidney-shaped, 7-9-shallowly lobed: fl-sts. to 15 im., with elongating infl.; fls. with yellowish petals. Alta. to Ore. and New Mex.

pilosissima. Very hairy, proper st. short or none: lvs. cordate, obtuse, blunt-lobed: fl.-sts. to 1½ ft., usually somewhat leafy, with narrow and dense cluster; fls. reddish. W. Cahf.

Pringlei (H. rubescens var. Pringlei). A probable segregate from the hybridization of H. rubescens and H. pulosissima: differs from H. rubescens in its much narrower lys, which are somewhat truncate at base rather than roundcordate, shorter petioles, and fis. hemispherical rather than open-campanulate. Mts., Calif.

pubéscens (H. alba). To 3 ft.: fls. purplish, in open panicles, petals slightly longer than calyx-lobes. Rich woods in mts., Pa. to N. C.

racemòsa: Elmera racemosa.

Richardsonii. Tufted, to 3 ft.: infl. a narrow panicle; fls. greenish, cylindrical-campanulate, petals spatulate, about as long as sepals. Ind., Mich., to Alta. and Colo.

Róbinsonii: a garden seedling.

Rósamondii: hort. form with coral-pink fis., to 11/2 ft. ròsea: hort. name, possibly for form of H. sanguinea.

rubéscens. To 15 in.: fls. in open secund panicles, with sepals pinkish, green-tipped, petals about twice as long as sepals. Mts., Utah to Ore. and Calif. Var. glandulosa (H. lithophila), fls. smaller than type usually less than 15 in. long, rarely secund.

sanguinea. Coral-Bells. To 2 ft.: infl. open, fis. bright red (in cult. sometimes whitish, pink or crimson), to ½ in. long, bell-shaped, petals shorter than calyx. New Mex., Ariz., and Mex. but hardy N. There are many hort. vars. as: álba, fis. white; gracfilima and gracfilima rôsea, slender form; grandiflora, fis. larger and plant more robust; hýbrida, plant robust; máxima, fis. dark crimson; Oxfordii, fis. deep scarlet; splendens, fis. dark crimson; virginale, fis. white.

spléndens: H. sanguinea var.

tenuifolia (H. cylindrica var. tenuifolia). Acaulescent: lvs. reniform to round-cordate, thin, ciliate, round-lobed: fl.-sts. to 2 ft.; fls. greenish. Ida., Ore., Wash.

tiarelloides (H. sanguinea var. tiarelloides). A bigeneric unterloides (H. sanguinea var. trateicoaes). A bigeneric hybrid with Tiarella, sometimes named Heucherella trateloides: resembles H. sanguinea in habit, infl. and color of fis., but differs in having 7-8 stamens and unequal carpel beaks. Plants of this parentage are sometimes sold under H. brizoides. A var. alba is listed.

undulata. Hort, hybrid of uncertain parentage: to 30 in.: fls. greenish-white, many in loose much branched racemes.

villòsa. To 3 ft.: panicles open, fis. nearly white, petals twice as long as calyx. Va. to Ga. and Tenn.

virginale: H. sanguinea var. Wálkeri: listed name.

HEUCHERELLA: Heuchera tiarelloides.

Euphorbiaceæ. Brazilian trees with milky juice which is the most important single source of rubber, lvs. of 3 lfts., small monœcious fls. without petals, in panicles, and fr. a large caps.; sometimes grown for ornament.

It does best in hot damp climates. Propagated by seeds, and sometimes by cuttings as an ornamental subject or when grown under glass for interest.

brasiliénsis. Para Rubber or Caoutchouc Tree. To 60 ft.: Ifts, elliptic, sometimes as much as 2 ft. long: fis. white: seeds about 1 in. long. Amazon.

HEXAGLÓTTIS. Iridaceæ. African S. cormous herbs allied to Nemastylis with usually 2 long narrow lvs. and fugacious yellow fls. in branched panicles; perianth rotate.

longifòlia. To 1½ ft.: lvs. flat, narrowly linear, slightly longer than st.: fls. 3-4 in spathe, segms. to ½ in. long.

virgata. To 1½ ft.: lvs. cylindrical, longer than st.: fls. ½ in. long, 3-4 in a spathe.

HEXASTYLIS: Asarum.

HIBBÉRTIA. Dilleniaceæ. Mostly Australian shrubs with erect, procumbent or climbing sts.: lvs. small and often heath-like: fls. yellow or white, solitary and terminal. Grown out-of-doors in S. Calif.

cuneif 6rmis: Candollea cuneiformis.

dentata. Sts. trailing or twining: lvs. oblong, to 214 in. long, slightly toothed, petioled: fis. dark yellow, to 2 in. across, with numerous stamens.

perfoliata. Sts. procumbent or ascending: lvs. ovate, to 2 in. long, slightly toothed, perfoliate: fls. pale yellow, with numerous stamens.

volubilis. Sts. trailing or twining to 30 ft.: lvs. obovate to lanceolate, to 3 in. long, clasping at base, silky-pubescent beneath: fls. yellow, with numerous stamens.

HIBÍSCUS. Rose-Mallow. Malvacex. Herbs, shrubs or small trees with alternate palmately lobed lvs., mostly very large and showy fls. from white to yellow and scarlet, and dry capsular 5-valved fr.; popular ornamental subjects, a few also grown for the edible parts. Species of hibiscus are among the most showy fls. of the tropics; abundant and prized in Hawaii.

The annual flower-garden sorts may be grown from seed sown where the plants are to stand. The perennials are propagated by seed or division; many of these are native in swamps and should have plenty of moisture. The shrubby kinds may be grown from seed sown in pots and transplanted; also by cuttings and grafting.

Abelmoschus (Abelmoschus moschatus). Musk-Mallow. Ann. or bien. to 6 ft.: lvs. variously lobed: fls. yellow with crimson center, 4 in. across: fr. to 3 in. long, the seeds with musky odor sometimes used in perfumery. India.

abutiloides. Shrubby: lvs. ovate-cordate, to 6 in. long, acuminate, glabrescent, margins usually crenate, stipules ovate-cordate: fis. solitary, probably yellow. N. S. Amer., W. Indies.

africanus: H. Trionum.

Arnottianus. Shrub or small tree: lvs. ovate, entire: fls. white, sometimes with pinkish veins, 4 in. or more across, handsome; calyx-teeth short; bracts of involucel 1/2 in. or less long. Háwaii.

aurantiacus: H. Rosa-sinensis var.

Báptistii: a form of H. Rosa-sinensis with double fis. variegated cream and red.

brilliantissimus: hort. name for scarlet-red-fid. form, resembling H. coccinea, but said not to be hardy N.

calisureus: hort. name, probably H. Trionum.

Cálleri: H. Rosa-sinensis var.

calfcinus (H. chrysanthus). Small shrub: lvs. round, angled: fis. lemon-yellow with dark center, to 3 in. across. S. Afr.; grown in Calif. and similar climates.

cannábinus. Ann. or per. with prickly st.: upper lvs. with deep narrow lobes: fis. yellow, with crimson center. Tropics of Old World.—Yields fiber.

chrysanthus: H. calucinus.

coccineus (H. speciosus). Per. to 10 ft., glaucous: lvs. with deep slender lobes: fls. rose-red or crimson, to 6 in. across. Swamps, Ga. and Fla.

Cooperi: H. Rosa-sinensis var.

Dénisonii. Lvs. ovate, leathery, entire: fls. white. Much like *H. Arnottianus* but calyx deeply cleft and involucel bracts much longer. Origin doubtful.

diversifòlius. To 8 ft., shrubby and prickly: lower lvs. deeply 3-5-lobed, upper toothed: fls. yellow with dark center. Afr., Pacific Isls., Austalia.

elatus (Paritium ela um). CUBAN BAST. Supposed to differ from H. Ulaceus in greater stature, larger fls. that change from yellow to red, involucre and calyces deciduous from ripe fr., and hairy seeds, but some of the plants so called not separable from that species.

esculéntus (Abelmoschus esculentus). OKRA. GUMBO. Ann. to 6 ft.: lvs. variously lobed or divided fis. yellow with reddish center, to 3 m. long; fr. to 1 ft. long, ribbed, becoming woody, when immature eaten as a vegetable. Tropics of Old World.—See Okra.

gossýpinus. Tall shrub lvs. ovate, finely toothed: fls. yellow, small, with an involucre of thread-like lfts. shorter than calyx-lobes. S. Afr.; adapted to Calif. and similar

grandiflorus. Great R. Velvety per. to 6 ft. or more: lvs. commonly broader than long and 3-lobed: fis. pale pink with reddish in bottom, petals to 6 in. long. Maishes, Ga., Fla., Miss.—Allied to H. Moscheutos; perhaps sometimes transplanted.

Hamabo. Shrub to 10 ft. or more: lvs. round, slightly toothed, white-tomentose beneath: fls. yellow, darker at base, 3 in. across. Japan; thrives in southernmost regions.

heteroph filus. Tall shrub: lvs. simple or divided into long narrow lobes: fis. white with crimson or purple center, to 4 in. long. Australia; adaptable to southern parts of the country.

Huègelii. Tall shrub, mostly tomentose: lvs. deeply 3-5-lobed fis. violet-purple, petals to 3 in. long. Australia. Var. glabréscens is nearly glabrous.

incanus. Per. to 6 ft.: Ivs. ovate-lanceolate, toothed, white-tomentose beneath: fls. white or pink with crimson center, to 4 in. long. Swamps, Md. to Fla. and La.

Lámbertii: hort. name.

Mánihot (Abelmoschus Manihot). Ann. or per. to 9 ft.: Ivs. divided into long narrow lobes: fls. yellow or whitish with dark brown center, to 9 in. across. Probably E. Asia, with dark brown center, to 9 in. across. Probably E. Asia. Var. grandiflorus is listed.—Showy in bloom; widely spread as a more or less weedy plant.

Mechanii: a crimson-fld. form of H. Moscheutos.

militaris. Soldier R. Per, to 6 ft.: lvs. halberd-shaped: white or pink with purple center, to 5 in. across. to Fla. and La.

Moscheùtos (H. palustris), Common R. Per. to 8 ft lvs. ovate, longer than broad, not lobed or sometimes with small lobes or angles on shoulders, toothed, white-tomentose underneath: fls. pink or rose, sometimes whitish, to 8 in. across. Swamps, Mass. to Fla. and Mo. Vars. **álbus** and roseus are color forms.—Here belong the large-fld. garden mallows, some of them accounted hybrids with related species

mutábilis. COTTON-ROSE. CONFEDERATE-ROSE. Shrub or small tree: lvs. broadly ovate, lobed to half or less their depth, tomentose beneath: fls. white or pink, becoming red, to 4 in. across. China; planted in southernmost states and in the tropics.

oculiròseus. Crimson-eye R. Closely resembling H. Moscheutos but the white fis. with a dark rose or crimson center. Salt marshes, N. Y. and N. J.

palústris: H. Moscheutos.

paramutábilis. Differs from H. mutabilis in If.-bases more truncate and broader sepals. China.

pedunculatus. Shrub to 4 ft.: lvs. 3-5-lobed, the lobes toothed: fis. on long peduncles, nodding, deep rose, 11/2 in. long. S. Afr.

règius-máximus: listed name.

respléndens: listed name.

Rôsa-sinénsis. Rosa-of-China. Chinese H. Shrub to 30 ft.: Ivs. ovate, not lobed, toothed or nearly entire: fls. of many colors, rose-red to white, sometimes double, to 6 in. across. Asia; widely grown in all warm countries and also under glass. Var. Cálleri has buff-yellow fls. crimson at base. Var. Coòperi (H. Cooperi) has narrow lvs. variegated with white and small scarlet fls. Var. Van Hoùttel has deep crimson fls. Other forms in the trade are aurantiacus, srandifibrus and miniètus. grandifiòrus and miniàtus.

Sabdariffa. ROSELLE. JAMAICA SORREL. Ann. or bien. to 7 ft.: st.-lvs. lobed or divided: fis. yellow, having thick red acid calyces and involucels from which sauces and jellies are made in warm countries; fiber is derived from the sts. Tropics of Old World.—See Roselle.

schizonétalus. Shrub: lvs. ovate, not lobed, toothed: fis. sourcepetatus. Survo: IVS. Ovate, not loosed, toothed: fis. long-peduncled and hanging, red or orange-red, to 3 in. across, the petals much cut and recurved, the staminal column long-exserted. E. trop. Afr.; grown in the southernmost parts of the country.

sinénsis: H. Rosa-sinensis

sinosyrlacus. Differs from H. syriacus in its broader sharp-toothed and larger lys. China.

speciòsus: H. coccineus.

subviolaceus: hort, name,

surviolaceus: nort. name.

syrlacus (Althwa frulex). Shrub-Althea. Rose-of-Sharon. Shrub to 12 ft., much planted: lvs. 3-lobed or toothed: fis. rose or purple to white and bluish, often double, to 3 in. across. E. Asia; hardy N. There are many hort. forms, such as álbus plenus, amplissimus with double purple-pink fis., anemonæflörus, årdens, bícolor, cárneus cœléstis, elegantíssimus, fólio-variegàtus, Lèopoldii, pæoni-flòrus, pulchérrimus, purpùreus, ròseus, rùber, speciòsus, tòtus álbus, variegàtus, violàceus.

tiliaceus (Pariti or Paritium tiliaceum). MAHOE. Shrub or tree: lvs. nearly or braining maceum). MARGE. Shrub or tree: lvs. nearly orbicular, resembling those of the linden: fis. yellow, to 3 in. long; involued and calyx persistent on fr. Probably Old World tropics, now widely spread.

Trionum (H. africanus. H. vesicarius) FLOWER-OF-AN-HOUR. Ann. to 2 ft.: Ivs. deeply divided into coarsely toothed lobes: fls. sulfur-yellow or white with dark center, to 3 in. across. Afr.; nat. in N. Amer. Var. grandifiorus is

versicolor: a form with single light carmine fls. with deep red center and yellowish shadings.

vesicarius: H. Trionum.

HICKENIA: Parodia microsperma.

HICKORY-NUT. The hard husk-inclosed fruit of various species of Carya (which see), characteristic of North America, and some of the species much prized. They are gathered in the wild and one of them is much planted in the South: see *Pecan*. All the hickories are readily raised from seeds (or nuts), stratified and planted in spring, or sown directly in the ground in autumn if they can be protected from rodents. Because of the tap-root, seedlings transplant with considerable loss if allowed to stand in the original nursery more than two years. A more branching root system can be produced by cutting the tap-root of the seedling about 6 inches below the ground at least a year before transplanting.

Named varieties of hickory may be propagated by budding and grafting. The principles involved are the same as with other fruit-trees, but greater skill and accuracy in workmanship are required. With seedlings ½ inch in diameter, ring or annular budding is successful, either in the early spring as growth starts using dormant cions, or preferably in July just as the current seasons growth hardens. Somewhat larger stocks may be cleft-grafted or side-grafted. With young trees 1½-4 inches in diameter the barkor inlay-graft is well adapted. Cions of vigorous one- or two-year shoots should be dormant. Grafting is done in the spring from the time growth starts until trees are well leaved out. It is important that all cut surfaces of the stock and the entire surface of the cion including the buds be covered with wax.

Aside from the pecan, the most prized of the hickory-nuts are the shagbark, Carya ovata, and the shellbark, C. laciniosa. Other species also produce edible nuts.

HICKSBEACHIA. Proteaceæ. One Australian tree, H. pinnatifòlia. Lys. of 18-23 stiff toothed Ifts. to 9 in. long and 2 in. wide: fls. silky outside,

½ in. long, in spike-like racemes to 11 in. long: fr. globular, to 1½ in. across, orange-colored.

HICORIA: Carva.

HIDALGÒA. Compositæ. Cent. American climbing shrubs with ternately cut lvs. and rather large heads of ray- and disk-fls., resembling single dahlias: one species grown out-of-doors in S. Calif.

Wércklei (Childsia Wercklei). CLIMBING-DAHLIA. Lvs. opposite, to 2½ in. long, climbing by the coiled petioles: heads orange-scarlet, to 2½ in. across. Costa Rica.

HIERACIUM. HAWKWEED. Compositæ. Many per. herbs, often stoloniferous, of the north temp. zone, with alternate or basal lvs. and panicled or occasionally solitary heads of yellow, orange or red ray- and disk-fis.; pappus of stiff usually brownish bristles.

A few hawkweeds are sometimes grown in the garden, especially in rockeries. They prosper in poor soil. Care must be exercised to keep them from spreading too much, as they may become weedy. Propagated easily from seed, also by division of the stolons. See also Tolpis.

alpinum. To 6 in, hairy: lvs. oblong or lanceolate, slightly toothed: heads solitary, bright yellow. Mts., Eu.,

amplexicaule. To 2 ft., glandular-sticky: lvs. ovate to lanceolate, toothed, the st.-lvs. clasping: heads 2-many, yellow, 1 in. or more across. S. Eu.

aurantiacum. Orange H. Devils-Paintbrush. To 20 in., covered with long spreading hairs: lvs. mostly in basal tuft, oblong, nearly entire: heads clustered, 1 in. across, deep orange to flame color. Eu.; a bad and abundant weed in E. N. Amer.

bombycinum. To 1½ ft.: lvs. obovate, densely silvery-pubescent; heads ½ in. across, yellow. Spain.

Grondvii. To 3 ft., harry: lvs obovate or oval, toothed or entire: heads clustered, ½ in. across, yellow. Mass. to Fla. and Tex.

gymnocephalum. To 2 ft., white-pubescent: lys. oval or oblong, slightly toothed: heads clustered, ¾ in. across, yellow. S. Eu.

Heldreichii. To 20 in., long-pilose: lvs. obovate to oblong, long-silky or setose-pilose, entire or minutely toothed: fis. yellow, involucre silky-villous. Balkan region.

lanatum. To 20 in., densely gray-tomentose: lvs. oval or ovate, nearly entire: heads clustered, 1 in. across, pale yellow. S. Eu.

marmòreum. To 1 ft., hairy: lvs. ovate-oblong, toothed: heads clustered, ¾ in. across, yellow. S. E. Eu.

murdrum. To 21/4 ft.: lvs. ovate to oblong, to 4 in. long, cordate, coarsely toothed: scapes glandular; heads about 1 in. across, yellow ray-fls. Eu., adventive in N. E. Amer.

paniculatum. To 3 ft., nearly glabrous: lvs. lanceolate, toothed: heads panicled, ½ in. across, yellow. N. S. to Ga. and Ala.

Pilosélla. Mouse-ear H. Slender, to 1 ft., densely hairy: lvs. in a basal tuft, oblong, entire: heads solitary, 1 in. across, pale yellow, sometimes striped or tinged with red or purple. Eu.; nat. in E. N. Amer.

ribrum. To 11/2 ft., densely woolly, resembling H. aurantiacum. E. Cent. Eu.

stoloniferum: a confused name.

tridentatum. To 3 ft., hairy: lvs. oblong to lanceolate, with few_coarse teeth: heads clustered, to 3/4 in. across, yellow. Eu.

umbellatum. NARROW-LEAVED H. To 3 ft.: lvs. lanceolate to linear, toothed: heads clustered, to 1½ in. across, golden-yellow. Eu., Asia.

venosum. To 3 ft., nearly glabrous: lvs. obovate to oval, toothed, often purple-veined: heads numerous, ½ in. across, yellow. Me. to Ga. and Neb.

villosum. Shaggy H. To 2 ft., soft silky-pubescent: lvs. oblanceolate to ovate, nearly entire: heads to 2 in. across, bright golden-yellow, often solitary at end of sts. Eu.

HILLS-OF-SNOW: Hydrangea arborescens var. grandiflora.

HIMALAYA-BERRY. A kind of blackberry introduced into North America in recent years and grown somewhat for fruit. It is one of the many kinds of European brambles with very

long scrambling more or less perennial canes, Rubus procerus; it is not Himalayan. The plant is rampant and viciously thorny. It is best handled on a trellis or arbor. In parts of California it is a useful fruit plant and may also be grown acceptably elsewhere when properly trained, but in general its pomological promise is not great. The plant has established itself in some places outside cultivation. Propagation and culture as for Blackberry.

HIPPEÁSTRUM. Amaryllidaceæ. Bulbous herbs with narrow strap-shaped basal lvs., spathes of 2 valves separated to the base, red or whitish lily-like declinate fls. usually 2-4 in number borne in an umbel at the top of a hollow scape, the perianth-segms. united to form an abbreviated tube and stamens in four different lengths

Hippeastrums, commonly known as amaryllis, are grown north as house plants and out-of-doors, but the bulbs must be lifted before winter. South they are commonly grown as garden plants. The best soil is one composed of fibrous loam, leaf-mold and sand with a neutral or slightly alkaline reaction. They may be propagated by seeds which reach blooming size in about two years. Named hybrid varieties are propagated true to type from bulb cuttings. The common garden kinds are hybrids or variants.

advenum. Lvs. linear, glaucous: fls. yellow or red, 2 in. long. Chile. Var. miniatum is II. miniatum.

Albertii: a hort, form of *H. puniceum* with double salmon-pink fls.

adlicum (H. robustum). Lilly-of-The-Palace. To 2 ft.: lvs. to 2 in. wide, obtuse: scape 2-fd.; fls. red with green throat, to 6 in. long, segms obovate, the 2 upper wider than others, stigms 3-parted, filaments red. Brazi.

brachyándrum: Habranthus brachyandrus.

equéstre: H. puniceum.

hfbridum: a name for hort. forms.

Jóhnsonii. An old hybrid between *H. Reginæ* and *H. nttatum* probably not now in cult., or represented by more recent crosses and variants.

miniatum. Lvs. strap-shaped, to 2 ft. long and 1 in. across: fls red, to 4½ in long, segms. to 1¼ in. across, inner ones narrower than outer. Peru. Var. nobile is a hort. form.

pratense (Habranthus pratensis. Amaryllis pratensis). Lvs. ½ in. wide, with fls.: fls. bright red, tube very short, segms. 2½ in. long. Chile.

puníceum (H. equestre. Amaryllis equestris). Lvs. to 2 in. wide, after fls: fls. red or salmon-red, highter toward base, to 5 in. long, the tube about 1 in. long. Trop. Amer.

Reginæ (Amaryllis Reginæ). Lvs. to 2 in. wide, after fls.: fls. bright red with whitish star in throat, to 5 in. long, the tube to ½ in. long. Trop. Amer.

reticulatum (Amaryllis reticulata). Lvs. to 2 in. wide, with fls.: fls. rose-pınk cross-barred with darker rose, to 4 in. long, the tube 1 in. long. Brazil. Var. striatifòlium has lvs. with a prominent white rib.

robústum: II. aulicum.

rùtilum. Lvs. 1 in wide: fls. red with green tube and keel, to 4 in long, tube ¾ in long. Brazil. Var. fúlgidum has wider lvs. with larger and more brilliantly scarlet fls.

solandriflorum. Lvs. to 2 in. wide, with fis.: fis. greenish-white, to 10 in. long, the tube 4-5 in. long. S. Amer.

texànum: see Habranthus texanus.

vittatum (Amaryllus vittata). Lvs. with or after fls.: fls. striped red and white, to 6 in, long, the tube about 1 in. long. Peruvian Andes.—The usual garden forms or colors are much like this species.

HIPPOCASTANACEÆ. HORSE-CHESTNUT FAMILY. Two widely distributed genera of trees and shrubs bearing opposite digitately compound lvs., irregular polygamous fls. having 5 sepals, 4–5 petals, 5–8 stamens, superior 3-celled ovary, and leathery capsular fr. Only Æsculus is cult.

HIPPOCRÈPIS. Leguminosæ. Herbs or small shrubs with pinnate lvs. and yellow papilionaceous fls. in nodding racemes or spikes; native in Medit. region and grown sometimes in rockgardens and borders.

comòsa. Per. to 2 ft.: lfts. in 3-5 pairs, obovate: fls. in 4-8-fld. umbels. May-July.—Sun, on alkaline soil.

multisiliquòsa. Ann. to 1 ft.: lfts. in 2-7 pairs: fls. small pods curved, breaking into 3-7 joints.

HIPPÓPHAË. SEA-BUCKTHORN. Elæagnacær. Spiny shrubs or small trees covered with silvery scales, having alternate willow-like lvs., inconspicuous yellow diœcious fls. appearing before the lvs., and drupe-like frs.

Any soil is satisfactory. To insure fruit care must be taken to have a few staminate plants. Propagated by seeds sown in fall or stratified, cuttings of ripened wood in spring, root-cuttings, layers and suckers.

rhamnoides. Very hardy, to 30 ft.: fr. bright orange-yellow, ¼ in. long, staying on through the winter. Eu., Asıa. Var. angustifòlia has narrow lvs. and pendulous branches. Var. procèra grows to 50 ft.

branches. Var. procèra grows to 50 ft. salicifòlia. To 50 ft., the branches drooping: lvs. stellate-tomentose below, dull green above: fr. yellow. Hımalayas; to be planted S.

HIPPOSELINUM LEVISTICUM: Levisticum officinale.

HIPPÙRIS. Haloragidaceæ. Per. aquatic herbs adapted to bog-garden or pool, having simple verticillate lvs. and small perfect fls. borne in axils. One species, H. vulgàris, is sometimes cult. in constantly wet ground or in water to 4 ft. deep. Sts. 6 in. long or more in deeper water: lvs. in whorls of 6–12, acute, the sts. unbranched and extending upward above level of water: fr. nut-like, 1-seeded. Of wide distribution, N. Amer., Eu., Asia, Patagonia.

HIRSUTE: with rather rough or coarse hairs.

HISPID: provided with stiff or bristly hairs.

HOARHOUND: Marrubium. Black: Ballota nıgra. Water: Lycopus.

HOARY: covered with a close white or whitish pubescence or down.

HOBBLE-BUSH; Viburnum alnifolium.

HOFFMÁNNIA. Rubiaceæ. Shrubs or rarely herbs native from Mex. to S. Amer. with opposite or whorled usually colored lvs., small tubular 4-lobed fls. in axillary cymes, and fr. a small berry; a few of them are grown as foliage plants in the greenhouse. Propagated by cuttings.

discolor. To 6 in., hairy: lvs. obovate, to 6 in. long, satiny above, purple beneath: fis. red, the cymes long-stalked. Mex.

Ghiesbréghtii (Campylobotrys Ghiesbreghtu). To 4 ft., nearly glabrous: lvs. oblong-lanceolate, to 1 ft. long, dark velvety-green above, purple-red beneath: fls. yellow with red spot, the cymes short-stalked. Mex. Var. variegāta has mottled lvs.

refúigens. To 15 in., sts. weak and flexuous: lvs. narrowly obovate, to 6 in. long, fleshy, dull green and somewhat indescent above, wine-red beneath: fls. pale red, to 1 in. across. Mex.

regàlis. Subshrub: lvs. round-ovate, dark green above, purple-red beneath: fis. yellow, the cymes nearly sessile. Mex.

HOHENBÉRGIA. Bromeliaceæ. Trop. stemless epiphytes with spiny strap-shaped lvs. in basal rosettes, differing from Æchmea in having floral bracts entire or only remotely denticulate, at least not serrate.

dístans (Æchmea distans). Lvs. to 2½ ft. long, narrowly ligulate, entire or minutely toothed: scape curving downward, to nearly 2 ft. long, bracts imbricate, lanceolate, and entire; fls. white or greenish-yellow, to ¾ in. long. Jamaica.

HOHERIA. Malvaceæ. New Zeal. trees with alternate toothed lvs., white small or medium fls. clustered or solitary in the axis, the pedicels jointed near middle, and 5 indehiscent winged carpels falling away from a central axis; grown in S. Calif.

angustifòlia (H. populnea var. angustifolia). To 25

ft.: lvs. linear-oblong, to 2 in, long, spiny-toothed: fls.

in across.

populnea. To 30 ft.: lvs. ovate, to 5 in long, doubly toothed: fis. to 1 in. across Var. Osbornii is listed.

sexstylòsa (H. populnea var lanceolata). To 25 ft.: lvs. lanceolate, to 5 in. long, sharp-toothed: fls. $\frac{3}{4}$ in. across.

HOLBOELLIA: see Lardyzabalaces:

HÓLCUS (Ginannia. Notholcus). Gramineæ. Old World ann. and per. grasses of medium size, with flat lvs. and spikelets in terminal panicles; one species is sometimes planted for ornament. See Grasses.

caffrdrum; Sorghum vulgare var. Dúrra: Sorahum vulgare var. halepénsis: Sorahum halepense.

lanatus. Velver-Grass. Per. to 3 ft., prominently velvety-pubescent: Ivs. to 6 in. long and 14 in. wide: panicles to 4 in. long, pale or purplish, glumes ciliate. Eu.; nat. in N. Amer.

saccharatus: Sorahum vulgare var. saccharatum.

Sorghum: Sorghum vulgare.

sudanénsis: Sorahum vulgare var. sudanense.

virgatus: Sorghum virgatum.

HOLLY: Ilex. African-: Solanum giganteum. Mountain-: Nemopanthus. Sea-: Eryngium maritimum.

HOLLYHOCK. Two species of Althæa, A. rosea and A. ficifolia, the latter differing in its deeply lobed and somewhat fig-like leaves and probably not specifically distinct. Hollyhocks are stately hardy plants, 5-9 feet tall, well known everywhere, summer-blooming, bearing large wide-open flowers along the main axis

in white, rose, red, yellowish, single and double. The culture is very simple. The seed is usually sown in July, and the plants set where wanted the following spring or they may stand where sown. They will boom the same year in which they are transplanted—the year following the seed-sowing. New plants should be set every two years, as they are essentially biennial. For the rust of hollyhocks, remove affected leaves promptly; do not allow diseased leaves to remain over winter, in particular remove all pustuled leaves of the low clump just before winter and again in spring; frequent thorough dusting on both surfaces of the leaf with sulfur on green-sulfur should then keep the disease in check. Clean up the garden thoroughly.

HOLMSKIÓLDIA. Verbenaceæ. Shrubs with opposite simple lvs., tubular fls. with conspicuous colored calvees borne in racemes or cymes, and drupaceous frs.; planted out-of-doors in warm climates and sometimes under glass, particularly for its large ornamental calyx.

sanguinea. Chinese-Hat Plant. To 30 ft, evergreen: lvs. ovate, to 4 in. long: fis. with red corolla 1 in long and spreading brick-red or orange calyx to 1 in. across. Himalayan region.—Now a characteristic plant in parts of trop.

HOLODÍSCUS (Sericotheca. Schizonotus). Rosacex. W. American deciduous shrubs with alternate toothed or lobed lvs. and small whitish fls. in terminal panicles; planted for ornament.

They thrive in sunny positions in well-drained soil. Propagated by seeds, by layers, and sometimes by greenwood cuttings under glass.

ariæfðlius: H. discolor var.

discolor (Spiræv discolor). ROCK-SPIREA. To 20 ft.: lvs. ovate, to 4 in. long, white-tomentose beneath: fis. creamy-white, in panicles to 9 in long on drooping branches. B. C. to Calif. and Mont. Var arisefolius (Spiræa ariæfolius) has lvs. gray-pubescent beneath.

dumòsus (H. discolor var. dumosus). To 8 ft.: lvs. obovate, to 2 in. long, white-hairy beneath, coarsely toothed, base cuneate: fls. in panicles to 7 in. long. Wyo. and Utah to Mex.

microphfilus. To 3 ft.: lvs. elliptic, to ½ in. long, white-silky beneath: fis. in panicles to 3 in. long. Colo., Utah,

Ulmacex. One large de-HOLOPTÈLEA. ciduous tree in India, separated from the elms by the entire lys, and technical characters of fl. and fr. H. integrifòlia has pubescent shoots and elliptic or obovate-oblong lvs. to 6 in. long and 5 or 7 pairs of nerves: fr. 1 in. long, elliptic or nearly orbicular, notched at end.—Adapted only to warm climates.

HOLY-GHOST-FLOWER: Peristeria elata.

HOMALÁNTHUS. Trop. Euphorbiaceæ. Asian and Australian trees or shrubs with alternate entire lys., monœcious apetalous fls. in terminal racemes, and capsular frs.; sometimes grown in S. U. S. for ornament or curiosity.

populifòlius (Carumbium populifòlium). Small tree: lvs. triangular-ovate, to 6 in. long, long-stalked: racemes to 4 in. long. Ceylon to Pacific Isls.

HOMALOBUS: Astragalus.

HOMALOCÉPHALA. Cactaceæ. Segregate from Echinocactus distinguished by the different fr., which is somewhat fleshy and bursts irregularly, the plant-body subglobose or depressed. One species. See Cacti. H. texénsis (Echinocactus texensis). Usually much depressed or flattened endwise, to 12 in. broad and half as high; ribs 13–27 and very prominent; radial spines 6 or 7; central 1 and longer: fls. 2 in. or more long, bell-shaped, scarlet and orange below, pink to nearly white above. Tex., New Mex., Mex.

HOMALOCLADIUM. RIBBON-BUSH. TIPEDE-PLANT. Polygonaceæ. One odd shrub with flat articulated striate sts. that are usually leafless in the flowering stage, bearing small greenish fls. in little sessile clusters at alternate joints; true lvs. appearing mostly in the vegetative stage, ½-2½ in. long, lanceolate, often lobed at base. H. platycladum (Muehlenbeckia platyclados), from the Solomon Isls., frequently grown as a pot-plant and in the open far S. for interest and curiosity: 2-4 ft. but in tropics making terete canes to 12 ft.: fr. small, red, berry-like, 5-sulcate at top.—Easily grown, sometimes standing light frost; propagated by cuttings.

HOMALOMÈNA. Araceæ. Trop. herbs with woody sts., lanceolate or oblong lvs. with sheathing petioles, and unisexual fls. borne on spadices slightly shorter than the erect spathes; occasionally grown under glass for the variegated foliage. Cult. as for Dieffenbachia.

picturata. Lvs elliptic, to 16 in. long and 8 in. wide, apex acute, dark green above, variegated yellowish-white only along each side of midrib, petiole and midrib pilose. Colombia.

Wallisii (Curmeria Wallisii). Lvs. to 8 in. long and 3 in. wide, deep green above irregularly spotted with yellow and margined with white, glaucescent beneath, the petioles 2 in. long and channelled: spathes pale red minutely spotted with white. Trop. Amer.

HOMÈRIA. Iridaceæ. Cormous S. African herbs with 1 linear lf. longer than the st. and orange or red fugacious fls. several in a spathe; perianth funnelform, cut nearly to base. Cult. as for Ixia.

collina. Lvs. to 2 ft. long: fis. bright red, 1 ½ in. long. Var. aurantiaca, fis. with yellow claw. Var. ochroleuca (H. ochroleuca) has pale yellow fis. with segms. strongly

6legans. Lvs. 1 ft. or more long: fis. yellow, the outer segms, with green or brownish blotch in middle, 1½ in. long.

lilácina. Lvs. 3, narrowly linear, to 12 in. long, acuminate: scape slender, to 9 in. long; fls. lilac, veined purple and with yellow-speckled purple blotch.

ochrolenca: H. collina var.

pfilida. Basal If. to 2 ft. long, the 2 st.-lvs. to 4 in. long: fis. golden-yellow, usually 4-6 in cymes, spathe-valves cuspidate.—H. Cookii, not known to be in cult. in this country, but said to be confused with H. pallida, differs in having segms. black-speckled at base and acuminate spathe-valves.

HOMÓGÝNE. Compositæ. Small per. herbs from mts. of Cent. Eu., allied to Tussilago but differing in having white or purple heads which usually are composed entirely of disk-fls., and lvs. more densely white-woolly and smaller. Propagated by division and seeds. Best suited to moist soil.

alpina. To 6 in.: basal lvs. cordate-reniform and often withering before blossoming, st.-lvs. ovate-lanceolate: heads pale purple, to 1 in. across, solitary on hairy scapes to 1 ft. high.

HONESTY: Lunaria.

HONEY-BELL: Mahernia verticillata.

HONEY-BUSH: Melianthus.

HONEYSUCKLE: Lonicera. Bush-: Diervilla. Cape-: Tecomaria capensis. French-: Hedysarum coronarium. Himalaya-: Leycesteria formosa. Jamaica-: Passiflora laurifolia. White Swamp: Rhododendron viscosum.

HONEYWORT: Cerinthe.

HOÒDIA. Asclepiadacex. African per. succulent leafless herbs of the Ceropegia class with thick cylindrical angled sts. having tubercles armed with spines or bristles, and large fls. in small clusters near top of sts.; corolla flat or cup-shaped; crown double.

Bàinii. Bushy, sts. 12-15-angled, spines pale brown: fls. light yellow sometimes tinged pink, glabrous, to 3 in.

Drègei. Sts. 20-24-angled, with stiff bristles: fls. light brown covered with white hairs, $1\frac{1}{2}$ in. across.

Górdonii. To 1½ ft., sts. many-angled, glaucous, spines pale brown: fls. yellowish-brown, glabrous except dark red papillæ in center, to 4 in. across.

Júttæ. To 10 in. tall, sts. to 2 in. thick, 14-16-angled, tubercles spine tipped: fis. 1-4 near taps of st.; corolla light yellowish-brown to dark reddish-brown, to 2½ in. across, glabrous, quite flat.

Lugardii. Sts. to 2½ ft. tall, spiny: fls. brick-red, to 2½ across, covered with colorless hairs, outer corona-lobes bifid.

 $macr\acute{a}ntha$. To 3 ft., sts. many-angled: fls. light purple with yellowish center, covered inside with purple hairs, to 8 in. across.

HOOKERA: Brodiza.

HOP: Humulus. -Bush: Dodonæa cuneata. -Tree: Ptelea.

HOPLOPHYTUM: Achmea.

HORDEUM. Gramineæ. Ann. and per. grasses in temp. regions of both hemispheres, with flat lvs. and spikelets in terminal cylindric dense spikes, awned; one species valuable for grain and forage. See Grasses.

jubatum. Squirrel-tail-Grass. Bien or per to 21/4 ft.: lvs. to 5 in long and 1/4 in. wide: spikes to 4 in. long, nodding, the slender awns to 3 in. long. N. Amer., Eu., Asia.—Sometimes grown for the abundant ornamental drooping

vulgare. Barley. Ann. to 3 ft.: lvs. to 1 ft. long and ¼ in. wide: panicles to 4 in. long, mostly erect, the stout awns to 6 in. long. Cultigen, of Old World origin. Var. trifurcatum is beardless.

HOREHOUND: Marrubium.

HORKÈLIA. Rosacex. Per. herbs related to Potentilla, with pinnate lvs. of many crowded lfts. and white or yellow fls. in cymes or panicles; differs from Potentilla in insertion of stamens and other technical characters.

Górdonii (Potentilla Gordonii. Ivesia Gordonii). To 8 in., woody and tufted: Ivs. of 10-20 pairs of small lits. which are again divided: fls. yellow, in head-like cymes to ¾ in. across. Wash. to Calif. and Colo.

truncata (Potentilla truncata). Glandular-pubescent, sts. erect, sparingly leafy, to 2 ft.: lvs. of 1-3 pairs of oblong-cuneate toothed lfts, terminal lft. petiolate: fls. with hypanthium saucer-shaped. Calif.

HORMIGO: Triplaris americana.

HORMINUM. Labiata. One per. herb adapted to the rock-garden, native from the Pyrenees to the Tyrol. H. pyrenaicum. To 1 ft.: lvs. mostly basal, ovate and toothed: fls. bluishpurple, 34 in. long, somewhat 2-lipped, in whorls in long leafless spikes, in summer.—The names H. longifolium and H. purpureum are listed but have no known botanical standing.

HORNBEAM; Carpinus. Hop-: Ostrya.

HORNWORT: Ceratophyllum demersum. HORSE-BRIER: Smilax rotundifolia. -Chestnut: Æsculus. -Radish-Tree: Moringa oleifera. -Weed: Collinsonia.

HORSE-RADISH. The comestible part of Armoracia rusticana, a deep-rooted perennial native in southeastern Europe and also run wild in this country, is the fleshy root, which is grated and employed as a relish or appetizer with meats and other foods. The plant blooms freely but does not mature seeds; it is therefore propagated by root-cuttings, which are planted in spring and the roots harvested in late autumn of the same year or for home use left in the ground until spring. By growing horse-radish as an annual crop and thoroughly cleaning the land of roots at harvesting time, the plant does not become established as a persistent dock-like weed and a more shapely tender easily managed product is obtained. Grown as a regular tilled crop on good land, the yield may be 3-5 tons more or less to the acre, of commercial roots fit for grating in machine. The usual practice of keeping a few old stools about the house for home use produces tough shapeless stringy roots.

Side roots saved from the trimmings, of the size of a lead-pencil to 34 inch diameter, are cut to 5-8 inches long; these cuttings are tied in bundles and stored in cellar till spring, when they are set in a slanting position where the plants are to grow, in rows far enough apart to allow of good tillage and 10-18 inches in the row; the top of the cutting should be 3-5 inches below the

surface of the ground.

HORSETAIL: Equisetum. -Tree: Casuarina equiseti-

HORTICULTURE is a broad inclusive term covering the making and care of home gardens, market-gardens, orchards, nurseries, greenhouses, as well as the plant-raising phase of parks, estates and botanic gardens. It comprises whatever has to do with the growing of ornamentals, of vegetables, of fruits, and of plants prized for their general interest. It may constitute the way of earning a living and developing a business, at the same moment that in the fuller sense its subjects are embedded in the emotional assets of life.

It follows that horticulture cannot be measured or defined by its organized and commercial aspects alone or its importance be represented in statistics. The amateur and personal practice of it determine the extent of the trade development; and this fact will be increasingly apparent as home-making rises to higher satisfactions.

The main departments of horticulture, defined by the plant subjects, are pomology or fruit-growing, floriculture or flower-growing, olericulture or vegetable-growing, landscape

To grow the vast range of plants successfully and to defend them against insect and disease requires experience and definite knowledge. The plant resources of the earth are largely within the purview of the horticulturist, involving conceptions of plant geography, climate, adaptations. These resources afford endless opportunities in plant-breeding. It follows that the exact identification of species and varieties is an indispensable part of this field of knowledge. Horticultural subjects have been put into pedagogical form and are now effective means of elementary and higher education. Personal skill in cultivation and in technique is essential to success and real satisfactions; yet horticulture and gardening are much more than the growing of plants. See Garden.

HOSACKIA: Lotus.

HÒSTA (Funkia. Niobe). PLANTAIN-LILY. Liliaceæ. Per. herbs with thick durable roots, large clumps of broad or at least not greatly elongated basal lys. and blue, lilac or white fls. in racemes or spikes terminating the scape or peduncle, the perianth-segms, partially united.

Plantain-lilies are hardy and of easy cultivation, doing well in moist shady places, making neat attractive foliage clumps until cut down by cold weather. Propagated by division of the stools, and only seldom by seeds for some of the kinds do not produce capsules. Il. carulea and II. plantaginea make shallow clumpy rootstocks with large scars, and the other kinds have more fibrous but thick roots from the crown or from short rootstocks. The long white wax-like flowers of H. plantaginea are very fragrant, appearing in late summer and autumn; the others have short lavender-purple ("blue") or lilac flowers, sometimes almost white, drooping or soon becoming so, and little if at all odorous. H. carulea differs from all others in the flower being suddenly enlarged or widened in its upper half; the other lilac or blue kinds have a gradually widened flower-tube. Plantain-lilies are hardy and of easy cultivation, doing tube.

álbo-marginàta: II. lancifolia var.

aureo-maculata and -variegata may be referable to H.

cardiea (F. ovata). Blue P. To 3 ft: lvs. to 9 in. long and 5 in wide, cordate at base, deep green: fls. lavender-purple (blue), striped with lighter color, to 2 in. long, in summer, the perianth-tube narrowly furrowed-cylindrical for about half its length and then suddenly bulging or shouldered into an urn-shaped bloom: seeds freely. Japan, China, Siberia.

cordata; may be H. carulea or H. plantaginea.

cordifòlia: may be H. plantaginea.

decorate. Blunt P. To 2 ft.: lvs. oval, to 6 in. long, obtuse or only very short- and abruptly pointed, about 5-nerved either side midrib, white-margined, petioles winged: scape exceeding foliage, winged: fls. rather dark lilao, to 2 in. or more long, drooping, in summer: seeds freely. Origin undetermined.

erromena. Midblummer P. To 3 ft., not glaucous: lvs. to 2 ft., with broadly ovate blades to 8 in. long and 4 in. broad: fls. in long racemes above the lvs., gradually trumpetform, about 2 in. long, pale lilac, July-Aug. (in N. Y.).—Long an inhabitant of gardens without definite name, recognized as a distinct species in 1932.

Fortunei. TALL-CLUSTER P. To 2 ft. and more, capes much taller than foliage: lvs. to 5 in. long and 3½ in. scapes much taller than foliage: Ivs. to 5 in. long and 3½ in. broad, heart-shaped at base, glaucous or blue-green as if glaucous, with 10-12 nerves either side midrib, short-petioled: fis. pale lilac, 1½ in long, in late spring and early summer, Probably Japan Var. gigantea is a form with larger longer-petioled lvs, rather larger fis. that stand less high above the foliage. Var. robusta is probably var. gigantea. Var. variegata has variegated lvs.

glauca: H. Sieboldiana. grandiflòra: H. plantaginea. japónica: H. lancifolia.

lanceolata: H. lancifolia.

lanceolàta: H. lancifolia.

lancifòlia (H. japonica. H. lanceolata). Narrow-Leaved P. To 2 ft., slender, the scapes exceeding the foliage: lvs. narrow, to 4 in. long and 2 in. wide, tapering to both ends, green, with 3 or 4 nerves either side midrib, the petioles slender and scarcely winged: fls. likac or pale lavender, to 2 in. long, in summer and autumn; seldom if at all fruitful in cult. Japan. Var. álbo-marginàta has lvs. edged with white. Var. fôrtis is a common form in cult. differing in greater size and vigor, larger and leaf-like bracts on scape, nerves 6 or 7, petioles winged, blooms in summer. Var. tardiflòra has prominently acuminate-pointed lvs., short margined petioles, autumnal fls. in a condensed often branched cluster; probably not in cult. in N. Amer., the plant so named being H. lancifolia itself. Var. variegàta is probably not distinct from var. albo-marginata.

mèdia and mèdia nicta: perhaps H. undulata.

mèdia and mèdia picta: perhaps H. undulata.

minor: probably *H. cærulea*, although considered by some as a distinct var. of it.

ovàta: H. carulea.

plantaginea (F. grandiflora. F. subcordata). FRAGRANT P. To 2½ ft, the scapes exceeding the foliage: lvs. to 10 in. long and 6 in. wide, cordate at base, green, nerves either side midrib 7-9: fis. tubular, ascending, white, fragrant, to 5 in. long, late summer and autumn. Japan, China.

robústa: a name of inexact application, sometimes meaning II. undulata.

Sieboldiana (F. glauca). Short-cluster P. Scapes mostly shorter than foliage: Ivs. 10-15 in. long and 6-10 in. broad, cordate, long-petioled, usually very glaucous, many-nerved either side midrib: fls. many, slender, faint lilac, conspicuously drooping, spring and early summer, in a close raceme. Japan.

sinensis; catalogue name of unknown botanical standing. subcordata: H. plantaginea.

tardiflòra: H. lancifolia var.

undulata. Wavy-Leaved P. To 2½ ft., stout, the scapes much exceeding foliage and leafy: lvs. ovate, 6 in. long and 3 in. broad, narrowed toward base, sharp-pointed, curved, margins more or less undulate, striped and splashed lengthwise with cream-color or white: fls. about 2 in. long, pale lavender. Origin undetermined—The supposed green-lvd. form is probably H. Fortune: Listed foliage forms include argentea, airea, media picta, and variegata, none of which may be distinct from the typical form.

variegata: probably H. undulata.

HOTBED is a frame or box that has artificial heat and a transparent covering and in which plants are grown. It differs from a coldframe in having artificial bottom heat. This bottom heat is supplied by fermenting organic matter, hot water or steam in pipes underneath the bed, and hot air conducted in horizontal flues. Formerly fermenting horse manure was the heating material, but with the lessened supply of it and the development of invented devices the mechanical agencies are now mostly employed. Information on such devices may be obtained from dealers in gardening equipment and from recent bulletins.

The hotbed is covered with sash of which the usual or standard size is 3 feet wide and 6 feet long. These sashes are laid crosswise the box or frame. The standard size of frame is 6 feet wide and 12 feet long. A "frame," therefore, accommodates four sashes. However, the frame may be of any length desired. This frame is ordinarily made of boards, and the back of it is 3 or 4 inches higher than the front, so that the sashes slope to the sun. It is customary to have a space of 6 to 10 inches between the ground and the sash on the lower or front side. The area or location in which the frames are set should be protected from cold and prevailing winds by a rising slope, a high board fence, a building, hedge, or other obstruction. If the frame yard is near the main buildings, it is much more accessible in rainy or snowy times, and the plants are likely to have better care. Water should also be at hand.

When to start a hotbed depends on the kinds of plants to be grown, the time one wishes to gain, and something, also, on the character of the heat. The hardier the plant the earlier it can be started. In the latitude of New York. from the first to the middle of March is the usual time for starting a hotbed. In this bed are sown seeds of early flowers and such vegetables as section of early howers and such vegetables as cabbage, cauliflower, tomato. In the raising of plants in the hotbed it is essential that they do not become "drawn" or "leggy." To prevent this, they must be given plenty of room, thorough ventilation on all pleasant days, and not too great heat. It is well to transplant them once or twice before they are finally set in the field, particularly if they are started, in New York, as early as the first or middle of March. When transplanted, they can be set in another hotbed or in a coldframe; but it is important that the succeeding frames in which they are set should not be very much colder than the one in which they grew, else they may become stunted. It is well, however, to transplant them into a gradually cooler and freer atmosphere to harden them off, that they may go into the open ground with-

On pleasant days, raise the sash at the upper end 1 or 2 inches, or if the sun shines brightly and the wind does not blow, give even more air; and eventually strip off the sashes entirely. It is important that the plants are not kept too close and grown too soft. It is usually advisable to sow cabbage, lettuce and hardy plants in different frames from tomatoes and other tender things, in order that the proper requirements may be given to each. At night the hotbeds (at least early in the season) need more protection than the glass sash. It was formerly the custom to use thick rye-straw mats to cover them, but it is now common practice to use straw matting or other fabric purchased of carpet dealers. This is rolled out on the sashes at night in one or two thicknesses; and if the weather is sharp, board shutters, the size of the sash, may be laid on top.

One must not expect to gain as much time in the crop as one gains in the starting of the seeds: that is, if seeds are started two months ahead of the normal season, one will not gain two months in the ripening of the crop. Ordinarily, one cannot expect to gain much more than one-half the time, if the plants are transplanted to the field from the hotbed.

Some plants may be grown to maturity in the hotbed, as lettuce and radishes. After hotbeds have been emptied of their plants, the sashes may be stored away, and the frames employed for the growing of a crop of melons or cucumbers.

HOTEIA: Astilbe.

HOTTENTOTS-BREAD: Testudinaria elephantipes.

HOULLÈTIA. Orchidacex. Epiphytes native in trop. Amer. with 1-lvd. pseudobulbs and basal racemes, the sepals and petals similar, the lip clawed. For cult. see Orchids.

odoratíssima. Lvs. elliptic-lanceolate, to 2 ft. long and 4 in. wide, long-petioled: infl. to 2 ft. high, loosely 5-10-fld.; fls. 2½-3 ½ in. across; sepals and petals reddish-brown; lip white with sickle-like side lobes. Aug. Colombia.

HOUNDS-TONGUE: Cynoglossum.

HOUSELEEK: Sempervivum.

HOUSE PLANTS are such as are capable of being readily and satisfactorily grown in a residence, for home adornment and decoration. The care of house plants is window-gardening, although porch- and window-boxes outside the building may not strictly be a part of it inasmuch as the purpose is exterior rather than domestic embellishment.

The growing of house plants becomes practically a question of proper window space. The essentials to be taken into consideration, before the attempt is made, is whether the place has sufficient sunlight, whether temperature can be depended on and controlled, whether the air will be too dry, and the room free from coal and illuminating gas and dust. The air of a livingroom is likely to be that of a desert, as to moisture; whereas the plants one commonly desires to grow in it are those requiring a more or less humid climate. Gas leaks soon cause foliage to shed.

The house garden may occupy an entire window or set of windows, or it may consist simply of a jardinière, or a few choice pot-plants on a stand. Expensive arrangements are by no means necessary, nor is a large collection. The plants and flowers themselves are the main consideration, and a small collection well cared for is better than a large one that is not kept in good condition. The window-box in the room will be seen near at hand, however, so may be more or less ornamental in character. The sides may be covered with ornamental tile held in place by molding, or a light lattice-work of wood. But a neatly made and strong box of stout pine of a length corresponding to the width of the window, about 10 inches wide and 8 deep, answers quite as well as a costlier receptacle. A zinc tray of a size to fit into the wooden box may be ordered of the tinsmith. It tends to keep the soil from drying out so rapidly. This is provided with a false wooden bottom, with cracks for drainage, 2 inches above the real bottom of the tray. The plants will then have a vacant space below them into which drainage water may pass. Such a box may be thoroughly watered as the plants require, without danger of the water running on the floor. Of course, a faucet should be provided at some suitable point on a level with the bottom of the tray, to permit of its being drained every day or so if the water tends to accumulate. It would not do to allow the water to remain long: specially should it never rise to the false bottom. as then the soil might become too wet.

Some persons attach the plant box to the window, or support it on brackets below the window-sill; but a preferable arrangement is to support it on a low and light stand of suitable height provided with rollers. It may then be drawn back from the window, turned around from time to time to give the plants light on all sides, or turned with the attractive side inward as may be desired.

The plants are often set directly in the soil; but if they are kept in pots they may be rearranged to suit the pleasure. Larger plants to stand on shelves or brackets may be in porous earthenware pots; but the smaller ones which are to fill the window-box may be placed in heavy paper pots. The sides of these are flexible, and the plants in them, therefore, may be crowded close together with great economy in space. When pots are spaced, damp sphagnum or other moss among them will hold them in place, keep the soil from drying out too rapidly, and at the same time give off moisture.

The window for winter plants should have southern, southeastern or eastern exposure. Plants need all the light they can get in the northern winter, especially those expected to bloom. The window should be tight-fitting. Shutters and a curtain are an advantage in cold weather.

The plants should have a certain regularity in conditions. It is trying on them, and often fatal to success, to be snug and warm one night and in a temperature only a few degrees above freezing the next. Some plants live in spite of it, but they cannot be expected to prosper to their best. Those persons whose rooms are heated with steam, hot water or hot air will have to guard against keeping rooms too warm fully as much as too cool. Rooms in brick dwellings that have been warm all day, if shut up and made snug in the evening, often keep warm over night without heat except in the coldest weather. Rooms in frame dwellings, and exposed on all sides, soon cool down. If the living-rooms are too dry for plants, the bow-window may be set off from the room by glass doors; one then has a miniature conservatory. A pan of water on the stove or on the register and damp moss among the pots may provide the necessary humidity.

From time to time the foliage will need cleansing to free it from dust. A bath-tub provided with a ready outlet for the water is an excellent place for this purpose. The plants may be turned on their sides and supported on a small box above the bottom of the tub. Then they may be freely syringed without danger of making the soil too wet. It is usually advisable not to wet the flowers, however, especially the white waxen kinds, like hyacinths. The foliage of Rex begonias should be cleansed with a piece of dry or only slightly moist cotton or soft cloth; but if the leaves can be quickly dried off by placing them in the open air on mild days, or moderately near the stove, the foliage may be

Plants suitable for the winter window-garden mostly belong to the groups that florists grow in their medium and cool houses. The former are given a night temperature of about 60°, the latter about 50°. In each case the temperature is 10° to 15° higher for the day time. Five degrees of variation below these temperatures is allowable without any injurious effects; even more may be borne, but not without more or less check to the plants. In bright sunny weather the day temperature may be higher than in cloudy and dark weather. The plant material suitable for winter window-gardens is really extensive if one desires to search for it.

The watering of house plants, as of other plants, requires caution and good judgment, and it is impossible to give rules. Conditions that hold with one grower are different from those of another. Give one good watering at the time of potting, after which water should be withheld until the plants really need it. If, on tapping the pot, it gives out a clear ring, it is indication that water is needed. In the case of a soft-wooded plant, just before the leaves begin to show signs of wilt is the time for watering. When the plants are taken up from the ground, or when they have their roots cut back in repotting, gardeners rely, after the first copious watering, on syringing the tops two or three times each day, until a new root growth

has started, watering at the roots only when really necessary. Plants that have been transferred into larger pots grow without the extra attention of syringing, but those from the bor-ders, that have had the roots mutilated or shortened, may be placed in a cool shady spot and be syringed often. One soon becomes familiar with the wants of individual plants, and can judge closely as to need of water. All soft-wooded plants with large leaf surface need more water than hard-wooded plants, and one in luxuriant growth more than one that has been cut back or become defoliated. When plants are grown in living-rooms, moisture must be supplied from some source, and if no arrangement has been made for having a moist air the plants should be syringed often. Be careful not to over-water when plants are dormant or in their

resting period.

Syringing with plain water is often practiced by gardeners. It has two general offices: to clean the plants of pests or of dirt; to check evaporation or transpiration from the plant itself. Gardeners look on water as a good insecticide if it can be thrown on the plants somewhat forcibly by means of a syringe or pump, or by the hose, as it washes off the insects and drowns many of them. The water should be applied in a fine and somewhat forcible spray. Care should be taken that the plant is not torn or bruised. The red-spider is one of the most serious pests on house plants, and, in a dry season, on those about the lawn. It thrives in a dry atmopshere. It usually lives on the under sides of the leaves. Syringing the plants frequently keeps the pest in check. Thrips and slugs on rose bushes are usually kept in check if one can spray or syringe the plants frequently. Syringing to check transpiration from the foliage is useful with plants recently transplanted. The same is true with cuttings. In syringing plants, it is well to take care that the ground does not become too wet; otherwise the plant may suffer at the root. In the house, plants should rarely be syringed except when the weather is bright, so that they may soon dry off. The plant should not go into the night with soaking foliage. With plants in the house, it is necessary to keep the leaves dry most of the time that fungi may not breed; this is true of carnations when liable to attacks of the rust.

nations when hadde to attacks of the rust.

Common winter window-garden plants for an average night temperature of 60°.

Upruht flowering plants.—Abutilon, browallia, calceolaria, begonia, bouvardia, euphorbia, scarlet sage, calla, heliotrope, fuchsia, Chinese hibiscus, jasmine, single petunia, swainsona, billbergia, freesia, geranium, cuphea.

Upruht foliage plants.—Ribbon-bush, Cycas revoluta, Dracena fragrans and others, palms, canna, Farfunum grande, achyranthes, ferns, araucaria, epiphyllum (zygo-cactus), pandanus or "screw-pine," pilea, Ficus elastica, grevillea, aspidistra.

grevillea, aspidistra.

Climbing plants—Asparagus plumosus, Cobæa scandens, smilax, Japanese hop, Madeira vine (Boussingaultia), Senecio mikamodes (parlor ivy), muehlenbeckia. See also

list below.

Low-growing, trailing, or drooping plants.—These may be used for baskets and edgings. Flowering kinds are: Sweet alyssum, lobelia, Fuchsia procumbens, mesembry-anthemum and allies, russelia, oxalis, Mahernia verticultata or honey-bell.

or noney-bell.

Foliage plants of drooping habit.—Vinca, Saxifraga sarmentosa, Kenilworth ivy, tradescantia or wandering lew, Festuca glauca, othonna, Isolepus gracilis, English ivy, selaginella, and others Some of these plants flower freely, but the flowers are small and of secondary consideration.

Plants for an average night temperature of 50°. Upright flowering hint.—Azalea, cyclamen, carnation, chrysanthenium, geranium, Chinese primrose, stevia, marguerite or Paris daisy, single petunia, camellia, ardisia (berries), cineraria, violet, hyacinth, narcissus, tulip, the Easter lily when in bloom, and others. Upright foliage plants.—Pittosporum, palms, aucuba, euonymus (golden and silvery variegated), araucaria, pandanus, dusty miller.

Climbing plants.—English ivv. maurandia, senecio or

parlor ivy, lygodium (climbing-fern).

Drooping or trailing plants—Flowering kinds are sweet alyssum, Mahernia verticullata, russelia and ivy geranium.

The practiced window-gardener will find many more plants than these as observation and experience multiply. Many kinds of cacti and other condensed or succulent plants are interesting and adaptable subjects for window-

gardening; see Cacti, Succulents.
Up to this point the instructions have applied to the winter window-garden. Summer windowgardening may now be considered; this kind of home-gardening is particularly suited to those who live in the crowded city, where the want of other space makes the window-garden the only

one possible.

The summer plants are grown in a window-box like that described for the winter garden except. of course, it must fit the outside rather than the inside of the window opening. Since there is more or less cramping of roots, it is necessary to make the soil richer than would be required were the plants to grow in the garden. most desirable soil is one that does not pack hard like clay, nor contract much when dry, but remains porous and springy. Such material is found in the potting soil used by florists, and it may be obtained from them. Often it is desirable to have at hand a box of sharp sand for mixing with the soil, to make it more porous and to prevent baking. Some persons pot the plants and then set them in the window-box, filling the spaces between the pots with moist moss. Others plant directly in the soil. The former method, as a general rule, is to be preferred in the winter window-garden, the latter in summer.

Useful plants for the summer window-garden are those of drooping habit, such as lobelias, tropæolums, Othonna crassifolia, Kenilworth ivy, ice-plant, sweet alyssum. Such plants may occupy the front row, while back of them may be the erect-growing plants, as geraniums, heliotropes, begonias. The suitability of the In the plants depends much on conditions. following lists certain kinds are of climbing or trailing habit and may be trained about the sides of the window. Others will be found among the climbing plants. For shady situations the main dependence is on plants of graceful form or handsome foliage; while for the sunny window the selection may be of blooming plants. For the shady side of the street, the more delicate kinds of plants may be used. (1) For full exposure to the sun, it is well to choose the more vigorous-growing kinds. In such position, suitable plants for drooping are: tropæolums, passifloras, the single petunias, sweet alyssum, lobelias, verbenas, mesembryanthemums. For erect-growing plants: geraniums, heliotropes.
(2) If the position is shaded, the drooping plants might be of the following: tradescantia, Kenilworth ivy, senecio or parlor ivy, sedums, moneywort, vinca, smilax, lygodium or climbing-fern. Erect-growing plants are dracænas, palms, ferns, coleus, centaurea, spotted calla, aspidistra, sansevieria, aucuba, and others.

When the plants have filled the earth with roots, it is desirable to give the surface of the soil among the plants a very light sprinkling of bone-dust or a thicker coating of rotted manure from time to time in the summer; or instead of this, a watering with weak liquid manure about once a week. This is not necessary, however, until the growth shows that the roots have about exhausted the soil.

In autumn the box may be placed on the inside of the window. In this case it is desirable to thin out the foliage somewhat, shorten some of the vines, and perhaps remove some of the plants. It is also well to give a fresh coating of rich soil. Increased care will be necessary in watering, since the plants have less light than previously, and, moreover, there may be no provision for drainage.

A very different kind of summer windowgardening is the florists window-box. Leading city plantsmen prepare such boxes with plants grown or chosen for the purpose, many of them of stiff habit and durable character to withstand difficult conditions and requiring the minimum of care. These boxes are usually very attractive.

HOUSTÒNIA. Rubiacex. North American small herbs, usually tufted, with opposite entire lvs. and small, white, blue or purple fls. in spring and summer, the corolla funnelform or salverform and 4-lobed.

A few species are transferred to the wild- or rock-garden where they thrive in moist and often partly shaded positions, and $H.\ carulea$ in sun. Propagated by division.

angustifòlia: II. nigricans.

cærûlea. Bluers. Per. to 7 in., tufted: lvs. oblanceolate, 14 in. long: fis. violet, blue or white with yellow eye, to 14 in across, solitary. N. S. to Ga. and Mo. Var. álba is

filifòlia: H. floridana.

floridana (H. filifolia). Per. to 1½ ft., much branched: lvs. linear or thread-like, to ¾ in. long: fls. purple, ¼ in. long, in loose leafy cymes. S. Fla.

longifòlia. Per. to 1 ft.: lvs. linear or linear-oblong, to 1 in. long: fls. purple or nearly white, 1/4 in. long, in cymes. Me. to Ga. and Mo.

mínima. Ann. to 4 in.: lvs. oval or oblong, 1/3 in. long: fls. purplish, 1/3 in. across, solitary. Ill. to Tex.

montana. To 6 in.: lvs. ovate, to $\frac{5}{6}$ in. long: fis. purple, to nearly $\frac{1}{2}$ in. long, sepals ovate. Tenn. and N. C. Var. álba is listed.—Similar to *H. purpurea*, but smaller.

nigricans (II. angustifolia). Per. to 2 ft.: lvs. linear, to 1½ in. long, often clustered: fls. white or purplish, ½ in. long, in terminal cymes. Ill. to Fla. and Tex.

purpurea. Per. to 1½ ft.: lvs. ovate or ovate-lanceolate to 2 in. long: fis. purple or hlac, ½ in. long, in terminal cymes, in spring. Md. to Ga. and Miss.

serpyllifòlia. Creeping Bluets. Per. with prostrate ts. to 10 in. long: lvs. orbicular, to 1/2 in. long: fis. deep blue, 1/2 in. across, solitary. Pa. to Ga. and Tenn.

tenuifòlia. Per. to 1 ft.: basal lvs. ovate, upper narrow-linear or filiform, to 1 in. long: fls. purple, to ¼ in. long, on long pedicels in loose corymbose cymes. Pa. to N. C. and

HOUTTUYNIA. Saururaceæ. One per. herb to 3 ft., native from the Himalayas to Japan. H. cordata. Rootstock creeping: lvs. alternate, ovate, 2-3 in. long, heart-shaped at base, buckwheat-like: fls. in dense spike about ½ in. long, subtended by white corolla-like 4-parted spathe.

—Grown in moist situations. Propagated by division or seeds.

HÒVEA. Leguminos x.Australian shrubs with alternate simple lvs., blue or purple papilionaceous fls. mostly in axillary clusters or racemes, and inflated pods; may be grown out-of-doors in mild climates. Propagated by seeds in spring under glass.

Célsii (H. elliptica). To 10 ft.: lvs. elliptic to lanceolate, to 3 m. long, pale and pubescent beneath: fis. blue, to ½ in.

ellíptica: H. Celsii.

pungens. To 2 ft.: lvs. linear or lanceolate, to 1 in. long, pungent-pointed, margins revolute: fls. 1/2 in, across.

trispérma. To 2 ft.: lvs. ovate to linear, to 3 in. long, nubescent beneath: fla large.

HOVÈNIA. Rhamnaceze. One or two deciduous shrubs or trees from China, Japan and the Himalayas. H. dúlcis. Japanese Raisin-TREE. To 30 ft.: lvs. alternate, ovate, to 7 in. long, toothed: fls. greenish, in many-fld. racemes: fr. about 1/4 in. across, the stalks becoming fleshy and reddish and club-shaped and sometimes eaten.—It thrives in sandy loam. Propagated by seeds, root-cuttings and cuttings of mature wood under glass. It has been recommended as a fruit plant; hardy well N.

HÒWEA. Palmaceæ. Two handsome and much planted unarmed monoccious ringed feather-palms of Lord Howe Isl. east of New S. Wales, commonly known as Kentias: lvs. long and gracefully curving, with many slender long-pointed pinnæ: spadices from the lower axils or nodes where lvs. have recently fallen, with a long peduncle-like part, long and slender and unbranched except perhaps at very base, soon becoming pendent; fls. in 3's in prominent pits, the central one pistillate and developing later; stamens 30-100; ovule basal: fr. ellipsoidoblong, nearly or quite 11/2 in. long, dry and somewhat fibrous outside, stigmatic point terminal, the enlarged perianth small and cuplike; seed 1. For cult. see Palm.

Belmoreana (Kentia Belmoreana). Medium-sized tree: lvs. 6 or 7 ft. long, strongly arching; pinnæ crowded, about 1 in. broad at middle, very sharp-pointed, standing in an upward or erect position on the rachis for part their length, not punctate or scaly underneath: spadix solitary, flowering part 2-3 ft. or more long; stamens 30-40.

Forsteriana (Kentia Forsteriana. Denea Forsteriana). Larger and stouter tree, to 60 ft. and more: lvs. mostly larger, standing upright or horizontal, not over-arching; pinne not crowded, mostly somewhat broader, hanging, on mature plants punctate-scaly on lower surface under a lens: spadices 3-6 side by side at the node on a short base included in the spathe, the flowering part usually less than 2 ft. long; stamens 80-100.—The more common in cult. being much seen in pots and tubs under glass and for room decoration.

HOYA. Asclepiadacex. Many climbing shrubs with thick opposite lvs., wheel-shaped fls. in axillary clusters with a star-shaped crown, and milkweed-like frs.: native from E. Asia to Australia, one grown under glass and in windowgardens.

Hoyas should be grown in a moist warm house and should not be forced in winter. Propagated by cuttings in spring and layering.

carnòsa. Wax-Plant. Root-climbing to 8 ft. or more: lvs. ovate-oblong, to 4 in. long: fis. white with pink center, in. across, fragrant, in summer. China, Australia. Var. variegata has variegated lvs.

HUAMUCHIL: Pithecellobium dulce.

HUCKLEBERRY: Gaylussacia. Garden: Solanum ni-grum. Hairy: Vaccinium hirsutum. He-: Lyonia ligustrina.

HUDSONIA. BEACH-HEATHER. Small evergreen shrubs of E. N. Amer. with alternate scale-like or awl-like lvs. and solitary yellow fls.

Hudsionias may be colonized in dry places in sandy soil or along the seashore. They are difficult to grow and short-hved. Propagated by seeds and probably by cut-

ericoldes. To 7 in., soft-pubescent: lvs. awl-like, to 1/2 in. long: fls. 1/2 in. across, on slender pedicels. N. S. to N. C.

monthma. To 6 in., tufted, slightly hairy: lvs. awl-like, to 1/2 in. long: fis. 1/2 in. across, on short pedicels. Mts., N. C.

tomentòsa. To 8 in., tufted, hoary-pubescent: lvs. scale-

like, densely imbricated, 14 in. long: fls. 1/4 in. across, sessile. N. B. to Va., along Great Lakes to Minn.

HUÉRNIA. Asclepiadacex. Several species of small succulent leafless per, herbs in S, and trop. Afr. and 1 in Arabia: sts. angled and toothed: fls. in cymes or solitary at or near the base of young shoots, mostly campanulate and 5-lobed limb, with crown inside.

4spera. Sts. procumbent or ascending, to 9 in. long, ½ in. thick, obscurely 5-6-angled, somewhat toothed: fls. 3-7 from base of young shoots, corolla dark purple, bell-shaped, about ½ in. deep, roughly papillate, inner corona yellow. Trop. Afr.

barbata. Sts. erect, to 2½ in. long and ¾ in. thick, acutely 4-5-angled, angles with sharp triangular teeth: fls. light yellow spotted red, corolla-tube to 1 in. long. S. Afr.

breviróstris (H. scabra). Habit and size of H. barbata: fls. yellowish-pink dotted purple, corolla to 1½ in. across, tube to ½ in. long and crimson at base. S. Afr. Var. immaculàta, corolla primrose-yellow without spots but tinged purple at base of tube around corona.

cerndes listed name

clavigera. Sts. to 4 in. tall and 1 in. thick, 4-5-angled, stoutly toothed: fls. broadly bell-shaped, to 1½ in. across, corolla yellowish dotted purple-brown and blood-red becoming solid blood-red in tube, tube to 1 in. long. S. Afr.

decipiens: Huerniopsis decipiens.

gibbòsa: Huerniopsis gibbosa.

Hýstrix. Sts. 3 in. high and ½ in. thick, 5-angled, with spreading active teeth: fls. 2-5, yellow marked with crimson, to 1½ in. across, tips of spreading corolla-lobes recurved. Natal.

keniénsis. Sts. ascending, to 6 in. long and ½ in. thick, green or reddish, obscurely 5-angled, with subulate lvs. to ½ in. long: fls. from st. bases, bell-shaped, to 1½ in. across, dark purple, minutely warty. S. Afr.

Kirkii. Sts. decumbent, to 1½ in. long and ¾ in. thick, acutely 5-angled, triangularly toothed fis. campanulate, pinkish outside, yellowish spotted reddish-brown within, to 2 in. across, tube to ¾ in. long. Transvaal.

Loeseneriana. Sts. 21/3 in long and 3/4 in. square, acutely 4-angled, with triangular acute teeth. fis. 1-2, brownish and brownish-purple, 1 in. across, campanulate, tube 1/4 in. long. Transvaal.

longitùba. Sts. 2 in. long and $\frac{34}{4}$ in. thick, sharply 4-5-angled: fls. 1-3, creamy-yellow spotted with purple, campanulate, tube to $\frac{7}{8}$ in. long. Kalahari.

Nouhiyzii. Similar to H. Loeseneriana but with spirally twisted sts. and fls. borne in conspicuous clusters. Trans-

oculāta. Sts. suberect, to 2½ in. tall and ¾ in. thick, sharply 5-angled, angles with sharp teeth to $\frac{3}{8}$ in. long: fls. green tinged purple outside, lobes blacksh-purple within, tube about ¼ in. long, white at base. S. W. Afr.

Pénzigii. Sts. 3 m. or so high and ¾ in. or less thick and spreading teeth nearly ¼ m. long: fls. 1-5, blackish-purple, about ¾ m. across and somewhat less in length, roughish with pimples. Nile Land.

Pfllansii. Tufted, sts. erect to 1½ in. tall and ½ in. thick, densely covered with recurved soft-spiny tubercles to ½ in. long: fls. pale yellow spotted crimson, to 1½ in. across, lobes ½ in. long, iong-tapered, covered with crimson papillæ, tube to ½ in. long, pinkish-cream. S. Afr.

primulina. Sts. to 1½ in. tall and 1 in. thick, acutely 4-5-angled, teeth with dark colored acute retrorse tips: fls. in groups of 3-8, corolla pale to golden-yellow, outer corona crimson to purple-black. S. Afr.

reticulata. Sts. erect or ascending, to 4 in. tall and 1 in. thick, acutely 5-angled, teeth acute, spreading: fls. whitish, speckled purple, to nearly 2 in. across, tube blood-red, to ½ in. deep, covered with purple hairs. S. Afr.

acabra: H. brevirostris.

Schinzii: listed name, perhaps Stapelia Schinzii.

Schneideriana. Sts. 2 in. but longer in cult., 6-7-angled, teeth inconspicuous: fls. with deep purple center, 1 in. across Nyassaland.

Thurêtii. Sts. ascending, to 2 in tall and ¾ in. thick, acutely 4-5-angled, glaucous, angles acutely toothed: fls. yellowish with blood-red spots, to 1 in. across, tube ⅓ in. deep, blood-red. S Afr.

transvaalénsis. Sts. 2½ in. long and ½ in. thick, 4-5-angled, with triangular acute teeth: fls. 1-3, 2 in. across, purple with deep purple spreading limb and raised deep purple shining ring around mouth, inside of campanulate tube having long purple hairs. Transvaal.

zebrina. Sts. to 3 in. long and 1/4 in. thick, 5-angled, with spreading acute teeth; fis. 2 yellow with transverse

purple-brown bands, 1¾ in. across, corolla-limb abruptly spreading from tube with thick raised ring around mouth. E. Afr.

HUERNIÓPSIS. Asclepiadaceæ. Four S. African succulents allied to Stapelia, distinguished from the closely related Huernia by the corolla having intermediate points or lobes at the sinuses between the primary lobes.

decipiens (Huernia decipiens of hort.) Sts. decumbent, to 3 in. long, obtusely 4-angled, with spreading teeth: fis. 1-4 at middle or top of st., brownish-red mottled yellow, 1 in. across, glabrous, crown simple.

gibbosa (Huernia gibbosa of hort.). Sts. decumbent or suberect, 2 in. long, prominently 4-angled, toothed: fis. to 2 in. across, dark purple with yellowish-white corona.

HUFELÁNDIA. Lauraceæ. A few trees in Mex., Cent. Amer. and W. Indies, allied to Persea but differing in technical characters, as anthers 2-celled rather than 4-celled; one, the anay, has been intro. experimentally in S. Fla. as a possible fruit plant.

Anay. Tree to 60 ft. and more: lvs. alternate, oval, to 8 in. long: fls. small, in somewhat pubescent axillary panieles fr. somewhat like an avocado in looks and flavor, to 6 in. long, narrow-pyriform, glossy purplish-black. Guatemala.

HUGELIA: Gilia.

HUISACHE: Acacia Farnesiana.

HÚLSEA. Compositæ. Ann. or per. herbs native in the mts. of W. N. Amer., something like Actinella, having mostly basal lvs. and large yellow or purple heads of ray- and disk-fls.; pappus of scales. Adapted to alpine-gardens.

agida. Differs from *H. nana* in the larger heads with narrow linear-attenuate loosely woolly involucial bracts. Ore., Calif.

nana. Per. to 7 in., sticky-pubescent, white-woolly when young: lvs. linear, to 3 in. long, toothed or pinnately cut: heads with yellow rays ½ in. long and oblong acute involucral bracts. Wash. to N. Calif.

HUMATA. Polypodiaceæ. Small trop. Asian rhizomatous ferns similar to Davallia and grown like the members of that genus, with leathery triangular or oblong entire or pinnatifid fronds, the sterile less cut than fertile, and sori borne near the margins of segms.

Tyermannii. Bears-foot-Fern. Rootstock creeping, white-scaly: fronds to 6 in. long, 3-4-pinnatifid. Cent. China.—Sometimes grown in the coolhouse.

HUMBLE-PLANT: Mimosa pudica.

HUMEA. Compositæ. Australian herbs or shrubs with small heads of disk-fls. borne in dense corymbs or panicles; pappus none.

Humeas are heavy feeders and need plenty of moisture. The seed may be sown from the first of July till September. In the North the young plants should be kept nearly dry and in a coolhouse in winter in preference to frames, as the foliage is likely to drop in the moisture of the latter. They may be planted in the garden in June. When in 10-inch pots they are very ornamental for the conservatory or plazza.

élegans. Bien. to 6 ft.: lvs. ovate-lanceolate or oblong, to 10 in long, wrinkled, sweet-scented: fls. in loose graceful drooping panicles, ruby-red, rose, pink or brownish-red.

HÙMULUS. Hop. Moraceæ. Rough-stemmed tall-twining herbs with opposite broad lobed lvs. and small not showy fls.: staminate and pistillate fls. on different plants, the former small and in loose panicles; pistillate fls. aggregated in heads which in two species become cones or "hops" from the growth of the bracts. Hardy plants grown for ornament and also for the hops employed in brewing, native in N. Amer., Eu. and Asia. Species probably 3.

americanus. Per.: lvs. mostly 5-11-lobed, the lobes attenuate and closely serrate, the terminal lobe about

twice as long as broad. N. Amer., probably native in central or western part, its separateness from *H. Lupulus* not yet determined; supposed parent of the Oregon Cluster hop.

japónicus. Ann., or grown as such: lvs. deeply 5-7-lobed, strongly serrate: fr. a loose aggregation of nutlets not much enlarging in maturity and not making true hops, the scales narrow and attenuate. China and Japan. Var. variegātus, foliage streaked and splashed with white.—Grown from seeds for porches and screens.

Liphius. Common or European H. Per.: lvs. mostly 3-5-lobed, the lobes about as broad as long and short-pointed, coarsely toothed. Eurasia, and escaped or nat. in N. Amer. Var. abreus, foliage yellow.—Source of most of the hopyard vars.; propagated by cuttings of underground sta.

HUNNEMÁNNIA. Papaveraceæ. A Mexican per. herb, much like Eschscholzia, grown as an ann. in the flower-garden. H. fumariæfðlia. MEXICAN TULIP-POPPY. GOLDEN-CUP. To 2 ft.: lvs. ternately dissected, glaucous: fis. yellow, to 3 in. across: fr. linear, to 4 in. long.—Requires a warm sunny exposure. Propagated by seeds.

HÜNTLEYA. Orchidaceæ. Trop. American epiphytes with solitary fls. borne on long stalks in axils of clustered two-ranked lvs., the sepals and petals similar, the lip narrowed into a claw having a fringed callus. For cult. see Orchids.

Búrtil (Batemannia and Zygopelulum Burtis). Lvs. to 15 in. long and 2 in. wide: fis. 3-4 in. across; sepals and petals red-brown spotted with yellow, and yellow at base (or light green with petals striped with reddish-lavender); lip brown in front, white at base, with the fringes of callus light purple. July-Aug., Nov. Costa Rica, Panama. Var. Wällisii has larger fis.

HÙRA. Euphorbiaceæ. Trop. American trees with milky juice which is a powerful irritant, alternate simple lvs., monœcious fis. without petals, and capsular frs.

Sometimes planted for ornament in tropical regions. It does best on a light loamy soil; propagated by cuttings as well as by seeds. Sometimes grown under glass as juvenile specimens.

crépitans. Sandbox-Trre. Great tree to 100 ft., the branches often spiny: lvs. broadly ovate, toothed, to 2 ft. long: fis. red: fr. about 3 in. across, many-ribbed, splitting forcibly into parts when ripe. W. Indies, Costa Rica, S. Amer.

HUTCHÍNSIA. Cruciferæ. Little ann. and per. draba-like herbs of Eu. and S. W. Asia, employed in alpine- and rock-gardening: lvs. pinnate or entire: fls. small, white, in close racemes: fr. or silicle short-oblong or oval.

alpina (H. Auerswalds). Per., tufted, 1-4 in. high: lvs. basal, 1 in. or less long, petioled, pinnatisect into oval or oblong lobes: fls. pure white, spring and summer. Mts., Eu. Auerswaldii: H. alpina.

brevicaulis. Similar to *H. alpina* and perhaps a form of it, but lower, the st. scarcely exceeding the lvs.: lvs. pinnate into 1-3 pairs of lfts. Pyrenees.

stylòsa (Iberis stylosa). Bien.: lvs. obovate-oblong or oblong, nearly entire, petioled: fis. white, in corymbs. Italy.

HYACINTH: Hyacinthus. Giant Summer: Galtonia candicans. Grape: Muscari. Pine: Clematis Baldwinii. Star: Scilla anæna. Water: Eichhornia crassipes. Wild: Brodien lactea.

HYACINTHUS. HYACINTH. Liliaceæ. Bulbous herbs with narrow basal lvs. and red, blue, white or yellow fls. in racemes terminating the scape, the perianth-segms. partially united into a tube. Only one species is in general cult., and this is popular both for the open garden and for forcing under glass for late winter bloom.

amethýstinus. To 6 in.: fis. light blue, nodding. Spain. Var. álbus, fis. white.

azureus: H. ciliatus.

cándicans: Galtonia candicans.

ciliatus (H. azureus. Muscari azureum). To 1 ft.: lvs. somewhat strap-shaped and acute with strongly ciliate

margins: fls. to ½ in. long, campanulate, ii. erect racemes but hanging from lax peduncles to 2 in. long. S. Eu.

orientalis. Common H. To 1½ ft. 1vs. to 1 ft. and more long and 1 in. across: fis. of many colors, about 1 in. long, often double, in early spring. Greece to Asia Minor. Var. dibulus, ROMAN H., is smaller and earlier, with white to light blue fls.

plumòsus: Muscari comosum var. monstrosum.

princeps: Galtonia princeps.

romanus (Bellevalia romana). To 1½ ft.. lvs. weak and prostrate, linear-lanceolate: fls. greenish-white shaded blue at base, about ½ in. long, in 20-30-fld. conical racemes, in spring. Medit. region.

The hyacinth is hardy in the United States and Canada, giving its bloom in early spring with the midseason tulps. Strong carefully grown and selected bulbs must be employed if best results are to be obtained. The bulbs may be planted, in the North, September and October, the bottom of the bulb being 5 or 6 inches below the surface in properly prepared well-drained ground; they may be planted about 5 to 6 inches apart. Mulch thoroughly for the winter if the place does not become naturally covered with autumn leaves. The bulbs may remain permanently if the leaves are allowed to grow after bloom and they are not crowded out by grass and weeds; or if the bed becomes too thick and weak, the bulbs may be lifted and the better ones replanted, preferably in another place. The hyacinth is hardy in the United States and Canada. in another place

For winter bloom, bulbs are set in pots or boxes in October, in a porous soil of loam and leaf-mold, lightened with sand if necessary to keep it friable and open; usually with sand if necessary to keep it friable and open; usually the bottom of the pot or box is covered with clinkers, charcoal or other material for drainage; and if boxes are employed they must have holes or cracks in the bottom. The tip of the bulb is allowed to show at the surface of the soil or to be barely covered. A large bulb is sufficient for a 5-inch pot: specially made hyacinth pots are deeper than the ordinary kind and preferable. The pots are placed in a coldframe or similar place to allow the bulbs to root, being covered a few inches deep with soil or sifted coal ashes. In six to eight weeks the roots will have formed and the pots or boxes may be brought into a room with a temperature of about 50°. Here they are allowed to remain till the shoots are vigorous, stocky and dark green, when they perature of about 50°. Here they are anowed to remain this the shoots are vigorous, stocky and dark green, when they may be brought to the living-room, some of them perhaps being left in the intermediate temperature to provide succession. If the bulbs are not well rooted when brought in from the frame, so that the roots fill the pot, the results will not be satisfactory. After the bloom is past the bulbs

will not be satisfactory. After the bloom is pust the bulbs are discarded.

Hyacunths are sometimes bloomed in glasses, that are made for the purpose and may be had of dealers in garden supplies. There is a flange at the top to hold the bulb; the glass is kept filled with water up to the bottom of the bulb. It is well to place a few pieces of charcoal in the bottom of the glass as it is supposed to keep the water sweet. The glasses are set aside in a dark cool place for the bulbs to form roots the same as in soil, a though quicker results are usually obtained with water culture. Roots having reached the bottom of the glass, receptacles are brought to an intermediate temperature and handled as for potted plants.

Propagation of the hyacinth is by means of bulblets or offsets from the old bulb, which should give blooming bulbs in two or three years. The production of bulblets is stimulated by variously cutting the bulb, but the home gardener would better depend on the commercial supply.

HYALIS: Iria.

HYBRID, in its historic application, is a product of a sex-cross between two or more species. In a broader but less desirable usage, it is the product of any cross independently of whether the parents are species or marked varieties. In a looser way the word is sometimes employed for plants that appear to be intermediate between given or assumed parents, even without record that the cross has been made or that it is possible, as if it were merely another word for variation. For exact description and record it is desirable that the word be employed as definitely as are the words species variety, forma, in systematic horticulture and botany. A half-hybrid is a sex-product between a species and a variety of another species; a cross-breed between plants of one species. A sex-product of plants of two genera is a bigener or bigeneric hybrid.

HYDASTYLUS: Sisyrinchium.

HYDATICA: Saxifragra leucanthemifolia.

HYDRÁNGEA. Saxifragacex. Ornamental woody plants, mostly deciduous shrubs, sometimes vines climbing by means of rootlets, or even tree-like, with showy white, pink or blue fls. in terminal panicles or cymes in summer, some of the marginal fls. usually enlarged and sterile and in some cult. races all the blossoms are of this form; lvs. medium-sized or large. opposite and simple, variously toothed or lobed: native in N. and S. Amer. and Asia.

native in N. and S. Amer. and Asia.

Hydrangeas require a rich porous and somewhat moist soil; they bloom most freely in full sun but thrive well also in partial shade. They should be pruned rather severely in the fall or early spring. The hardy species are propagated by green cuttings in summer under glass; the tender ones by cuttings taken at any time from vigorous young wood, usually in late winter. Suckers can be separated from some species, while layering is occasionally employed in others. II. quercifolia is increased by little suckers or "root pips;" H. panculata easily from young wood taken in June and planted under glass. Seeds may be employed when available

arboréscens. Erect, to 10 ft.: lvs. ovate, to 8 in. long, glabrous or slightly pubescent beneath: fls. white, in rounded or globular clusters to 6 in. across, the sterile ones few. June-July. N. Y. to Fla. and La. Frequently planted, especially var. grandiflora, Hills-of-Snow, with large clusters of clear white sterile fls. Var. cordata (H. cordata) has broad lvs. cordate at base, but may not be distinct from the typical form. Var. stérilis has all fls. sterile.

Bélzonii: H macrophulla var cærulea

Bretschneideri (H. vestila var. pubescens. H. pekinensis). To 10 ft.: lvs. ovate to oblong-ovate, to 5 in. long, pubescent beneath. fls. white, the sterile becoming purplish, in corymbs to 6 in. across. July. N. China.

cinèrea. To 6 ft.: lvs. elliptic to ovate-oblong, to 6 in. long, gray-tomentose beneath: fis. white, in corymbs to 8 in. across, the sterile fis. few. N. C. to Ga. and Ala. Var. stérilis, fis. sterile.

cordata: II. arborescens var.

cuspidata: II. serrata.

Horténsia, horténsis: H. macrophylla.

involucrata. To 7 ft.: lvs. elliptic to oblong, to 10 in. long, acuminate, base cuneate, sharply serrate, densely appressed-pubescent: fis. whitish to pink, sterile ones to 114 in. across. Japan.

japónica: II. macrophylla var. rosea.

japónica: II. macrophylla var. rosea.

macrophylla (II. opulodes. II. hortensis. II. Hortensia). To 12 ft.: lvs. elliptuc to broad-ovate, to 8 in. long, often nearly as broad, glabrous or slightly pubescent beneath, more or less thock and shining: fis. blue, pink or white, in flat or roundish cymes to 8 in. across. June-July. China, Japan.—Grown in the open in mild regions and often forced in the greenhouse. There are many cult. vars. as: cærilea (II. Belzonii), fis. deep blue with blue or white ray-fis.; Horténsia, fis. all sterile, pink to blue; mandshirtica (II. opuloides var. cyanoclada), fis. rose, mostly sterile; Marièsli, ray-fis., rose-pink, to 3 in. across, entire or slightly toothed; otáksa (II. olaksa) is dwarfer with mostly sterile fis.; ròsea (II. japonica), sterile fis. pink, in flat clusters; Veitchii (II. Hortensia var. japonica rosea), sterile fis. deep rose.

nívea: H. radiata.

opuloides: II. macrophylla.

otáksa: H. macrophylla var.

paniculata. Shrub or tree-like, to 30 ft.: lvs. elliptic to ovate, to 5 in. long, pubescent beneath: fls. whitish, in a panicle to 15 in. long, the sterile ones few, long-pedicelled, changing to purplish. Aug.—Sept. China, Japan. Var. grandiflora, Perger H., is the common outdoor hydrangea with large long panicles in which many or most of the fls. are sterile, large, persistent and showy. Var. præcox, fls. about six weeks earlier than type. Var. tardiva, late-flowering. flowering.

pekinénsis: H. Bretschneideri.

petiolaris. (H. scandens. H. volubilis). Tall root-climber reaching to 50 ft. or more but making a straggling partly decumbent bush when support is not provided: lvs. broadovate, to 4 in. long, nearly glabrous: fls. in nearly circular open clusters to 10 in. across, the few white sterile fls. on very long pedicels. June-July. Japan.

quercifòlia. To 6 ft., young parts brown-tomentose: lvs-to 8 in. long and nearly as broad, strongly 3-5-lobed, whitish-tomentose beneath: fls. in a panicle to 1 ft. long, with many white sterile fls. turning purple. June. Ga. to Fla. and Miss. but hardy well N.

radiàta (H. nivea). Erect, to 8 ft.: lvs. ovate to ovate-lanceolate, to 5 in. long, white-tomentose beneath: corymbs

rounded, to 5 in. across, with white sterile fls. about the margin. N. C., S. C.

Sargentiana. To 6 ft.: lvs. ovate or ovate-oblong, to 10 in. long, hairy: fis. pale violet, in flat corymbs to 6 in. across, with white sterile fis. July-Aug. China.

scándens: H. petiolaris.

serrata (H. Thunbergni, H. cuspidata). To 6 ft.: lvs. elliptic to lanceolate, to 4 in. long, more or less pubescent, dull: fis. blue or white, in flat corymbs to 3 in. across, with few small sterile fis. July-Aug. Japan, Korea. Var. acuminata (H. opuloides var. acuminata), lvs. to 7 in. long, caudate-acuminate, fis. susually blue. Var. prolifera (var. stellata, H. stellata, H. opuloides var. stellata), sepals narrow and pointed. Var. rosálba, sterile fis. white and pink.

stellata: H. serrata var. prolifera.

strigosa. To 8 ft.: lvs. oblong-ovate to lanceolate, to 7 in. long, stiff-hairy beneath: corymbs to 6 in. across, the sterile fls. white or purplish. Aug. China. Var. macrophylla has lvs. to 1 ft. long and cymes to 8 in. across.

Thunbergii: H. serrata.

vestita var. pubéscens: H. Bretschneideri.

volùbilis: H. petiolaris.

xanthonèura. To 15 ft.: lvs. elliptic, to 7 in. long, slightly pubescent beneath: fls. white, in convex corymbs to 6 in. across, with sterile fls. W. China. Var. setchuenénsis has lys. more harry below. Var. Wilsonii has oblong lvs. shining shove.

HYDRANGEA-VINE: Schizophragma hydrangeoides.

HYDRÁSTIS. Ranunculacex. Low per. herbs with palmately lobed lvs., small solitary fls. with 3 petal-like sepals, no petals and numerous stamens, and fr. a head of crimson berries; 1 species in Japan, 1 in E. N. Amer., the latter grown or gathered for the roots which have medicinal properties.

Hydrastis requires rich moist soil with plenty of leafmold. For commercial plantations lath coverings are often used or trees to simulate the native woods conditions. Propagated by seeds or by division of roots.

canadénsis. GOLDENSEAL. ORANGE-ROOT. To 1 ft., the rootstock thick and yellow: basal lvs. to 8 in. across, 5-9-lobed; st.-lvs. 2, the upper one sessile under the fl.: fis. greenish-white, ½ in. across. Conn. to Ga. and Kans.

HYDRIASTÈLE. Palmaceæ. Three or 4 tall unarmed pinnate-lvd. palms of Australia and New Guinea. Known to planters in the western hemisphere by the name H. Wendlandiana but the palm so planted is really Ptychosperma elegans. The true Hydriasteles are apparently not planted in our territory.

HYDRÓCHARIS. Hydrocharitacex. Aquatic floating herbs with long-stalked round lvs. and white unisexual fls.; grown in the aquarium. Propagated by cuttings or long runners and naturally by the winter-buds which form in the fall.

Mórsus-rànse. Frogs-Bit. Roots fine and silky: lvs. 2 in. across, heart-shaped at base: fis. nearly or quite 1 in. across. Eu., E. Asia.

HYDROCHARITÀCEÆ. FROGS-BIT FAMILY. Aquatic herbs of 14 genera over the world, with mostly unisexual fis. from a bracted spathe, having perianth of 3 calyx-like and 3 petal-like parts, 3-12 stamens, and inferior 1-celled ovary. Some of them are submerged plants, the fis. often coming to the surface on long very slender stalks; others are floating. Elodea, Hydrocharis, Stratiotes and Vallisneria are sometimes grown in ponds and aquaria.

HYDRÒCLEYS. Butomaceæ. Three Brazilian aquatic herbs with basal lvs. and large fls. with 3 leathery sepals and 3 fugacious petals.

Of easy cultivation in ponds and aquaria. When grown in tubs, soil should be put in to two-thirds the depth and then filled with water. Propagated by division of rooting stems.

nympholdes (Limnocharis Humboldii). WATER-POPPT. Lvs. floating or sometimes erect, broadly ovate, glossy above: fls. yellow, 2 in. across, in clusters.—Tender N.

HYDROCÓTYLE. Umbelliferæ. Creeping per. herbs with nearly or quite orbicular sometimes peltate palmately lobed or veined lvs. usually crenate, small white fls. in little umbels, and strongly compressed frs.; sometimes grown for carpet-bedding and ground-cover in moist locations. Propagated by seeds, cuttings or layers.

peduncularis. Creeping, densely matted, sts. covered with imbricated stipules: lvs. orbicular-cordate or kidney-shaped, ½ in. long, 5-lobed; heads with slender peduncles. Tasmanis.

rotundifòlia. Rooting at nodes: lvs. nearly circular, 1 in. across, toothed or lobed, shining. Trop. Asia, Afr.

HYDRÒLEA. Hydrophyllaceæ. Ann. or per. herbs widely distributed in warm regions, having alternate entire lvs. and wheel-shaped fis. mostly in corymbs; one sometimes planted in warm countries.

spinosa. Per. to 4 ft., sticky-pubescent: lvs. oval or oblong, to 5 in. long: fls. blue, ½ in. across, fragrant. Trop. and subtrop. Amer.

HYDROPHYLLACEÆ. WATER-LEAF FAMILY. About 18 herbaceous genera of wide distribution, especially in N. Amer., and a few of the plants woody, some of them grown for ornament. Family characterized by the mostly alternate lvs., regular fls. with corolla united, 1- or 2-celled superior ovary with 2 separate or united styles, and fr. a dehiscent caps.; the related Polemoniaceæ has a single 3-lobed style and 3-celled ovary. Genera in cult. are Emmenanthe, Eriodictyon, Hesperochiron, Hydrolea, Hydrophyllum, Nemophila, Phacelia, Pholistoma, Romanzoffia, Wigandia.

HYDROPHÝLLUM. WATER-LEAF. Hydrophyllaceæ. N. American bien. and per. woods herbs with large, thin, pinnately or palmately divided lvs. and rather small bell-shaped white, blue or purple fls. in cymes, the stamens exserted; sometimes transplanted to the wild-garden.

appendiculatum. Bien. to 2 ft.: basal lvs. pinnately 5-7-divided, st-lvs. palmately lobed, hairy: fis. purple or violet, calyx with reflexed lobe at each sinus. N. E. U. S.

canadénse. Per. to 2½ ft.: lvs. to 1 ft. across, palmately 5-9-lobed, toothed: fis. greenish-white or purplish. Vt. to N. C. and Ky.

capitatum. To 8 in. or more, grayish-puberulent: Ifts. 5-7, to 2 in. long, often 2-3-cleft and again lobed, ultimate segms. ovate: fls. to 1/2 in. high, in a capitate-cymose infl., calyx hispid, the lobes linear-lanceolate. Mont. to B. C. south to Colo. and Calif.

virginianum. Per. to 3 ft.: lvs. to 10 in. long, pinnately divided into 5-7 toothed segms.: fis. white or violet-purple. Que. to S. C. and Kans.

HYDROPONICS: see Soilless Gardening.

HYDRÓSME. Araceæ. Herbs native in trop. Afr., E. Indies and Cochin-China, differing only in seed characters from Amorphophallus.

Rivieri (Amorphophallus Rivieri). Devila-Tongue. To 4 ft.: lvs. to 4 ft. across, the petioles spotted with brown and white; It-blade pedately decompound into broad pointed segms: spathes ovate, 1 ft. long, green spotted white and purplish toward the wavy margins. Cochin-China.

HYDRÓTRIDA. Scrophulariaceæ. A small American genus of aquatic and semi-aquatic plants of lax habit, orbicular palmately-veined lvs. and blue campanulate and irregular fls. It has been confused with the monotypic genus Herpestis from which it differs in bracted pedicels, acute caps. and styles united entire length. Propagated by seeds or by division of stolons.

caroliniana (Herpestis amplexicaulis). Per., stoloniferous, sts. creeping or ascending to 2 ft., little branched: lvs. ovate, sessile, somewhat parallel-veined, punctate, margins cliate or glabrous, entire: fls. blue, to ½ in. long, solitary on peduncles to ½ in. long in axils. June-Oct. Wet pinebarrens, N. J. to Fla. and west to La.

HYLÌNE. Amaryllidaceæ. A small genus from Brazil resembling Pancratium. One species, H. Wórsleyi, may be cult. To 15 in. high, bulbs producing offsets: lvs. 8-14, usually 10-20 in. long and 2½ in. wide, acute: fls. usually 2, white with greenish base, to 6 in. across, opening at night and closing the next morning, segms. to 7 in. long and ½ in. wide, becoming recurved and twisted, the lowest one supporting the filaments: seeds not known. Cult. as for Eucharis. Generic name is pronounced in three syllables.

HYLOCÈREUS. Cactaceæ. Climbing and often epiphytic, the long sts. commonly 3-angled or 3-winged and bearing aerial roots, mostly with short spines: fls. nocturnal, very large, with large leaf-like scales but no spines or wool, white or red. Mex., Cent. Amer., W. Indies, N. S. Amer. H. undatus is much cult., and has run wild in trop. countries; greenhouse plant in the N.

calcarátus (Cereus calcaratus). Climber, joints 2 in. wide more or less, green, strongly 3-winged, margins lobed, areoles with 2-4 white bristles and no spines: fis. not described. Costa Rica.

costaricénsis (Cereus trigonus var. costaricensis). Vine, joints to 4 in. wide, usually 3-angled; spines 2-4 and short and at first usually with 2 white bristles: fls. about 1 in. long, very fragrant, pure white, reddish outside. Costa Rica.

exténsus. Sts. obtusely triangular, to 1½ in. diam.; spines 2-3, short and thick: fls. white or pale pink within and yellowish-green to purplish outside, to 3 in. long. Lesser

Lemàirei (Cereus Lemairei). Tall vine, 3-angled and rooting on one side, about 1 in. diam.; spines usually 2 and very short: fls. about 10 in. long, white, reddish outside, odorous, stigma-lobes divided. Trindad, Tobago.

monacánthus (Cereus monacanthus). Sts. 3-angled, margins undulate; spine commonly 1 (sometimes 2) at an areole: fls. funnelform, about 11 in. long and 7 in. broad, white, greenish outside and rose-colored at base. Panama, Colombia.

ocamponis (Cereus ocamponis). Strongly 3-angled, glaucous; spines 5-8 and needle-like: fls. to 12 in. long and broad, white, greenish outside. Probably Mex.

polyrhizus (Cereus polyrhizus). Sts. triangular at joints, to 1½ in thick, green becoming grayish-white, margins obtuse; spines 2-4, to ½ in long; fis. to 1 ft. long, inner segms. white, outer ones reddish. Panama, Colombia.

stenopterus (Cereus stenopterus). Weak vine, joints 114 in. broad, not glaucous; ribs 3 and thin; spines 1-3 and yellow: fis. 4 in. or more long, reddish-purple. Costa Rica.

triangularis (Cereus triangularis: see H. undatus). Vine, shurply 3-angled, to 1½ in. broad, with many aerial roots; spines mostly 6-8 and needle-like: fis. 8 in. or more long, white. Jamaica

tricostàtus: H. undatus.

trigonus. Climbing, joints 1 in. diam., 3-angled, the margins very wavy; spines usually 8 and to $\frac{1}{2}$ in. long: fis. similar to H. undatus. W. Indies.

unditus (Cereus undatus. T. Indicatus. C. and Seleni-cereus triangularis of hort. Heliocereus undatus). Long-clambering; ribs usually 3 and thin, margins undulate; spines 1-3 and small; fis. to nearly 1 ft. long, white, yellow-ish-green outside. Tropics and subtropics.—Much cult., and one of the plants best known as night-blooming cereus.

HYMENÆA. Leguminosæ. Trop. American trees, one species yielding a resin which is used for medicinal purposes and as a varnish and also H. Courbaril. furnishing valuable timber. H. Courbarfl. West Indian Locust. To 60 ft.: lvs. of 2 oblong to ovate lfts.: fls. white, in terminal panicles: pods thick and woody, rough, to 5 in. long.-Propagated by seeds or by cuttings over heat.

HYMENANTHERA. Violacex. Stiff shrubs with alternate or clustered simple lvs., small bisexual or unisexual fls. and fr. a small berry; grown out-of-doors in S. Calif. Propagated by seeds, cuttings and lavers.

chathámica. Tall shrub: lvs. leathery, lanceolate, to 5 in. long, sharp-toothed: fis. diæcious, in clusters along the branches: berry white. New Zeal.

crassifolia. To 5 ft., sometimes prostrate, much branched: lvs. leathery, linear-obovate, to 1½ in. long, entire or margins wavy: fls. few in the axils: berry purplish. New Zeal.

dentata. Tall much branched shrub: lvs. leathery, oblong to linear, to 1½ in. long, remotely toothed: fis. solitary or in 2's: berry purplish. Australia.

nôvæ-zelándiæ. To 10 ft.: lvs. leathery, ovate or obovate, to 4 in. long, usually wavy-toothed: fis. diœcious, clustered: berry purplish. New Zeal.

obovàta. To 12 ft.: lvs. obovate, to 2 in. long, entire or slightly toothed: fs. diœcious, solitary or few: berry purplish. New Zeal.

Traversii. Small tree: lvs. leathery, obovate, to 1 in. long, margins reflexed, covered below with silvery-white tubercles: fis. solitary, very small. New Zeal.

HYMENATHERUM: Thymophylla tenuiloba.

HYMENOCÁLLIS. SPIDER-LILY. A marullidacex. American summer-flowering bulbous herbs with linear or strap-shaped basal lys, and mostly white fls. borne in umbels terminating the solid scapes, the perianth with narrow segms. and long tube, the stamens united into a cup-like crown below.

Of easy cultivation in warm climates where the bulbs will bloom year after year if given good care. Propagated by offsets.

americana. To 2½ ft.: lvs. to 2½ ft. long and 2½ in. broad: fis. with tube 4 in. or more long and linear segms. about same length; crown toothed, 1 in. long, the filaments of the stamens to 2 in. long. Trop. Amer.

calathina (Pancratium calathinum. Ismene calathina). BABKET-FLOWER. To 2 ft.: lvs. to 2 ft. long and 2 in. broad: fts. with tube to 4 in. long and lanceolate segms, about same as, went care to \$10. long and narconite segms, about same length; crown funnel-shaped, the lobes fringed, 2 in. long, the filaments of stamens \$\frac{1}{2}\$ in. long. Andes of Peru and Bolivia. Vur. sulphurea, ffs said to be pale yellow.—Probably the most frequent kind in cult.

caribæa. Lvs. 1 ft. and more long and 3 in. wide, shining: fls. fragrant, the tube to 3 in. long and linear segms. about same length; crown toothed, about 1 in. long, the filaments of stamens to 2 in long. Lesser Antilles—Much of the material in trade referred to this species belongs to H. keyensıs.

crassiblia. Lvs. sessile, strap-shaped, to 2 ft. long and 2 in. across at middle: fls. to 6 in. long with tube somewhat shorter than segms. S. U. S. and Bahamas.

festalis. White-fld. hybrid between H. calathina and

Elssena longipetala.

galvestonensis. To 2 ft.: lvs. linear, 2 ft. or more long:
fls. with tube to 3 in. long and linear segms. slightly longer;
crown funnel-shaped, 1 1/2 in. long, the filaments of stamens ½ in. long. Tex.

Harrisiana. Lvs. sessile, oblanceolate, to 1 ft. long, somewhat erect: fls. with greenish slender tube to 4 in. long, segms. shorter and whitish. Mex.

keyénsis. Similar to *H. cartbwa*, differing in perianth-segms. shorter than tube and lvs. distinctly arching and not flat or nearly so. Fla.—Perhaps not distinct from *H.* caymanensis of the Bahamas and Cuba.

macrostéphana. Lvs. to 3 ft. long and 3 in. wide: fls. with tube 3 in. long and linear-lanceolate segms. somewhat longer; crown large, 2 in. long, the filaments of stamens 1 in. long. Probably a hybrid.

occidentalis. Lvs. to 1½ ft. long and 1¼ in. wide, glaucous: fls. with tube to 4 in. long and linear segms. about same length; crown to 1¼ in. long. S. C. to Mo. and Miss.

rotats. Stoloniferous: lvs. 1½ ft. long and 1 in. or less wide: fls. with tube to 4 in. long and linear segms. of about same length; crown rotate, 1 in. long, the filaments of stamens 1½ in. long. N. C. to Fla.

speciosa. Lvs. petioled, oblanceolate, to 2 ft. long, acute: fls. greenish, tube to 3 in. and segms. to 2 in. long.

W. Indies

tenuifiora. Lvs. sessile, ensiform, to 2½ ft. long, somewhat erect: fis. with slender tube to 6 in. long and very narrow segms. to 4 in. long. Colombia.

HYMENOCÝCLUS. Aizoacex.woody perennials of the Mesembryanthemum group, and often put in the genus Malephora: lvs. half-cylindrical, united at base: fls. golden-yellow, stalked: S. Afr.

cròceus (M. croceum). To 2 ft., much branched: lvs. to 2 in. long and 1/2 in. wide, pale green: fis. reddish outside, 1 in. across, solitary and terminal.

Hérrei. Branches prostrate: lvs. to 2 in. long and 1/4 in. wide: fis. axillary, orange outside, 2 in. across.

latipétalus. Branches spreading or decumbent, to 5 in. or more long: lvs. to 1 in. long and); in. wide and thick, purplish: fls. 1¼ in. across.

luteolus (M. luteolum). To 1 ft., much branched: lvs. to 11/2 in. long, slightly recurved: fis. numerous, less than 1 in. SCTOSS.

purpureo-croceus (M. purpureo-croceum). Similar to H. croceus: fis. in shades of orange and crimson, blooming continuously

Thünbergii (M. Thunbergii and læve). Prostrate, with short erect branches 1 ft. or more: lvs somewhat curved, punctate, to 2½ in. long: fis. solitary, reddish outside, petals twice longer than calyx.

HYMENODIUM: Elaphoglossum crinitum.

HYMENOPÁPPUS. Compositæ. Bien. or per. American herbs, having angled sts., dis-Bien. or sected lvs. and heads of white or yellow discoid fls. with colored petal-like involucral bracts. Adapted to the wild garden or hardy border, doing best in a loose well-drained soil. Propagated by seeds or division.

carolinénsis (*H. scabiosæus*). Bien. to 3 ft., sts. woolly becoming glabrate: lvs. 1-2-pinnatifid, to 6 in. long, lobes linear-oblong, obtusish, green above and white-tomentose beneath: disk-fls. and involucral bracts white, in many corymbose heads to ¾ m across: pappus of very small scales. S. C. to Fla. west to Ill. and Tex.

scabiosæus: H. carolinensis.

HYMENÓSPORUM. Pittosporaceæ. One Australian evergreen shrub or tree to 50 ft., planted out-of-doors in S. U. S. H. flavum. Lvs. obovate, entire, to 6 in. long: fls. yellow and prominent, 1½ in. long, the petals united into a tomentose tube about 1 in. long, borne in loose terminal umbel-like panicles: caps. 1 in. long, the seeds winged. Cult as for Pittosporum.

HYMENOSTEMMA: Chrysanthemum Fontanesii. HYMENOXYS CALIFORNICA: Baeria aristata.

HYOPHÓRBE. PIGNUT PALM. Palmacex. Unarmed monoecious feather-palms of the Mascarene Isls., the 2 species cult. having conspicuous swollen or bulging trunks: stocky trees as usually seen in cult., with the pinnæ close together on the rachis, the lf.-sheaths surrounding the trunk at the top: infl. below the lf.-crown, the branches many and making a bushy mass; spathes ascending club-shaped before anthesis: fls. very small, 3-7 together on the strands of which the lowermost 1 or 2 are pistillate; stamens 6: fr. a small purplish oblong drupe 1 in. or less long; albumen homogeneous. Sometimes planted in the open in S. Fla.; *H. Verschaffeltii* is the commoner species in the U. S. See *Palm*.

amaricaulis (Areca speciosa). BOTTLE PALM. ft. in native isls., the trunk stout and tapering to a bottle-like neck at top: petiole mostly 1 ft. or more long on mature tree; pinnæ short, about 18 in. or less long, with prominent

Verschafféltii (Areca Verschaffeltii). SPINDLE PALM. To 30 ft., trunk bulging above the base or near the middle and tapering to top: petiole about 3-4 in. long; pinnæ mostly 2 ft. or more long, only the midvein prominent.

HYOSCÝAMUS. HENBANE. Solanaceæ. Coarse erect or prostrate herbs with alternate coarsely toothed or deeply cut lvs., axillary funnel-shaped fls., the upper ones forming a leafy cluster or spike, and capsular frs.; native in the Medit. region, a few grown for ornament and medicinal purposes.

álbus. Sticky-hairy ann. or per.: lvs. nearly orbicular, coarsely triangular-lobed, all petioled: fis. pale yellow, green or purple at base, nearly sessile.

aureus. Sticky-hairy per. with decumbent branches: lvs. cordate-ovate, sharply triangular-lobed, all petioled: fis. yellow, violet at base, peduncled.

niger (H. pictus). Bien, or ann to 2½ ft., with spindle-shaped roots: Ivs. oblong, to 8 in. long, irregularly cut and toothed, clasping or lower petioled: fls. greenish-yellow veined with purple, sessile, caps. inclosed in the large calyx. pictus: H. niger.

HYPERANTHERA: Moringa.

HYPERICACEÆ. St. JohnsWort Family. The species planted in our territory are herbs or subshrubs native in many countries, characterized by opposite or whorled pellucid-dotted or black-dotted simple mostly entire lvs.: fls. polypetalous, mainly yellow, cymose or solitary, regular and bisexual, with many stamens commonly united into clusters, styles separate: fr. a caps. By some authors the family is united with Guttiferæ. Only the genera Ascyrum, Cratoxylon and Hypericum require attention here.

HYPÉRICUM. St. JOHNSWORT. Hypericaceæ. A large genus of yellow-fld. herbs and small shrubs furnishing much ornamental material for planting in borders, shrubberies or the rock-garden, with the characteristics of the family, differing from Ascyrum in fls. 5-merous and from Cratoxylon in caps. dehiscing septicidally and seeds not winged. Pronounced also Hyperi-cum.

The hypericums are of easy cultivation, some of them preferably in shady situations. Propagated by seeds, greenwood cuttings under glass in summer and the low kinds by division and suckers. Most of the species are hardy to New York and New England, unless otherwise noted.

adpréssum. Per or substrub to 2 ft.: lvs. oblong or lanceolate, to 2 in. long: fls $\frac{1}{4}$ in. across, in terminal cymes; styles 3. Mass. to Ga. and La.

anagalloides. Ann. or per. with procumbent or ascending branches to 1 ft. long: lvs. elliptic or oval, to ½ in. long: fls. very small, in few-fld. cymes. B. C. to Mex.

Androsæmum. Tutsan. Shrub to 3 ft, semi-evergreen: lvs. ovate to ovate-oblong, to 4 in. long, whitish beneath: fis. 1 in. across, solitary or in cymes; styles 3. Eu., W. Asia; for central or southern states.

Arnoldianum. Hybrid between H. lobocarpum and

Arnoldands.

Ascyron. Per to 6 ft: lvs. ovate-oblong, to 5 in. long: fls. to 2 m. across, in few-fld cymes. Que. to Pa. and Kans., N. Eu, N. Asia.

aspalathoides. Evergreen shrub to nearly 3 ft.: lvs aspatanoides. Evergreen suring to nearly 3 1t.: Ivs subulate, to 15 in. long, with much shorter ones clustered in axils: fls. very bright orange-yellow, about 15 in. across, sepals less than 15 petal length. N. C. to Fla. and La., coastal plain —Material in cult. may be II. fasciculatum; the two species are separated by some authors.

aureum: H. frondosum.

australe. Per. to 1 ft.: lvs. elliptic or linear-oblong: fls. in few-fld. corymbs, yellow veined red; styles 3. Medit. baleáricum. Low shrub to 1 ft. or more, twigs warty: lvs. oval, to ½ in. long: fls. yellow, soltary, to 1½ in. across, terminal. Medit. region.

barbatum. Per to 3 ft.: Ivs. lanceolate to ovate, to 1½ in. long, acute, glabrous, punctate, margins slightly revolute: fls. yellow-orange, to 1 in. across, usually 3-8 in loose panieles. E. Eu.

Bückleii. Subshrub to 1 ft.: lvs. obovate, to ¾ in. long; fs. 2 in. across, 1-3 together; styles 3. N. C. to Ga.; to be planted far S.

calfoinum (H. grandiflorum). Shrub to 1 ft., evergreen: lvs. ovate-oblong to oblong, to 4 in. long, glaucous beneath: fls. to 2 in. across, solitary or in cymes; styles 5. S. E. Eu., Asia Minor.

canariense. Shrub to 15 ft.: lvs. oblong-lanceolate, to 3 in. long: fls. to 1½ in. across, in panieles. Canary Isls.; far S. or Calif.

chinénse. Shrub to 2 ft., semi-evergreen: lvs. oblong, to 3 in. long; fls. 2 in. across; styles 5-parted at apex. China; to be planted far S.

cistifolium. Subshrub to 3 ft., stoloniferous: lvs. oblong to linear-lanceolate, to 3 in. long, revolute: fls. ½ in. across, in loose cymes; styles 3. Ohio to Ill. and Ark.

cólchicum: catalogue name of plant listed as having evergreen foliage and large yellow fis.

Còris. Subshrub to 1 ft.: lvs. narrow-linear, to 1 in. long:

fls. $\frac{3}{4}$ in. across, in cymes; styles 3. Eu.; adapted only to southern states.

córsicum. Herb to 8 in., sts. glabrous, 4-sided: lvs. broadly ovate, obtuse, with minute pellucid dots: fls. yellow yeined purple, minute, usually 1-3 borne terminally. Corsica, Cent. Spain, Crete.

densiflorum. Shrub to 6 ft., evergreen: lvs. linear-oblong to linear, to 2 in long: fls. to ½ in. across, in dense cymes; styles 3. N J. to Fla. and Tex.

Dyeri (H lysimachioides). Shrub to 4 ft.: lvs. ovate, to 1½ in. long: fls. to 1½ in. across, in loose cymes; styles 5. Himalayas; for southern states.

elatum (H. grandifolium). Shrub to 4 ft.: lvs. ovate-oblong, to 3 m. long; fis. to 1½ m. across, in panicles; styles 3. Canary Isls., Madeira; for southernmost states.

élegans. Per. to 1 ft.: lvs. ovate-lanceolate, to 1 in. long: fis. to 1 in. across, in terminal panicles. Cent. Eu. to Altai Mts.

empetrifolium. Shrub to 1 ft., evergreen: lvs. linear, to % in. long: fis. to % in. across, in panicles. S. E. Eu., Asia Minor; to be planted far S. Var. prostratum is a lower prostrate form.

fasciculatum. Sandweed. Evergreen shrub to 1½ or more ft.: lvs. linear-subulate, to ½ in. long: fls. brilliant orange-yellow, sepals as long as petals or nearly so. N. C. to Mrs.—See II. aspalathoides.

floribúndum. Shrub to 6 ft.: lvs. lanceolate-elliptic, 1½ in. long: fls. to 2 in. across, in many-fld. panicles; styles 3. Canary and Madeira Isls.; far S. or Calif.

formosum. Per. to 11/2 ft.: lvs. ovate-oblong, 1 in. long: fis, in many-fid. corymbs, petals dotted at tip with dark violet glands; styles 3. Mex.

Forrestii: II. patulum var.

frágile. Dwarf subshrub: lvs. ovate, 1/6 in. long: fis. in cymes. Greece; not hardy N.

frondôsum (H. aureum). Shrub to 4 ft.: lvs. ovate-oblong to oblong, bluish-green, to 3 in. long: fis. to 2 in. across, solitary or few together; styles 3. S. C. to Tenn. and Tex.

fruticosum: listed name of a shrubby form.

galloides. Shrub to 3 ft.: lvs. linear, to 3/4 in. long: ffs. 1/2 in. across, solitary or in cymes; styles 3. Del. to Fla. and Tex.

gentianoides (H. Sarothra. H. nudicaule. Sarothra gentianoides). Orange-Grass. Pineweed. Ann. to 1½ ft.: lvs. reduced to awl-shaped scales appressed to wiry sts.: fts. yellow, minute, scattered along the fastignately branched sts. Mc. to Fla., west to Ont., Ill. and Tex.

glomeratum. Shrub to 3 ft.: lvs. narrow-oblong, to 13 in. long: fls. 1 in. across, in dense cymes; styles 3. N. C.

grácile: listed name.

grandiflorum: H. calycinum, grandifolium: H. elatum.

graveolens. Per, to 3 ft.: lvs. oval to elliptic-oblong, to 3 in. long fis. yellow, in terminal cymes, to 1 in. across, with slender filiform styles. Mts. of Va., Tenn. and N. C.

Griffithii. Shrub: lvs. ovate, to 41/2 in. long, younger lvs. more lanceolate and acute: fls. yellow. India.

Héctori: listed name.

Hénryi: II. patulum var.

hirchum. Shrub to 3 ft.: lvs. ovate-lanceolate, to 2½ in. long: fls. 1½ in. across, solitary or clustered; styles 3. Medit. region; to be planted in central regions or S.

hirsûtum. Hairy per. to 2 ft.: lvs. oval or oblong, 1 in. or more long fis. in panieles. Eu., N. Asia.

Hookerianum. Shrub to 6 ft., evergreen: lvs. ovate to oblong, to 4 in. long: fls. 2½ in. across, in terminal cymes; styles 5. Himalayas; to be grown far S.

humifusum. Bien. or per. to 8 in., glabrous, sts. slender, ascending and with 2 longitudinal ridges: lvs. oblong to oblong-ovate, obtuse, glandular-punctate, black-dotted along margins: fls. yellow, solitary or few in corymbs. W. and Cent. Eu.

hyssopifolium. To 1 ft.: lvs. linear, about 1 in. long: ffs. 1/2 in. across, in panicles. S. Eu.; to be planted far S. or in Calif.

inodòrum. Arching shrub, the branchlets 2-edged: lvs. ovate or ovate-oblong, to 2 in. long: fls. 1 in. across, in dense few-fld. cymes. Caucasus.

japónicum. Decumbent per.: lvs. ovate or oval, to 1/2 in.: fls. 1/2 in. across, in cymes. Japan to Australia and India; to be tried far S.

Kalmianum. Shrub to 3 ft., evergreen: lvs. oblong-linear or oblanceolate, to 2½ in. long: fis. 1 in. across, in few-fid. cymes; styles 5. Que. to Ill.

Kotschyanum. Herb to about 8 in.: lvs. oblong: fis. in cymes or panicles. Asia Minor; not hardy N.

lanceolatum. Shrub: lvs. lanceolate to oblong-lanceo-

late, acute, entire, punctate, pale beneath: fis. yellow, solitary, terminal, calyx longer than corolla. Mascarene Isls.

lanuginòsum. Per. to 2 ft., usually unbranched: lvs. ovate to oblong, woolly beneath, sessile, nearly perfoliate: fls. yellow, in terminal panicles, calyx black-glandularfls. yellow, in ciliate. Levant.

linarifòlium. Per. to 10 in.: lvs. linear, to 3\(\) in. long: fls. in loose corymbs, sepals with black dots; styles 3. W. Eu.

lobocárpum. Shrub to 6 ft.: lvs. narrow-oblong, to 2½ in. long, revolute: fis. ½ in. across, in terminal panicles; styles 5. N. C., Tenn.

lysimachioides: H. Dueri.

maculatum: H. punctatum.

mediflòrum: listed name.

Mitchellianum. BLUE-RIDGE S. Similar to H. graveolens, differing in fis, only to ¾ in. across, more conspicuously brown-spotted and with awl-shaped styles. Blue Ridge Mts., Va. to Tenn. and N. C.

montanum. Per. to 2 ft. lvs. oblong to ovate, to 2 in. long: fts. 1/2 in. across, in cymes. Eu.; probably not hardy N.

Moserianum. Gold-Flower, Hybrid between H. patulum and H. calycinum: shrub to 2 ft.: lvs. ovate, to 2 in. long, fls. to 2½ in. long, solitary or in cymes; styles 5. Var. tricolor has lvs. edged with red and white.

nudicaule: H. gentianoides.

nudiflorum. Shrub to 3 ft.: lvs. oblong to oblong-lanceo-late, to 21/4 in. long: fls. pale yellow, to 3/4 in. across, in loose cymes on leafless peduncles; styles 3. N. C. to Fla.

nummularium. Subshrub: lvs. round, ½ in. long: fls. ¾ in. across, in terminal cymes. Pyrenees; probably not hardy N.

oblongifdlium: H. patulum var.

olympicum. Subshrub to 1 ft.: lvs. oblong-lanceolate to elliptic-oblong, to 1½ in. long. fls. to 2½ in. across, in terminal cymes; styles 3; sepals acuminate and not glandular. S. E. Eu., Assa Minor; hardy N. only to Philadelphia. Var. citrinum is listed.

orientale. Per. to 1 ft.; lvs. obovate to linear-oblong, to 1 in. long: fls. 1 in. across, in terminal cymes. Asia Minor; for the S.

for the S. pátulum. Shrub to 3 ft., evergreen: lvs. ovate-lanceolate to oblong, to 2½ in. long: fls. to 2 in. across, solitary or in cymes; styles 5. Japan. Var. Förrestii (H. Forrestii) has fls. larger than var. Henryi. Var. grandiflorum has fls. to 3 in. across. Var. Hénryi is a vigorous form with larger lvs. and fls. Var. oblongifolium (H. oblongiolium), lvs. to 4 in. long, bluish beneath. Var. urālum (H. uralum), lvs. I in. love del ijagaeve. long, fls. 1 in. across.

perforatum. Per. to 2 ft.: lvs. oblong to linear, to 1 in. long: fis. to 1 in. across, in terminal cymes; styles 3. Eu.; nat. in N. Amer.

polyphflum. Per., the sts. ascending: lvs. elliptic-linear, 1/3 in. long, densely glaucous on both sides: fls. to 2 in. across, in terminal cymes. Cilicia; not hardy N.—Much of the material in cult. seems to be H. olympicum, from which this differs in its sepals acute and margined with black seemile glands. black sessile glands.

prolificum. Shrub to 5 ft.: lvs. narrowly oblong, to 3 in. long: fls. to 34 in. across, in cymes; styles 3. Ont. to Ga. and west.—Lvs. may be persistent in warm regions.

pulchéllum: Cratoxylon polyanthum.

púlchrum. Shrubby per. to 2 ft.: lvs. ovate, 1/2 in. long: fls. to 34 in. long, in panicles. Eu.

punctàtum (II. maculatum). Per, to 3 ft. lvs. ovate-lanceolate, to 3 in. long, black-dotted: fis. yellow with black dots. E. U. S.

rèpens. Prostrate per.: lvs. oblong to linear-oblong, 14 in. long: fls. 1 in. across, in terminal cymes; styles 3. S. E. Eu., Asia Minor; not hardy N.

réptans. Prostrate shrub, the sts. rooting: lvs. ellipticoblong, ½ in. long: fls. to 1¾ in. across, solitary; styles 5. Himalayas; stands only far S.

rhodopèum. Tufted per. with prostrate sts. to 5 in. high pubescent: lvs. oblong, punctate: fls. in 1-3-fld. terminal clusters; styles 3. Asia Minor.

Richeri. Per. to 2 ft.: lvs. oval-lanceolate, only slightly punctate, bluish-green beneath. fls. to 1½ in. across, in few-fid. cymes; styles 3. Eu.

rumélicum. Per. to 1 ft., glabrous: lvs. narrowly oblong-linear, to 1/2 in. long, not punctate, margins strongly revolute: fis. few in corymbose cymes, sepals and petals with black dotted glands. Greece.

Sarothra: II. gentianoides.

Scouleri. Per. to 11/2 ft.: lvs. oblong to ovate, to 11/2 in. long: fls. 1 in. across, in cymes; styles 3. B. C. to Mont.

tomentosum. Per., the sts. ascending: lvs. ovate, to ¾ in. long, woolly: fis. to ¾ in. across, in corymbs. Eu.

uralum: H. patulum var.

Van Fleetii. Hybrid of compact habit with bright vellow

venústum. Per. to 1 ft. and more: lvs. ovate, the upper cordate, punctate: fis, in cymes borne in panicles. Asia Minor

virgatum. Herb to 2½ ft., sts. 4-angled: lvs. oblong-lanceolate, to 1½ in. long: fls. copper-yellow, in terminal compound cymes. N. J. to Fla. west to Ill. and Tenn.

virginicum (Tradenum virginicum). Marsh S. Per. to 1½ ft.: lvs. ovate-cordate, to 2½ in. long: fis. salmon-pink, to ½ in. across, in small close cymes. Swamps of Lab. to Fla. west to Man. and La.

HYPHÆNE. Palmacex. African fan-palms and 1 in W. India, often with widely branched trunks, unarmed except perhaps on petiole, diccious, spadices among the lvs., fls. in pits on thick stiff branches of the infl., stamens 6: fr. oblong, ovoid or obovoid, sometimes obscurely lobed, 2-3 in. long, woody outside but more or less fleshy inside: species 28 as now understood; the distinctions between them lie largely in the frs., and it is not always possible to distinguish the plants accurately in the juvenile state, and it is not known whether the plants in this country are correctly named. The species so far intro. thrive in protected places in S. Fla. For cult. see Palm.

crinita. Trunk forked: lvs. bright green or at first with a whitish bloom that soon disappears, divided into several or many segms, roughish on margins and nerves above: fr. obovoid or pear-shaped, narrowed to base, short-pedicelled, upwards of 2 in. long; seed 1 in. or more long, globose. S. Afr.

natalénsis. Trunk forked: fr. broadly top-shaped, flat on top, very little contracted at base, obtusely 3-angled, shining chestnut-colored or somewhat purplish, about 2 in. long and thick. Natal.

Schätan. More or less soboliferous, trunk simple or becoming branched: If.-blade about 2 ft. across lengthwise;

becoming branched: If.-blade about 2 ft. across lengthwise; segms. acuminate-pointed, rigid, mnuttely scaly; petiole spiny or armed on margin: fr. variable, mostly obovoid and with a truncate or slightly convex top, short-pedicelled, about 2 in. long. Madagascar.

thebaica. EGYPTIAN DOUM PALM. To 20 or 30 ft, commonly forked but sometimes simple: lvs. nearly orbicular, stiff, the blade 2-2½ ft. long, cut to middle or deeper into 20 or more strong midribbed acuminate segms.; petiole strongly armed: fr. variable, mostly obliquely ovoid or oblong, 3 in. more or less long, the fibrous part giving the plant the name "gingerbread palm." Nile region; the species usually seen in cult., but little known within the U.S.

HYPOCALÝMMA. Myrtaceæ. Shrubs native in W. Australia, with opposite lvs. and fls. in axillary pairs or few-fld. clusters; petals 5; stamens numerous, shorter than petals.

robústum. To 3 ft., glabrous: lvs. linear or linear-lanceolate, to 1 in. long, stiff: fls. pink. Planted in Calif.

HYPOCHÈRIS. CATS-EAR. Compositæ. Herbaceous annuals and perennials with mostly basal, toothed or cut lvs. and solitary or clustered yellow heads of ligulate fls.; pappus plumose. Sometimes grown in the wild-garden. Propagated by seeds or division.

bijuga: hort. name, probably H. uniflora.

glàbra. Ann. to 16 in., glabrous: lvs. spatulate, oblong, to 5 in. long: heads about ½ in. long, yellow, fis. scarcely longer than involucre. Eu.; nat. in W. N. Amer.

radicata. Per. to 2 ft.: lvs. sharp-toothed or lobed, white-hairy: heads solitary, deep yellow, fis. longer than involucre. Medit. region.

uniflora. Per. to 11/2 ft., hairy: lvs. oblong-lanceolate: heads mostly solitary, about 1 in. long, yellow, fis. longer than involucre. Mts. of Eu.

HYPOGYNOUS: borne on the torus or under the ovary; said of the stamens or perianth-parts when the ovary is superior to their point of attachment.

HYPOLEPIS. Polypodiacex. Mostly trop. ferns of both hemispheres, with creeping rhizomes, 2-4-pinnate fronds, and sori in the sinuses of frond and covered by its reflexed margin. Allied to Cheilanthes; sometimes grown under glass.

tenuifòlia. Fronds to 3 ft. long and 2 ft. wide, 4-pinnate into wavy-toothed segms., on brown stipes to 2 ft. long. New Zeal., Australia, Pacific Isls.

HYPÓXIS. STAR-GRASS. Amaryllidacex. Small herbs with rootstocks or corms, grass-like basal lvs. and rather small fls. on few-fld. scapes, the perianth-segms, distinct. Of simple cult, in the wild-garden or border in dry soil. Propagated by division.

erécta: H. hirsuta.

hirsuta (H. erecta). To 12 in.: lvs. to 1 ft. and more long and ½ in. broad: fis. bright yellow, star-like, ½ in. long, in spring. Me. to Fla. and Tex.

hygrométrica (Rhodohypoxis hygrometrica). Golden Weather-Glass. To 6 in: lvs. grass-like, to 10 in. long, somewhat pilose: fis. yellow, in clusters of 1-4, anthers with long linear auricles at base. Australia.—Common name derived from fis. closing in cloudy weather.

leptocárpa: listed name of unknown botanical standing. stellata. Lvs. to 12 in long: fls. white on inside, striped green without. S. Afr. Var. élegans has fls. white banded with blue.

HYPSÈLA. Lobeliacex. A few very low creeping herbs, probably per., of the Andean region, suitable for rock-gardens: lvs. small, ovate to reniform, entire or emarginate or retuse, petioled, thickish or succulent: fls. solitary, pink- and yellow-marked, corolla irregular, deeply lobed and shortly split on one side: fr. a caps. Allied to Pratia, in which the corolla is more deeply split and fr. baccate.

longifiora. Plant 1 or 2 in. high: petiole longer than the broadly ovate practically entire blade which is less than j_2 in. across: fis. erect, about j_2 in. long, pink with yellow in throat, pedicels equalling or exceeding petiole.

reniformis. Lvs. orbicular-reniform, emarginate retuse at apex, petiole about equalling the limb and longer than pedicels.

rèpens, réptans are listed; probably H. reniformis or a

HYSSÒPUS. Labiatæ. One hardy per. subshrub from S. Eu. to Cent. Asia, grown for ornament in borders, somewhat for medicinal purposes and also as a sweet-herb. Hyssop is easily grown; propagated by seeds, cuttings and division. H. officinalis. Hyssor. To 1½ ft., sts. 4-angled: lys. linear to oblong, to 2 in. long: fls. blue, 1/2 in. long, in terminal one-sided spikes to 5 in. long, stamens exserted. Var. albus, fls. white, roseus, fls. rose, ruber, fls. red. Var. grandiflorus has large fls.

HYSTERIÓNICA. Compositæ. Per. herbs, mostly of S. Amer., having entire linear to lanceolate lvs., solitary yellow to orange heads of both disk- and ray-fls., the former being perfect and the latter mostly pistillate: fr. an achene with truncate apex crowned by 2 rows of pappi, the outer row minute and much shorter than the inner one. Propagated by seed and sometimes treated as annuals.

montevidensis (Erigeron dubius). To 1 ft., pilose, very leafy: lvs. linear, to 1½ in. long, flat, ascending, acute, rarely remotely dentate, often glandular-puberulous: involucre about ¼ in. diam., ray-fls. narrowly linear, usually

HÝSTRIX. Graminex. Tall per. grasses with flat lvs. and awned spikelets borne in terminal spikes; native in N. Amer., Eu. and Asia and one sometimes planted for ornament and useful for dry bouquets. See Grasses.

pátula (Asprella Hystrix). BOTTLE-BRUSH-GRASS. To 4 ft.: lvs. to 9 in. long and ½ in. wide, rough above: spikes to 7 in. long, awns 1 in. or more long. N. B. to Ga. and Neb.

IBERIDELLA: Athionema tringraium

CANDYTUFT. Small Cruciferæ. usually glabrous herbs, ann. and per., sometimes woody and durable at base and evergreen, native in Medit. region some of them well known as garden ornamentals: lvs. narrow, entire or dentate, in some species pinnatifid: fls. white, red, purple, in umbel-form clusters or in racemes that lengthen with age: fr. a broad more or less orbicular pod or silicle usually winged.

Usual candytufts of flower-gardens and borders are of two classes,—the half-hardy annuals (grown every year from seeds), and the evergreen perennials. All of the garden candytufts thrive in any usual garden soil and require no special treatment. Usually the seeds of the annuals are sown where the plants are to grow, the plants thinned eventually to 6-12 inches apart. Bloom may be expected in two months or less. In mild countries, seeds are sometimes sown in autumn for winter and spring bloom. The colors are largely white, but run into flesh-colored, hyacinth and crimson. They are used for flower-beds, edgings, and for cutting. Keep the pods cut off, and do not allow the ground to become very dry as the plants tend to run rapidly to seed. Some of the kinds are fragrant. Some of the kinds are fragrant.

Perennial candytufts are low compact plants, somewhat roody at base, with white flowers sometimes becoming lac with age. Propagated by division, or by seeds sown lilac with age. Propagated by a year before bloom is wanted.

affinis. Ann., erect, closely branching, to 16 in. high, setose-hairy to nearly glabrous: lys. lobed along sides half seuse-mary to nearly galarious: ivs. lobed along sides nair way more or less to midrib, particularly toward apex: fls, white, frequently with lilac tinge, sometimes slightly fragrant, in umbel-like head that briefly elongates in fr. S. Eu.—Stock in cult. as I. odorata, I. panduræformis, I. pectinata, I. pinnata probably belong here rather than to botanical species of those names.

amàra (I. coronaria). Rocket C. Ann., erect, to 1 ft., sparsely pubescent. lvs. thickish, oblanceolate to spatulate, to 3 or 4 m. long, coarsely few-toothed: fls. large, white, fragrant, the raceme soon clongating, Fields, Eu.—A favorite flower-garden and florists candytuft, known in the Empress races, White Spiral, Hesperidiflora, Hyacinth-fld.; also very dwarf forms.

corifolia. Per., evergreen, to 1 ft., glabrous: lvs. oblong to spatulate, 1½ in. or less long, entire: fls. white, in close clusters that clongate somewhat. Said to be a garden hybrid; sometimes mislabelled cordifolia and cornifolia.

coronària: I. amara

Dunnéttii: I. umbellata var.

Garrexiana: I. sempervirens var.

gibraltarica. Gibraltar C. Per., evergreen, glabrous or nearly so, to 1 ft.: lvs. oblong-spatulate, 1-2 in. long, mostly entire: fls. hlac or light purple, the inner ones often white, in flattish clusters. Spain.—Useful for edgings.

Jórdanii. Bien. to 6 in.: lvs. oblong-spatulate, entire, white-hairy below: fls. rose, in umbels. Asia Minor.

iucunda: Æthionema coridifolium.

Lagascana. Ann. to 1 ft., pubescent: lvs. oblong or nearly spatulate, toothed or notched at apex: fls. pure white, in close clusters. Spain.—Plants grown under this name are likely to be I. amara.

odorata: see I. affinis.

panduræfórmis: see I. affinis.

pectinàta: see I. affinis.

pinnata: see I. affinis.

Prùitii. Per., evergreen, glabrous, to 6 or 8 in.: lvs. narrow-obovate to spatulate, sometimes obscurely toothed: fls. white. Sicily.

pygmæa: hort, name for form listed as dwarf, compact and to 4 in. high.

saxátilis. Per., evergreen, to 6 in.: lvs. linear, entire, ciliate, rather fleshy, acute: fls. white, in corymbs. S. Eu.

semperflorens. Per., evergreen, to 2 ft., glabrous: lvs. wedge-shaped, entire, rather fleshy: fls. white, large, fragrant. Sicily.

sempérvirens. Edging C. Per., evergreen, to 12 in., glabrous or nearly so: lvs. linear or narrow-oblong, to 1½ in. long, entire, blunt: fls. white, in elongating heads or racemes. S. Eu. to W. Asia. Var. Garrexiàna (I. Garraxiana) has lvs. acute with fls. in umbels. S. Eu. Listed vars. include compácta, nàna and supérba.—Useful for edgings.

styldsa: Hutchinsia stylosa.

taurica. Bien. to 9 in.: lvs. linear-spatulate, entire or slightly toothed: fis. rose, in corymbs. Asia Minor.

Tenoreana (I. Pruntu var. hirtula). Per., evergreen, to 6 or 8 in., simple, thinly pubescent: lvs. oblong to linear-spatulate, entire or toothed at summit: fls. whitish or rose, in a short umbel-like raceme. Span to Italy.

in a short umbel-like raceme. Spain to Italy.

umbellåta. Globe C. Ann., glabrous or nearly so, to
16 in., branching: lvs. thin, lanceolate, acuminate, to 3½ in.
long, entire or with 1 or 2 angles on margin. fls. pink, violet,
purple, red, blush, not fragrant. S. Eu.—The common
colored candytuft of flower-gardens, in such varietal names
as Atropurpurea, Cardinal, Dunnettii with dark purple fls.,
Lavender, Lilacea, Rosea.

ventosícola: catalogue name.

IBICÉLLA. Martuniaceæ. Viscid-pubescent herbs of S. Amer.: lvs. broadly ovate to suborbicular, entire: fls. in dense compact terminal racemes, calyx of 5 free sepals, fertile anthers 4. The fr. may be used for pickles as in Proboscidea.

lûtea (Proboscidea lutea). Clammy spreading ann. to 1½ ft.: lvs. suborbicular, to 1 ft. across, dentate: fls. greensh-yellow without and deeper yellow to orange within, sometimes red-blotched, in erect dense racemes; fr. longhorned, echinate. Argentina.

IBIDIUM: Spiranthes.

IBÒZA. Labiatæ. Shrubs or herbs with very small diceious fls., one grown under glass or out-of-doors in the S.; African.

After blooming the plants should be cut back, and this will give good cuttings for the next winters stock. Iboza is treated much like salvia and coleus.

ripària (Moschosma riparium). Per, to 5 ft., st. 4-angled: lvs. broad-ovate, to 2 in. long, coarsely toothed: fls. numerous, creamy-white with dark anthers, in erect panicles to 1 ft. long.

ICACINACEÆ. ICACINA FAMILY. Trees and shrubs, sometimes climbers, of about 40 genera of trop. distribution, allied to Sapindaceæ, of which Pennantia and Villaresia may be cult.: lvs. alternate, simple: fls. bisexual or polygamous, with 4-5 sepals, petals and stamens and 1-celled ovary: fr. a drupe.

ICACOREA: Ardisia paniculata.

ICE-PLANT: Cryophytum crystallinum.

IDÈSIA. Flacourtiacex. Monotypic genus, comprising a deciduous tree to 50 ft., native of Japan and China and hardy in the southern states. Propagated by seeds, root-cuttings and cuttings of green wood. I. polycarpa. Lvs. alternate, cordate-ovate, to 10 in. long, toothed, glaucous beneath: fls. mostly unisexual, greenishyellow, fragrant, in drooping panicles to 10 in. long, without petals: berries orange-red, 1/3 in. across. Var. vestita has lvs. densely pubescent beneath.

fDRIA. Fouquieriaceæ. One odd tree with soft often hollow trunks and lopping branches, native in Lower Calif. I. columnaris (Fouquieria columnaris). To 70 ft., with spines to 11/2 in. long: lvs. oblanceolate, to ¾ in. long: fls. yellow, about ½ in. long, in large panicles at top of trunk: fr. a caps. to ¾ in. long. Sometimes planted in S. Calif.

ILAMA: Annona diversifolia.

ILEX. Holly. Aguifoliacex. Trees or shrubs, sometimes evergreen, with alternate simple lvs., mostly polygamous or diœcious: fls. small, whitish, usually in axillary cymes, the petals somewhat united at base and sepals persistent: fr. a berry-like drupe with large hard seeds or

nutlets: planted for good habit, attractive foliage and showy berries. Some species have medicinal value. The lvs. of one kind (*I. para*quariensis) are used in S. Amer. for a tea or verba de maté, and probably more than a single species is involved.

Most hollies succeed in rich well-drained soil, although Most hollies succeed in rich well-drained soil, although some species are native in swampy land. They do not bear transplanting well and most of the leaves should be stripped off first. Early fall or spring before growth starts are the best times for transplanting. Propagated by seeds which should be stratified as they do not germinate until the second year. The evergreen species may be propagated by cuttings under glass. Varieties may be grafted or budded.

altaclarénsis. Hybrid between I. Aquifolium and I. Perado. Here belong the vars. camelliæfolia. Hódginsonii and Lawsoniana.

ambigua: I. caroliniana.

Amelánchier: I. dubia.

ambigus: 1. caroliniana.
Amelianchier: 1. dubia.
Aquifòlium. English H. Evergreen tree to 40 ft.: lvs. shining, ovate, with coarse spiny teeth: fls. in May-June on growth of previous year: bernes scarlet. Eu., Asia. There are many hort. forms, the best known being: álbomarginàta (var. argenteo-marginata), lvs. with narrow silvery margin; adreo-regina (var. aureo-marginata), the lvs. mottled with gray and having a yellow margin; baccifàva (var. fracto-luteo), fr. yellow; baleárica, lvs. variously toothed; camelliæfòlia is a form of I. altaclarcusis; fèrox, Hedgehog H., lvs. with strong teeth and numerous small spines and its form aùrea with yellow spines and margins; fèrtilis, listed as heavy fruiting strain; flavéscens, lvs. suffused with yellow; handsworthensis; lvs 2 in or less long, with numerous spines; hastàta, lvs. halberd-shaped; heterophylla, lvs. entire or some of them with few teeth; Hódginsonii is I. altaclarcusis; laurifòlia, lvs usually entire; microphylla, lvs. small with small spines; myrinfòlia, lvs. 1½ in. or less long; nigra has deep purple sts; péndula with pendulous branches; polycárpa has numerous berries; princeps, large broad lvs. with strong spines; pyramidàlis with ascending branches; recūrva (var. tortuosa), lvs. spirally twisted; serratifòlia, lvs. with numerous small spiny teeth; variegàta, lvs. variegated with silver and gold.

Aquipérni is listed as a hybrid of I. Aquifolium × I.

Aquipérni is listed as a hybrid of I. Aquifolium $\times I$.

attenuata (I. Topelii). Hybrid between I. opaca and I.

bronxensis: I. verticillata var. tenuifolia.

B \hat{u} rfordii: properly a var of I. cornuta, of more globose form and drooping branches and lvs. with few or no spines. caroliniàna (1. ambigua). Deciduous shrub or a tree to 20 ft.: lvs. oval to obovate or elliptic, to 3 in long, serrate toward apex, glabrous: fls solitary or several in axils: berries about ½ in. diam., red. N. C., Fla. to Tex.

Cassine (I. Dahoon). Dahoon. Evergreen shrub or tree to 25 ft.: lvs. obovate, entire or shallow-toothed: fls. in May, on wood of season: bernes dull red, rarely yellow. Va. to Fla. and La. Var. angustifòlia, narrow-lvd. form.

ciliospinosa. Evergreen shrub to 15 ft, similar to I. dipyrena: lvs. ovate, to $1\frac{1}{2}$ in, long, with small spiny teeth. China.

convéxa: I. crenata var.

corállina. Evergreen tree to 25 ft.: lvs. lanceolate, spinyor wavy-toothed, shining above: berries red. China.

coriacea (I. lucida). Deciduous shrub to 10 ft.: lvs. obovate to elliptic, to 3½ in. long, acute or briefly acuminate, somewhat spiny-toothed above middle, dark green, glossy above: berries to ½ in. diam., black. Swamps, S. Va. to Fla. west to La.

cornuta. Evergreen shrub to 10 ft.: lvs. shining, quadrangular-oblong, 3-pointed at apex, with strong spines: fls. June-July on branches of previous year: berries scarlet.

N. China. crenata (I. Fortunei). Japanese H. Evergreen shrub to 20 ft.: lvs. oval to oblong, wavy-toothed: fls. May-June, on the seasons growth: bernes black. Japan. Var. buxifolia, of columnar habit with broad box-like lvs. Var. convéxa (var. bullata), lvs. nearly round. Var. glodòsa, dwarf compact form. Var. Hélleri, dwarf, 6-8 in. Var. latifolia has elliptic lvs. Var. lùteo-variegàta (var. rarregata) has lvs. spotted yellow. Var. macrophýlla has lvs. larger than type. Var. microphýlla has lvs. ½ in. or less long. Var. numulařia, dwarf with broad-ovate lvs. to ½ in. long. Var. rotundifolia, lvs. round and glossy. Var. variegàta is var. luteo-varregata.

Dahoòn: I. Casane.

Dahodn: I. Cassine.

decidua. Possum-Haw. Deciduous shrub or tree to 30 ft.: lvs. obovate, wavy-toothed: fis. in May: berries red or orange. Swamps, Va. to Fla. and Tex.

dipyrèna. Evergreen tree to 40 ft.: lvs. ovate to oblong remotely spiny-toothed: fis. Apr.—May, on branches of previous year: berries red. Himalayas.

dùbia. The plant commonly grown under this name is I. montana. True I. dubia (I. Amelanchier) is a deciduous shrub to 7 ft. with elliptic-oblong lvs. and scarlet ir. with stalks ½ in. long or more. Va. to La.

emarginata: Eurva emarginata.

europea; hort. name, probably for I. Aquifolium,

Fárgesii. Tree or shrub to 20 ft.: lvs. oblong- to linear-lanceolate, finely toothed above middle: fls. May-June: berries :ed. China.

Fortunei: I. crenata.

fujisanénsis: I. pedunculosa.

geniculata. Deciduous shrub: lvs. ovate, to 2 in. long, sharp-toothed, turning yellow in autumn: fis. May-June: berries red, on slender drooping stalks. Japan.

glabra. Inkberry. Winterberry. Evergreen shrub to 8 ft.: lvs. obovate, entire or with a few teeth at apex: fls. June-July, on seasons growth: berries black. Mass. to Fla. and Miss.

Hélleri: I. crenata var.

Hódginsonii: see I. altachrensis.

integra. Evergreen shrub or tree to 40 ft.: lvs. oval to oblong, entire or rarely with few teeth; fls. in spring, on branches of previous year: berries red. Japan.

intricata. Low straggling evergreen shrub; lvs. obovate. coarsely toothed: berries red. Himalayas.

lævigata. Smooth Winterberry. Deciduous shrub to 6 ft.: lvs. oval to oblong, finely toothed, turning yellow in autumn: fis. May-June: berries orange-red. Swamps, Me.

lanceolata: confused name applied to forms from Cuba and S. E. U. S.

latifòlia. Tarajo. Evergreen tree to 60 ft.: lvs. oblong, shallowly toothed, shining, to 7 in. long: berries red. Japan. lúcida: L. corracea.

macrocárpa. Tree to 30 ft.: lvs elliptic or lanceolate-oblong, finely toothed; fr. black. China.

macrópoda: I. montana var.

maderénsis: I. Perado.

microcócca. Tree or shrub to 40 ft.: lvs. elliptic-ovate to elliptic-oblong, to 6 in. long, acuminate, base rounded, margins shallowly serrulate: berries red, in small cymes to 1 in. across. Japan.

móllis: I. montana var.

monthas (I. dubia of Auth. I. monticola. I. dubia var. monthas (I. dubia of Auth. I. monticola. I. dubia var. monthcola). Deciduous tree to 30 ft. and more or a shrub: lvs. ovate to oblong-lanceolate, to 4 or 5 m. long, serrate, soft-pubescent underneath: berries cherry-red, about 1/8 in. across, on very short stalks N. Y. to S. C. west to Ala. Var. macropoda has lvs. more elliptical, coarsely-toothed. Var. mollis (I. mollis) has lvs. broadly ovate to ovate-lanceolate, to 5 in. long, soft-pubescent beneath. Mass. to Ga

montícola: I. montana.

myrtifòlia. Evergreen shrub or small tree: lvs. oblong to lmear, entire: fls. in spring, on seasons growth: bernes red, rarely yellow. Swamps, N. C. to Fla. and La. Var. Lòwei has yellow bernes.

Óldhamii: I. purpurea var.

opaca. American H. Evergreen tree to 50 ft.: lvs. elliptic to obovate, with large spiny teeth, rarely entire: fls. in June, on seasons growth: berries dull red or rarely yellow. Muss to Fla and Tex. The so-called var. fémina is only the pistillate tree of the type and not a distinct form or var. Var. Howardii has darker lvs. and fruits more abundantly. Var. xanthocárpa has yellow berries.

paraguariénsis. Evergreen shrub or small tree to 20 ft.: lvs. obovate or oblong, wavy-toothed: berries red or reddish-brown. Brazil.

pedunculòsa (I.fujisanensis). Evergreen shrub or tree to 30 ft.: lvs ovate, to 23j in. long, entire: berries bright red, on long stalks. Japan. Var. continentàlis has lvs. to 43j in. long, usually finely toothed above middle.

Perado (I. maderensis). Evergreen shrub or tree to 20 ft.; lvs. ovate to oblong-lanceolate, spiny-toothed; berries dark red or nearly black. Canary Isls., Azores. Var. aurea has yellow-tipped or margined lvs.

Pérnyi. Evergreen shrub or tree to 30 ft.: lvs. rhombicovate, about 1 in. long, with 1-3 spines on each side, shining; fls. in May; berries red. China. Var. manipurensis (I. Wilsonti in part) has larger ovate lvs. with shorter terminal spine. Var. Veltchii has larger lvs. with 4-5 spines on a side.

purpurea. Tree to 50 ft.: lvs. oblong to oblong-lanceolate, usually 3 in., rarely 5 in., long, margins crenulate-serrate, brownish-green above, leathery: fis. small, axillary, 4-merous: berries red. Java. Var. Oldhamii (I. Oldhamii), lvs. narrower, more leathery. Japan. rotúnda (I. rotundi/olia). Evergreen tree to 40 ft.: lvs. entire, elliptic, to $4\frac{1}{2}$ in. long, petioles to 1 in. long: berries bright red. Japan, Korea.—Differs from I. pedunculosa in its larger lvs. and berries on shorter pedicels.

rotundifòlia: I. rotunda.

serrata (I. Sieboldis). Deciduous shrub to 15 ft.: lvs. ovate, finely toothed, glabrous beneath: fls. in June: berries bright red. Japan. Var. xanthocárpa has yellow frs.—Similar to I. verticillata, but smaller in all respects.

Sièboldii: I. serrata.

Topelii: I. attenuata.

verticillata. Black-Alder. Winterberry. Deciduous shrub to 10 ft.: lvs. oval to lanceolate, toothed, pubescent beneath at least on nerves: fis. June-July: berries bright red. Mass. to Fla and Mo. Var. chrysocárpa has yellow berries. Var. polycárpa, an improved form with numerous berries. Var. tenuifòlia (I. bronxensis), lvs. obovate, larger, with pellucid dots, berries usually solitary.

vomitoria. Yaupon. Cassena. Evergreen shrub or small tree to 25 ft.: lvs. oval to oblong, wavy-toothed: fls. in May, on branches of previous year: berries scarlet. Va. to Pla. and Tex.

Wilsonii. Shrub: lvs. ovate, oblong to obovate, to 3 in. long, coriaceous, margins slightly recurved: fis. small, axillary. China.—See also I. Pernyi var. manipurensis.

ILLECEBRACEÆ. KNOTWORT FAMILY. A small family of ann. and per. herbs having usually opposite entire lvs. and small greenish or whitish fls. in forked cymes or clusters, characterized by the persistent calyx on which are borne the stamens, petals absent or minute, styles 2 and frequently united and fr. a 1-seeded utricle. By some authors it has been united with the Pink Family, Caryophyllaceæ, but differs in the 1-ovuled ovary and the corollas vestigial or absent. Herniaria, Paronychia and Scleranthus are cult.

ILLÍCIUM. Magnoliaceæ. Evergreen trees and shrubs native in S. U. S. and the Orient, mostly aromatic, having simple, entire, short-stalked lvs. and small axillary fls. solitary or in 3's; grown for ornament in warm countries. Propagated by seeds and cuttings of half-ripened wood.

anisatum (I. religiosum). Small tree or shrub: lvs. elliptic, to 3 m. long: fis. greenish-yellow, about 1 in. across, with spreading petals, borne on bracted peduncles. Japan. Var. variegatum has variegated foliage.—Yields a poison.

floridanum. Shrub to 10 ft.: lvs. elliptic, to 6 in. long: fls. purple, to 2 in. across, nodding; petals very narrow, 20-30. Fla. to La.

Hénryi. Small tree or shrub: lvs. oblanceolate to oblongovate, acute, alternate, close together on long petioles, pale green beneath, nerves very conspicuous: fis. on long peduncles. Cent. China.

religiòsum: I. anisatum.

vèrum. STAR ANISE. Small tree or bush: fls. globose, on short nearly or quite bractless peduncles, the petals not spreading ('hina.—Some of the stock grown in this country as 1. anisatum may belong here.

IMANTOPHYLLUM: Clivia.

IMMORTELLE: Xeranthemum annuum; see Everlasting; also Erythrina.

IMPATIENS. TOUCH-ME-NOT. SNAPWEED. Balsaminacex. More or less succulent ann. and per. herbs with simple lvs., very irregular spurred fls. solitary or clustered in the axils, and capsular fr. which bursts elastically into spirally coiled valves, expelling the seeds; grown in the flowergarden or under glass for the odd and showy bloom; tender to frost.

Common garden balsam, I. Balsamina, requires a fertile sandy soil and should be spaced about 2 feet apart for best development. It makes a stout central stem and many side branches. It may be grown to a single stem by pinching off the side shoots and thereby expose the bloom. Seeds should be sown in boxes or pots in April and transplanted. The greenhouse species may be increased by seeds or cuttings and can be grown in the open if treated like tender annuals.

Báifouri. Per. to 3 ft.: lvs. ovate-lanceolate: fls. light rose on standard, red on keel, yellow at base of wings and rose at apex, on long stalks in racemes at top of st. W. Himalayas.—A good flower-garden subject if seeds are started early.

Balsamina. Garden Balsam. Ann. to 2½ ft.: lvs. lanceolate: fls. of various colors, white to red or yellow, spotted, the cult. forms mostly double, borne close to the st. and overtopped by leafy shoots. Trop. and subtrop. India, Malaya, China.—An old flower-garden favorite, in many vars.: tender.

biflora. Jewel-Weed. Ann. to 5 ft.: lvs. ovate, to 3½ in. long, coarsely toothed: fls. orange-yellow, spotted with reddish-brown, to 1 in. long, spur strongly incurved, in 2-4-fid. clusters. Newf. to Fla. and Neb.

capénsis. Ann. to 14 in : lvs. ovate to rhombic, to 3 in. long: fis. pale rose, to $1\frac{1}{4}$ in. long including spur, solitary, axillary. S. Afr.

firmula. Suffrutescent per.: lvs. oblong-elliptic, to 3½ in. long, tapering at ends, serrulate with bristle in each sinus, petrole margined with 2-3 clavate glands: fis. reddish, with subulate spur about 1 in. long, solitary, axillary on ascending peduncles to 2 in. long. Cent. Madagascar.

glanduligera: I. Royler.

Hölstii. Per. to 3 ft: main lvs. ovate and little if at all tapering at base, 3-4 in. long and three-fourths as broad: fls. scarlet, to 134 in. across, on long stalks and borne toward top of st., with slender downward spur about 1½ in. long. E. trop Afr.—Modified under cult. Var. Liegnitzia (I. nama var. Liegnitzia) is more floriferous, brilliant colored and compact than the type.

nàna: see I. Holstri.

Noli-tangere (I. Noli-me-tangere). Ann. to 2 ft.: lvs. ovate, to 3 in. long: fls. yellow spotted with orange, to 2 in. long. Eu.

Óliveri. Per. to 8 ft.: lvs. oblanceolate to oblong, with setose serratures: fls. lilac or rose, on long stalks toward top of st., with long slender spur. E. trop. Afr.

pállida. Similar to I. biflora but very pale yellow fls. having a short spreading spur. N. S. to Ga. and Kans.

Petersiana. Differs from *I. Holstni* in the general red or bronzy color, the elliptic lvs. and carmine-red fis. W. trop. Afr

platypétala. Per.: lvs. lanceolate to oval: fls. rose-colored, on long stalks toward top of st., with long curved spur. Java.

Róylei (I. glanduligera). Ann. to 4 or 5 ft., very erect: lvs. ovate to ovate-lanceolate: fls. dark purple, on long stalks toward top of st., with very short spur. Mts. of India.

scábrida. Ann. to 5 ft.: lvs. ovate to lanceolate: fls. golden-yellow spotted with red, on long stalk toward top of st., spurred. Himalayas.

Súltanii. Per to 2 ft.: main lvs. ovate-lanceolate, long-tapering at base and apex, 2-3 in. long and half or less as broad: fis. scarlet (varying to white and pink), to 1½ in. across, on long stalks toward top of st, with slender upcurved spur, sometimes twice as long as petals. Zanzibar—Plants grown under this name may be I. Holstii.

IMPERATORIA: Peucedanum Ostruthium.

INCARVÍLLEA. Bignoniaceæ. Several Asian herbs with alternate simple or pinnate lvs., funnelform red or yellow fls. in terminal clusters, and narrow capsular frs.; good border plants, doing best in sunny positions in light sandy loam. Propagated by seed or division. Some of them hardy in N. Y.

brévipes: I. grandiflora var.

compacta. Per. to 1 ft. or more: lfts. nearly entire: fis. purple, $1\frac{1}{2}$ in. across and $2\frac{1}{2}$ in. long. China.

Delavayi. To 2 ft.: lvs. pinnate into 15-20 toothed lfts. to 5 in. long: fts. rose-purple with yellow tube, to 3 in. long and wide. China.

Fárreri: listed name for plant said to differ from I. Delavay: in having yellow fls., perhaps a form of it.

grandiflora. Similar to I. Delawayi but shorter, with lfts. nearly entire, and fewer rose-red fis. China. Var. brévipes has brilliant crimson fis.

lùtea. To 4 ft.: lfts. wavy-toothed: fls. yellow, 2 in. across. China.

Olgs. To 3 ft., shrubby: lfts. entire or toothed toward apex: fls. pale pink, 1½ in. long and 1 in. across. Cent. Asia

variabilis. Shrubby, to 2 ft. or wore: lvs. 2-3-pinnate into cut segms.: fls. pink, 1 in. across. China.

INCISED: cut; slashed irregularly, more or less deeply and sharply.

INCLUDED: not protruded, as stamens not projecting from the corolla; not exserted.

INDEHISCENT: not regularly opening, said of a seednod or anther.

INDIAN CUP: Silphium perfoliatum. Pipe: Monotropa uniflora. Shot: Canna indica.

INDIGEN: an indigenous plant or species; native in origin and normal to the country or region; to be employed in contrast to cultigen, which see.

INDIGO: Indigofera. Bastard: Amorpha fruticosa. False: Amorpha, Baptisia. Wild: Baptisia.

INDIGÓFERA. INDIGO. Leguminosæ. Shrubs and per, herbs with pinnate lvs. or sometimes reduced to 1 lft., papilionaceous fls. in axillary racemes, and cylindrical pods; grown for ornament in borders and shrubberies, and some species formerly for indigo and now run wild. Most of the species are not hardy in the northern states. Propagated by seeds and cuttings.

amblyantha. Shrub to 6 ft.: lfts. 7-11, to 1½ in. long: fls. pink, ¼ in. long, in racemes shorter than the lvs. China; hardy N.

Anil: I. suffruticosa.

australis. Shrub to 4 ft.: lfts. 9-17, to 34 in. long: fls. red, about 14 in. long, in racemes about length of lvs. Australia.

decòra: I. incarnata.

divaricata. Differs from I. Kirilowii in its lavender fls. Habitat not definitely known.

Dosùa. Low shrub: lfts, 21-31, to ½ in. long: fls. red, to ½ in. long, in racemes about length of lvs. India. Var. tomentòsa is more pubescent, with longer lvs. and racemes. tomentosa is more pubescent, with longer lys. and racemes.—Plants in cult. under this name are likely to be I. Gerardiana and I. stachyodes. The latter, I. stachyodes also from India, apparently specifically distinct, differs from I. Dosua in being more vigorous, bearing more numerous acutish lits, longer and stouter racemes, and has dense brownish pubescence.

floribúnda: I. Gerardiana.

Gerardiana (I. floribunda). Shrub to 6 ft., much branched: Ifts. 13-21, to $\frac{1}{2}$ in. long: fls. rosy-purple, $\frac{1}{2}$ in. long, in racemes about length of lvs. India.

hebepetala. Tall shruh: lvs. to 6 in. long, lfts. 7-11, opposite, ovate-oblong, to 1½ in. long, obtuse: fls. pale pink to deep crimson-red, to 3½ in. long, in lax tapering racemes 2-4 in. long. Himalayas.

incarnàta (I. decora). Shrub to 2 ft.: Ifts. 7-13, to 2 ½ in. long: fs. pink with white standard, to 3½ in. long, in racemes longer than lvs. China. Var. álba has white fis.

Kirilòwii. Shrub to 4 ft.: lfts. 7-11, to 1½ in. long: fls. bright rose, ¾ in long, in racemes longer than lvs. N. China, Korea; hardy N.

leptosépala. Per., the decumbent sts. to 2 ft. long: lfts. 5-9, to 1 in. long: fis. pink or purplish, 1/4 in. long, in racemes longer than lvs. Ga. to Mex.

Potaninii. Shrub to 5 ft.: lfts. 5-9, to 1½ in. long: fls. lilac-pink, ½ in. long, in racemes longer than the lvs. China; hardy N.

pseudo-tinctòria. Small shrub differing from I. tinctoria in racemes longer than lvs., lfts. usually 11, and corolla red. Asia.

stachyòdes: see I. Dosua.

suffruticosa $(I.\ Anil)$. Shrub to 6 ft.: lfts. 11-13, to $1\frac{1}{2}$ in. long: fis. orange, $\frac{1}{2}$ in. long, in racemes shorter than lvs. W. Indies; nat. in S. U. S.

tinctoria. Shrub to 2 ft.: lfts. typically 9, but sometimes to 17, to 3/4 in. long: fls. reddish-yellow, 1/4 in. long, in racemes shorter than lvs. Tropics.

INFERIOR: beneath, lower, below; as an inferior ovary, one that is below the calyx-leaves.

INFLATED: blown up; bladdery.

INFLORESCENCE: mode of flower-bearing; technically s correct but much more common in the sense of a flowercluster.

INGA. Leguminosæ. Trees or shrubs with pinnate lvs. of large lfts., the petiole often winged, large fls. in racemes, spikes or heads, not papilionaceous, the stamens long-exserted,

often 4-angled pods thickened on the margins: native in trop. Amer, where some of the species are planted for shade in coffee plantations and as windbreaks; the fleshy pulp around the seeds is also an article of food. Some of them stand in S. Calif. and S. Fla.

dülcis: Pithecellobium dulce.

Feuillei. To 30 ft.: lvs, of 6-8 lfts., the petioles winged: fls. white: pods flat, to 2 ft. long. Peru.

laurina. Guama. To 50 ft.: lvs. of 4-6 lfts.: fls. white, fragrant, in long racemes: pods flat, 6 in. long. Trop.

pulchérrima: Calliandra Tweedii.

Samán: Samanea Saman.

vers. Guaba. To 50 ft.; lvs. of 8-12 lfts., the petioles winged: fls. white, in short spikes: pods 4-ribbed, to 6 in. long. Trop. Amer.

INGENHOÙZIA. Malvaceæ. A few Mexican shrubs or subshrubs, one sometimes planted in warm regions. I. triloba. To 10 ft.: lvs. alternate, parted nearly to the base into 3-5 narrow lobes. or the upper lvs. may be mitten-shaped or entire: fls. white turning to pink, about 1 in. long: fr. a caps. about ½ in. long.

INKBERRY: Ilex glabra.

INODES: Sabal.

INSERTED: attached; as of a stamen growing on the corolla.

INSIDE-OUT FLOWER: Vancouveria parviflora.

INTERRUPTED: not continuous; in particular, the interposition of small leaflets or segments between large

INULA. Compositæ. Showy herbaceous perennials, mostly hairy, with alternate or basal lvs. and solitary or few daisy-like heads, yellow, seldom white; pappus of bristles; native in Eu., Asia and Afr.

The species grow well in the average garden soil but require a sunny situation. Propagated by division and by seeds. Useful in the border, and mostly hardy North.

acaulis. Stemless: lvs. all basal, oblong-spatulate, entire, to 1½ in. long: heads solitary, yellow. Asia Minor.

bifrons. Bier Bien., sticky-glandular: lvs. oval-oblong,

británnica (Aster orientalis). To 1½ ft., hairy: lvs. lanceolate, slightly toothed: heads lemon-yellow, to 1½ in. across. June-Aug. Eu., Asia.

bubonium: I. ensifolia.

dvsentérica: Pulicaria dysenterica.

ensifòlia (I. bubonium). To 2 ft., nearly glabrous: lvs. linear-lanceolate: heads yellow, 1½ in. across. July-Aug. Eu., N. Asia.

glandulòsa. Caucasian I. To 4 ft., hairy: lvs. obiong-spatulate to oblong, entire: heads solitary, yellow. Cau-casus. Var. laciniàta has fringed half-drooping golden-yellow rays. Var. supérba is listed as an improved strain.

glauca. Per. to 15 in.: lvs. ovate to obovate, to 21/2 in. long, cordate, glaucous above, margins densely ciliate, entire: heads usually 1-2, to 1½ in. across. Turkestan.

grandiflòra. To 4 ft., hairy: lvs. elliptic-oblong, toothed, to 4 in. long: heads solitary, orange-yellow, to 5 in. across. Himalayas, Caucasus.

Helènium. Elecampane. To 6 ft.: lvs. oblong, to 2 ft. long, toothed, velvety beneath, rough above: heads yellow, to 4 in. across. Eu., N. Asia; widely nat. in E. N. Amer.

hirta. To 15 in.: lvs. lanceolate or ovate-oblong, nearly entire, reticulated: heads yellow, to 2 in. across. Aug. Eu., W. Asia.

Hookeri. To 2 ft.: lvs. oblong-lanceolate, to 5 in. long, glandular, denticulate: heads to 2½ in. across, ray-fis. pale to orange-yellow. Himalayas.

japónica. To 7 ft. or more, much branched above: lvs. incised-palmate, lobes or segms. dentate, basal ones to 1½ ft. long, st.-lvs. smaller: heads corymbose, peduncled, ray-fis. yellow to orange. Japan.

limonifòlia. To 1 ft., shrubby, gray-pubescent: lvs. ovate or oblong-spatulate, entire: heads yellow. Greece.

macrocéphala: I. Royleana.

magnifica. Per. to 4 ft.: upper lvs. ovate-oblong, acuminate, coarsely toothed, setose-pilose: heads yellowish-orange, to 6 in. across or more, on peduncles about 1 ft. long. Caucasus.

montana. To 1½ ft.: lvs. lanceolate, entire, hairy: heads solitary, 1½ in. across, with many narrow yellow rays. S. Eu.

Öculus-Christi. To 2 ft., silky-hairy: lvs. oblong, entire: heads yellow, about 1 in. across. Eu.

odòra: Pulicaria odora.

rhizocéphala. Bien, steinless: lvs. in basal rosettes, oblong, to 3 m long, slightly toothed: heads 10-20, in dense clusters 2 m. across. Asia Minor.

Royleana (I mucrocephala). To 2 ft.: lvs. ovate, to 10 in. long, toothed, tomentose beneath: heads orange-yellow, to 4 in. across, buds conspicuous, black. Himalayas.

salicina. To 2 ft., nearly glabrous: lvs. lanceolate, usually entire, sessile, cordate or rounded at base: heads golden-yellow, 1½ in across. Eu, Asia.

squarrosa. To 1 ft., erect, somewhat branched: lvs. oblong, somewhat scabrous, acuminate: heads solitary or corymbose, involucral scales reflexed, ray-fis. yellow. Cent.

INVERTED: turned over; end-for-end; top-side down.

INVOLUCEL: a secondary involucre; small involucre about the parts of a cluster, prominent in some of the Umbellifere.

INVOLUCRE: a whorl or aggregation of small leaves or bracts standing close underneath a flower or flower-cluster.

IOCHRÒMA. Solanaceæ. Trop. shrubs and small trees sometimes grown under glass and in the open in warm or subtrop. parts, with entire often large lys. and showy tubular or bell-shaped fls. in pairs or sometimes clusters, purple, blue, scarlet, yellow or white. Propagated by cuttings in Feb. or early Mar., and by seed when obtainable.

cárneum: hort. name.

coccineum. Shrub, the branches pubescent: lvs. oblong, wavy, long-acuminate: fls. scarlet, 2 in. long, in drooping clusters Cent Amer.

fuchsioldes. Shrub, nearly glabrous: lvs. obovate to oblong, very obtuse: fis more or less clustered, drooping, orange-scarlet, 1½ in. long. Peru.

hýbridum: hort, name.

lanceolatum. Shrub to 8 ft., pubescent: lvs. ovate or oval-lanceolate, acute: fis. rich deep purple-blue, to 2 in. long, in umbels. Ecuador.

purpureum: hort, name,

tubulòsum. Shrub to 8 ft, pubescent: lvs. ovate, acute or acummate: fls. deep blue, 1½ in. long, in drooping clusters. Colombia.

IONACTIS: Aster linariifolius.

IONÍDIUM. Violacex. Herbs or rarely shrubs of wide distribution with simple lvs. and irregular fls. saccate or gibbous at base, solitary or in racemes in axils.

linearifòlium (Viola linearifolia). To 1½ ft.: lvs. oblong-linear or obovate, to 2 in. long and ½ in. wide: fis. bluish or bluish-white, ¼ in. long. W. Indies.

IONOPSIDIUM. DIAMOND-FLOWER. ciferæ. A single flower-garden ann., I. acaule, from Portugal, adaptable also to pots in the cool greenhouse. It is a running miniature, the violet or sometimes white dianty little fls. rising 3 or 4 in. above the ground on very slender stalks: lvs. very long-petioled, the blade nearly orbicular, to ½ in. across.—Seeds may be sown in early spring for bloom before midsummer; or in summer for autumn bloom; or in autumn for spring bloom, the transplants being carried over in pots under glass. See that the plant is well protected from drying winds and burning sun.

IONÓPSIS. Orchidacex. Small genus of trop. American epiphytic orchids similar to Rodriquezia but differing in possessing shortly spurred sepals and not a spurred lip and in having much smaller indistinct pseudobulbs. Cult. as for Oncidium; see Orchids.

satyrioldes (I. testiculata). Plant small, to 12 in. high: lvs. terete, to almost 6 in. long and ½ in. wide: infl. racemose or narrowly paniculate; fis. creamy-white often with purple lines, small, about ½ in. long; lip entire, scarcely longer than sepals. Mar.-Nov. Honduras, Costa Rica, W. Indies.

testiculata: I. satyrioides.

utricularioides. Plant to 30 in. high: lvs. basal, flat, to nearly 7 in. long and 34 in. wide: infl. racemose or spreading-paniculate; fls. white to pale rose often veined or variegated with purple; lip 2-lobed, much longer than sepals. Jan.—July. Fla. and trop. Amer.

IONOXALIS: Oxalis.

IPECAC, AMERICAN: Gillenia stipulata.

IPOMČA. IPOMEA. MORNING-GLORY (see also Argyreia). Convolvulaceæ. Plants of many kinds and habits but mostly known to hort, as twining ann. and per. herbs: lvs. alternate, simple or compound: fls. funnelform, with 5-angled limb. Differs from Convolvulus in having a capitate instead of 2 linear stigmas, and from Calonyction and Quamoclit in the stamens and style not prominently exserted and other characters. The species are widely distributed over the earth.

Ipomeas are of easy cultivation in any good soil. In the North the tubers of the perennial kinds should be dug up and kept indoors over winter. They are useful for covering fences, trellises and banks and may also be grown in pots. Propagated by seeds which germinate more readily if small notches are filed in them. The perennial species are increased by cuttings under glass, and rarely by division or grafting on common stocks. grafting on common stocks.

althmoides is listed as a per, trailer with silvery lvs. and pink fls; the name has no known botanical standing.

Bathtas. Sweet-Porato (which see). Per with trailing rooting sts. and tuberous edible roots: lys varying from ovate and entire to digitately lobed, to 6 in long; fls. roseviolet or pule pink, 2 in. long, infrequently produced in U.S. Tropics; cultigen.

Bona-Nox: Calonyction aculeatum.

cairica. Per, twining: lvs palmately divided into 5 oval lfts. to 2 in long; fls. pale pink, to $2\frac{1}{2}$ in. long. Tropics.

cardinalis: Quamocht Sloteri.

coccinea: Quamocht coccinea.

crassicallis (I. fistulosa) Sts fleshy, becoming woody, prostrate or ascending: lvs. heart-shaped, to 6 in. long, acuminate, glabrous above, soft-hairy beneath, petiole hairy, 1-2 in. long; fls purplish, to 3 in. long, solitary or in pairs; sepals rounded at apex, imbricated: caps. globose, elabrous. Basal experience. glabrous. Brazil.

digitàta: I paniculata.

dissécta. Per, twining, sts. hairy: lvs. to 4 in. long, digitately 5-7-parted into toothed or lobed segms.: fls. white with purple throat, to 2 in. across, the calyx much enlarged in fr. Tropics, Ga. to Fla. and Tex.

fistulòsa: I. crassicaulis.

grandifidra: Calonyction aculeatum.

hederacea. Ann, twining, hairy: lvs. cordate-ovate, to 3½ in long, usually 3-lobed to the middle: fis. blue or pale purple, to 2 in. long Trop. Amer.—Differs from related species in the sepals contracted into linear recurved or spreading tips. Improved forms are grandiflora and supérba.

hederifòlia: Quamoclit coccinea var.

hirsùtula. Ann, twining or trailing, pubescent: lvs. cordate-ovate, to 3 m. long, becoming deeply 3-lobed: fis. bright bluish-purple to white, to $2\frac{1}{2}$ in. long. Trop. Amer.

Horsfallies. Per., twining: lvs. palmately divided into 5-7 obovate entire thick lfts. to 4 in. long: fls. rose or pale purple, to 214 in. long, the limb becoming revolute. Tropics. Var. Briggsii has many magenta-crimson fls.

Hûberi: I. purpurea var.

imperialis: I. Nıl.

Leari. Blue Dawn-Flower. Per., twining: lvs. cordate-ovate, to 8 in. long, entire or sometimes 3-lobed, finely pubescent beneath: fls. blue turning pink, the tube white, to 5 in. across. Trop. Amer.

leptophýlla. Bush M. Per., with large tuberous roots and erect or ascending sts. to 4 ft: lvs. linear, to 5 in. long, entire: fls. purple or pink, 3 in. across. S. D. to New Mex.

limbata: I. Nil va.

máxima: plants so listed in the trade are probably forms of I. hederacea; the I. maxima of botanists is the Indian I semaria

melanotricha. Vigorous long twiner with blackish retrorsely hairy-hispid sts.: lvs. 5-7-lobed with broad rounded sinuses, not dentate: fls. purple, 4 in. or more long, strongly ribbed; calyx long-hairy. Mex.; cult. in S. Tex.—Has been confused with I. setosa.

mexicana grandiflora: Calonyction aculeatum.

montana: Jacquemontra montana.

mutábilis. Per., twining: lvs. broad-cordate-ovate, to 6 in. long, entire or sometimes 3-lobed, gray-pubescent beneath: fis. blue or purplish, the tube white, to 3½ in. long. Trop. Amer.

Nfl. Per., twining or trailing, hairy: lvs. broad-cordate-ovate, to 6 in. across, usually shallowly 3-lobed: fis blue, purple or rose, 2 in. across, often double Tropics. Var. limbata (I. limbata), fis violet-purple margined with white.—Here belong the Imperial Japanese morning-glories, I. imperials of hort.

noctiflora: Calonuction aculeatum.

pandurâta. Wild Sweet-Potato Vine. Per., with large tuberous root, trailing or twining: lvs. broad-cordate-ovate, to 6 in. long, entire or fiddle-shaped: fis. white with purple throat, to 4 in. across. Conn. to Fla. and Tex.

paniculata (I. digitata). Per., twining or trailing: lvs. to 7 in. across, digitately parted nearly to base into 5-7 narrow entire lobes: fis. hlac or pink, to 3 in. across; sepals thick, much shorter than tube of corolla. Tropics.

Pés-cápræ. Creeping to 60 ft, roots to 2 in thick and 10 ft. long: lvs. orbicular to elliptical, broader than long, to 4 in. across, fleshy: fls. blue or purple, bell-shaped, to 2 in. long. Tropics and semi-tropics; Ga. to Tex.

pteròdes. Per, twining, with large tuberous root: lvs. cordate, to 3 in. long: fis. yellow, 2 in. long and across. Panama to Guiana.

purplies. Common M. Ann., twining, sts. hairy: lvs. broad-cordate-ovate, to 5 in. long, entire: fls purple, blue or pink with pale tube, to 3 in. long, sometimes double. Trop. Amer, and more or less nat. Var. álba has white fls. Var. Hûberi (I. Huberi), lvs. marked silvery-white, fls. pink to purple and margined white. Var. violàcea, fls. violet-purple, a double fld.-form is known.

Ouamoclit: Quamoclit pennata.

rùbro-cærùlea: I. tricolor.

sanguinea: a bright red hort. form, perhaps of I. pur-purea.

scarletina: hort. form, perhaps of I. purpurea.

Schiediana. Sts. woody at base: Ivs. suborbicular to cordate, acute to acummate: fls. pale blue, in axillary and terminal racemes of 6-10, stamens included, style nearly exserted. Probably Mex.

sepiària (I. marima, in part). Per. twining vine: lvs. ovate-cordate, to 3½ in. long, rarely lobed, glabrous or harry: fls. white to pale purple with dark purple eye, to 2 in. long. India.

setòsa. Brazilian M. Per., twining, sts. with stiff purphsh hairs: lvs. cordate-ovate, to 10 in. across, 3-lobed and grape-like, notched and toothed: fls. rose-purple, to 3 in. long, calyx nearly smooth. Brazil.—See I. melanotricha.

Sloteri: Quamoclit Sloteri.

tiliàcea. Per, twining: lvs. cordate-ovate, to 3 in. long: fls. purple or pink with darker throat, rarely white, to 2½ in. long. Trop. Amer.

tricolor (I. rubro-cærulea). Per. but grown as ann., twining: lvs. cordate-ovate, to 5 in. long, entire: fls. purplish-blue, the tube white and limb red before opening, to 4 in across. Trop. Amer.

Tùba: Calonyction Tuba.

tuberòsa. Per vine: lvs. to 8 in. across, digitately parted nearly to base into 5-7 narrowly elliptical acuminate entire lobes: fls. yellow, sepals herbaceous, half the length of corolla-tube. Tropics.

violàcea: I. purpurea var.

IPOMŒA, STAR: Quamoclit coccinea.

IPOMOPSIS: Gilia rubra.

IRESINE. BLOOD-LEAF. Amaranthaceæ. Herbs and subshrubs, sometimes climbing, with ornamental foliage, the fls. small and borne in panicles; native in many trop. and temp. regions, a few cult. as house and bedding plants.

Propagated by cuttings taken in late summer for house plants and in February or March for summer bedding purposes in the North; the stock plants for these are easily wintered over. They are handled in the same way as coleus. They are commonly grown only as seasonal plants for foliage and not allowed to go into the flowering stage.

acuminata: I. Lindenis.

Émersonii: I. Lindensi. formòsa: I. Lindensi.

Hérbstii (Achgranthes Herbstii. A. Verschaffeltii). To 6 ft.: lvs. broad-ovate, to 5 m. long, notched at tip, purplished or green with yellowish veins. S. Amer. Var. aureoreticulăta has green or greenish-red lvs. with yellow veins.—I. Wállisii of the trade probably belongs here.

Lindenii (I. acuminata. Achyranthes acuminata). Lys. usually deep blood-red, narrow and sharp-pointed. Ecuador.—Here evidently belong I. Emersonii (Achyranthes Emersonii) and I. formosa.

Wállisii: I. Herbstii.

IRIDACEÆ. IRIS FAMILY. IRIDS. About 60 widely distributed herbaceous monocotyledenous genera having corms, bulbs or root-stocks, mostly narrow basal lvs., bisexual fls. subtended by bracts or spathes, the perianth of 6 segms. in 2 series, 3 stamens, inferior usually 3-celled ovary, and capsular fr. The family yields many ornamental subjects, some medicinal products, and other genera have minor economic uses. Some of them are hardy perennials for the open garden, others are summer "bulbs," and a few are known mostly with us as glasshouse subjects. There are no special difficulties in the cult. of the irids except, perhaps, that some of the bulbous and stoloniferous species of iris may require careful attention to conditions. Genera known to cult. in N. Amer. are: Acidanthera, Anapalina, Antholyza, Aristea, Babiana, Belamcanda, Chasmanthe, Cipura, Crocosmia, Crocus, Curtonus, Cypella, Dierama, Diplar-rhena, Eustylis, Ferraria, Freesia, Geissorhiza, Gladiolus, Herbertia, Hermodactyius, Iresperantha, Hexaglottis, Homeria, Iris, Ixia, Lapeirousia, Libertia, Melaspharula, Moraea, Patersonia, Rigidella, Herbertia, Hermodactylus, Hes-Nemastylis, Neomarica, Patersonia, Rigidella, Romulea, Salpingostylis, Schizostylis, Sisyrinchium, Sparaxis, Streptanthera, Synnotia, Tigridia, Trimeza, Tritonia, Watsonia.

IRIS. IRIS. Iridacex. Per. herbaceous plants widely spread in the northern hemisphere, of 200 species or more, many of them highly prized for the showy and characteristic bloom. The fis. vary greatly in conformation and color. The general structure is a perianth of 6 parts united below into an evident or a very short tube; the 3 outer parts or segms, are mostly long and hanging or horizontal and are known as the "falls," the narrowed lower or stem-like part being the "haft"; the 3 inner segms., known as "standards," are commonly erect or inwardly or outwardly arched, often small, being narrowed below into a "haft" or "claw." There are 3 flat and more or less petal-like colored stylebranches, covering the 3 stamens beneath, the stigmatic part being underneath and at some distance from the notched or crested tip of the branch. The ovary is inferior, and it matures into a 3-celled more or less angled many-seeded mostly dry pod or caps. The fls. are borne singly or few together in the axils of green bracts or spathes, at the top of the st. or culm and some-times from the axils. The infl. from each spathe is known technically as a "head," whether the fls. are one or several; when the fls. are more than one in a spathe or head, they follow each other successively, the old ones withering.

These plants yield a wide range of color, from the lilacs and purples to whites, browns and yellows. The color ar-

rangement is difficult to describe because of the complicated rangement is diment to describe occause or the complicated markings and the shading of one tint into another. In the lilac series of colors the tints are numerous from blue to purple and it is practically impossible to express them in words; and different persons will describe the same plant in different color terms.

words; and anterent persons will describe the same plant in different color terms.

Irises are spring- and summer-flowering plants, the common kinds following the late tulps. They are excellent for borders and also in special beds by themselves; if shaded by bushes or other tall plants they may not make proper late root development for the next years bloom.

The "blue flags" of old gardens are irises, mostly of the bearded type. The horticultural kinds have been greatly improved in recent years and the named varieties are very numerous. In a work of this kind only the species can be definitely referred to botanical species, as they are widely variable derivatives and probably in part the results of old hybridizations. One desiring descriptions of varieties should consult books and reports and the publications of the iris societies. The American Iris Society publishes The American Iris Society publishes the iris societies.

The great diffusion of horticultural irises has arisen in the past from the Kaempferi group or Japanese kinds, and the Germanica group or German bearded kinds. A new group of horticultural irises is undoubtedly to arise from the American species, most of which have been recognized and separated only recently. The introductions to commerce in the past decade of new American irises are represented by I. Albispiritus, callulopha, chrysæola, chrysæola, cutrevistata, citriviola, elephantica, fourchiana, fulvaurea, giganticærulea, ianthina, iodantha, Kimballiæ, lincipetala, ludovicuna, miraculosa, mississippiensis, morcolor, anantha, oolopha, regalis, rhodantha, thocherysea, rivularis, rosifora, savannarum, Thomasii, tripetala, vinicolor, violulutea, violipurpurea, virulis, viridivinea; and those longer in cultivation are I. foliosa, fulva, lacustris, missouriensis, priematica, rubicunda, Shrevei, verna, versicolor, virginica among the eastern American types. Many other souriensis, prismatica, runcumda, Surevei, verna, versicolor, virginica among the eastern American types. Many other species will be introduced. Breeding of new combinations and races is under way, with promise of a new type of horticultural iris. It is of the greatest importance that care be taken at the beginning to make dependable records and to forestall confusion in nomenclature.

Latin-form names in the trude of no botanical standing or of unknown origin are listed for whatever record they may be worth. Probably most of them are horticultural forms named as if they were regular species; the value of these forms to plantamen is not involved in these statements but only the nomenclature in the interest of clarity. The habit only the nomenature in the interest of caracty. The most of giving a Latin binomial to a horticultural variety leads directly to confusion and should be discontinued; thus, aurea maculatu is not a variety of Iris aurea, as one would suppose, but a form of I. pumila.

Special terminology has long been developed in descriptions of the iris flower. The outer three flower parts (sepals)

tions of the iris flower. The outer three flower parts (sepals) are known as the falls, each consisting of an expanded part or blade and a contracted base or haft (sometimes called claw). The inner flower parts or leaves are the standards (petals), consisting also of a blade and claw (sometimes called haft). Still inside are three narrow colored petallike parts, which are style-branches, the stigmatic parts being at the base underneath of terminal expansions. Beneath the style-branches are the anthers.

The classes of iris

Iris separates rather naturally into two divisions: species

Iris separates rather naturally into two divisions: species with rhizomes or rootstocks that are mostly thick and durable; species with a basal bulb rather than rhizome. There is really a third division, with a corm rather than bulb represented by the single species, I. Sisgruchaum.

The rhizomatous kinds are again of three main groups: the bearded irises or pogons, in which the basal half of the fall is variously provided with beards or hairs; the crested or evansia irises, in which the falls bear a central ridge or serrated or cockscombed crest; and the beardless irises, or apogons, in which the falls are free of beards or protuberances.

The bulbous kinds may be ranged in three groups: the juno irises, with standards spreading or deflexed and small or even minute, the bulb bearing thick fleshy roots from the or even minute, the bulb bearing thick fleshy roots from the base at the resting stage; the xiphiums, or so-called Spanish and English irises, with large and erect standards and smooth bulbs without roots in the resting stage; the reticulatas, differing from the xipniums particularly in the netted covering of the bulbs and a different nativity.

Included in the general bearded group are associations of various habit and floral characters: the true pogonirises in which the beards or hairs are in a line on the fall and the seeds are without an evident or a comprisons aril the

in which the beards or hairs are in a line on the fall and the seeds are without an evident or a conspicuous aril, the rhizomes being stout and more or less regular, and the leaves commonly broad; and other subgroups in which the seeds have prominent cream-colored arils and the beards may be of different character, as the regelias with stolons arising from the main rhizome and flowers 2 or 3 in a spathe and beards in a line on both fall and standard, the pseudoregelias in which the rhizome is compact and without

stolons and with hairs in lines on the fall and capsule pointed, and the oncocyclus species with reddish crowded rhizome bearing stolons and 1 flower to a spathe or stem and scattered hairs on the fall.

and scattered hairs on the fall.

Apogons or beardless rises are the most numerous in species and the most widely distributed. They are the only ones native in North America, and they occur in the temperate regions of Asia and Europe, often in wet or moist places; the leaves are prevailingly narrow or grass-like. The pogons or bearded irises are native from Portugal and Morocco through southern and central Europe to Asia Minor, Manchuria and western China. The oncocyclus group is small, native in southwestern Asia to Egypt. The evansias or crested irises are a small group in North America and eastern Asia. Regelias are native in the Afghanistan and Turkestan region north of the great mountains, and pseudoregelias east of the Pamirs on the southern side of the Himalayas. The junos are native in the Mediterranean region to Asia Minor, Turkestan and the frontiers of India. The xiphiums proper are in southwestern Europe and northwestern Africa, and the reticulata group in the Caucasus, Asia Minor and southern Palestine.

Cultivation of iris

Irises are planted in either autumn or spring. In the colder parts of the country, spring planting is to be preferred unless transplanted soon after blooming so that the roots become well established before winter; if the bearded concer parts of the country, spring pianting is to be preferred unless transplanted soon after blooming so that the roots become well established before winter; if the bearded iris varieties are divided and planted just after the flowering period, in July or August (in the North) bloom should be obtained the following year, if proper land and care are provided. The kinds with thick heavy rhizomes may be moved when dormant, but those with slender root parts only when new roots are starting so that the plants may become quickly established. Clumps of strong iris should produce 8 or 10 flowering stalks, and the plants should be spaced for this result, say 1½-2 feet apart. Irises are durable perennials, but new plantings are likely to give best results in bloom. A little chemical fertilizer should give good returns, but stable-manure is not advised. Winter mulching is desirable in cold climates, particularly the first year. There are diverse opinions and practices as to the cultivation of iris, which indicates that the plants may thrive under varying conditions.

Named horticultural forms of bearded iris (pogoniris) are particularly numerous and constitute the larger part of the current listed varieties aside from the very different Japanese race; they have been known under the collective name of German iris, but this designation is inexact and should be given up (see Iris germanica). The bearded horticultural irises are commonly classified as to stature into dwarf, intermediate, and tall. The rhizome is thick and stands near the surface of the ground, and will withstand considerable drying and exposure; the bearded irises require an open sunny exposure and well-drained ground, and should be shallowly planted. It is well to take up the plants about every fourth year, after blooming, remove the old and weak parts of the rhizomes, and replant in newly worked ground.

Horticultural beardless kinds (apogoniris) are of several subgroups, of which the Japanese and Siberian irises are

old and weak parts of the rhizomes, and replant in newly worked ground.

Horticultural beardless kinds (apogoniris) are of several subgroups, of which the Japanese and Siberian irises are the most prominent (see Iris Kaempfert). The rhizome in the apogons is mostly rather slender or fibrous and will not withstand much exposure. Most of the kinds thrive best in moist places; they usually do not prosper with lime. The Japanese irises are of two groups, one derived apparently from I. Kaempfers and the other from I. kavipata, the common cultivated varieties probably being from the former. I. Kaempfers is not a real bog plant and should be kept comparatively dry except when in active growth, at which time the spaces or channels between plants may be filled with water. I. kavipata, however, is a bog plant and thrives where continuously wet. Some growers recommend application of liquid manure to Japanese mises just before blooming if specially good flowers are desired.

Regelia and pseudoregelia mises are rather difficult to manage except in mild countries, as southern California, where there are dry and moist seasons, the moisture coming so late that the plants do not start into autumn growth. The roots may be hardy in the East and North but they are dormant in summer and are likely to start in the autumn and be injured. If lifted when the foliage is about ripe, the roots may be kept dry and then planted so late that they will not start till spring. The oncocyclus irises require similar treatment, although the odd I. susianus (the commonest one of them in cultivation) is rather difficult to grow permanently.

monest one of them in cultivation) is rather difficult to grow permanently.

Horticultural crested irises (evansias) are about a half dozen species, not greatly modified by cultivation. There are no general rules for culture, as they are of various requirements and degrees of hardiness. I. juponica thrives in California; I. tectorum thrives where the winters do not destroy the evergreen foliage. I. gracitipes of Japan and I. cristata of North America are hardy and excellent.

Bulbous irises are not generally grown, as they are likely to start into growth in autumn and they may need protection in cold regions. As garden plants, where they can

be given good conditions and care, they are excellent because of their showy often orchid-like early bloom. They do well in California, and can be raised successfully also in the northeastern states. They are sometimes bloomed indoors after the manner of tulips, and good results are attained if the bulbs have been properly piened. The bulbs are planted in autumn for this purpose, in deep pans or boxes, then set outside and brought in as required like other hardy bulbs, or placed in a cool house and then grown on slowly in a temperature of 50° to 55°, for bloom in late winter or early spring

on slowly in a temperature of 50° to 55°, for bloom in late winter or early spring.

Propagation of irises is commonly by dividing the rhizomes, or by using the offsets or bulbels in the bulbous species. Each piece of the rhizome should preferably bear at least one strong bud. Bearded irises are commonly divided just after flowering, so that flowering buds may be formed before autumn. Beardless and crested species may be handled similarly, but preferably, as a rule, by division when growth begins in spring.

Seeds commonly graphing to provide readily in spring if sown incommonly graphing to the spring of sown incommonly graphing to the spring of sown incommonly graphing to the spring it sown incommonly graphing to the spring it sown incommonly graphing the spring it sown in
when growth begins in spring.
Seeds commonly germinate readily in spring if sown immediately on ripening the previous year. Transplant into permanent position as soon as the seedlings are large enough to handle; the bearded irises usually bloom the year following germination, but other kinds mostly the second year.

Species of iris cultivated, or so listed, in North America

To economize space in the following brief diagnosis of species, or of plants under Latin names, letters are employed to distinguish the group or association into which the plant falls: B, plant bulbous: R, plant rhizomatous; a, apogon or beardless; c, crested or evansia. j, juno; o, onceyclus: p, pogon or bearded; ps, pseudoregelia; reg, regelia; ret, irids with reticulated bulbs; x, xiphium. It is understood that the entries here are for the purpose of accounting for the Latinized binomials appearing currently in lists and literature and not as recommendations. Other Latin-form names appearing in lists are likely to be only hort. vars., particularly of the common bearded irises.

acoroides: I. Pseudacorus.

Acorus aurea: listed as a beardless iris of the spuria type: hort

acuta: I. sibirica.

æquilòba: I. pumila.

alata (I. scorproides). B, j: nearly stemless, the fl-tube reaching to the ground: lvs. 6-12 in.: falls 3-4 in. long, blue or sometimes white or variegated white, yellow-keeled, haft broadly winged; standards 1 in. long. Spain to Sicily and Tripoli.

álba: white-fld. forms of many species.

Albertii. R, p: lvs. erect, broad, to 20 in.: st. branched, each branch 3-fld.: falls lavender-purple or occasionally yellow venned reddish-brown, obovate; beard white tipped with yellow; standards pure white. May. Turkestan.—Place in hot dry position.

álbicans (R. florentina var. albicans). R, p: much like a white I. germanica but lateral fls. closer and on shorter branches that are covered in the searcely scarious bracts; falls look as if pointed as they hang; standards without hairs or barbs. Probably Arabia; employed in Mohammedan graveyards.

Albispfritus. Ghost I. R, a: st. erect and rigid: lvs. 3-5 in number and 2-3 ft. long: fls. large, white with yellow signal; falls to 5 in. long, undulate and toothed; petals shorter, spatulate, broad claw greenish. S. Fla.

albopurpùrea: I. lævigata.

ánglica: I. xiphioides.

aphylla. R. p.: to 15 in., branched below: lvs. glaucescent, 6-12 in., withering in autumn: falls and standards purple, beard white or tipped blue. E. Eu.—Synonyms appearing in lists are I. biflora, bifurca, bohemica, breviscapa, extrafoliacea, falcala, Fieberi, furcala, hungarica, nudicaulis, reflexa, rigida, Schmidtii, subtriflora.

arenària: I. flavissima.

atrofúsca (I. Haynei). R, o: st. about 1 ft. concealed in lf.-sheaths: lvs. about 1 ft., broad: falls veined and dotted red-black, beards yellow tipped brown; standards similarly veined and dotted on gray ground. Palestine.

atropurphrea (I. Eggeri). R, o: st. to 8 in., 1-headed, fls. rather small: lvs. slightly glaucous, about 6 in.: falls somewhat oval, blade nearly black with a yellow and a velvety black patch, beard yellowish tipped purple; standards orbicular, reddish-purple. Syria.—See also I. germanica var. nepalensis.

atroviolacea: hort. offering of a dwarf bearded very early small-fld. Iris, velvety red-purple with white-tipped beard, said to be a var. of *I. pumila*. *I. atroviolacea* of old botanical publication is unidentified.

áttica: I. pumila.

auranitica. R, o: lvs. 6, to 10 in. long, nearly erect: falls and standards bronze-yellow with reddish-brown dots and veins, hairs yellow. Palestine.

aurea. R. a: st. 3 ft. or more, several-fid.: lvs. 2-3 ft.: fls. golden-yellow, 2 or 3 in a spathe; falls with frilled margin. Probably Kashmir.

azùrea: soft lavender-blue dwarf iris, probably not the botanical I. azurea.

Bakeriana. B, ret.: st. short or none: lvs. cylindrical and hollow, becoming 1 ft. or more, 8-ribbed: fl. fragrant, tube to 6 in. long; falls with violet ovate blade with central white and spotted area; standards deep lilac. Asia Minor, Mesopotamia.

baleárica: catalogue name.

balkana: I. Reichenbachii.

Bárnumiæ. R, o: st. 3-6 in.: lvs. linear, to 6 in.: fl. 1 to a spathe, self-colored, red-purple with darker veins; beard of close yellow purple-tipped hairs. Palestine to Egypt. There are yellow-fld. forms, var. urmiénsis (I. chrysantha). A form with outer lvs., in the tuft falcate is var. Mariæ (I. Mariæ, I. Heleniæ).

Bártonii: I. kashmeriana.

Báxteri: listed as a Siberian beardless with white slightly veined blue falls and blue standards.

bicolor: trade name of uncertain application.

biflora (I. lisbonensis. I. subbiflora). R, p: st. to 12 in., with small clasping lvs., and commonly 1 fl. which is deep blue-purple or violet-purple: lvs. to 9 in. long and 1 in. broad. falls obovate, to 2½ in. long, beard blue to yellowish; standards somewhat lighter. Portugal, Spain, N. Afr. Var. fragrans is listed.—Another I. biflora is I. aphylla.

bifurca: I. aphylla.

biglùmis: I. ensata.

Biliôttii. R, p: like *I. germanica* with red-purple falls and the haft is white with purple-brown veins: stigmatic crests iridescent: spathes long, narrow and green or scarious (if at all) only at the tip. N. E. Asia Minor.

binata: probable hybrid of I. aphylla and I. pumila.

Bismarckiana. R, o: st. 1 ft. or more, sheathed: lvs. 8 in., broad, glaucous: falls black-purple dotted and veined on cream-yellow ground, and standards with blue on cream-white ground; beard purple-black on yellowish ground.

Bloudowii (I. flavissima var. Bloudowii). R, p: st. to 6 in, leaf-bearing only at base, 2-3-fld: lvs. to 8 in. long and ½ in. broad: falls rounded, yellow and haft veined brownish, beard yellow; standards bright yellow. Turkestan to N. China.

bohèmica: I. aphylla.

Boissièri (I. heterophylla). B, x: st. about 1 ft., with 1 or 2 fts.: lvs. linear, channelled, about 1 ft. long: fall obovate, blue-purple with red-purple veins, yellow on haft, beard yellow; standards purple but reddish on lower part. Portu-

Bornmuelleri: I. Danfordiæ.

bosniaca: I. Reichenbachii.

bracteata. R, a: st. 4-12 in., bracted, 1-headed: lvs. few and rigid, linear, exceeding st.: falls broad-oblanceolate, yellow, veined brown-purple; standards short, yellow. Ore.

brévipes. R: to 6 in., st. zigzag, often reclining on the ground or ascending: fls. usually in pairs; falls violet-blue, crest yellow: caps. 6-angled, to 1½ in. long. S. La.

breviscapa: I. aphylla.

buchárica. B, j: st. to 18 in., with 5-7 fls.: lvs. broad, to 1 ft. long, glaucous underneath: falls 2 in. or more long, golden-yellow with white haft and with a wavy golden crest; standards small, pure white. Bokhara, Turkestan.

Bulleyana. R, a: st. to 18 in, hollow, with single head of 1 or 2 fis.: lvs. 18 in. long, ½ in. broad, glaucous underneath: falls obovate, blue-purple on creamy ground; standards oblanceolate, pale blue-purple. W. China, or perhaps a hybrid.

carrilea. B, j: st. 15 in., with 3-5 fls. in lf.-axils: lvs. about 8, broad, with white edge: falls with obovate-oblong bright lilac blade, crest whitish, yellow blotch in throat; standards to 1 in. long, drooping, lanceolate-pointed. Turkestan.—The name carrulea may also be applied to other blue-fld. irises.

cæspitòsa: I. ensata.

californica. R, a: usually referred to *I. macrosiphon* but differs in greater size (st. to 16 in. high), fis. cream-color with lilac veins. Calif.

callilopha. R, a: st. erect and stiff: falls to 4 in., with yellow haft and lilac or purple blade, haft-center orange-yellow with darker markings; standards of similar color as falls, yellow claw nearly wingless; radial zone of simal deep yellow with the outline of it streaked into the falls color. S. La.

canadénsis; I. setosa var. canadensis, east-American representative of an Asian and Alaskan species sometimes separated as I. Hookeri.

carolina, caroliniana: I. virginica.

Céngialtii, R. p. st. to 1 ft, 1-3-headed: lvs. about 6 in. long, slightly glaucous: falls broad-obovate, blue-purple, haft veined, beard white tipped orange; standards somewhat lighter color than falls. S. Tyrol, N. Italy.—Probably a form of 1. pullula, distinguished by less glaucous foliage and spathes pale brown rather than silvery and of more slender and lower habit.

chalcedónica: "light mauve and purple."

Chamseris (I stalica. I. lutescens. I. olbrensis. I. virescens). R, p: st. 1-10 in, commonly 1-headed and fis mostly 2 to spathe: lvs. 3-6 in. long and ½ in. broad, slightly glaucous; falls obovate, blue, red-purple, yellow or white, beard of same range but usually contrasting; standards slightly shorter; tube about 1 in. long. N. W. Italy and adjacent France. Var. Cámpbellii is listed as to 4 in. high with deep purple fis.—Often sold as I. pumila.

Chékillii: st 4 ft: beardless hort. iris, old rose overlaid with coppery yeans, lighter at edges.

chinénsis: I. japonica.

chrysæðla. R, a: stout and rigid: fls. violet-blue, with yellow signal and veins; petals broadly spatulate; sepals recurved-spreading. S. La.

chrysantha: I. Barnumiæ var. urmiensis.

chrysofor. R, p: a hybrid strain of hort, origin listed as to 1 ft, and of wide color range.

chrysógraphes. R, a: st. to 18 in., hollow, with 1 or 2 small lvs, the other lvs to 18 in. long, ½ in. broad: falls oblong, deep violet-velvety-purple, haft with golden venns; standards oblanceolate, deep violet. W. China.—Of the I. orientalis type.

chrysophenfeia. R, a: falls somewhat shorter than in I. calhlopha: radial zone of signal light yellow with the outline clearly separated or demarked from the general falls color. S. La. Var. álba is listed.

chrysophylla. R, a: probably a form of *I. californica* with lanceolate stigma-crests to ¾ in. long. S. Ore.

Chrysowegii: listed as a hybrid with grass-like lys., fls. royal purple.

citrea: dwarf bearded iris with yellow fls.

citricristata. R, as st. erect and stiff: fis. violet or violet-blue, signal of falls lemon-colored with a paler zone; falls to 4 in long, blade a little longer than halt and oval-obovnie; standards much shorter than falls, cuneate-spatulate. S. La., forming great colonies Var. alba is

citriviòla. R, a: st. erect and rigid: fls. deep violet with brilliant lemon-color on signal: falls recurved-spreading. haft greenish-white veined yellowish; standards same color as blade of falls. S. La.

Clárkei (I. hmalaica). R, a: like I. sibirica, but st. solid and usually branched, lvs. shining above and glaucous underneath, spathes all herbaceous and green. Himalayas, 6,000 11,000 ft.

Clusiana: a confused name, applied to two or three anacies.

columncata: listed name.

compacta: dwarf bearded: falls black-purple: standards violet-blue: hort.

concolor: one of the forms of bearded iris, probably to be associated with I. sambucina.

confusa. R, c: to 3 ft.: fls. 1 1/2 in. across, white faintly tinged with mauve, with yellow stain and orange spots; falls and segms. undulate-crenate at margins, crests ciliatefimbriate. Yunnan.—Some of the material grown as I. Wattu may belong here.

coreana is listed.

creténsis, crética: I. unquicularis.

cristata. R, c: st. 1-3 in. high, 1-2-fid.: lvs. about 6, to 9 in. long and 34 in broad: fis. blue, segms. obovate, to 134 in. long, the falls little longer than standards and bearing a white and yellow more or less dotted crest; tube slender and exceeding the spathes. Md. to Ga. and Mo. Var. alba, white-fid. race. Var. cærulea is listed.

cuprea: I. fulva.

cyanea: dwarf bearded iris with violet-blue fis.

cyprians. R, p: st. about 3 ft., with terminal head of 3 fts. and 2 or 3 lateral heads; lvs. somewhat blue-green, rather narrow, 2 ft.: falls wedge-shape, blue-lilac, beard whitish; standards paler than falls. Cyprus.

dahurica: I. flavissima.

Dånfordise (1. Bornmuelleri). B, ret.: st. 2-4 in., 1-headed: lvs. 2, at first short but becoming 12 in., 4-sided: falls with ovate-lanceolate orange blade veined and dotted olive-green; standards reduced to small bristles. E. Asia Minor.

darwásica (I. Suwarowii). R, reg.: to 1 ft.: lvs. glaucous fis. 3; falls and standards narrow, greenish-yellow veined reddish-brown, beard white tipped with blue, segms. all very acute, late Apr. Persia.

Delavayi. R, a: st. 3-4 ft. or more, hollow, with 2 or 3 heads: lvs to 2½ ft. and to 1 in. broad, glaucescent: falls orbicular and notched, violet-purple with white patch and markings; standards lanceolate, small. S. W. China.

delicatissima: tall hearded hort, iris, lilac-rose,

demawéndica. R. o: st. 6 in., with 1 lf. and fl.: lvs. 6-8 in. long, almost linear: falls deep violet-purple, veined and dotted, beard dark; standards paler. N. Persia.—Perhaps a form of I. vberica.

dichôtoma. R: single representative of the pardanthopdichótoma. R: single representative of the pardanthopsis section (Pardanthus-like) with many fis. in racemes on forked sts. 2 ft. or more high: lvs. 6-8, bluish-green and white-edged, to 12 in. long, borne fan-shaped: blade of falls nearly square and horizontal, white with brown-purple spots, haft barred and flecked; standards grayish-white striped purple. Sibera to N. China. Var. álba is listed.—Fls. late and then usually dies; seeds quickly produce new flowering plants; very floriferous.

Douglasiana (I. Watsoniana). R, a: st. to 20 in, simple and 1-headed or sometimes branched: lvs. equalling or surpassing st., about ½ in. broad: fis variable, lilar-purple to cream-white or white; blade of falls broadly oblanceolate, standards lanceolate and somewhat shorter. Calif. Ore. Var. pygmæa is said to be a dwarf form.

eburnea: dwarf bearded hort, iris: falls creamy-vellow: standards creamy-white.

Éggeri: I. atropurpurea.

elephántina. R. a: st. erect and rigid: fls. ivory-white: elepaantina. It, a: st. erect and rigid: iis. ivory-winte; falls to 4 in long, recurved, blade nearly or quite oval and exceeding greenish halt, with signal lemon-colored and radiating lateral veins; standards spatulate, shorter than falls. S. La. Var. 4lba is listed as having pure white fis.

elongàta: I. scarrosa.

ensata (I. bialumis I. cæspitosa. I. lactea. ensata (I. biglums I. exspitosa. I. lactea. I. longi-folia). R. a: making close clumps: st. 6-16 in. high, flat-tened, 1-headed: lvs linear, equalling or exceeding st.: fls lilac to white, sometimes finely veined, rather small; blade of falls oblanceolate; standards usually darker than falls Cent. Asia, China, Japan Var. álba, fls. white Var. hyacínthina, catalogue name. Var. pabulària (I pabularia) is large and robust, 2-3 ft., producing much foliage, once intro, for forage under the name "krishum," withstanding drought.

Euleféldii: I. scarrosa.

excélsa: listed name of unknown botanical standing.

extrafoliàcea: I. aphylla.

falcata: I. aphylla.

falcifòlia. R, reg.: small, 10 in. or more: lvs. linear and rush-like, curved, shorter than sts.: fls. 2-4, lavender; falls oblong, 1½ in long; standards narrow-lanceolute, 1½ in. long. Caspian region to Afghanistan.

Fièberi: I. aphulla.

fliifolia. B, x: st. to 18 in. or more, 1-headed and usually 2-fld.: lvs. 1 ft or more, very slender: fls reddish-purple with darker veins; falls with orbicular blade and orange central patch; standards obovate and emarginate. S. Spain, N. W. Afr.

fimbriàta: I. japonica or I. tectorum.

Fisheri: listed name of a dwarf bearded iris.

flava: light yellow late hort, iris.

flavéscens. R, p: st. 2-2½ ft., with 2-4 heads, the spathes not inflated and dry (scarious): lvs. about half as long as st., to 1½ in broad: falls obovate-cuneate, 2½ in. long, blade pale yellow to nearly white with brownish veins, beard yellow, standards obovate, pale lemon-yellow. Probably a hybrid—The name flavescens is sometimes applied to I. imbricata.

flavíssima (I. arenaria. I. dahurica). R, p: st. 1-3 or 6 in., 1-headed with 2 or 3 yellow fls.: lvs. 3-4 and about 3-8 in. long, very narrow: fails oblong, the hatt faintly veined brown-purple, beard orange; standards oblong-clawed, veined brown-purple on edge. Hungary to Mongolia.

flexicallis. R. a: relative of *I. foliosa* but much less leafy, and of *I. hexagona*, from which it differs in the weak zigzag prostrate sts, with 1 or 2 fls. arising at each node: fls. deep or dull violet; falls broad-spatulate, to 2¾ in. long, spreading and perhaps recurved at tip; standards erect-spreading, shorter than falls. South cent. U. S.

flexudsa: I. sibirica var.

florentina: I. germanica var.

floribúnda: trade name for a bearded iris.

flórida: dwarf bearded pale yellow hort. iris.

fætidíssima. GLADWIN. R. a: st. 2-3 ft., 2- or 3-headed: lvs. to 1½ ft. and 1 in. broad, evergreen, ill-smelling when bruised: fis. small or inconspicuous, purplish-gray (but a

yellow-fid. form); blade of falls nearly orbicular and slightly notched at end; standards narrow. W. and S. Eu. and N. Afr.—Grown for the striking large pods that open in autumn and display the many scarlet globular seeds

foliosa. R, a: st. zigzag and to 18 in.: lvs. green, to 1½ in. broad and surpassing the blue-purple fis.: falls with ovate blade with greenish-white patch; standards oblanceolate. Ky. to Kans.

Fontanèsii. B, x: like a slender I. tingitana, but color clear light blue and central yellow band on rounded falls. Morocco.

Forrestii. R. a: much like I. Wilsonii but more slender: sts. to 18 in.: lvs. narrow and glossy, not equalling st.: fls. clear yellow, sometimes with inconspicuous purplish veins; standards almost erect. S. W. China, at high altitudes.

fourchiana. R, a: st. erect and strict: fis red-violet; falls about 3 in. long, the haft yellow-green, signal yellow not extending into blade; petals often brighter violet than falls, the claw apricot. S. La.

fragrans: doubtful name in the lists; may be I. ensata.

fálya (I. cuprea). R, a: st. rather slender, 2-3 ft, several-fld: lvs. somewhat glaucous, equalling or less than st., to 1 in. broad: fis reddish-brown or copper-colored, vanegated blue and green; falls oblanceolate, 2½ in. long; standards emarginate. Ga. to Ill., Mo. and Tex.

fulvala. Hybrid between I. fulva and I. foliosa (Lamancer)

fulvaurea. R, a: st. rather slender, erect and straight: fls red or orange-red; falls spreading with apricot-yellow crimson-yeined haft and crimson-scarlet blade, signal yellow to red-orange; standards apricot and crimson. S. La.

furcàta: I. aphylla.

Gàtesii. R, o: st. to 18 in., spathe 1-fld · lvs. glaucous, to 34 in. broad, to 12 in. long: fls. very large, the under color pale greenish or grayish-white with close purplish veins and dots; blade of falls and standards 4-5 in. across. Asia Minor.

georgiàna: I. virginica.

georgiàna: I. virginica.
germânica (I. viulgaris). R, p; st. about 2 ft., bearing
4 or 5 fls.: Ivs. glaucous, to 18 in. long and 1½ in. broad;
blade of falls obovate, reddish shade of blue-purple, beard
white more or less tipped yellow; standards obovate, bluepurple, the claw often bearing a few whitish hairs. Perhaps
Medit but unknown native—The forms of this plant are
many and they constitute one source of the cult. tall
bearded irises, and these vars are frequently known as
"German rises" but this vernacular should be discarded;
I pallida, I. variegata and other species are involved. Var.
florentina (I florentina of many authors, var. alba) has fls.
nearly white, with traces of pale blue or purple, plant
rather slender; one of the sources of the perfumed orrisroot. Var. nepalénsis (var. atropurparea), Purple King,
has red-purple fls., the falls being darker. Varieties listed
with Latin-form names are: assidica, alirea, Brookiana,
honorábilis, lûtea, magnifica, mājor. honorábilis, lùtea, magnífica, major.

giganticerilea. R, a: st. erect and stout, to 4 ft.: fls. violet-blue, musk-scented; falls about 4 m. long, recurved-spreading, blade oval, haft greenish with yellow signal; standards broad-spatulate, somewhat shorter than falls. S La. Var. álba is listed.

glaucéscens: I. scariosa.

Górmanii. R, a: sts. slender, 1-fld, to 16 in. high: lvs. linear, those on st. 2 or 3: fls. cream-color to pale yellow; sepals or falls ascending, more or less spatulate, about 1½ in. long; petals or standards erect, somewhat shorter. Coast mts, Ore.

gracilipes. R, c: slender, st. to 10 in., forked: lvs. to 1 ft. long and ½ in. broad: falls about 1 in. long and ½ in. broad, notched, pink-lilac with deeper veins and central patch of white, crest yellow; standards narrower, pink-lilac. Japan. Var. álba, hort. name.

grácilis: name of various applications, perhaps most correctly an albino-like form of *I. aphylla* with fls. pale yellowish or grayish-white somewhat splashed purple; also a synonym of I. prismatica.

graminea. R, a: st. 8-9 in., 2-edged, its lvs. sometimes surpassing the 1 or 2 fragrant fls.: lvs. grass-like, mostly very narrow but sometimes 1 in. broad, 1-3 ft long: blade of falls orbicular, yellowish-white veined purple; standards broad-lanceolate, somewhat redder. Cent. and S. Eu. to Caucasus.

grandis: listed as a Siberian iris, violet reticulated white: hort.

Grant-Duffii. R, a: st. 6 in., 1-headed: lvs. linear, 18 in.: blade of falls obovate, yellow with orange patch; standards oblance olate, yellow with lilac or purple on claw. Palestine, S. E. Asia Minor.

Gueldenstadtiàna: I. halophila.

hæmatophýlla: plants under this name may be I. orientalis or I. ensata.

halophila (I. Gueldenstadtiana). R, a: st. 12-18 in., with naiophila (I. Guedenstadiana). R, a: st. 12-18 in., with 2 or 3 heads: Ivs. mostly exceeding sts., ample: fls. rather small; blade of falls rounded and ½-¾ in. broad, white veined purple, dull yellow or gray-purple; standards shorter and erect. Caucasus to N. W. India. Var. litea is listed.—Allied to I. spuria, but known by the small horizontal blade of fall.

Blade of Iall.

Hártwegii. R, a: st. to 1 ft., flattened, its lvs. 1-3: lvs. linear, longer than st.: fls. 2, yellow with lavender veins, or pale lilac with deeper veins and yellow patch; falls obvovate-cuneate; s:andards oblanceolate, a little longer than falls. Coniferous forests, N. Calif. Var. austrâlis, fls. llac-purple and larger; high elevations in S. Calif. and by some not considered distinct from I. tenax.

hauranénsis. R, o: to 16 in.: lvs erect, closely sheathing, to 6 in. tall: falls and standards white with many minute dark purple dots, beard of short white hairs. Palestine.

Haynei: I. atrofusca.

Héleniæ: I. Barnumiæ var. Mariæ.

heterophylla: I. Boissieri.

hexagòna. R, a: st. to 3 ft., mostly simple, leafy: lvs. 2-3 ft. and to 1½ in. broad: fls. solitary and sessile; falls with obovate llac or sometimes white blade to 4½ in. long; standards much narrower and erect, like varying to white. Swamps, S. C. to Fla. and Tex. Var. álba, catalogue name.

himaldica: I. Clarkei.

hispánica: I. Xiphium.

Histrio. B, ret.: st. short or almost none, 1-headed: lvs-4-angled, to 1 ft. long, usually appearing before the fls.: falls obliquely ascending, the blade deep blue on margins and creamy-white and blotched in center, to 2½ in. long; standards oblaneoolate, blue. Syria, Asia Minor—Differs from I. reticulata in lighter colored odorless earlier fls.

histrioldes. B, ret.: like I. Histrio but fis. arise about as soon as lvs. appear, and the falls stand nearly horizontal and central patch is narrower; bright blue-purple, with central white blotched area and yellow ridge: lvs. stout. N. Asia Minor. Var. måjor is listed.

hollándica: hort. strain of I. Xiphium, more often referred to as Dutch Bulbous iris.

Hoogiana. R, reg.: st. 18-20 in , fls. 2 or 3 in 1 head: lvs. to 18 in. and 34 in. broad: fls. large, of uniform gray-blue or blue-purple, with thick golden beard; falls about 3 m. long; standards erect-connivent, broad at top. Turkestan.

Hoòkeri: see I. setosa.

hàmilis. R, a: st. about 1 in. high, 2-lvd: lvs. linear, to 1 ft. or so: blade of falls nearly orbicular, deep blue-purple with darker veins, haft with greenish-yellow to white under color veined reddish-brown; standards oblanceolate, blue-purple. Transylvania to Caucasus and perhaps beyond. Var. minor, a hort. name.—Another humilis is a form of I. uncurcularis.

hungárica: I. aphylla.

hyacinthina: see I. ensata.

ianthina. R, a: st. erect and rigid: fls. deep violet; falls about 3 in. long, reflexed, spreading, haft cream-colored, signal with a violet-black streak; standards flushed reddish near base. S. La.

ibérica. R, o: st. 3-6 in., 1-fld.: lvs. 5 or 6, linear, glaucous, 4-6 in. long; blade of falls nearly orbeular, about 3 in. long, with whitish-yellow ground, brownish-purple veined and triangular patch of purplish-black; standards with orbicular connivent blades silvery-white dotted and veined purplish. Concare to N. Person. purplish or brownish. Caucasus to N. Persia,

ill vrica: race of I. Cengraltin.

imbricata (I. sulphurea). R. p: st. to 20 in., bearing several heads, the spathes inflated and green: lvs. broad, 6-8 in. long at flowering time, the outer ones obtuse: falls obovate, greenish-yellow veined brown-purple on haft and sometimes on blade, the beard whitish typed orange; standards rounded-oblong, greenish-yellow. S. W. Asia.—Separated from I. flavescens by the spathes.

imperialis. Fls. imperial purple, signal with golden I-bar, La.

innominata. R, a: like I. Pu dyi in dark green narrower lvs., darker fis. and in characters of bracts and spathes: to 30 in. high: lvs. abundant: fis. dark yellow, usually 2, with purple lines on falls, the blade of which is nearly 2 in. long; standards somewhat shorter and lighter yellow lacking purple lines. Ore.

intermèdia. Name for hort. intermediate irises, earlier blooming than the main German, said to be crosses between *I. germanica* and form of *I. pumila*.

interrégna: hort, name.

iodantha. R. a: st. erect and stout: fis. violet; falls recurved, haft winged and greenish-yellow and creamy and veined, signal lemon-yellow; standards and blade of falls violet, and the claw streaked. S. La.

İstria: hort. form of *I. germanica* var. *florentina* having greenish veins on the haft and a white beard.

itálica: I. Chameiris.

Sacquesiàna: listed hort, name: tall bearded copper and margon tris

japónica (I. chinensis). R. c: st. 18 in., of 5-8 branches and many-fid.: lvs. to 16 in. long, thick, glossy on one side and glaucous on the other, often exceeding infl.: fls. 2-3 in. across, pale lavender-blue with conspicuous yellow crests and orange markings on falls; segm. margins undulate-serrate, crests fimbriate. Japan, China.—Individual fls. short-lived.

jordana. R, o: to about 16 in., st. leafy: lvs. erect, to 15 in: fis. to 6 in across; falls reddish-purple with beard of yellow hairs; standard similarly colored with white haft, veined and dotted purple. Palestine.

innea. B, x: st. shout 1 ft., with 1 or 2 golden-yellow fls.: lvs narrow, about 18-24 in. long, mostly appearing in autumn: falls about 214 in. long, the blade nearly orbicular, emarginate, usually faintly brown-yeined in lower part; standards much shorter, spreading. Sicily, N. Afr.

Junonia. R, p: st. to 2 ft., with usually 5 heads: lvs. shorter, about 1% in broad, glaucous: falls obovate, about 3% in. long, the blade light purple, beard white tipped orange; standards obovate, pale blue, sides reflexed. Asia Minor.

Minor.

Kaémpferi (I. lævigata var. Kaempferi). Japanese I. R. a.: st. to 2 ft. or more, with terminal head of 2 fls. and commonly a lateral head: lvs. to 2 ft. and more, with a marked midrib: fls. reddish-purple (in the wild); falls hanging, 3 in. long, blade oval or obovate, the haft with yellow center; standards about 3\(^c\) as long as falls, narrow, also reddish-purple. Manchuria, N. China, Japan. Var. grandiflora is listed.—Source of numberless cult. forms, varying in form and color of fl.; sometimes the fl. is partially double due to the style becoming petal-like. See I. lævigata.

kamaoénsis: I. kumaonensis.

kashmeriana (I. Bartonu). R, p: st. about 2 ft., with 1 or 2 fragrant fls. in 1 3 heads, spathes 3 or 4 in. long: lvs. to 20 in., glaucous: falls obovate, blade creamy-white, sometimes tinged blue, beard white and yellow; standards white. Kashmir, Afghanistan, Baluchistan.

Kerneriana. R, a: st. 12 in or less: lvs. ½ in. or less broad, in clusters: fls. yellow; falls broad-lanceolate and undulate, about 2½ in. long; standards linear-lanceolate and undulate, notched at end, more or less twisted. Asia Minor.

Kímballiæ. R, a: st. erect and rigid: fls. violet with yellow center on haft; falls to 4 in. long, recurved-spreading, blade ovate and violet with yellowish blotch; standards spatulate, somewhat shorter than falls, red-violet. N. W. Fla.

Köchii. R, p: probably a form of *I. germanica*, rather dwarf (st. mostly about 18 m., sometimes 2 ft.), fls. redourple without white under color displayed between the brownish vens at end of haft. Istria.

koreana. R, a: small, somewhat taller than *I. minuta* with 2 fls.: lvs. to 14 in. long: fls. yellow; sepals obovate, petals erect. Korea.

Korolkòwii. R, reg.: st. about 1 ft., with 2 or 3 small lvs. and 2 or 3 fls. in one head: lvs. glaucous, about 1 ft. long: falls obovate, pale olive-green with brown veins; standards erect, obovate, whitish with brown veins. Turkestan. Var. cóncolor, trade name.

kumaonensis. R, ps: st. practically none or seldom 2-3 in., 1-headed and 1- or 2-fld.: lvs. glaucous, finally becoming 18 in. long: fls. bright hlac or blue-purple; blade of fulls oblong-ovate, veined and mottled, halt white with purplish veins. Himalaya, at high altitudes.

láctea: I. ensata.

lacústris (I. cristata var. lacustris). R, e: differs from I. cristata in its commonly smaller size and rather narrower lvs., and perianth-tube only 1 in. or less long and not exceeding spathes: fis. blue. Shores, Lakes Huron, Michigan, Superior.

Isvigata (I. albopurpurea). R, a: like I. Kaempferi but lys. lacking distinct midrib, standards as long as falls, fls. blue-purple (in wild). E. Asia, China, Japan. Vars. atropurpirea and semperflorens are listed.—Source of some of the irises grown by the Japanese.

lancipétala. R, a: st. slender but erect and rigid: fls. lavender; falls spreading, blade lavender and much veined, haft yellowish with signal very narrow and dark yellow; standards pale lilac-brown veined. S. La.

làzica: I. unquicularis var.

Leichtlinii: I. stolonifera.

linifòlia. B, i: bulb slender; lvs. 3-4, narrowly ensiform, acute, dark green with white horny edge: falls greenish-white with yellow marginal blotch; standards minute and horizontal: seeds characterized by presence of white aril. Persia.—Infrequent and grown with difficulty.

lisbonénsis: I. biflora.

longiflòra: I. scariosa.

longifòlia: I. ensata.

longipétala. R. a: st. to 2 ft., 1-headed or with 1 or 2 lateral heads: lvs. narrow, equalling or exceeding st.: fls. bright lilac; falls obovate, drooping, central ridge yellowish; standards oblanceolate. Coastal Cent. Calif.—See

Lortétii. R, o: st. about 1 ft, bearing 1 large beautiful fl. with creamy-white under color closely veined and dotted crimson: falls obovate, reflexed, with dark crimson patch, beard of scattered brown hairs; standards orbicular, 3-4 in. broad, erect. Mt. Lebanon.

ludoviciàna. R, a: st. rigid and erect: fis. red-violet; falls recurved-spreading, about 3 in. long, haft yellow and dark-veined, signal light yellow; standards red-purple with red-violet toward center. S. La.

lupina: I. Saari.

lùrida (I Redoutana). R, p: st. about 18 in. high, 1-headed with 2 fls. and sometimes 1 lateral fl.: lvs. rather narrow, reaching 1 ft.: falls long and narrow, blade reddishmaroon, beard prominent of orange hairs; standards oval, emarginate, brownish-purple. Probably of garden origin.

lusitánica: I. Xinhium.

lutea: I. Pseudacorus.

lutéscens: a confused name and plants so listed may be either I. Chamæiris, I. pseudo-pumila, I. pumila or forms of these

macedónica; I. Reichenbachii.

macrántha: hort. name of a tall bearded iris.

macrocárpa: listed name of a dwarf bearded iris.

macrosiphon. R, a: st. very short but sometimes to 8 in.: lvs. very narrow, exceeding sts: fls. 1 or 2, bright lilac-purple; falls 2 in. long broadly oblanceolate; standards lanceolate, edges undulate. Cent. and N. Calif.

maculata: a confused name, the true form from Mesopotama, and here described, is believed not to be in cult. R, o: lvs. falcate, to 6 in long; fl-st. short: fls. large; falls obovate to 2 in. long, said to be "pale, marked with a blue or lilac central spot"; standards oblong-lanceolate, cuspidate, as long as falls, styles about 1 in. long with obtuse crest.—The material in cult. under this name may be I. Sisyrinchium.

magnifica: very large-fld. form of German iris, sts. 4 ft. high: falls dark reddish-purple, standards light violet-blue.

major: name applied to large forms.

Mandraléscæ: I. pallida.

mandshurica. R, p: yellow-fld. plant like I. flavissima, apparently not in cult. although the name is in the hort. hterature.

Manissádjanii; I. Saari.

mardinénsis: listed name (Mardin is in Armenia).

Mariæ: I. Barnumiæ var.

marítima: I. sibirica.

melanosticta. Black-spotted I. R, p: st. to 16 in.: lvs. narrowly linear: falls yellow with violet-black spots and veins; standards pale yellow. Palestine.

mellita (I. rubro-marginata). R, p: st. to 4 or 5 in., 1-headed: lvs. 3-5 in. long and 1/2 in. broad: fis. of delicate texture, fragrant, brown-purple (varying to yellow); falls obovate, shorter than the standards. S. E. Eu., Asia Minor. -Differs from I. pumila in more rigid keeled herbaceous spathes.

mesopotámica. R, p: large, the st. 3-4 ft, erect, 3 fls. in terminal head and 2 in lateral ones: lvs. to 2 in. broad and 2 ft. long: fls. lavender-blue; blade of falls obovate, haft nearly white overlaid with purple-bronze veins, beard white and orange; standards obovate, somewhat lighter than falls. Probably Armenia.—Under the form known as I. Ricardii it has entered into the development of hort.

Milesii. R, c: st. to 3 ft., leafy, bearing 2-4 branches: fls. about 4 in. across, pale reddish-lilac with darker veins and blotches and prominent orange or yellow crests on the falls, crests finely laciniate. N. W. Humalayas.

minuta. R, a: st. very short: lvs. 5-6 in. long, ½ in. or less broad: fls. yellow; falls with obovate emarginate bladbrown at edges; standards obovate and emarginate, shorter than falls and somewhat paler in color. Japan.

miraculòsa. R, a: st. rigid and strict: fis. large, lavender or white; falls 4 or more in. long, recurved-spreading, blade elliptic to obovate, signal marked bright yellow; standards spatulate or cuneate, shorter than falls and of similar color.

mississippiénsis. R, a: st. zigzag, to 8 in. long: lvs. long: fls. lavender to violet; falls more or less recurved, about 2½ in. long, haft white and darker veined, signal yellow; standards scarcely clawed, white toward base. La.

missouriénsis (I. Tolmieana. I. longipetala montana).

R. a: st. mostly simple and rather slender, 6-24 in. high, n, a; st. mostly simple and rather stender, 5-24 in. high, much like I. longipetala but usually not so tall and spathes dry (scarious) rather than foliaceous (green) and lvs. commonly shorter than st.: fls. pale blue and vanegated. S. D. to B. C., S. Caln. and Ariz.

monaurea. Hybrid between I. Monnieri and I. aurea: very large deep clear yellow fis.

mongólica: listed name.

Monnièri. R, a: perhaps a color form of *I. ochroleuca*, the fls. soft lemon-yellow: blade of falls 1½ in. broad, orbicular, emarginate; standards oblong-cuneate, 3 in. long. Probably of garden origin.—Some authors treat I. Monnieri and I. ochroleuca as variants of I. spuria.

monspur: strain of hort, hybrids from W. Asiatic stock.

montana. R. a: similar to I. missouriensis with which it may be confused in the trade, differing in its fewer fis which are lilac or lavender with darker veins and a central vellow blotch on the blade of the falls. Rocky Mts.

morfcolor. R, a: st. rigid: fls. crimson-maroon; falls re-curved-spreading with short haft dark yellow and flecked and the central line a yellow ridge, blade oval; standards somewhat shorter than falls, spatulate. S. I.a.

mussulmánica: probably I. halophila

neglecta. R, p: st. to 2 ft., with many fls: lvs. shorter, somewhat glaucous: falls obovate and very obtuse, 2 in. long, margin violet-blue, center whitish-veined and blue, beard yellow; standards lilac. In cult. only; probably a hybrid, and the name does not have definite standing.

nepalénsis. R., usually assigned to the Nepalensis section: rootstock dahlia-like, flattened, white and fleshy: lvs. about 12 in. long: falls white with violet veins, broadly lanceolate, central ridge brownish-yellow to pale rose-violet; standards darker violet, styles pale violet. Cent. Asia.—In many localities the roots must be lifted and stored in dry sand during winter. Much of the material so listed may be referred to I. germanica var.

nfgricans. R, o: to 12 in: 1/vs. narrowly-ensiform, many, to 6 in. long, mostly basal: fls. large; falls white veined and dotted dark purplish-brown, obovate, blade dark purple on white ground; standards white veined dark purple lilac. Apr. Palestine.—Perhaps only a variant of 1. atropurpurea.

notha: dubious name, probably to be associated with I. spuria.

nudicaulis: I. aphylla.

ochràcea cærùlea: hort, iris, old gold, falls flushed blue. ochraurea: listed as a tall hybrid, spuria group, in two shades of yellow.

ochroleuca (I. orientalis of some authors). R, a: st. 3 ft. ochroleuca (1. orientais of some authors). R, at st. 3 ft. and more with terminal head and lateral ones: 1vs. 2-3 ft. and 1 in or more broad, with a spiral twist; fis commonly white with patch of golden-yellow on falls which have an orbicular blade; standards lemon-yellow to whitish. W. Asia Minor. Listed Latin-form names are: airea, gigantea, sulphirea, Warei.—By some considered a variant of I.

odoratíssima: I. pallida.

cenantha. R, a: st. erect and stout: fis. violet and purple falls to 4 in long, drooping, with haft orange-yellow and darker flushed, blade much exceeding haft and wine-purple with darker center; standards nearly as long as falls, light red-violet. S. La.

olbiénsis: I. Chamæiris.

oolopha. R, a: st. erect and strict: fis. lilac or lavender; falls recurved, about 3 in long, haft yellow with deep yellow and radial signal, blade smoky lilac or pale violet; standards light bluish-lilac to pale lavender-violet. S. La.

orchioldes. Orchio I. B, j: st. jointed, 1 ft. or so, leafy with 3 or more fls. solitary in the axils: lvs. 9 in. or more long, 2 in. broad: fls. not large, deep yellow but variable; falls ovate, with greenish and darker color either side crest; standards small, commonly deflexed Turkestan.

orientalis (I. sibirica var. orientalis. I. sanguinea). R, st hollow, with terminal head of 2 or 3 fls.: lvs. to 18 in., a; st nollow, with terminal nead of 2 or 3 ns.; ivs. to 18 in., usually exceeding the st, to ½ in. broad: fis. typically rich blue-purple (white under color) but sometimes white; falls with nearly orbicular blade; standards broad-oval, a little shorter than falls, blue-purple or white. Manchuria, Japan. Latin-form names of vars. are adrea, gigantèa, sanguinea, supérba.—Two plants have passed under this name: see I. ochroleuca.

pabulària: I. ensata var.

pállida (I. Mandralesce. I. odoratissima). R. p: much like I. Cenqualtii but a tall and stouter iris, sts. 2-3 ft., spathes silvery-white: lvs glaucous: fls pale lavenderblue; falls obovate, beard white tipped yellow; standards obovate, somewhat paler than falls. S. Tyrol. Var. dalmática is a garden form. Listed vars. with Latin-form names are atroviolàces, racemòsa, speciòsa.—One of the most important sources of tall bearded irises of gardens.

panormitàna: I. pseudo-pumila.

paradóxa. R, o: st. to 6 in., spathe 1-fid.: lvs. linear, to 6 in.: fi. large, showy; falls narrow, 2 in. long and ¾ in. or less broad, horizontal, pale pinkish-crimson with purpleblack hairs; standards orbicular, blue or white under color with blue-purple veins and dots. Caucasus to N. Persia.

parisiénsis: a listed name

pavdnia: Moræa pavonia.

pérsica (I. præcox). B, j st. not evident, with 1 or 2 fls.: lvs. linear, 2-3 in. long but becoming twice that length: fls. lvs. linear, 2-3 in. long but becoming twice that length; ins. white tinged with pale greenish-blue or sea-green; blade of fall to 2½ in. long, rounded-oblong, with orange ridge and patch of purplish; standards about ¾ in. long. E. Asia Minor, Persia.

picturata: catalogue name.

plicata: hort. name of a tall bearded iris like an albino pallida, origin unknown.

Plùmeri: hort. name, a tall bearded variety.

præcox: I. persica.

prismática. R, a: st. slender, to 3 ft., mostly simple: lvs. narrow, somewhat glaucous, usually shorter than st: fls. solitary or 2, blue or violet veined yellow; falls to 2 in. long, the blade ovate, lighter at base; standards shorter, lanceolate. N. S. to Ga.

Pseudácorus (I. acoroides. I. lutea) Yellow Flac. R, a: stout st to 3 ft. or more, commonly several-fid: lvs. more or less glaucous, to 1 m. or more broad and equalling or surpassing st.: fs. not large, bright yellow; falls about 2 in. long, the blade broadly obovate to ovate, often veined violet; standards shorter, oblong, nearly erect. Widespread in Eu, N. Afr., Asia Minor; nat. in E. N. Amer. Vars. with Latin-form names are álba, aurea, gigantèa, manschirice veinedte. rica, variegata.

pseddo-pimila (I. panormitana). R, p: like I. Chamæiris but spathes narrower, fl. usually 1 and tube 2 or 3 in. long: from I. pumila distinguished by st. longer than fl.-tube: st. 4-6 in.: fls. purple, yellow or white. S. Italy.

4-6 m.: fis. purple, yellow or white. S. Italy.

pùmila (I. æquiloba. I. attica. I. stenoloba. I. taurica. I.

transsilvanca. I. tristis). R, p: resembles I. Chamæirıs but
almost or quite stemless and fi.-tube 2 or 3 in. long, thus
exceeding the st.: fis. varying from yellow to bright or dark
lılac. Austria to Russia and Asia Minor. Many Latinnamed vars. are offered: álba, atropurpirea, atroviolàcea,
aùrea, cærûlea, cinèrea, compácta, cyànea, excèlsa, floribúnda, formòsa, gigantèa, hýbrida, litea, maculàta, manschùrica, purpirea, sulphirea, Sweètseri, variegata, violàcea.—Variable in cult., and the true or original species
may not appear. may not appear.

Pdrdyi. R, a: differs from I. Douglassana in the sts. bearing somewhat overlapping inflated and sheathing bract-like lvs.: st. to 1 ft.: lvs. exceeding st. and about ½ in. broad: fts 2, cream-color with purple and yellow lines. N. Calif, Ore. Var. alba is offered.

puríssima: listed as a tall bearded white hort, iris.

purpirea: "raisin-purple wild hybrid collected in the southern U. S."

pygmæa: I. Tigridia.

pyrenàica: I. xiphioides.

Redoutiàna: I. lurida.

refléxa: I. aphylla.

regalis. R. a: st. erect: fls. lilac, musk-scented; falls 4 in. long more or less, spreading, haft suffused green and agnal yellow, blade rosy-lilac with darker veins; standards broad-spatulate, a little shorter than falls, blade oval or elliptic or obovate and rosy-lilac. S. La.

Règelii: I. tenurfolia.

Reichenbachii (I balkana. I. bosniaca. I. macedonica. I. serbica). R. p. eastern representative of I. Chamerris, and has sharply keeled spathes: st. 3-12 in., 1-headed: fis. delicate in texture, clear yellow varying to brownish-purple. S. Hungary, Balkans.

s. Hungary, Daikans.
reticulata. B, ret.: st. none until fr. matures, the single fl. being raised on a long tube: lvs. linear and 4-angled, 8-10 in. but becoming 2 ft.: falls with long haft and small oval blade which is deep violet, marked, veined and spotted, with orange ridge; standards slightly longer, 2½ in., narrow, erect, deep violet. Caucasus Vars. cyanea and superba are offered.—The name reticulata is also given to a tall brancha garden sits. tall bearded garden iris.

rhodántha. R. a: st. crect and strict: fls rose and yellow; falls recurved, haft lemon-yellow and brown-streaked, signal bright lemon-yellow, blade deep orange-rose veined brownish; standards light rose with apricot claw. S. La.

rhodochrysea. R, a. st. stiff and erect: fls. rose-lilac and yellow; falls spreading, haft orange-yellow and brown-veined with deep orange signal, blade old rose-lilac and darker veined; standards old rose and veined lilac. S. La.

Ricardii: I. mesopotamica.

rigida: I. aphylla.

rivularis. R, a: tall and rigid: fls. slightly fragrant, violetblue with green signal, petals subulate. Ga., Fla.

ròsea: "variant form of versicolor in a striking red tone."

Rosenbachiàna. B, j: st. very short or practically none, with 1-3 fis in axils: lvs. channelled, 1-2 in. long but becoming 9 in. long and 2 in. broad: fis. brilliant, variable in color; falls long-oblong, about 2 in. long, blade dark crimson-purple and other parts of fl. faint purple or white; standards about 1 in. long. Turkestan.

rosiflora. R, a; st. strict and rigid: fis. lilac; 'alls spreading, about 3 in. long, haft cream or greenish and brown-veined with yellow signal, blade obovate to nearly orbicular, old rose-lilac and darker veined; standards spatulate, much shorter than falls, claw yellowish and brown-veined, blade usually paler than falls. S. La.

Rôssii. R, a: st. 4 in. or less: lvs. about 3 in. at anthesis, grass-like: fls lilac, pink to white; falls with oblong blade as long as haft; standards oblanceolate. Korea, China.

rubicúnda. R. a: st. erect and stiff: fls. lilac-rose; falls about 3 in long haft greenish-yellow with veins and spots, signal orange-yellow, blade inagenta-cerise veined brown; standards shorter, lilac-old rose veined orange. S. La.

rùbro-marginàta: I. mellita.

ruthénica. R. a: st. to 8 in., 1-headed: lvs. linear and grass-like, 6 in. but becoming 1 ft.: falls broad-oval, under color creamy-white overlaid with blue dots and veins; standards lanceolate, deep purple-violet. E. Eu. to N. China and Korea. Var. nana, listed as a dwarf form.

Saàri (I. lupna. I. Manissadjanii). R, o: st. about 6-8 m., concealed in If.-sheaths: lvs. linear, becoming 1 ft. long: falls 3 in long and half as broad, under color yellow or greenish with brownish-red veins giving a lilac effect, beard bright yellow; standards larger, nearly orbicular, connivent, somewhat darker. Asia Minor.—Latterly but not originally written Sari.

sambucina. Bearded iris related to *I. squalens*, probably a hybrid: plant less robust, the fis. veined claret-color and with a sambucus-like odor.

sanguinea: I. orientalis.

savannārum. R. a: st. strict and rigid: fls. blue-violet; falls 3 in. or less, recurved-spreading, haft greenish, blade elliptic to oval, violet or violet-blue with central greenish part extending into blade; standards spatulate to nearly linear, often shorter than falls, bluish or violet. Fla. Variable in color, and offered in vars. álba, azurèa, pállida, Ròvalii.

scariosa (I. elongata. I. Eulefeldii. I. glaucescens. I. longrifora) R, p: st. to 6 in. or so, bearing 1 or 2 red-purple fls. with darker veins on falls, the spathes to 2½ in. long, dry and more or less transparent: lvs very glaucous, to 1 ft. or so long and ¾ in. broad: falls obovate, reflexed, 1¾ in. long, beard yellow and white; standards obovate. Caspian Sea to Turkestan and Altai.

Schmidtii: I. aphylla.

scorpioldes: I. alata.

sérbica: I. Reichenbachii.

setosa. R. a. st. stout, forked, bearing 2 or 3 heads: lvs. to 2 ft. long and 1 in. broad, much shorter than st.: falls more or less orbicular, light hlac or purple and often with reddish tinge; standards 3 in. or less long, various in shape. N. Asia —Represented Me northward by I. Hookeri (I. setosa var. canudensis and probably var. gaspensis of hort.), very similar.

Shrèvei. R, a; st. to 3 ft., with 1 or 2 branches: lvs. frequently somewhat glaucous, as long as st: falls lavender-blue with flecks and lines, to 2½ in. long, recurved-spreading; standards light violet with darker tints, as long as falls. Marshes, Cent. U. S. Var. Alba is listed.

sibfrica (I. acuta. I. maritima. I. trigonocarpa). R. a: st. hollow, with a 2-5-fid. terminal head and commonly a lateral head: lvs. to 1-2 ft. and much shorter than st., linear: falls hlac-blue or blue-purple, the blade orbicular (varying to grayish); standards broad-lanceolate, shorter. Cent. Eu., Russia. Offered in several Latin-named vars.: álba, cærdlea, grándis, máxima, orientális, sanguínea, supérba. The var. flexuôsa has fls. white with curly segms.

sindjarénsis. B. j. st. to 9 in bearing 3 or more pale blue large fls.: 4vs. to 10 in long and 2 in broad: falls with large wings, blade rounded-oblong, with yellowish central ridge; standards obovate or narrower, horizontal or deflexed. Syria and Mesopotamia.

Sindpur: hort, hybrid of *I. sindjarensis* and *I. persica* var. purpurea, having turquoise-blue fls ridged with yellow.

Sintenisii. R, a: st. to 1 ft.: lvs. linear, 34 in. or less broad: fls. purple; falls narrow, spreuding, blade elliptic, blue-purple on whitish ground; standards erect, oblanceolate, emarginate, blue-purple. S. E. Eu., Asia Minor.

Sisyrinchium (Morza Sisyrinchium) Sole member of the Gynandriris section, producing a corm in place of bulb and the stamens adhering to the style-branches: st. to 1 ft.,

bearing usually several heads of fugitive lavender or lilae or blue-purple fls.; lvs. few, to 1 ft. or more long; falls to 1½ in. long, lanceolate to obovate, with white patch; standards a little shorter. Portugal and Medit. region to Cent. Asia.

sofarana. R, o: like I. sustana but under color creamy-white and veins dark purple. Mt. Lebanon.

sogdiàna: I. spuria var.

sórdida: probably I. juncea.

speciòsa: lavender-purple hort. iris.

spectábilis: I. Xiphium; the name is also given to a tall bearded garden iris.

spùria. R. a.: sts. with 3 or 4 reduced lvs. and 1-3 spicate heads: lvs. glaucous, linear, 1 ft. long and shorter than st.: fls. blue-purple or lilac, the rather shorter standards somewhat redder; falls with nearly orbicular blade 2 in long. Cent. and S. Eu. and Algeria, to Persia. Listed Latinnamed forms include álba, añrea, cærillea, lilácina, nótha, ochroleùca, and sogdiàna with grayish-lilae fls.

squalens. R, p: sts 2-3 ft, with 3 or 4 heads: lvs. glaucous, to 1½ ft long and 1½ in. broad: falls obovate, the blade to 3 m. long, lilac-purple, haft same with whitish or yellowish under color, beard bright yellow; standards as long and broad as falls, lilac or brownish with yellow. Cent. Eu to Persia.—Perhaps a series of forms of tall bearded iris and not a natural species.

Statellæ: form of I. pseudo-pumila.

stenolòba: I. pumila.

stenophylia: one of the many forms of I. persica: also a hort, name for a dwarf bearded iris,

stolonifera (I. Leachtlinn: I. vaga). R, reg.: st. to 2 ft., covered with clasping lvs, with 1-3 fls. in a single head: lvs. to 1½ ft.: fls. usually light or dark brown-purple, marked in middle of the frilled segms. with blue; falls reflexed, obovate, about 1 in. broad, haft yellow-bearded; standards of similar size, erect. Turkestan.

stylòsa: I. unquicularis.

suaveolens. R, p: st. to 5 in., 1-fld.: lvs. becoming 1 ft. long, glaucous: fls. greenish-yellow, very fragrant; falls oblong-cuneate, with central mark of lilac-blue, beard yellow; standards broader, crisped. Bulgaria.—Like I. pumila, but segms. much broader.

subbifidra: I. biflora.

subtriflòra: I. aphylla.

sulphurea: a confused name, the true I. sulphurea is a synonym of I umbricula, but much of the material in the trade represents a color form of I. orchondes.

susiàna. Mounning I. R. o: st. to 15 in, with few reduced lvs, 1-headed and 1-fid.: lvs. linear, 1 ft. or more: fis. large, under color gray overlaid with purple-black veins; falls 3-4 in. long, the blade ovate, with black patch, beard broad and brownish; standards orbicular, somewhat lighter. Probably Asia Minor and Persia.—An old garden plant.

Suwardwii: I. darwasica.

Swértii. R. p.: st. to 1½ ft.: falls to 2½ in. long, white veined and flushed purple on margin, inner segms. white with purple keel and margin, fragrant. Known only in cult.

Taitii: I. Xiphium.

taurica: I. mimila.

tectorum (I. tomiolopha). R, c: st. 1 ft. or more, with 2 or 3 heads: lvs. to 1½ ft. and 2 in. broad: fls. deep lilac or blue-purple, segms. nearly or quite horizontal; falls 2 in. long, blade obovate or nearly orbicular, mottled darker shade, crest cut and white-violet; standards obovate. China. Vars. álba and lilácina are listed.

tènax. R. a: st. to 1 ft., with bract-like lvs.: basal lvs. longer than st., linear: fts. solıtary, bright lilac-purple (varying to white); falls lanceolate, about 2 in. long, with yellow ridge; standards nearly as long. W. Ore. and Wash.—The name, tenax Douglasu, listed, is presumably I. tenax, Douglas, the authority for the species being Douglas.

tenuifòlia (I. Regelii). R, a: st. 6 in. or less, sheathed: lvs. rigid, less than ¼ in. broad, to 1 ft. long: fis. with very slender tube to 4 in. long; falls blue-purple, with wedgeshaped haft; standards oblanceolate, about as long as falls. Cent. Asia to China.—Rhizome very slender.

ténuis. R, a: st. to 10 in. high: lvs. very thin, ½ in. or less broad: fls. white lightly marked with pale yellow and purple; falls oblong-spatulate, something over 1 in. long; standards somewhat shorter, emarginate. N. W. Ore.

tenuíssima. R, a: lvs. linear, to 14 in. long: fls. yellow; standards and falls narrowing, tapering, to $1\frac{1}{2}$ in long. Calif.—Somewhat similar to *I. Purdyi*, but less vigorous and more tender.

Thómasii. R. a: st. erect and rigid: fls. red-violet; falls recurved-spreading, haft yellow; standards red-violet with light orange-brown channel. S. La.

Thômpsonii: catalogue name.

Tigridia (I. pugmæa). R. p. small, in dense masses: st. 1-3 in, 1-headed: lvs. narrow-linear, to 6 in.; fls. blue-purple or yellow; falls reflexed, 1½ in. long, narrow; standards of similar length. N. E. Asia.

tingitàna. B, x: large: st. to 2 ft., with 2 fls. and lvs. clasping: basal lvs. 12-18 in.: fls. 3 in. long, blade nearly orbicular, light blue or lilae with orange-yellow ridge; standards narrow, blue-purple. Tangiers (whence the name), Morocco.

Tolmieana: I. missouriensis.

tomiolópha: I. tectorum

transsilvánica: I. pumila.

tricúspis: Moræa tricuspis. trigonocárna: I. sibirica.

tripétala. R, a: to 16 in., slender: fls. mostly solitary, violet to whitish, fragrant; falls 3 in. more or less, somewhat drooping, blade oval or nearly orbicular and violet to white with yellow at base; standards very short, violet at top. N. C. to Fla.

tristis. I mimila

trojana. R, p: st. 2 ft. and more: lvs. somewhat glaucous, shorter than st.: fis. large; falls obovate, blue- or violet-purple with a somewhat reddish tint, beard white and yellow; standards obovate and rounded, light blue-purple. Intro. from region of ancient Troy (Asia Minor) but nativity uncertain. Var. supérba, listed form.

tuberdsa: Hermodactylus tuberosus.

unguiculāris (I. cretensis. I. stylosa). R, a: st. very short or practically none. lvs. linear, becoming 2 ft. long: fi-tube 5-6 in. or more long; falls to 3 in. long, blade broad-obovate, bright lilae with central area of deep lilae on a lighter under color; standards oblong. Algeria, Greece, Asia Minor, Syria—Blooms in autumn or earliest spring. Var lāzica (I. lazica), lvs. shorter and wider: fls. dark purple with shorter tube. Other vars. listed are ālba, fis. white; altafibra, lilácina, margināta, speciòsa, fls. dark purple with odor of honey, and violâcea.

urmiénsis: I. Barnumiæ var.

vàga: I. stolonifera.

variegata. R, pt. st. 12 in. or more: lvs. 8 in. long or those of non-flowering shoots to 18 in.: fls. with obovate falls yellow variegated chestnut or purple, rounded-oblong standards yellow; beard yellow or orange. Austria, Balkans.—Considered to be the source of the yellows in the tall bearded irises. Var. honorébilis is yellow shaded brown. The name variegata is also applied to striped-lvd. forms of other irises.

Vártanii. B, ret.: st. none or practically so: lvs. 4-angled, to 9 in and becoming 18 in.: fl. slaty-lilac or grayish (varying to white); falls with lanceolate blade with darker veins, yellow crest on the haft; standards narrow-lanceolate with faint veins. Palestine.

vérna. R, a: early-blooming: st. to 3 in. high and mostly 1-fld.: lvs. narrow-linear, to 8 in.: fls. violet-blue (to white); falls obovate, $1\frac{1}{2}$ in long, with slender yellow haft, standards erect, somewhat smaller. Pa. to Ga.

versicolor. R, a: st. to 3 ft., often branched: lvs. somewhat glaucous, shorter than st, to 1 in. broad: fls. purplishblue; falls ovate to reniform-ovate, to 3 in. long, the spot at base, if present, greenish; standards shorter and narrower, about ¾ in. or less broad. The common iris from E. Canada to Pa. and Mınn. Color vars. are listed as Fósteri, kermesina, ròsea.

vinícolor. R, a: st. strict and erect: fls. purple, falls about 3 in long, recurved or drooping, haft yellowishmarked, blade vinaceous-purple with yellow spot; standards broad-spatulate, much shorter than falls, vinaceous-purple.

violàcea: indefinite name; may be I. pumila, I. germanica, or violet forms of other species.

violilutea. R, a: st. strict and erect: fis. violet and yellow; falls 3 in. or more long, recurved-spreading, haft whitish-green veined yellowish, signal yellow, blade dull violet; standards spatulate, much shorter than falls, blade violet and darker veined. S. La.

violipurpurea. R, a: st. rigid and strict: fls. violet-purple; falls 3-4 in. or more, spreading or recurved, haft veined violet with creamy margins and yellow in center, blade elliptic, violet-purple; standards spatulate, much shorter than falls, violet-purple. S. La.

viréscens: I. Chamæiris.

virginica (I. carolina. I. caroliniana. I. georgiana). R, a: st. 2-3 ft., the fls. pedicelled, solitary or 2-3 together: lvs. bright green. I in. broad more or less, equalling or exceeding the st.: falls broad-spatulate, to 3 in. long, liac marked yellow, purple and brown; standards nearly erect. Va. to La.—Sometimes combined with I. sersicolor but separated by green lvs. and seeds in 1 row (rather than 2 rows) in our beautiful.

vfridis. R, a: st. strict and erect: fls. green and violet; falls about 3 in. long, spreading, haft greenish, blade violet and greenish-yellow; standards spatulate, somewhat less than falls, blade violet. S. La.

viridivinea. R, a: st. slender but erect: fls. green and violet; falls spreading or recurving, haft greenish-yellow veined and marked brownish, blade red-violet and flecked; standards red-violet flushed bluish-lilac in center. S. La.

vulgăris: I. germanica.

Warei: listed as an improved form of I. ochroleuca.

warleyénsis. B, j: related to *I. orchioides*: differs in having white hard edge on lvs. and falls velvety violet-purple often edged white, crest white and often surrounded by orange patch: st. to 18 in., with 3-5 fls. Turkestan.

Watsoniana: I. Douglasiana.

Wattii. R, c: st. to 3 ft., leafy, bearing 5-8 branches: fls. about 4 m, across, layender-blue; crests and centers of falls white with orange-yellow spots and surrounded by darker mauve spots, crests fimbriate or entire. Assam to Yunnan.—Some of the material so listed may be I. confusa. Yunnan.-

Wéstii. R, o: st. to 12 in.: lvs. falcate, to 8 in. long: fls. to 6 in. across; falls cream-colored heavily dotted purple; standards hlac with darker lilac-blue veins. Palestine

Willmottiana. B, j; st. to 8 in., with several fls. sessile in axils: lvs. broad and nearly flat, with whitish hard edge: fls. blue-purple or reddish-purple on oblong blade with white veined patch; standards small, cuspidate. Turkestan.

Wilsonii. R, a: st. hollow, about 2 ft., with 1 head of 2 fts.; Ivs. slightly glaucous, about equalling st.: fts. long-pedicelled, not large; falls pale yellow vened in bright yellow center with reddish-brown, the blade ovate; standards narrow, yellowish-white with faint purple veins and frilled edges. China.

xiphioides (I. anglica. I. pyrenaica). English I. B, x: st. to 18 in. with 1 head of 2 or 3 fls.; lvs. channelled, equalling st.; falls with short broadly cuneate haft bearing large wings, blade nearly orbicular, deep blue-purple with golden patch but colors variable under cult.; blade of standards almost orbicular, shorter than falls; pedicels shorter than spathe. Pyrenees

Spatne. Pyrenees.

Xiphium (I. hispanica. I. lusitanica. I. spectabilis. I. Taitn)

Spanish I. B, x; st. to 18 in., 1- or 2-fid.; lvs. to 2 ft., glaucous, channelled; falls with long oval haft separated from nearly orbicular blade by a narrow neck making it somewhat fiddle-shaped, color variable but in wild plants mostly blue-purple or pale slaty-blue, blade with yellow or orange patch; standards oblanceolate, as long as falls; pedicels equaling or exceeding the spathes. S. France, Spain, Portugal, N. Afr.

IRIS, SNAKES-HEAD: Hermodactulus.

IRONBARK: Eucalyptus.

IRON-TREE: see Metrosideros.

IRONWEED: Vernonia.

IRONWOOD: Ostrua virginiana. Catalina: Luonothamnus floribundus. Desert: Olneya Tesota.

IRREGULAR FLOWER: some parts different in shape or size from other parts in the same series.

fSATIS. WOAD. Cruciferæ. Ann., bien. and per. herbs of the Medit. region and eastward, a few of which are more or less cult. for ornament and interest: erect and branching, glabrous to tomentose, with undivided often clasping lys.: fls. small, yellow or yellowish, in bractless often panicled racemes in late spring and early summer: fr. an indehiscent flat pendulous pod or silique.

alpina. Probably ann. or bien., sts. usually decumbent or ascending, to 1 ft.: lvs. spatulate to elliptic-lanceolate, to 3½ in. long, entire, sessile and often clasping, somewhat glaucous: fls. yellow, in terminal panicles to 6 in. long and as wide: pedicels as long or longer than fr. Italy.—Material so listed in trade may be I. tinctoria which differs from above in taller erect habit and narrower more cuneate for whose vedicels are less the architects. fr. whose pedicels are less than one-half as long as fr.

Boissieriàna. Ann. to 1 ft., glaucous: lower lvs. cuneate-oblong, sinuate-dentate, upper ones cordate-sagittate: fis. yellow: pods heteromorphous. Turkestan.

glauca. Per. to 4 ft. (perhaps sometimes bien.), glabrous, glaucus: Ivs. long-oblong, to 10 in. long, obtuse and entire, tapering to petiole, not clasping on st.: fis. mustard-yellow, in very large terminal panicle. Asia Minor, Persia.—Sometimes planted for ornament; raised from seeds sown the year before blooming.

tinctòria. Dyers W. Bien. to 3 ft., glabrous above: lvs. oblong to lanceolate, to 4 in. long, entire or toothed, those on st. clasping or auricled: fls. yellow, in terminal panicles. Eu., S. W. Asia.—Formerly grown for its blue dye.

ISÉRTIA. Rubiacex. Shrubs or trees native in S. Amer. and Trinidad, having large leathery lvs., tubular red, rarely yellow or white, fis. in many-fld. panieles, and fr. a berry.

parviflors. Shrub or small tree: lvs. oblong, to 1 ft. long: fls. light red, about ½ in. long. Trinidad.

ISLAY: Prunus ilicifolia. ISLAYA: Parodia minor.

ISMELIA: Chrusanthemum Broussonetii.

ISMENE: Ilymenocallis calathina. ISNARDIA: see Ludwigia Mulerttii.

ISOLEPIS: Scirpus cernuus.

ISOLÒMA (Tydxa). Gesneriaceæ. Showy trop. American herbs with creeping roots, opposite lvs., scarlet or orange fls. with ventricose tube and 5-lobed limb, and capsular frs.; grown in the greenhouse and much hybridized. Propagated by seeds.

amábile. To 2 ft., hairy: lvs. ovate, tapering to petiole, spotted and veined with purple: fls. dark rose dotted with purple, to 2 in. long, drooping. Colombia.

bogoténse (I. Tydxa). To 2 ft., hairy: lvs. ovate, cordate at base, spotted and veined with pale or silvery-green: fis. red, yellow spotted with red below, nodding. Colombia.

grandiflorum: catalogue name for improved strains. hirsutum. To 4 ft., hairy: lvs. oblong-ovate, rounded at base and petioled: fls. purple with spotted limb, to 1 in. long, nodding. W. Indies. Var. multiflorum is listed as a more floriferous form.

hondense. To 1 ft., hairy: lvs. ovate: fis. yellow, the tube with bright red hairs, 1 in. or more long. Colombia.

hýbridum: listed name.

multiflorum: probably I. hirsutum var.

Tydæa: I. bogotense.

ISONANDRA: Palaquium Gutta.

ISOPLÉXIS. Scrophulariacex. Subshrubs with alternate lvs. and dense terminal racemes of yellow tubular fls., differing from Digitalis chiefly in the upper lip of corolla as long as lower lip; grown in the open in Calif.; two species from Canary Isls. Cult. and propagation as for the shrubby forms of Digitalis.

canariénsis (Digitalis canariensis). Stiff, to 4 ft.: lvs. shining, thick, lanceolate, to 6 in. long, sharp-toothed: fls. yellow-brown, 1 in. long, strongly 2-lipped, in racemes to 1 ft. long—The plant sometimes grown in the East as Digitalis canariensis is D. ambigua.

Scéptrum. Differs from *I. canariensis* in the larger lys., fis drooping and not bilabiate, the lobes obtuse and half length of tube.

ISOPÒGON. Proteaceæ. Shrubs from Australia with stiff rigid lvs., bisexual fls. in dense cone-like spikes, each fl. sessile in a bract or seale, and small nut-like frs.; grown somewhat in S. Calif. Cult. as for Hakea.

anemonifolius. To 6 ft.: lvs. to 4 in. long, 2-3-pinnate into linear flat entire or lobed segms.: fls. yellow, in nearly globose cones to 34 in. across. New S. Wales.

anethifòlius. To 4 ft.: lvs. 1-2-pinnate into needle-like terete segms.: fls. yellow, in globular cones to 1 in. across. New S. Wales.

ròseus. To 4 ft.: lvs. to 3 in. long, 1-2 ternately divided into linear or lobed segms.: fis. pink, in globular cones to 1 in. across. W. Australia.

spherocéphalus. Lvs. linear, to 4 in. long, sessile: fls. yellow-hairy, in globular cones to ¾ in. across. W. Australia.

ISOPYRUM. Ranunculaceæ. Small northern delicate per. herbs with basal decompound lvs. and white fls. solitary or in panicles having 5-6 petal-like sepals, small petals or none, and numerous stamens; native in north temp. zone and sometimes transferred to the wild-garden

or colonized. Propagated by seeds or division of

biternatum. Lvs. biternate, long-stalked: fis. to ¾ in. across, in clusters in spring. Ont. to Fla. and Tex.

fumarioldes: Leptopyrum fumarioides.

thalictroides. To 6 in.: lvs. biternate, lfts. lobed, short-petioled: fis. white. Apr.-May. Eu.

ISÓTOMA. Lobeliaceæ. Ann. or per. herbs with alternate simple or pinnatifid lvs. and blue, purple or white fls., differing from Lobelia in the entire corolla-tube and the stamens inserted near top of corolla.

petræa. Per. to 1 ft., but blooming the first year: lvs. ovate-oblong, with linear irregular teeth; fls. bluish-purple, to 1 in. long and limb spreading to 1 in., on long axillary stalks. Australia. Var. alba is listed.

ISÒTRIA. Orchidaceæ. N. American terrestrial plants: roots elongate and fibrous: st. scapose, terminated by a whorl of 5-6 elliptic-lanceolate lvs.: fls. solitary or in pairs, erect or ascending. Similar to Pogonia from which it differs in having whorled lvs. and compound pollen-grains. See Orchids for cult.

verticillata (Pogonia verticillata). Whorled Pogonia. To 14 in. high: lvs. elliptic to elliptic-obovate, acute or obtuse, usually 5 in number, to 3½ in. long: fis. solitary (rarely 2); sepals dark madder-purple, linear, to 2 in long; petals greenish-yellow, oblong, to 1 in. long; lip small, 3-lobed near apex. May-June. Me. to Fla. west to Mich. and Tex.

fTEA. Saxifragaceæ. Deciduous or evergreen trees and shrubs, with alternate simple narrow lvs. and small numerous white fls. in terminal or axillary racemes; about 10 species, 1 in E. U. S. and the others in trop. and temp. Asia.

The native itea is hardy as far north as Boston. It grows well in almost any soil and in both sun and shade. In autumn the foliage becomes a brilliant red. Propagated by cuttings and by division of the roots, which spread slowly and form clumps of stems; also by seed when obtainable.

ilicifòlia. Evergreen shrub to 10 ft: lvs. to 4 in. long, spiny-toothed and holly-like: fls. greenish-white, in drooping racemes to 1 ft. long. China.—To be grown under glass N.

virgínica. Sweet Spire. Virginia-Willow. Deciduous shrub to 10 ft.: lvs. to 4 in. long, finely toothed: fls. white, fragrant, in upright racemes to 6 in. long. N. J. to Fla. and La.

yunnanénsis. Evergreen shrub: lvs. ovate, to 4 in. long, toothed or rarely nearly entire, glaucescent: fis. in racemes to 6 in. long. Yunnan.

IVESIA: Horkelia Gordonii.

IVY: Hedera. American: Parthenocissus quinquefolia. Boston: Parthenocissus tricuspidata. Five-leaved: Parthenocissus quinquefolia. German: Senecio mikunoides. Grand: Nepeta hederacca. Japanese: Parthenocissus tricuspidata. Kenilworth: Cymbalaria muralis. Marine: Cissus incisa. Poison: Rhus radicans.

IXIA (Hyalis). Iridaceæ. Cormous herbs of S. Afr. with grass-like lvs. mostly at base of st. and fls. of many colors in terminal spikes or racemes, the perianth-tube long or short.

Ixias may be planted out-of-doors in late November in some parts of the country, but should be well protected by mulch. Bulbs should be set about 2 to 3 inches deep in the open with a little sand sprinkled under them. They may also be planted in spring for summer bloom. After flowering the bulbs should remain in the ground until July when they are lifted and stored in boxes without packing. In the North, ixias are usually grown under glass for winter and early spring bloom. They should be retarded at first and then kept in a temperature of about 55° until after flowering. The corms may be planted in September or October, 5 or 6 of them in a 6-inch pot, about 1 inch deep. They are not hardy in the northern states.

aurantiaca: I. leucantha var. lutea.

azùrea. To 18 in., st. unbranched: lvs. very narrowly linear, to 14 in. long or more: fls. pale blue with dark basal blotch, many in lax spikes, anthers yellow on dark purplish filaments.

bucéphala: hort. name.

campanulata (I. speciosa. I. crateroides). To 1 ft.: fis. dark crimson, yellow anthers on purple filaments.

coléstina: Salpingostulis calestina.

columellaris. To 2 ft. or less: lvs. short, acute and falcate: fis. lilac- or mauve-purple, segms. to 1 in. long, usually 4-6 in corymb, anthers black.

crateroides: I. campanulata.

incarnata: I. scarrosa.

leucântha. To 2 ft.: lvs. to 1 ft. long, acuminate: fls. white with bright yellow anthers and white filaments, segms. 3/4 in. long, in dense many-fld. erect spikes. Var. litea (I. aurantiaca, I. lutea) differs only in its deep yellow fla.

lùtea: I. leucantha var.

maculata. To 2 ft.: lvs. conspicuously ribbed: fls. yellow but in cult. varying to white and tinged with red or purple, segms. 1 in. long, throat with large dark spot, anthers yellow, filaments cream-white, in dense erect spikes.

micrándra. To 10 in, unbranched: fls. white, few on short erect spikes, segms. ½ in. long.

monodélpha. To 1 ft.: lvs. linear, 4-8 in. long: fls. starlike, lilac with red or green basal blotch, in racemes of 4-6, tube cylindrical and twice as long as spathe-valves, May.— Many color forms are known.

Nélsonii: listed as having light red fls. with light eye.

paniculata (Morphixia paniculata). To 3 ft.: lvs. 6-15 in, long: fis creamy-white often tinged red, the cylindrical tube to 3 in. long, limb to 1 in. long, anthers yellow, filaments pale green.

polystachya. To 2 ft.: lvs strongly ribbed, 6-12 in. long: fls. white, fragrant, in dense many-fld. erect spikes, segms. ½ in long, anthers yellow.

scariosa (I. incarnata). To 1 ft.: lvs. short, sword-shaped: fis. reddish or lilac, usually 4-6 in lax spikes, anthers yellow, segms. ½ in. long.

speciòsa: I. campanulata.

spectábilis: I. viridiflora.

viridiflora (I. spectabilis). To 2 ft.: fls. pale green, throat black, many in lax erect spikes on simple scape, tube 1/4 in. long, segms. 1 in. long, yellow anthers on black filaments.

IXIOLÍRION. Amaryllidaceæ. Bulbous herbs of Asia with very narrow mostly basal lvs. and blue or violet fls. in umbels, the perianth-segms. distinct. The bulbs would better be stored over winter. The genus was formerly associated doubtfully with Liliaceæ.

Lédebouri: I. montanum.

montànum (I. tatarıcum. I. Ledebouri. I. Pallasii). To 1 ft.: basal lvs 4, persistent: fls. lilac, 1½ in. long, in 4-6fld. umbels. Siberia to W. Asia.

Pállasii: I. montanum. tatáricum: I. montanum.

IXÒRA. Rubiacex. Many trop. evergreen shrubs or trees with opposite or whorled lvs., white to red fis. in compact corymbs, the corolla long-tubular with spreading 4-5-lobed limb, and fr. a berry. Names in cult. are confused. See Hamelia erecta.

Ixoras are grown in the greenhouse, and in the open in warm climates as Florida and Gulf Coast. They should have a night temperature of about 65°. Propagated by cuttings, preferably with three or four joints, in spring and kept over bottom heat; also by seeds when produced.

acuminata. Shrub: lvs. variable, oval to linear-oblong, to 9 m. or more long, leathery: fls. white, fragrant, 36 in. across, lobes rounded, in corymbs to 4 in. across. India.

amábilis: hort. name for a form with pinkish fis. suffused with orange

amboinica. Shrub: lvs. ovate-oblong, undulate: fis. orange-yellow, the lobes acute, in branched cymes. Moluccas. aurantiaca: hort. form with orange-red fis.

barbata. Large shrub: lvs. elliptic, more or less acute, to 8 in. long and nearly half as broad: fls. white, in short-stalked large cymes that are broader than high, to 12 in. across. India.

Chélsonii: garden form having brilliant salmon-orange fls.
chinénsis. Shrub: lvs. obovate, to 4 in. long: fls. red
varying to white, 1 in. long, lobes rounded, in dense corymbs. Malaya, China.

coccinea (I. incarnata). Shrub: lvs. oblong, to 4 in. long: fls. red, to 134 in. long, the lobes acute, in dense corymbs. E. Indies.

Còlei: hort. var. with pure white fls.

congésta. Tree: lvs. oval, to 1 ft. long, leathery: fls. orange-yellow becoming reddish, lobes rounded, in nearly sessile cymes. India.

Dixiana: hort, form with deep orange fis.

Dúffii: I. macrothursa.

Finlaysoniàna: see I. Thwaitesii.

flore-luteo: hort. name for a yellow-fld. kind.

fúlgens. Shrub: lvs. narrow-oblong, to 8 in. long, shining above: fis. orange-scarlet, to 1¾ in. long, the lobes acute, in large sessile cymes. India, E. Indies.

incarnata: I. coccinea.

javánica. Shrub: lvs. ovate-oblong, to 7 in. long: fls. orange-red, 1½ in. long, lobes rounded, in corymbs with coral-red branches. Java.

laxiflora. Slender shrub to 4 ft.: lvs. oblong-lanceolate ad acuminate: fls. white tinged pink, with tube 1½ in. long, fragrant, in large 3-forked panicles. Guinea.

latea. Garden plant similar to *I. coccinea* and apparently a form of it, but with pale yellow fis. and larger lobes; more than one thing may be grown under this name.

macroth frsa (I. Duffi). Large shrub: lvs. linear-oblong, to 1 ft. long: fts. deep red, 1 in. across, lobes obtuse, in many-fld. corymbs to 8 in. across. E. Indies.

odorata. Small shrub: lvs. ovate to somewhat obovate, acute or acuminate, firm, sometimes 12 in long; fls. white changing to brownish, very fragrant, corolla to 4 or 5 in. long, in large purple-branched clusters. Madagascar.

parviflora. Tree: lvs. oblong or oval, to 6 in. long: fls. white, fragrant, 1/2 in. long, in clusters in cymes to 6 in. across. India.

ròseo-spléndens: hort. name.

Thwaitesii. Large shrub or somewhat tree-like: lvs. somewhat coriaceous, oblong to broadly oblanceolate, to 5 in., more or less undulate but entire: fls. to 1½ in. long, very slender, white, fragrant. Ceylon.—The plant known as I. Finlaysoniana is probably the same.

Westii: hort. form with pale or brilliant rose fls.

Williamsii: hort, name for a var. with reddish-salmon fis.

IABOTICABA: Eugenia cauliflora.

TACARÁNDA. Bianoniacex. shrubs of trop. Amer. with opposite usually 2-pinnate lvs., funnelform 5-lobed blue or violet fls. in panicles, and capsular broad frs.; grown in subtrop. regions or under glass in the N. Propagated by cuttings of half-ripened wood when seeds are not available.

acutifòlia (J. mimosifolia. J. ovalifolia). To 50 ft. or more: Ivs. fern-like, pubescent, the ultimate segms. about ½ in. long: fls. blue, 2 in. long and 1½ in. across. Brazil.

cuspidifòlia. To 30 ft.: lvs. to 2 ft. long, glabrous, the ultimate segms. about 1 in. long: ffs. blue-violet, 1½ in. long and very long-pointed. Brazil, Argentina.

mimosifòlia: J. acutifolia.

ovalifòlia: J. acutifolia.

JACKFRUIT: Artocarpus integra.

JACK-IN-THE-PULPIT: Arisæma triphyllum.

TACOBÆA: Senecio.

JACOBÍNIA. Acanthaceæ. Trop. American rather showy herbs and shrubs with opposite entire lvs. and red, orange or yellow, tubular 2-lipped fls. in racemes or heads.

Jacobinias are grown in greenhouses and in the open in warm regions. They are of easy cultivation but likely to become weedy unless properly restrained and cared for. Propagated by cuttings as well as by seeds.

aurea: J. umbrosa.

cárnea (Justicia magnifica and carnea). To 5 ft.: lvs. ovate or oblong, to 7 in. long: fls. rose-purple or pink, 2 in. long, in dense terminal heads 4 in. long, with acuminate bracts ¾ in. long Brazil.—Most of the plants grown under this name are J. obtusior.

coccinea: Pachystachys coccinea.

floribúnda: listed name, possibly referable to J. pauci-

Ghiesbreghtiana (Justicia Ghiesbreghtiana). To 5 ft.: lvs. lanceolate-ovate, to 6 in. long: fls. orange or crimson, 11/2 in. long, in loose panicles, with small bracts. Mex.

Mohintlii: J. spicigera.

obtusior. Lvs. lanceolate or ovate-lanceolate; fls. pink to crimson, in short dense terminal infl., the bracts very obtuse. Brazil.

pauciflora (Libonia floribunda. Sericographis pauci-flora). To 2 ft.: lvs. oblong or oval, about 34 in. long: fls. scarlet deeply tipped with yellow, 34 in. long, solitary and nodding. Brazil.

penrhoziensis. Hybrid between J. pauciflora and J. Ghiesbreghtiana: fls. carmine slightly tipped with yellow, 11/2 in. long.

Pohliana. To 5 ft. or more: lys. ovate, often purplish: fis. bright crimson, in spikes, the bracts acute. Brazil. ròsea: hort, name.

spicigera (J. Mohintlii. Justicia spicigera and Mohintlii). To 5 ft.: lvs. lanceolate-oblong to ovate, to 7 in. long: fis. red or orange, 1½ in. long, in few-fid. cymes. Mex. umbrosa (J. aurea). To 12 ft.: lvs. lanceolate-oblong to ovate, to 1 ft. long: fis. yellow, 2 in. long, in dense terminal infl. to 1 ft. long, with acute bracts. Mex, Cent. Amer.

velatina. Similar to J. obtusior but lvs. pubescent on both sides. Brazil.

JACOBS-LADDER: Polemonium cæruleum. -Rod: As-phodeline. -Staff: Fouquieria splendens.

JACQUEMÓNTIA. Convolvulacex. Herbaceous twining vines of trop. Amer. with usually entire lvs. and blue or white bell-shaped fls. in cymes or panicles; d ffers from Ipomæa in the 2 flattened stigmas, fls. usually smaller and in closer clusters. Cult. as for Ipomæa; sometimes planted S.

cerulea: probably Ipomaea hederacea.

califórnica: listed name.

Eastwoodians. Small bush or trailing, densely tomentose: lvs. cordate-ovate, to 1 in. long: fis. bright blue, % in. across, on peduncles longer than lvs. Isls., Gulf of Calif.

montana (Ipomaa montana). Plant densely tomentose: lvs. ovate, to 3 in. long, entire or 3-lobed and toothed: fis. yellow, \mathcal{Y}_2 in. across, in dense cymes on peduncles much longer than lvs. Brazil.

pentantha (J. violucea). Lvs. cordate-ovate, to 2 in. long: fis. blue, 1 in. across, the cymes on peduncles as long as or longer than the lvs. Fla. to S. Amer.

violacea: J. pentantha.

IA IOBA: Simmondsia californica. JAKFRUIT: Artocarpus integra. JAMBOS, JAMBOSA: Eugenia.

JAMÈSIA (Edwinia). Saxifragacex. Deciduous shrubs native in W. N. Amer., with opposite toothed lvs. and fls. in terminal cymes.

One species is planted, hardy North; it succeeds in sunny positions in well-drained soil. Propagated by seeds and cuttings of ripe wood.

americana. To 3 ft. or more: lvs. ovate, to 21/2 in. long, gray- or white-tomentose beneath: fis white or in var. rosea pink, about ½ in. across. May-June. Wyo. to New Mex. Var. californica is lower in habit than type, fis. rose. Sierra Nevada Mts.

IAMESTOWN-WEED: Datura Stramonium.

JANKÆA: Ramonda Heldreichii. JAPONICA: Camellia japonica. IARRAH: Eucaluptus marginata.

JASIÒNE. Campanulacex. Many ann. and per. European herbs with alternate simple lvs., blue or white 5-parted fls. in close heads subtended by an involucre, and many-seeded capsular frs.; only a few species in cult. with us; useful in the rock-garden and for borders. Propagated by seed and division.

biénnis: listed name.

hùmilis. Per. to 9 in., hairy: lvs. linear-obovate, entire: fls. blue, in short-stalked heads $\frac{1}{2}$ in. across. Pyrenees.

Per., sts. many, simple or branched, naked above, glabrous, perhaps hispid on lower part: lvs. lanceo-late to linear-oblong, repand-dentate: fls. violet-blue, in heads with very narrow bracts. Balkans.

montana. Bien. to 1 ft.: lvs. linear or lanceolate, wavy: fis. pale blue, in long-stalked heads to 1 in. across, subtended by ovate-lanceolate bracts. S. E. Eu.

perénnis. Shepherds-Scabious. Sheeps-Bit. Per. to 1 ft. lvs. obovate to oblong-linear, entire: fis. blue, in long-stalked globose heads to 2 in. across. S. Eu.

JASMINE: Jasminum. Cape-: Gardenia jasminoides. Chilean-: Mandevilla suaveolens. Confederate-: Trachelospermum jasminoides. Crape-: Ervatamia coronaria. Madagascar-: Stephanoits floribinda. Night-: Nycianthes Arbortisis Rock-: Androsace. Star-: Trachelospermum jasminude.

JASMINUM. Jasmine. Jessamine. Oleaceæ. Attractive trop. and semi-trop. mostly Old World shrubs, often clambering climbers, with pinnate opposite or alternate lvs., white, yellow or pink salverform fls. having slender tube and 4-9 corolla-lobes, and fr. a more or less 2-lobed mostly black berry; most of them are evergreen, often very fragrant. They are essentially plants of warm or mild climates; none is hardy in the open in the northern states although J. humile, J. nudiflorum and J. officinale stand near the coast in central parts.

The jasmines fall into three botanical groups: Unifoliats, in which the leaflets are reduced to 1, as if the leaf were truly simple; Trifoliata, when the leaflets are 3; Pinnatifolia, leaflets more than 3. Recognition of these sections will aid the gardener in making determinations In the following entries, these groups are designated by the letters U, T, P, even though the leaf number is not always definite.

Jasmines are grown out-of-doors in warm regions and as greenhouse plants elsewhere They are of easy cultivaas greenhouse plants elsewhere They are of easy cultiva-tion. Propagated by cuttings of nearly ripe wood in summer, of ripe wood in autumn, by layers, and sometimes by seeds.

absímile. U: evergreen vigorous climber, very florif-erous: single lít. ovate-lanceolate, briefly blunt at apex, narrowed to base, about 2 in. long: fls. white, in axillary and terminal panicles, about 1 in. long, corolla-lobes 6 or 7 and narrow; calyx-teeth narrow, about as long as cup of calyx. Country unknown.—Planted in Calif. It has been erroneously known as J. calcarium, a species not in cult. in this country.

acuminatum. U: climber: single lft. ovate-acuminate, about 3 in. long, rather shortly narrowed to base: fls. white, in a terminal divaricating panicle, about ¾ in. long; calyxteeth very short, much exceeded by the calyx-cup. Aus-

azôricum. T: climbing, evergreen: lvs. opposite, of 3 broad-ovate lfts. to 3 in. long, and obtuse or nearly so, the terminal one long-stalked: fls white, 1 m. across, m manyfid. rather open cymes; teeth of calyx very short. Canary

bahiénse. T: much like J. azoricum, of which it is considered a var. by some authors, but lits. ovate or narrower, acuminate, prominently pointed. Brazil, and planted in Cuba.—Grown in S. Fla.

Beesianum. U: to 3 ft. or more, somewhat clambering: lvs. opposite, simple, lance-late or ovate-lance-late, to 2 in. long, sharp-pointed: fls. pink or rose, fragrant, to 34 in. across, in 1-3-fld. cymes; teeth of calyx 1/4 in. long. China.

calcàrium. U: Australian species not in cult. in N. Amer.; the name has been applied erroneously to J. absimile.

dichôtomum. Gold Coast J T: climbing or clambering evergreen, blooming continuously: lvs. in 2's or 3's, thick and glossy, oblong, pointed, to 3 in. long; fls. white, fragrant, more than 1 in. long, opening at night. W. Afr.; promising in S. Fla.

diversifolium (J. heterophyllum). U, T: climbing or scrambling: lvs. thickish, simple or with 3 ovate-lanceolate lfts., shining above, 3-5 in. long: fls. yellow, tube 1/2 in. long, in corymbs; calyx-teeth minute. Himalayas.

floridum. T, P: erect, half-evergreen: lvs. alternate, of 3 or rarely 5 oval to ovate-oblong lfts. to 1½ in. long: fls. yellow, ½ in. across, in many-fld. cymes; teeth of calyx as long as tube. China.

fruticans. T: to 9 ft. or more, not climbing, evergreen or partially so, the branches weak: lvs. alternate, of 3 oblong obtuse lfts. to 34 in. long: fls. yellow, in 2-5-fld. cymes; teeth of calyx as long as tube. S. Eu., N. Afr.

Giráldii. T. P: to 6 ft, erect, deciduous: lvs. alternate, of 3 or rarely 5 ovate or oblong-ovate lfts. to 1½ in. long, obtuse or acute: fls. yellow, ½ in. across, in 3-9-fld. cymes; teeth of calyx about length of tube. China.

grácile. U: tall, vigorous, profuse bloomer, climbing or gracile. U: tail, vigorous, profuse bloomer, climbing or scrambling: Ift. privet-like, ovate, glossy above, 2 in. or less long, blunt or apiculate: fls. white, nearly or quite 1 in. long; petals narrow and sharp; calyx-lobes minute: panicle upwardly branched or forked. Australia; nat. in Bermuda.—Erroneously known as J. simplicifolium.

gracillimum. U: climbing, pubescent: lvs. opposite, simple, ovate-lanceolate, to $1\frac{1}{2}$ in. long: fis. white, fragrant, in. or more across, in many-fid. cymes; teeth of calyx to ½ in. long. N. Borneo.

grandiflòrum: J. officinale var.

Hackènia: said to be a dwarf jasmine.

heterophyllum; J. diversifolium.

hàmile (J. Reevesii. J. triumphans). T, P: to 20 ft., erect and sometimes almost tree-like, evergreen, with weak branches: Ivs. alternate, of 3-7 ovate to lanceolate lfts. to 2 in. long: fis. yellow, to 1 in. across, fragrant, in clusters; teeth of calyx very short. Trop. Asia. Var. glabrum (J. Walkchanum), lfts. 7-13, ovate or narrower, terminal ones usually caudate. Var. revolutum (J. revolutum), lfts. 5-7, ovate, oval or ovate-lanceolate, acute.—One of the commonest and hardiest in cult. commonest and hardiest in cult.

ilicifòlium: J. dichotomum, probably.

ligustrifòlium: J. rigidum.

lùcidum: probably J. gracile.

Mésnyi (J. primulnum). T: to 10 ft., not climbing, evergreen, the long branchlets 4-angled: lvs. opposite, of 3 oblong to lanceolate lfts. to 3 in. long: fts. yellow with darker center, often double, to 2 in. across, solitary, the corolla-tube short; teeth of calyx leafy, longer than tube. China.—Showy, and sometimes grown under glass.

nítidum. U: partly climbing: lvs. opposite, simple, oval-lanceolate, to 3 in. long: fis. white, $1\frac{1}{2}$ in. across, fragrant; teeth of calyx short. S. Pacific.

nudifiòrum. T: to 15 ft., diffuse but not climbing, deciduous, the branchlets 4-angled: lvs. opposite, of 3 oblong or ovate lfts. to 1 in. long: fis. yellow, 1 in. across,

solitary, before the lvs.; teeth of calyx leafy, as long as tube. China.—Showy shrub in early spring.

officinale. Poets Jessamine. P: to 30 ft., climbing or with weak sts.: Ivs. opposite, of 5-7 ovate lits. to 2½ in. long, the terminal lit. larger: fis. white, ¾ 1 in. across, fragrant, in clusters; teeth of ealyx to ½ in. long. Persia. Var. airco-variegatum has variegated lvs. Var. grandiflorum (J. grandiflorum), fis. larger and more showy, the corolla about 11/2 in. across.

Párkeri. T, P: to 1 ft.: lvs. alternate, of 3-5 ovate líts. to 1/2 in. long: fis. yellow, 1/2 in. across, solitary; teeth of calyx half as long as tube. Himalayas.

poéticum: probably applied to J. officinale, but also to J. absimile.

primulinum: J. Mesnyi.

pubéscens. U: climbing evergreen, pubescent: lvs. opposite, ovate and acuminate, to 2 in. long: fis. white, often double, 1 in. across, in dense clusters; teeth of calyx ½ in. long, yellow hairy-pubescent; cool season. India.

Reèvesii: J. humile.

revolutum. I humile var

rigidum (J. ligustrifolium). U: stiff shrub: lvs. opposite, ovate, to 2 in. long, leathery: fis. white, fragrant, in few-fid. cymes, teeth of calyx linear. India.

Sámbac. Arabian J. U: to 5 ft., climbing, the sts. pubescent: lvs. opposite or perhaps sometimes in 3's, broadovate, to 3 m. long: fis white, to 1 m. across, fragrant, in clusters, often full double; teeth of calyx ½ in. long. India.

simplicifolium: species of the S. Sea Isls., not in cult., the plant so named being J. gracule.

speciosum: hort, name for a dwarf jasmine, 4 ft. high, with glossy lys, and yellow fis.

stephanénse. Hybrid between J. Beesianum and J. officinale var. grandisforum: fis. with color of former and fragrance of latter parent. Yunnan.

trinérve. U: climbing: lvs. opposite, ovate-oblong, 3-nerved from base: fis. white, in clusters; teeth of calyx longer than tube. India.

triúmphans: J. humile

undulatum. U: climbing: lvs. opposite, lance-ovate, acuminate, to 3 in. long: fis. white, fragrant, in cymes; teeth of calyx much longer than tube. India.

Wallichianum: J. humile var. glabrum.

JASÒNIA. Compositæ. Per. herbs of S. Eu., allied to Inula and differing in achenes tapering at each end with pappus at distal end composed of 2 circles, the outer of short bristles and the inner of long hairs. Probably only 2 species, of which one. I. tuberosa, is sometimes cult. To which one, J. tuberosa, is sometimes cult. 18 in., plant glandular, rootstock woody, black and tuberous, sts. erect or ascending, pubescent: lvs. linear-spatulate, to 3 in. long, acute, entire, glandular on both sides: heads yellow, of both ray- and disk-fls.

JÁTROPHA. Euphorbiaceæ. Herbs, shrubs or trees with milky juice, alternate palmately lobed or cut lvs. and unisexual fls. with or without petals; a few of them are listed for sale. Propagated by seeds and cuttings. They often bear stinging hairs. The species are mostly tropical.

Berlandièri. Per. to 1 ft., from a starchy root: lvs. 3 in. across, deeply 7-parted into acuminate pinnately cut lobes, glaucous beneath: fls. purple, with petals, in long-stalked many-fld. cymes. Tex., Mex., Cent. Amer.

Cárcas (Curcas). BARBADOS-NUT. PHYSIC-NUT. Tree to 15 ft.: lvs. roundish, to 6 in. across, slightly 3-5-lobed, long-stalked: fls. yellow, in cymes, with petals. Trop. Amer.

hastata (Adenoropium hastatum). Peregrina. Shrub to 5 ft., glabrous or close-pubescent: lvs. oblong-obovate and constricted below into a fiddle-shape, sharp-acuminate: fls. scarlet or rose, to 1 in. across, in terminal cymes. Cuba.

Mánihot: Manihot esculenta.

multifida (Adenoropium multifidum). CORAL-PLANT. Shrub or tree to 20 ft.: lvs. nearly orbicular, to 1 ft. across, deeply parted into entire or cut lobes, glaucous beneath: fls. scarlet, with petals, in compound cymes. Trop. Amer.

podágrica. Tartogo. Trunk short and swollen and gouty, to about 1½ ft., with bristled scars: lvs. orbicular-ovate in outline, peltate, long-stalked, to 10 in. across, deeply 3-5-lobed with obtuse sinuses: fis. small, coral-red, in terminal long-peduncled cymes with red pedicels. Cent.

Amer.—Planted in warm countries and sometimes seen under glass.

texàna; Cnidoscolus texanus.

JEFFERSÒNIA. Berberidaceæ. Two small per. herbs native in E. N. Amer. and Asia, the former transferred from the woods: lvs. basal, palmately veined or lobed: fls. white, solitary at tip of slender scape: fr. a leathery caps.

diphylla. Twin-Leaf. To 1 ft.: lvs. 2-parted into kidney-shaped entire or lobed divisions, glaucous beneath: fls. 1 in. across. May. Ont. to Va. and Tenn.

dûbia. Young lvs. cordate, margins irregularly angled: petals oblong, very obtuse, narrowed into a short claw: fis. blush. China.

IERUSALEM CROSS: Lychnis chalcedonica.

JESSAMINE: Jasminum, Cestrum. Carolina Yellow: Gelsemium sempervirens. Orange-: Murræa.

 $\textbf{JETBEAD:} \ \ Rhodotypos\ tetrapetala.$

JEW-BUSH: Pedrlanthus trthymaloides.

JEWEL VINE, MALAY: Derris scandens.

JEWEL-WEED: Impatiens biflora.

JIMSON-WEED: Datura Stramonium.

JOBS-TEARS: Conx Lacryma-Jobi.

JOE-PYE WEED: Eupatorium dubium, maculatum, purpureum.

JOINTED: with nodes, or points of real or apparent articulation.

JOINT-FIR: Ephedra.

JOINTWOOD: Cassia nodosa.

JONQUIL: Narcissus.

IOSEPHS-COAT: see Amaranthus tricolor.

IOSHUA-TREE: Yucca brevifolia.

JOVELLANA. Scrophulariaceæ. Herbs or small shrubs from Chile and New Zeal., allied to Calceolaria and differing in the 2 lobes of the corolla being nearly equal in size.

Sinclairi. To 1½ ft., glandular-pubescent: lvs. opposite, ovate, to 3 in long, coarsely toothed or lobed: fis. white or yellow spotted with purple, ¼ in. across, in terminal panucles. New Zeal.

violacea (Calceolaria violacea). To 1½ ft., the st. whitehairy: lvs ovute, to 1 in. long, coarsely toothed or sometimes lobed: fls. yellowish-white spotted with purple, ½ in. across, in terminal panieles. Chile.

JUANIA. Palmaceæ. One monœcious unarmed graceful feather-palm of isl. Juan Fernandez (Chile), which has been intro. into S. Calif.: spadices among the lvs., about 1 ft. long, simply branched, the sexes in different inflorescences; stamens 6: fr. size of cherry, with the stigmatic point terminal rather than basal and in that respect differing from Ceroxylon. J. australis. Tree of medium stature: lvs. 4-6 ft. long; pinnæ many, 2-3 together, linear and acuminate, bifid at apex into slender points, scaly or lepidote underneath, with about 2 secondary nerves either side midrib, margins somewhat thickened; peduncle more than 1 ft. long.

JUBÈA. Palmacex. One massive unarmed monoccious feather-palm of Chile, frequently planted in S. Calif., also sometimes grown under glass in the juvenile state and in tubs for planting out in subtrop. clumps; does not thrive in Fla.

spectibilis (I. chilensis). STRUP PALM. Trunk columnar even when the tree is low, 4-6 ft. diam., bearing scars of the expanded fallen If.-bases, carrying a thick crown of erect-spreading foliage; height to 80 ft. or more: petioles relatively short, margined with stiff hair-like filaments but not truly spiny; lvs. green. 6-12 ft. long; pinnes numerous, 2 ft. or more long and about 1 in. broad, conduplicate, bifid at tip: spadices from lower If.-axils, the large spathes hanging long; stammate fis. on upper part of branches, stamens 15-30: fr. globose-ovoid, 1½ in. long, yellow, 1-

seeded, drupe-like with fibrous flesh.—In Chile sugar or "honey" is made from the sap, and the nuts are employed in confectionery.

TUDAS-TREE: Cercis.

JUGLANDACEÆ. WALNUT FAMILY. Six woody monœcious genera in the north temp. zone, having alternate pinnate lvs., staminate fls. in hanging catkins with 3-many stamens and with or without perianth, pistillate fls. with 3-5-lobed calyx and inferior ovary and borne a few together or in racemes, and fr. a nut, winged nutlet, or drupe. Carya, Juglans, Platycarya and Pterocarya are grown for ornament, shade, and for the edible nuts; many of the species are timber trees.

JÜGLANS. WALNUT. Juglandaceæ. Conspicuous deciduous monœcious trees with large odd-pinnate lvs., staminate fls. in drooping catkins from last-year wood, pistillate fls. on wood of current year, and fr. a furrowed nut inclosed in a thick indehiscent husk. Walnuts may be distinguished from hickories in part by the pith of the twigs chambered or with minute crosspartitions in the former and solid or continuous in the latter. Grown for ornament, the edible nuts, and for timber used in building and making of furniture. For cult. see Walnut.

ailanthifdlia. J. Sieholdiana

califórnica. California W. Shrub or tree to 60 ft.: lvs. of 9-17 ovate-lanceolate lfts. to 3 m. long: fr. globose, ¾ in. across, pubescent. S. Calif.

cathayénsis. CHINESE W. To 80 ft.: lvs. of 9-17 ovateoblong lfts. to 6 in. or more long, pubescent beneath: fr. ovoid, to 2 in. long, pointed, sticky-pubescent, nut thickshelled. China.

cinèrea. Butternut. To 100 ft.: lvs. of 11-19 pubescent lfts. to 5 in. long: fr. ovoid-oblong, to 4 in. long, sticky-pubescent. N. B. to Ark.

cordifórmis: J. Sieboldiana var.

Hindsii. To 75 ft.: lvs. of 15-19 ovate-lanceolate or lanceolate lfts. to 4 in. long: fr. nearly globose, to 2 in. across, pubescent, the nuts nearly smooth. Cent. Calif.

japônica: a name erroneously applied in the trade to forms of J. Sieboldiana or J. regia.

major. To 60 ft: lvs. of 9-13 or more narrow-ovate to oblong-lanceolate lfts. pubescent on rib and rachs underneath: fr. nearly globose, 1 in. or more long, nut deeply grooved. Colo. to Ariz.

mandshùrica. To 60 ft.: lvs. of 9-17 oblong lfts. to 8 in. long: fr. ovate to oblong, 2 in. long, sticky-pubescent. Manchuria.

nigra. Black W. To 150 ft.: lvs. of 15-23 ovate-oblong lfts. to 5 in. long, pubescent beneath: fr. globose, to 2 in. across, pubescent. Mass. to Fla. and Tex.

règia. Persian of English W. To 100 ft., with silverygray bark: lvs. of usually 7-9 oblong lfts. to 5 m. long: fr. nearly globose, to 2 in. across, glabrous. S. E. Eu., Asia. Var. chinensis is a geographic form from China and Himalayas but not morphologically distinguishable from the type. Var. laciniata, lfts. pinnately cut. Var maxima (var. macrocarpa), nuts much larger. Var. monophfila, lvs. simple or with 3 lfts. Var. péndula, branches drooping. Var. præparthrens, shrubby earlier-maturing form.

rupéstris. Rarely to 30 ft.: lvs. of 15-23 lanceolate lfts. to 3 in. long: fr. globose, ¾ in. across, nearly glabrous. Tex., New Mex.

Sieboldiana (J. ailanthifolia). To 60 ft.: lvs. of 11-17 oval lfts to 6 in long, pubescent beneath; fr. globose, about 2 in. long, pointed, sticky-pubescent. Japan. Var. cordiformis (J. cordiformis) has heart-shaped flattened sharply 2-edged lvs.

JUJUBE: Zizyphus.

JUNCACEÆ. RUSH FAMILY. Grass-like herbs of 8 widely distributed genera, with inconspicuous, greenish, chaff-like bisexual fls. borne in heads, panicles or corymbs, having 3 sepals and 3 petals, 3 or 6 stamens, superior 1- or 3-celled ovary, and capsular frs. Juncus and Luzula are occasionally planted.

TUNCUS. RUSH. Juncaceæ. Glabrous stiffish herbs, the following per., with lvs. reduced to basal sheaths; rarely transplanted for ground-cover or interest, and the forms of J. effusus sometimes grown in pots. Propagated by seeds and division. Most of the species are plants of low ground.

bálticus. Tufted, to 31/2 ft.: fls. greenish, 1/2 in. long, the segms. with white margins. Eu., N. Amer.

effùsus. Tufted, to 4 ft.: fls. pale brown, 🔓 in. long. N. Amer, Eu., Asia. Var. spiràlis has spirally twisted sts. and var. vittàtus yellow-striped herbage.

Léscuri. To 3 ft.: fls. dark brown, ¼ in. long, the segms. with deep purple margins. Alaska to Calif.

IUNEBERRY. Some of the species of Amelanchier yield attractive edible berry-like small fruits. The ones grown sometimes in gardens for the fruit are dwarf bushes. The variety Success (Amelanchier stolonifera), which is best known, is a hardy bush 2-3 feet high, suckering at the base and by that means it is propagated. It may be grown much like currants and goose-berries. A row at one side of the garden will soon make a good border, showy with its racemes of white flowers in May (in central New York) while the leaves are small, and laden in July with red-purple blueberry-like fruits about ½ inch in diameter. Juneberries are of simple cultural requirements.

JUNÍPERUS. JUNIPER. Cupressacex. Evergreen mostly small trees and shrubs widely dispersed in the northern hemisphere, some of them arctic, having needle- or scale-like lvs., commonly appressed on old branchlets and spreading on new growth, yellow staminate fls. in little catkins, and fr. a berry-like body formed of the coalescence of the fleshy scales of the cone. Many species are grown for ornament and some of them supply useful timber; some, as J. virginiana, are known as cedars. For cult. see Conifers.

arizónica: possibly Cupressus arizonica.

Áshei: J. mexicana.

barbadénsis (J. bermudiana, sometimes erroneously J. lucyana). Tree to 40 ft.: lvs. mostly overlapping, spinypointed, pale bluish-green: fr. blue, bloomy. Bermuda, Barbados, Antigua; to be planted only far S.

bermudiàna: J. barbadensis.

califórnica (Sabina californica). Shrub to 12 ft. or rarely tree: lvs. overlapping, scale-like: fr. reddish-brown. Calif.—The names var. glauca and Hetzi are listed.

canadénsis: J. communis var. depressa

Cédrus. Tree to 12 ft., with drooping branchlets: lvs. spreading, linear: fr. orange-brown. Canary Isls.

chinénsis. Tree to 60 ft. and more or sometimes shrubby: lvs. of two kinds, scale-like or linear and spreading with 2 white bands below: fr. brown, bloomy. E. Asia; hardy in Cent. N. Y. and New England. There are numerous hort. vars. of high ornament. I value, as: álbo-spica is J. virginiana var.; álbo-variegāta is var. variegāta; Armstrongii, sport of var. Pfitzeriana; aŭrea, young growth golden-yellow; saireo-globòsa, dwarf globose form with young growth golden-yellow; columnāris, narrow-pyramidal habit; conferta, probably J. conferta; dénsa, compact habit; Douglasii is J. horizontals var.; fémina, a form with female fls. and fr.; Fortunei, habit columnar; glauca, foliage bluishgreen; globòsa (J. virginates globosa), of dwarf globose habit; japónica (var. nana, J. japonica), low shrub with decumbent branches, and its forms álba (var. procumbens albo-arriegata) with lvs. variegated white, and aŭreo-variegāta variegated with yellow; Keteleðri, of pyramidal habit with dark green scale-like lvs.; más (var. mascula, var. neaboriensis), conical form with male fls.; Meyeri, similar to var. glauca; nana, synonym of japonica; neaboriensis, ysnonym of mas; oblönga, nearly globose, forming a distinct leading shoot with branches recurved at tips; péndula, branches drooping at tips; Pfitzeriāna, of broad pyramidal habit with nodding spreading branchlets, often without central leader and appearing prostrate, grayishgreen; plumôsa, low, with arching branches and branchlets forming plumose sprays and aŭrea (var. japonica aurea) chinénsis. Tree to 60 ft. and more or sometimes shrubby: forming plumose sprays and aurea (var. japonica aurea)

with young lvs. golden-yellow; procumbens is J. procumbens, but some of the material is var. Sargentii; pyramidālis, of narrow pyramidal habit and bluish-green lvs.; Reèvesii is var. fæmina; Sargentii, prostrate shrub with creeping sts.; Shéppardii, juvenile form of bushy drooping habit; Smithii, pyramidal with drooping terminal branchlets; sphérica, fr. not glaucous; stricta is J. excelsa var.; sylvéstris, probably a synonym for plumosa; torulòsa, a form with twisted branchlets; variegāta (var. albo-variegata), tips of branchlets creamy-white.—Other listed names are dentata, monumentalis, viridis.

monumentatis, viridis.

communis. Common J. Shrub or tree to 40 ft.: lvs. linear, spreading, sharp-pointed, with broad white band above: fr. dark blue, bloomy. Widely distributed in N. Amer. (E. Mass. south and west), Eu., Assa. Vars. are: alpina is var. sazatilis; Ashfordii, probably a form of var. hibernica; aurea, young growth golden-yellow; canadénsis, synonym of depressa; columnaris, probably a form of var. hibernica; compréssa, dwarf shrub with short crowded branchlets; cracôvia, Polish J., branchlets drooping; depréssa (var. canadensis), Prostrate J., shrub to 4 ft. with sts. ascending and its form aurea-spica with tips of branchlets golden-yellow; echinifórmis, Hedehog J., to 2 ft. with densely crowded branchlets; fastigiata is var. suecica; Grayi, pyramidal quick-growing sport; hemisphérica, dense rounded shrub to 3 ft.; hibérnica, Irash J., columnar form with upright dark green branches; horizonsphárica, dense rounded shrub to 3 it; hibérnica, Imsh J., columnar form with upright dark green branches; horizontàlis is probably a synonym of var. prostrata; Jáckii, prostrate shrub with slender trailing branches, Ore., N. Calif.; montàna is var. saratitis; nàna is var. saratitis; nippónica, a Japanese form differing from var. Jackii in having its lvs. deeply sulcate above and keeled below, high mts. of Japan; oblôngo-péndula, columnar form with drooping branches; péndula, branchlets drooping; Pòlishii, probably var. cracona; prostrata, prostrate with smaller lvs. than type; sarátilis (vars. alpina, montana, nana, J. nana, J. saratitis, J. subirica), Mountain J., spreading shrub to 2 ft. high with denser shorter foliage, arctic and mountainous regions of N. Amer; sibirica is var. saratitis; suécica (var. fastigata), Swedish J., of narrow columnar habit and branchlets drooping at tips.—Other listed names are Dap, koratenses and pyramidates. are Days, korasensis and pyramidalis.

conférta (J. litoralis). Shore J. Procumbent shrub: lvs. linear, spreading, spiny-pointed, bluish-green with white band above: fr. black, bloomy. Japan, Saghalin; hardy in S. New England.

contorta is listed as a creeping plant characterized by fastignate branch tips; its botanical position is unknown, but it is probably a hort, var. or form.

cupressifòlia: J. Sabina var.

drupacea. Syrian J. Tree to 45 ft., of pyramidal habit: lvs. linear-lanceolate, spreading, spiny-pointed, with 2 white lines above: cones bluish or brown, bloomy. Greece, Asia Minor; to be planted far S.

excélsa. Greek J. Tree to 60 ft., of pyramidal habit; lvs. mostly scale-like, dark or bluish-green: fr. purplish-brown, bloomy. S. W. Eu., Asia Minor; hardy only far S. Var. dénse is a compact form; var. strícta is a columnar form with young lvs. glaucous, more hardy; var. variegàta has lvs. variegated with yellowish-white.

fláccida. Tree to 30 ft., with drooping branchlets: lvs. scale-like, acuminate: fr. red-brown, bloomy. Tex., Mex.

formosana (J. oblonga pendula). Tree to 40 ft., with drooping branchlets: Ivs. linear, spreading, spiny-pointed, with 2 broad white bands above: fr. reddsh or orange-brown. Formosa, China; may be planted as far north as N. Y. and New England.

Fortunei: J. sphærica, but the material cult. under this name is probably a form of J. chinensis.

Gossinthiana: listed name. hibérnica: J. communis var.

hibérnica: J. communis var.
horizontàlis (J. hudsonica. J. prostrata. J. virginiana var. prostrata). Creffeing J. or Savin. Procumbent shrub with long trailing branches: lvs. mostly scale-like, overlapping, bluish-green: fr. blue. N. S. west and south.—Once thought to be a form of other species. Var. alpina (J. Sabina var. alpina), sts. nearly upright at first; var. airea, young growth golden-vellow; var. depréssa is J. communis var.; var. Douglasii (J. chinensis var.), Waukegan J., trailing form with steel-blue lvs; var. glaica, lvs. more bluish than type; var. glomerata, dwarf form with branchlets crowded into dense clusters; var. plumòsa, depressed shrub with linear lvs.; var. procimbens, very dwarf, only reaching a few in.; var. variegàta, procumbent with creamy-white tips of branchlets.

hudsónica: J. horizontalis.

japónica: J. chinensis var.

Kaizùda: listed name.

litoralis: J. conferta. lucayana: see J. silicicola.

macrocárpa (J. neaboriensis). Plum J. Shrub or dense

pyramidal tree to 12 ft.: lvs. linear, spreading, spiny-pointed; fr. dark brown, bloomy. Medit. region; to be grown far S.

mexicana (J. Ashei). Ozark White-Cedar. Tree to 30 ft. and more; lvs. mostly scale-like; fr. dark blue, bloomy. S. Mo., Ark. to Mex.; to be planted far S.

monospérma. Cherrystone J. Tree to 50 ft.: lvs. mostly scale-like, grayish-green: fr. dark blue, bloomy. Colo. to Tex. and Mex.; useful in lower S.

morrisonicola. Mt. Morrison J. Differs from J. chinensis in the longer black frs. and other technical characters. Formosa.

nana: J. communis var. saxatilis.

neaboriénsis: J. macrocarpa or J. chinensis var. mas.

oblônga péndula: J. formosana.

occidentalis (Sabina occidentalis). Shrub or tree to 40 ft. and more: lvs. mostly scale-like, overlapping, grayish-green: fr. bluish-black, bloomy. Wash. to S. Calif.; to be planted only far S. on eastern side of continent.

Oxycedrus. PRICKLY J. Shrub or tree to 30 ft.: lvs. linear, spreading, spiny-pointed: fr. somewhat bloomy. Medit. to Persia; adaptable only far S.

pachyphlea. Alligator J. Tree to 60 ft. with checkered bark: lvs. mostly scale-lke, bluish-green: fr. reddish-brown, bloomy. Tex., Ariz., Mex.; adapted only to lower S.

Pfitzeriana: J. chinensis var.

phoenicea. Shrub or tree to 20 ft.: lvs. mostly scale-like, dark or bluish-green: fr. yellow or reddish-brown. Medit. region, and to be planted only far S.—The name Longsgoldiana is listed here.

Pinchotii. Tree to 20 ft.: lvs. mostly scale-like: fr. red-dish-brown. Tex.

procèra. African J. Tree to 100 ft. and more: lvs. of two kinds, lanceolate and spreading, or scale-like: fr. brown or purplish. E. Afr.

procumbens (J. chinensis var.). Spreading shrub to 2 ft. high: lvs. linear-lanceolate, spiny-pointed, glaucous above and bluish below. Japan, where it is cult., and hardy in northern states. Var. variegāta is listed.

prostrata: J. horizontalis.

pseudosabina. Low shrub: lvs. of two kinds, scale-like and needle-shaped. Turkestan.

recurva. Tree to 30 ft., with curved branches and drooping branchlets: lvs. linear-lanceolate, grayish or bluishgreen with white band above: fr brown or purple. Himalayas; to be tried far S. Vur. dénsa is J. squamata.

rigida. Needle J. Pyramidal shrub or tree to 30 ft., with drooping branchlets: lvs. linear, spreading, spiny-pointed, yellowish-green with white band above: fr. brownish-black, bloomy. Japan, Korea, N. China; hardy in northern states, but should be protected from severe winter winds.

Sabina. Savin. Shrub to 10 ft., usually spreading or procumbent: lvs. of two kinds, needle-shaped and spreading or scale-like and overlapping, dark green: fr. brownish-blue, bloomy. Eu., W. Asia; hardy in northern states; the native plant once supposed to be this species is J. horizontalis Some of the hort vars are: cupressifolia, procumbent, with scale-like lvs.; fastigitat (sometimes called erecta), shrub of columnar habit; fcmina is J. chinensis var.; horizontalis is listed; lusitanica, upright shrub with scale-like lvs.; prostrata is J. horizontalis; prostrata is J. horizontalis; prostrata is J. horizontalis; prostrata is J. horizontalis; prostrata is listed as of more conical habit; Sanderi, finer blue foliage than type; tamariscifolia, lvs. usually all needle-shaped, bright green; variegata, branchlets variegated creamy-white. variegata, branchlets variegated creamy-white.

saltuaria. Tree to 50 ft.: lvs. overlapping, mostly scale-like, bright green: fr. black. W. China.

Sárgentii: J. chinensis var.

saxátilis: J. communis var.

scopulorum (Sabina scopulorum). Colorado Red-Cedar. Tree to 30 ft. and more: Ivs. overlapping, scale-like, yellowish-green or glaucous: ft. bright blue, bloomy. B. C. to Calif., and hardy in eastern states. Var. argéntea is a pyramidal form with s'lvery-white lvs.; var glauca has more glaucous foliage; var. Fråseri is advertised with silvery lvs. and growing to 20 ft.; var. Hillii, very light blue foliage; var. horizontalis has spreading branches and bluish-white lvs.; var. pendula is listed as a weeping form to 15 ft., lvs. silvery; var. rollerénsis is offered as an erect, compact blue-green foliaged form; var. viridifòlia is a bright green form of pyramidal habit.—Other Latin named forms are: Chandleri, columnaris, cupressifolia, globosa, prostrata. scopulòrum (Sabina scopulorum). COLORADO RED-

sibírica: J. communis var. saxatilis.

silicícola (Sabina silicícola). Southern Red-Cedar. Tree to 50 ft, with drooping branchlets: lvs. scale-like, overlapping, light green: fr. dark blue, bloomy. Ga. to Tex., W. Indies; adaptable only far S. Var. Bedfordiàna, juvenile form with needle-like lvs.—This plant differs from

J. virginiana in its more slender twigs, larger staminate catkins and smaller fr. By some authors it has been confused with J. lucayana, a juniper of the W. Indies which differs in having smaller 4-ranked lvs. and a depressed more or less laterally flattened fr.

sphérica (J. Fortunei). A species from N. China, but the material cult. under this name is J. chinensis.

squamata (J. recurva var. densa). Decumbent shrub: lvs. linear or lanceolate, pointed, grayish- or blush-green with 2 white bands above: fr. brown to black. E. Asia, and hardy in northern states. Var. fibo-variegata (argenteo-variegata), branchlets somewhat creamy-white; var. Fárgesii is a tree to 70 ft; var. Meyeri is an upright dense shrub with blush-watte lvs; var. Pársonii is listed as more dwarf; var. prostrâta is a prostrate form; var. variegāta has creamy-white branchlets; var. Wilsonii is a shrub to 6 ft. with branchlets recurved at tips.

stricta: J. excelsa var.

sylvéstris: a listed name of unknown botanical standing; the plant may be a var. or form of J. chinensis.

taxifòlia. Differs from J. formosana in the obtuse lvs. and shiny light brown fr. Bonin Isls.

thurifera. Pyramidal tree to 40 ft.: lvs. scale-like or needle-shaped: fr. dark blue, bloomy. S. Eu., N. Afr.; to be planted only in lower S.

utahénsis (Sabina utahénsis). Tree to 20 ft.; lvs. mostly scale-like, overlapping, light yellowish-green: fr. reddishbrown, bloomy. Wyo. to Calif.; not hardy in northeastern states. Var. megalocárpa is taller with a single trunk.

venústa: J. virginiana var.

virginalis globosa: J. chinensis var. globosa.

veriusta: J. verjiniana var.
virginàlis globòsa: J. chinensis var. globosa.
virginàlna. Red-Cedar. Tree to 100 ft.: lvs. scale-like
and overlapping or spreading and needle-like: fr. blush,
bloomy. Me. to Fla — Liable to attacks of red-spider.
There are numerous garden vars. as follows: álbo-spica
and "Triomphe d'Angers," tips of branchlets white;
argéntea, lvs and young shoots silvery; alrea, lvs. dark
green tipped with bronze; Būrkii, habit columnar, lvs
steel-blue; Canærtii, pyramidal form with dark green lvs;
Châmberlaynii, branchlets golden-yellow; fastigiàta is
listed as having fastigiate branches; fliffera, branchlets
slender and much divided; glaūca, lvs. very glaucous;
globòsa, globose form with bright green scale-like lvs;
Hillii, a form of var. pyramidaformis; inverta, branches
drooping; Kösteri, low form with glaucous lvs; péndula, branchlets slender and drooping; plumòsa, of pyramidal habit, white-tipped; prostràta is J. horizontalis;
pseddo-cupréssus, habit pyramidal with silvery-gray
foliage; pyramidalis, of dense columnar habit; pyramidiform Hillii, Dundes J., is columnar with pale blush-green
foliage when young, plum-colored in autumn; réptans,
low shrub with spreading branches; Schôttii, columnar,
with scale-like lvs. bright green; tripartita, dwarf densely
branched form; variegata, branchlets variegated with
white; Towsonii, gray-green turning purple-blue in autumn;
vendsta (J. venusta), of columnar habit, lvs. shiny dark
green —Other listed names are cunerascens, corymbosa,
cytindrica, Donaldsonii, Libretonii, McCabei, Smithii,
vegetus and viridis. vegetus and viridis.

Wallichiana. Shrub or tree to 60 ft.: lvs. scale-like and needle-shaped, bright green: fr. blue. S. W. China; to be planted only in mild climates.

Whittmanniana: a listed name.

Wilsonii: J. squamata var.

JUPITERS-BEARD: Anthyllis Barba-Jovis, Centranthus ruber.

JURÎNEA. Compositæ. Old World herbs or shrubs adapted to the wild garden, having white-tomentose foliage and purple fls. in longpeduncled heads forming cymose infl.: achenes 4-5-sided and crowned with a pappus of unequal stiff and rough hairs. Propagated by seeds or division and planted in any ordinary garden soil.

alata. Bien. or per. to 3 ft.: basal lvs. lyrate-pinnatifid, oblong, to 6 in. long, glabrescent above and hairy beneath, st.-lvs. lanceolate, dentate and decurrent: heads purplishblue, to 1 in. across, involucral bracts narrow with spreading tip. Caucasus.

anatólica. Bien. or per., gray-canescent: lvs. finely pinnately lobed, the upper ones less so and linear but not decurrent: heads purplish, large, involucre webby-tomentose, lower bracts squarrose and reflexed. Asia Minor.

móllis. Bien. or per., little branched or simple: lvs. oblong to linear-lanceolate, usually pinnately lobed, segms. linear: heads rose-purple, to 2½ in. across. S. Eu.

JUSSLEA. PRIMROSE-WILLOW. Onagraceæ. Shrubs and per. herbs with alternate simple lvs., yellow or white fls. solitary in the axils, and capsular frs.

Jussiæas are grown in the aquatic or damp garden, and mostly treated as tender annuals. Seeds should be sown in pots or pans which after two days should be submerged in water. The seedlings should be transferred to pots and it is not always necessary to keep them under water.

californica. Yellow Water-weed. Per. with sts. to 10 ft. long: lvs. oblong to ovate, to 2 in. long, floating lvs. often more orbicular and with longer petioles: fls. yellow, solitary in axils. Calif.

decarrens. Erect per to 2 ft.: lvs. lanceolate, to 4 in. long, sessile, decurrent: fls. yellow, to ½ in. across. Swamps, Md. to Ill. south to Fla. and Tex.

longifòlia. Erect, to 2 ft.: lvs linear-lanceolate, long-pointed: fis. yellow. Brazil.

peruviàna (J. Sprengeri). Per., evergreen, prostrate, sts. winged, much branched, harry: lvs. opposite, ovate, acute, crowded: fls. canary-yellow, large Argentina.—Said to be adapted to aquatic or terrestrial habitats.

rèpens. Sts. creeping, rooting at nodes: lvs. oval to spatulate, to 3 in. long: fls. yellow, ½ in. long. Tropics.

salicifòlia: J. suffruticosa.

Spréngeri: J. peruviana.

suffruticosa (J. salicifolia). Per., woody at base, to 4 ft., erect and much branched, branchlets angled: lvs. narrowly lanceolate to elliptic-ovate, to 4 in. long, base cuneate, apex acute: fls. yellow, to % in. across. W. Indies, distributed throughout tropics.

JUSTÍCIA. Acanthacex. Trop. herbs and shrubs allied to Jacobinia and distinguished by

technical characters of the stamens and pollengrains. Cult. as for *Jacobinia*.

cárnes: Jacobinia carnea

coccinea: Pachystachys coccinea; see also Odontonema strictum.

Ghiesbreghtiana: Jacobinia Ghiesbreghtiana.

magnifica: Jacobinia carnea.

Mohintlii: Jacobinia spicigera.

secanda. Red J. Shrub to 8 ft.: lvs. ovate-oblong, to 6 in. long, long-acuminate: ffs. red, 1½ in. long, deeply 2-lipped, on narrow terminal panicles. N. S. Amer.

spicigera: Jacobinia spicigera.

JUTE: Corchorus capsularis.

JUTTADINTÈRIA. Aizoucex. Subshrubs with short sts., very thick decussate lvs. and white to rose short-stalked fls. having linear recurved petals and 8–10 stigmas; a segregate from Mesembryanthemum; S. Africa.

albata. To 1 ft.: lvs. densely imbricated, to 3 in. long, 1/2 in. wide and thick, keeled on back, glaucous tinged with rose: fls. solitary, white, 1/2 in. long.

buchubergénsis: listed name.

próxima. To 3 in , each branch with 2 pairs of lvs.: lvs. to 2 in. long and $\frac{1}{2}$ in. thick, glaucous: fls. solitary, rose-pink, $1\frac{1}{4}$ in. across, fragrant.

rhèolens. Branches crowded, usually densely 4-lvd., glaucous, with rhubarb odor: lvs. to 1½ in long, ½ in. wide and thick: fls. solitary, pale rose-hlac, 1¼ in. across.

Simpsonii (M. Simpsonii). To 10 in.: lvs. to 1½ in. long and ½ in. thick, 3-angled, with short usually red teeth: fls. solitary, white, shining, 1 in. long.

KADSURA. Magnoliacex. Evergreen woody twiners from trop. Asia with simple lvs., unisexual usually solitary fls., and fr. a globose head of berries (separate carpels) which are ornamental in autumn. Propagated by cuttings of half-ripened wood under glass. To be planted far S.

japónica. Lvs. oval to oblong-lanceolate, to 4 in. long, slightly toothed: fls. yellowish-white, ¾ in. across, not showy, stalked: fr. scarlet, the heads about 1 in. across. Japan, Korea.

KAFIR: Sorahum vulgare var. caffrorum.

KAGENÉCKIA. Rosaceæ. Small evergreen trees from Chile with leathery sharp-toothed lvs. and diocious fls., the pistillate solitary and staminate in racemes or corymbs; one species intro. in S. Calif.

oblongs. To 30 ft.: lvs. oblong: fls. white, 3/4 in. across. Chile.

KAHIKA: Podocarpus dacrydioides.

KAKI: Diospuros Kaki.

KALÁNCHOË. Crassulaceæ. Succulent trop. per. herbs or subshrubs, mostly in Afr., Madagascar and Asia, with opposite fleshy lvs. that are sometimes pinnatifid or pinnate, and yellow, scarlet or purple fls. in terminal panicled cymes, the corolla urn-shaped or salverform and the calyx sometimes much inflated. Plants listed here are sometimes also referred to Bryophyllum and Kitchingia.

The kalanchoës are grown in the greenhouse or out-ofdoors in the South for the bloom. The cultivation is not peculiar. Propagated by stem-cuttings and seeds but more readily by placing a leaf on wet sand in a warm light propagating frame or even laying it on the ground; from the notches of the leaf young plants will grow and these may be potted when of sufficient size.

æthiðpica: listed name.

Áliciæ. Sts. robust, hairy: lvs. nearly orbicular, crenate, hairy: fls. large, with broad-ovate deeply emarginate segms, hairy, in corymbs. Madagascar.

beharénsis. Per. and woody, branching, sts. hairy at apex, 3 to even 10 ft.: lvs. in terminal rosettes, sagittate with shallow lobes on side, silvery underneath and rusty-hairy above: fis about ½ in long, woolly, in branched cymes, yellowish-green to white, violet inside. Madagascar.—Plants in the American trade as Kitchingia mandrakensis and K peralta are to be referred here.

Blossfeldiana (K. globulifera var. coccinea). Sts. short: lvs. obovate, to 1 in. long and ¾ in. wide, entire or toothed: fls. scarlet, in many-fld. cymes. Madagascar.

brachfloba. Sts. robust, glabrous: lvs. ovate-lanceolate, entire or weakly sinuate, petiolate: fls. about ½ in. across. Trop. Afr.

cárnea: R. laciniata.

coccinea: K. laciniata.

crenata. To 6 ft., with thick root: lvs. oblong to spatulate, to 3 in. long, coarsely toothed: fis. yellow or orange. Trop. Afr.

Daigremontiana (Bryophyllum Daigremontianum). Glabrous, simple, erect, 1½ ft. or more, plant green-brown: lvs. thick, long-oblong, producing plantlets from the many serratures: fls. about 1 in. long, corolla much exceeding the sharp-lobed calyx. Madagascar.

Dyeri: K. Quartiniana.

Éngleri: listed name.

farinacea: K. scapigera.

Fedtschénkoi. Per, glabrous, about 1 ft., more or less branched at base: lvs. fleshy, obovate to nearly orbicular, crenate-dentate, short-petioled: fls. corymbose, on a terminal peduncle, hanging on their pedicels, corolla longer than tubular calyx, purple. Madagascar.

flámmea. To 1½ ft.: lvs. ovate-oblong, 2 in. long, entire or slightly toothed: fls. yellow and orange-scarlet, ½ in. across. Trop Afr.—A good subject for a rather cool greenhouse.

formòsa: listed name. glaucéscens: K. laciniata.

globulifera: see K. Blossfeldiana.

grándis: listed name.

kewénsis. Hybrid between K. flammea and K. teretifolia, the latter a white large-fid. species from Arabia, 3 ft., with somewhat terete and pointed lvs. in pairs at top of st., but apparently not in cult. with us.

Kirkii: K. velutina.

lacinièta (K. carnea. K. coccinea. K. glaucescens. K. spathulata. K. Welwitschii). Sts. erect, to 4 ft.: lvs. oblong, ovate or lanceolate, entire, crenate or lobed, to 5 in. long, petiolate: fls. yellow, orange, pink or scarlet, to ½ in. across. Trop. Afr.—A good conservatory plant for winter bloom; seeds sown in spring should give fls. at the holidays; established in Fls.

lanceolata (K. pilosa). Lvs. ovate or lanceolate, to 1½ in. long, entire or slightly sinuate: fls. hairy, with lobes of calyx equalling the tube. Trop. Afr., India.

laxiflora (Bryophyllum crenatum). Sts. to 3 ft.; lvs. oblong or ovate, to 3 in. long, crenate: fls. pale yellow or red, ¾ in. long, in branched panicles 1 ft. long. Madagascar.—This has also been mistakenly listed in the trade as Bryophyllum cruentum.

mandrakénsis: plants in the American trade under this name are to be referred to K. beharensis.

marmorata. Sts. branching, upright or prostrate: lvs. obovate, to 8 in. long, coarsely toothed, blotched with purple on both sides: fls. white or yellowish, tubular. Abvasinia.

miniata (Bryophyllum miniatum. Kitchingia miniata). To 2 ft.: lvs. ovate-oblong, to 2 in., coarsely crenate, on long petioles to 1½ in.: fls. salmon-pink, 1 in. long, drooping. Madagascar.

orgyalis. Sts. erect, glabrous, to 3 ft.: lvs. oblong-spatulate, entire, to 6 in. long: fls. yellow, about 1/4 in. across. Madagascar.

peltata (Kitchingia peltata). Sts. to 6 ft. high, erect, glabrous: lvs. ovate-oblong, obtuse, crenate, to 4 in. long, with petioles somewhat shorter than blades and attached about 1/2 in above the bases: fls. pink, 3/2 in. long, drooping. Madagascar

pilòsa: K. lanceolata.

pinnata (Bryophyllum calycinum. B. pinnatum). AIR-PLANT. LIFE-PLANT. FLOPPERS. To 6 ft.: lvs. of 3-5 oval or oblong lfts. to 5 in. long: fts. with greenish- or yellowish-white purple-tinted inflated calyx and reddish corolla to 3 in. long Probably E. India but run wild in warm regions.

Quartiniana (K. Dyeri). To 2½ ft., with stout sts., glabrous and more or less glaucous: lvs. broad, elliptic, petiolate, to 7½ in. long and 5 in. wide: fls. white, about 2 in. aeross, in a terminal corymbose cyme. Trop. Afr.

rotundifòlia. To 1½ ft., erect, glabrous: lvs. obovateoblong or oblong-lanceolate, entire, subacute, to 1 in. long: fls. vermilion. S. Afr., Socotra.

scandens. St. climbing, to 10 ft. long: lvs. sessile, st.-clasping, linear-lanceolate, to 3 in. long: calyx-tube 1/2-1/2 in. long and up to 1/2 in. wide; corolla campanulate, purplish-green to dark violet. Madagascar.

scapigera (K. farinacea). To 1½ ft., erect, glabrous: lvs. obovate-orbicular, slightly farinaceous, 1 in. long; fis. red. Trop. Afr., Socotra.

Schamacheri. To 1½ ft., ascending or erect, glabrous and glaucous: lvs. ovate-lanceolate, acute, coarsely doubly serrate, rarely lobed, to 5 in. long: fls. yellow, to ¾ in. long. Java

somaliénsis. Sts. leafy, erect: lvs. obovate, to 6 in. long, toothed, slightly spotted with brown: fls. white, 3 in. long. Somaliand.

spathulata: K. laciniata.

teretifòlia: see K. kewensis.

thyrsiflora. To 2 ft., sts. densely leafy: lvs. to 6 in. long and 2½ in. wide, hoary: fls. yellow, ½ in. long. S. Afr.

tuberosa. Rootstock woody-tuberous, plant mealywhite: lvs. crenate, 1 in. long: fis. 1½ in. long, rose-colored. Madagascar.

tubiflòra: K. verticillata.

tubulòsa: listed name.

uniflora (Kitchingia uniflora). Prostrate, rooting at joints: lvs. obovate, obtuse, to 1 in. long, bright green: fis. solitary or 3, 1 in. long. Madagascar.

velutina (K. Kirkii). To 2½ ft., erect, pubescent: lvs. oblong-ovate, blunt, crenate, to 4 in. long, petiolate: fis. salmon-pink to yellow, ¼ in. long, in terminal cymes. Trop. Afr.

verticillata. Per., glabrous, making single sts. erect

above base 3 ft. or more high: lvs. many, long-linear, to 6 in. long, with budlets at end: fls. bright light red, about 1 in. long, hanging in many terminal clusters. S. Afr.—This is available in the American trade as Bryophyllum tubiyforum and K. tubiflora.

Welwitschij K laciniata

KALE, BORECOLE (Brassica oleracea var. acephala, B. fimbriata, and others). The kales are of many kinds; they are cool-season plants grown as greens or pot-herbs, for their succulent edible leaves which are used either in autumn or spring. For autumn crop, seeds are sown in late spring where the plants are to stand or in some cases in seed-beds and the young plants transplanted. In the middle regions, as about Norfolk, kale is mostly a spring crop, seeds being sown in late summer or in autumn, the plants standing in the field over winter. In market kale, the entire plant is cut; in kitchengardens leaves are often taken as needed and the plants allowed to stand, in which case the distances between them may be 10-24 inches in the row depending on the variety. When the entire plant is to be removed in harvesting, the space need be only half as much or even less. The curled or crimped varieties are usually most prized. The plant goes to seed the second year. The pests are those of cabbage. See *Collard*; also Rrassica

KÁLMIA. Ericacex. Mostly evergreen shrubs. of the western hemisphere, with simple entire lvs., purple, pink or white fls. which are bellshaped or saucer-shaped and bear 10 pouches on the corolla in which the anthers are held back until they discharge the pollen. The following species are amongst the good broad-leaved evergreens.

Most of the species are hardy North and very ornamental. They succeed on sandy or peaty soils which are rather noist, but do not thrive on clay or limestone. Plants can be transplanted from the wild and a mulch should be provided the first year. Propagated by seeds sown in pans of sandy peat or sphagnum and set out-of-doors the following year; also by cuttings of half-ripened wood under glass, by layers, and varieties by veneer-grafting.

angustifolia. Lambrill. Sheep-Laurel. To 3 ft.: lvs. usually opposite, to 2½ in. long: fis. purple or crimson, to ½ in. across, in lateral corymbs. June-July. E. N. Amer. Var. cándida has white fis. Var. pûmila (var. nana) is a dwarf form to 1 ft.

carolina. Resembling K. angustifolia but with smaller lvs. gray-pubescent beneath and purplish fis. Va. to S. C.

cuneata. Shrub to 3½ ft.: lvs. obovate-cuneate, to 2 in. long, alternate, deciduous: fis. pinkish-white, axillary. N. C., S. C.

glauca: K. polifolia.

latifolia. MOUNTAIN-LAUREL. CALICO-BUSH. To 10 ft. or more: lvs. alternate or irregular, to 5 in. long: fls. rose marked inside with purple, 1 in. across, in large terminal corymbs. May-June. E. N. Amer. Var. álba, fls. white. Var. myrtifolia, dwarf, lvs. to 2 in. long. Var. polypétala, corolla deeply cut. Var ribra, fls. dark pink.

microphýlla: K. polifolia var.

polifòlia (K. glauca). Bog K. To 2 ft.: lvs. opposite or in 3's, to 1½ in. long, glaucous-white beneath: fls. rose-purple, ½ in. across. in terminal corymbs. May-June. N. Amer. Var. mòntana is listed. Var. microphylla (K. microphylla), to 8 in., lvs. to ¾ in. long. W. N. Amer. Var. nàna is a dwarf hort. form.

KALMIÓPSIS. Ericacex. One evergreen shrub from Ore., K. Leachiana (Rhododendron Leachianum). Sts. erect, to 10 in.: lvs. ellipticaloblong to nearly obovate, usually acute, glandular-dotted beneath, coriaceous, alternate: fls. regular, with rose-colored corolla and red fleshy glandular calyx, to 18 in. long, solitary, arising from persistent bracts in lf. axils: fr. a subglobose caps.—Grows in dry rocky exposed areas at 2,000-4,000 ft. elevation.

KALÓPANAX. Araliacex. One species, K. pictus (K. and Acanthopanax ricinifolius and septemlobus), formerly retained under Acanthopanax but distinguished in part from that genus by lvs. palmately lobed and not divided into lifts. Tree to 80 ft.: vs. 5-7-lobed, toothed, to 1 ft. across: fls. whitish, in umbels, styles free at base but arched and fused toward apex. Japan. Var. Maximowiczii (Aralia Maximowiczii) has more deeply lobed lys.

KALOSANTHES: Rochea coccinea.

KAMANI: Calophullum inophullum.

KANGAROO-THORN: Acacia armata

KAPOK: see Ceiba.

KARANDA: Carissa Carandas.

KARO: Pittosporum crassifolium.

KARUM OIL TREE: Ponoamia vinnata.

KASSOD-TREE: Cassia siamea.

KATSURA-TREE: Cercidiphyllum japonicum.

KAIILEUSSIA AMELLOIDES: Charie's heterophulla

KEELED: ridged like the bottom of a boat; the two front united petals of a papilionaceous flower constitute a

KEI-APPLE: Dovyalis caffra.

KÉLSEYA. Rosaceæ. A monotypic American genus allied to Petrophytum, differing in having densely imbricated lys. and solitary fls. The one species is K. uniflora, a semi-prostrate subshrub: lvs. entire, leathery, persistent, to 1/8 in. long: fls. white, about 1/4 in. across, inclosed in the rosette of subtending lys.: fr. a follicle. Mountainous cliffs in Mont., Ida. and Wyo.—Adapted to rock-gardens, doing best over a limestone substratum or beneath limestone scree.

KENNÉDIA. Leguminosæ. Showy trailing or climbing shrubs with pinnate lvs. mostly of 3 lfts. but sometimes 5 or 1, papilionaceous fls. usually in axillary pairs, umbels or racemes, and linear pods; native in Australia and grown in N. Amer. for ornament under glass and in the open in S. Calif. and elsewhere. Propagated by seeds and cuttings. See Hardenbergia for generic differences.

bimaculàta: Hardenbergia monophylla. Comptoniana: Hardenbergia Comptoniana.

Márryattæ: K. prostrata var. major. monophýlla: Hardenbergia monophylla.

nigricans (Lotus nigricans). Robust twiner: lfts. 3 or sometimes reduced to 1, broadly ovate: fis. purple-black blotched with green on the standard, in a one-sided raceme: pods flattened.

ovata: Hardenbergia monophylla.

prostrata. Prostrate: lfts. 3, broadly obovate: fls. scarlet, 2-4 together on a long stell; rock-2-4 together on a long stalk; pods nearly cylindrical. Var. major (K. Marryattæ) is a larger twining form.

rubicúnda. Twining: líts. 3, ovate to orbicular, to 4 in. long: fis. dull red, in drooping racemes: pods flat.

Palmacex.As currently understood there are only 2 true Kentias and probably neither one is known in general cult. or in this country. The original species, K. procera, is native in New Guinea and the other, K. Ramsayi, on Crocker Isl., N. Australia. Some 50 names have been made in Kentia, but as all these palms have become better understood they have been referred to other genera. Names appearing in hort. literature are as follows:

Baueri: Rhopalostylis Baueri.

Belmoreana: Howea Belmoreana.

Canterburyana: Hedyscepe Canterburyana.

Forsteriana: Howea Forsteriana.

Lindenii: Chambeuronia.

Macárthuri: Actinophlæus Macarthuri. macrocárpa: Chambeyronia macrocarpa.

sápida: Rhopalostylis sapida.

KENTIÓPSIS. Palmacex. As now defined, 1 species of feather-palm, K. olivæformis, a lofty tree of New Caledonia and apparently not in cult. For K. macrocarpa, see Chambeyronia.

KENTRANTHUS: Centranthus.
KENTROPHYLLUM: Carthamus.

KERNÈRA. Cruciferæ. A few per. species in the mts. of S. and Cent. Eu., by some authors united with Cochlearia, from which the genus differs only in technical characters; one species is grown in rock-gardens. K. saxátilis (K. and Cochleuria Boissieri, Cochleuria saxatilis) grows 2–12 in. high, glabrous or nearly so: lower lvs. oblong to spatulate and somewhat dentate, in a rosette, st.-lvs. few, lanceolate: fls. white, in a terminal raceme, in summer.

KÉRRIA. Rosaceæ. Well-known Chinese deciduous green-twigged shrub commonly planted for ornament and hardy N., K. japónica (Corchorus japonicus). To 8 ft.: lvs. oblongovate, to 2 in. long, doubly toothed: fls. golden-yellow, to 2 in. across, solitary. Var. aðreo-variegāta, lvs. edged yellow. Var. aðreo-variegāta, lvs. edged yellow. Var. aðreo-vittāta, branchlets striped green and yellow. Var. píctā (var. argenteo-variegata), lvs. edged with white. Var. pleniflðra, fls. double, the prevailing form.—Kerria does well in partial shade. Propagated by cuttings, layers, and division of the roots.

KETELEÈRIA. Pinaceæ. Very tall evergreen trees of 2 or more species in China, adapted only to the lower S. and similar climates, having solitary linear lvs. pale beneath and large erect cones with woody persistent scales; belongs to the Abies group. For cult. see Conifers.

Davidiana. To 120 ft.: lvs. rounded or notched at apex: cones to 8 in. long.

Fortunei. To 100 ft., young branchlets orange-red: lvs. spiny-pointed becoming blunt: cones to 7 in. long.

KHAT: Catha edulis.

KHUS-KHUS: Vetiveria zizanioides.

KÍCKXIA (Elatinoides). Scrophulariaceæ. Ann. creeping herbs of the Old World, the fls. solitary, irregular, 2-lipped, corolla spurred and throat closed by palate; 2 species sometimes planted for ground-cover in rockeries.

Elatine (Linaria Elatine). Lvs. ovate-hastate, to 1 in. long: fls. yellowish, purplish outside, ¼ in. long, spur straight. Eu., Asia; nat. in E. N. Amer.

spùria (Linaria spuria). Lvs. ovate, to 1 in. across: fis. yellowish with upper lip purple, spur curved. Eu.; nat. in E. N. Amer.

KIGÈLIA. Bignoniaceæ. Trees with pinnate lvs., bell-shaped 2-lipped orange or red fls. in long-stalked drooping panicles, and hard cylindrical indehiscent frs.; grown in S. U. S. as an oddity; native in trop. Afr.

pinnata. Sausage-Tree. To 50 ft.: lvs. ternate, with 7-9 oval-oblong lfts. to 6 in. long: fis. claret-colored, to 3 in. long: fr. somewhat gourd-like, to 1½ ft. long, swinging on cord-like stalks to several ft. long.

KIRENGESHÒMA. Saxifragacex. One Japanese per. occasionally grown in the garden. K. palmàta. To 4 ft.: lvs. nearly orbicular, den-

tate and some of them somewhat palmately 7–10-lobed, to 4 in. or more across: fls. yellow, to 134 in. long, bell-shaped and nodding, 1–3 together, the calyx prominent.—Propagated by division.

KITAIBÈLIA. Malvaceæ. One, or perhaps more, species native in the Danube region. K. vitifòlia. Per. to 8 ft.: lvs. grape-like, 5-lobed or -angled, toothed, to 3 in. or more long: fls. white or rose, large, solitary or in axillary clusters.—Of easy cult. in good garden soil. Propagated by division or seeds.

KITAMBILLA: Dovualis hebecarpa.

KITCHINGIA: Kalanchoë.

KLEÌNIA. Compositæ. Succulent plants of Afr. allied to Senecio and often united with that genus, distinguished mainly by the disk-florets having style-branches minutely conetipped; heads of disk-fls. only, white or pale vellow.

acaùlis. Nearly stemless, at most to 3 in.: lvs. linear, to 6 in. long: heads solitary on scapes to 8 in. high, to 1 in. across.

amaniénsis. St. to $1\frac{1}{2}$ ft. long and $\frac{3}{4}$ in. thick, becoming prostrate: lvs. oblong or spatulate, to 4 in. long; heads nodding, yellow, about 1 in. long, on scapes to $2\frac{1}{2}$ ft. tall.

Anteuphorbium. Much branched shrub to 5 ft.: lvs. to 1½ in. long and ½ in. wide, soon deciduous: heads 1-3, yellowish-white.

articulata (Senecio articulatus). CANDLE-PLANT. To 2 ft., the branches swollen and fleshy: lvs. deeply lobed, to 2 in. long: heads white, in long-stalked corymbs.

cineráscens: Senecio cinerascens.

crassissima: Senecio crassissimus.

cylindrica. Shrub to 2 ft, branched from base: lvs. cylindrical, to 3 in. long and ½ in. thick: heads white, in terminal cymes.

ficoides (Senecio ficoides). Sts. fleshy and woody: lvs. powdery-glaucous, compressed, to 3½ in. long: heads whitish, in corymbs. S. Afr.

fülgens. Sts. spreading or prostrate, to $1\frac{1}{2}$ ft. long: lvs spatulate, to $3\frac{1}{2}$ in. long, with 2-3 teeth on either side: heads 1-2, red, 1 in. across.

longiflora. Much branched shrub to 2 ft.: lvs. scale-like, to $\frac{1}{3}$ in long: heads 3-5, whitish, $\frac{3}{4}$ in long.

Mándraliscæ. Subshrub to 10 in.: Ivs. semi-cylindrical, to 3½ in. long: heads whitish, ½ in. long, in loose cymes. neriifòlia. Shrub to 10 ft.: Ivs. in terminal tufts, linearlanceolate, to 6 in long and ¾ in. wide: heads yellowishwhite, in cymes. Canary Isls.

péndula: Notonia pendula.

radicans. Sts. prostrate and rooting, to 2 ft. long: lvs. cylindrical, 1 in. long and 1/2 in. thick: heads 1-2, white.

rèpens (Senecio succulentus. Cacalia repens). Subshrub to 1 ft.: lvs. at tips of branches, nearly cylindrical, to 11/2 in. long and 1/2 in. wide: heads 2-3, pale yellow, 1/2 in. long. réptans: Senecio reptans.

stapeliæfórmis. To 10 in., the fleshy sts. 4-7-angled and angles toothed, teeth tipped with small withering lvs.; heads solitary, scarlet, 1 in. long.

tomentòsa: Senecio cinerascens. tropæolifòlia: Senecio tropæolifòlius.

KNAPWEED: Centaurea nigra.

KNAÙTIA. Dipsaceæ. Eurasian per. herbs with opposite lvs. and long-stalked heads of fls. subtended by numerous involucral bracts; differs from Scabiosa in the 4-lobed rather than 5-lobed corolla and other technical characters.

ambigua. Per., sts. retrorse-hispid below, glandular-pubescent above: basal lvs. oblong-cuneate, entire, lower st.-lvs. lyrate-pinnatifid to pinnatisect: heads yellow, on long peduncles. Macedonia.—Plants of more slender habit than K. arvensis and with smaller heads.

arvénsis. Per. to 4 ft., sts. glandular-pubescent to hirsute: basal lvs. oblong, margins crenate-dentate, st.-lvs. lyrate to pinnatifid, segms. linear-lanceolate, entire: heads lilac, short-peduncied. Caucasia to Greece.

drymèia. To 31/2 ft., sts. ascending, softly hairy: st.-lvs.

ovate to lanceolate, acuminate, serrate, pubescent: fis. reddish-violet to purple, in heads to nearly 2 in, across, Balkan region.

lyratifòlia: probably hort, name for K, lyrophylla.

lyrophýlla (Scabiosa lyrophylla). Per. to 2 ft., sts. slender. lyrophila (Scabiosa tyrophylla). Fer. to 2 II., sts. siender, obscurely retrorse-hispid: 1vs. lyrate to lyrate-pinnatifid, appressed-pubescent beneath, lower ones long-petioled: heads dark purple, small. Serbia.—Differs from K. macedonica only in its lvs. lyrate and not entire, and by some authors considered only a minor form of that species.

macedónica (Scabiosa macedonica). Per. to 2½ ft., sts. slender, much branched: lvs. lyrate, st.-lvs. pinnatifid, pubescent: fls. dark purple, marginal ones radiating. Cent. Eu.—A form with lilae fls. is known.

orientàlis. Ann., somewhat sticky-pubescent, sts. slender: lower lvs. oblong to oblong-linear, entire to pinnatisect, upper ones linear, acuminate: heads purple, usually only 5-10-fld. S. E. Eu. and Caucasus.

sylvática (Scabrosa sylvatica). To 3 ft.: lvs. oval to lanceolate, toothed: fis. violet, in heads to 1½ in. across. Eu.

KNAWEL: Scleranthus. KNEIFFIA: (Enothera.

KNIGHTIA. Proteacee. Trees and shrubs of New Zeal. and New Caledonia, one occasionally planted in Calif.: lvs. alternate, leathery: fls. in densely-fld. racemes: fr. a leathery follicle.

excélsa. Tree to 90 ft., resembling a Lombardy poplar in habit: lvs. oblong, to 6 in. long, very stiff: fls. to 1½ in. long, brown-tomentose, in racemes to 4 in. long. New Zeal.

KNIPHÒFIA (Tritoma). TORCH-LILY. POKER-PLANT. Liliaceæ. Stout per. herbs with thick roots, clumps of long grass-like basal lvs., and red or yellow drooping fls. in showy pokerlike spikes or racemes terminating the scape, in summer and autumn, the perianth-segms. united into a long tube; native in Afr.

Poker-plants may be hardy in the North with a winter mulch, but it is safer to lift the roots in autumn and store in a cellar in boxes of dry earth. Propagated by rootdivision, offsets if produced, and seeds.

alooides: K. Uvaria.

cauléscens. St. to 1 ft : lvs. to 3 ft. long and 3 in, across, glaucous: fls. red or lower ones yellow, 1 in. long, in spikes 6 in. long, the stamens exserted.

chrysántha: hort. name for yellow-fld. form.

corállina. Hybrid between K. Macowanii and K. Uvaria; to 2 ft: fls. coral-red.

élegans: K. Schimperi.

ensàta: hort. name, perhaps for K. ensifolia.

ensifòlia. To 3 ft.: lvs. sword-shaped, long-acuminate, about 1½ in. wide at base, margins rough: fls. yellow, to ¾ in long, funnel-shaped not cylindrical, in dense racemes, stamens and style much exserted.

erécta: hort. form of K. Uvaria.

foliosa (K. Quartiniana). To 3 ft.: lvs. to 3 ft. long and 2 in. wide: fls. yellow, 1 in. and less long, cylindrical, the stamens much exserted.—One of the usual species, the

Gálpinii. To 3 ft.: lvs. linear, about ½ in. wide, margins smooth, not rough: fis. reddish-orange, to ½ in. long, narrowly cylindrical, in dense racemes to 3 in. long, stamens not exserted.

grandiflòra: a form of K. Uvaria.

grándis: K. Uvaria var.

hýbrida: a group name to include hybrid and hort. forms

Macowanii. To 2 ft.: lvs. to 2 ft. long and 1/6 in. across: fls. yellowish- or orange-red, 1 in. long, in dense racemes to 4 in. long, the stamens not exserted.

mirábilis: listed name, perhaps of hybrid form.

Náthalinæ: listed name of unknown botanical standing.

Nélsonii. To 2 ft.: lvs. narrowly linear, to 20 in. long, tapering to sharp tip, margins revolute and obscurely serulate: fls. brilliant orange-scarlet, tubular, to 1½ in. long, in dense racemes to 3 in. long, style reddish, stamens included.

nóbilis: K. Uvaria var.

Northise. To 3 ft.: lvs. broadly lanceolate, to 4 ft. long or more, dark glaucous green, serrulate, acuminate: fls. red becoming pale greenish-yellow, tubular, about 1½ in. long, in very dense racemes 6 in. and more long, style pale yellow, stamens much exserted.

Pfitzeri: a form of K. Uvaria.

pracox: a form of K. Uvaria flowering in summer or

pyramidalis: hort, form of K, foliosa.

Ouartiniana: K. foliosa.

Robperi. To 4½ ft.: lvs. ensiform-acuminate, to 4 ft. long and 1½ in. across, dull green, margins scabrous: fls. pale red to yellow, cylindrical, to 1½ in. long, in racemes to 6 in. long.—Doubtfully in cult.

rufa. Lvs. to $1\frac{1}{2}$ ft. long and $\frac{1}{3}$ in. across: fls. yellow, the upper tinged red, $\frac{3}{4}$ in. long, drooping, in racemes to 6 in. long, the stamens exserted. Natal.

sarmentòsa. To 3 ft.: lvs. to 3 ft. long and 1 in. across: fls. red or yellow tinged red, to 1 in. long, in racemes to 1 ft. long, the stamens exserted. S. Afr.

Saundersii: a form of K. Uvaria but some of the stock passing under this name in the trade is K. foliosa.

Schimperi (K. elegans). Lvs. to 2 ft. long and ½ in. across, numerous and limp: fls. pale yellow, to 1½ in. long, on short pedicels arranged loosely in racemes to 10 in. long on scape to 21/2 ft. high.

semperflorens: a hort, name,

tricolor: hort, form.

Túckii. Lvs. to 1½ ft. long and ¾ in. across: fis. yellow tinged with red, ½ in. long, in dense racemes to 6 in. long, stamens slightly exserted.

Uvària (K. alooides). To 4 ft.: lvs. to 3 ft. long and 1 in. across: fls. scarlet or lower ones yellow, to 2 in. long, in racemes to 10 in. long, the stamens scarcely exserted. S. Afr. Var. floribinda flowers earlier; var. grandifòra is larger; var. grándis, to 5 ft, fls. bright red and yellow, probably much of the material in trade as K. Pfitzer belongs here; var. nobilis has stiffer and shorter lvs., fls. large on peduncle to 6 ft.—One of the well-known species, with

KNOTROOT: Stachys Sieboldii.

KNOTWEED: Polygonum.

KNOTWORT FAMILY: Illecebraceæ.

KOA: Acacia Koa

KÒCHIA. Chenopodiacex. Eurasian herbs or subshrubs with alternate, narrow, entire lvs. and small fls. solitary or clustered in the axils; one species grown for ornamental form and color. Seeds may be sown in the open about May 1st or started in the greenhouse earlier and transplanted.

Childsii: an unidentified trade name.

hyssopifòlia. Ann. to $1\frac{1}{2}$ ft.: lvs. oblong-linear, to 4 inlong. S. Eu., W. Asia.

scoparia. Summer-Cypress. Belvedere. Ann. to 5 ft, of columnar, pyramidal or globular habit: lvs. linear, to 2 in. long, ciliate. Eu; nat. in N. Amer. Var. trichôphila (K. trichophylla) is of globular dense habit and the foliage turns purplish-red in autumn; the form most commonly grown for borders and formal effects.

trichophýlla: K. scoparia var. trichophila.

KŒLÈRIA. Gramineæ. Tufted ann. or pergrasses with flat or involute lvs. and spikelets in dense spike-like contracted panicles; widely distributed in temp. regions, a few of ornamental value. See Grasses.

berythèa: K. phleoides.

brachystachya: K. phleoides.

cristata. Per. to 2½ ft.: lvs. to 1 ft. long and ½ in. wide, flat or involute: panicles to 7 in. long, branches erect, shining. N. Amer., Eu., Asia.

phleoides (K. berythea. K. brachystachya). Ann. to 1 ft.: lvs. to 5 in. long and ½ in. wide, flat, hairy: panieles to 3 in. long, dense and cylindrical. Medit. region; nat. in Calif.

setàcea. Per. to 1½ ft.: lvs. involute-setaceous: panicles to 2 in. long, spike-like. S. Eu., N. Afr.

KOELLIA: Pycnanthemum

KŒLREUTÈRIA. Sapindaceæ. Medium to large trees from China and Japan with alternate pinnate lvs., irregular yellow polygamous fls. in terminal panicles, and fr. a bladdery caps.; grown for ornament.

The species are not particular as to soil but prefer sunny locations. Propagated by seeds in autumn or stratified, or by root-cuttings.

bipinnata. To 60 ft.: lvs. bipinnate, lfts. ovate or ovate-oblong, to 4 in. long, equally toothed. China; not hardy N. formosana. To 60 ft.: lvs. bipinnate, to 1½ ft. long, of ovate-lanceolate shallowly toothed lfts.: frs. papery, to 2 in. long, of 3 roundish valves. Formosa; suitable for Fla. to Calif.

integrifoliola. To 30 ft.: lvs. bipinnate, 14 in. long, of oblong-ovate entire somewhat leathery lfts. to 4 in. long; fr. inflated, about 1 in. long. China.

iapónica: K. vaniculata.

paniculata (K. japonica). Goldenrain-Tree. To 30 ft.: lvs. of 7-15 ovate to oblong coarsely toothed and notched lfts. to 3 in. long: panicles to 1½ ft. long, July-Aug., showy: frs. papery, to 2 in. long, separating into 3 pointed valves. China, Korea, Japan; hardy in northern states.

KOHLRABI (Brassica caulorapa). Common name of the so-called "stem-turnip" because the turnip-like tuber is an enlargement of the stem 1 to 3 inches above the ground. It is a low biennial plant of unknown nativity, producing seeds the second year from old stocks left over or planted out. The tuberous stem is used the same as turnips, both for the table and for stock feed. For the table the tubers should be taken when 2 or 3 inches in diameter, before they become hard and bitter. Kohlrabi is grown the same as turnips. Seeds are usually sown where plants are to stand, in rows far enough apart for tillage (say 18–20 inches), and thinned to 5 to 10 inches in the row; sow from early spring to early summer if succession is desired, as for table turnips. Keep the plants growing rapidly for a tender product. Pests are those of the cabbage. There are green and purplish races.

KOHUHU: Pittosporum tenuifolium.

KÒKIA. Malvaceæ. Hawaiian trees of 2 species allied to Gossypium and Hibiscus, with simple lobed lvs.: fls. solitary in axils of uppermost lvs., with 3 persistent bractcoles: fr. a woody ovoid caps.: one species intro. in S. Fla.

drynarioides. To 15 ft. or more: lvs. 5-7-lobed, long-stalked: fls. red, to 4 in. long: caps. 1 in. across.—Yet very rare in cult.

KOLKWİTZIA. Caprifoliaceæ. Showy Chinese deciduous shrub to 8 ft., hardy in the northern states. Propagated by cuttings of green wood late in summer. K. amābilis. BEAUTYBUSH. Lvs. opposite, ovate, to 3 in. long: fls. pink with yellow throat, bell-shaped, ½ in. long, with bristly sepals and pedicels, borne in axillary pairs forming terminal corymbs to 3 in. across, May-June: fr. bristly, ½ in. long.

KONIGA: Lobularia. KOPSIA: see Ochrosia.

KORTHÁLSIA. Palmaceæ. Climbing hookbearing hermaphrodite palms of the Indo-Malayan region, 25–30 species: lvs. pinnate or pinnatisect, pinnæ broadened upwards and more or less erose, the rachis mostly prolonged into a whip-like part bearing sharp claws; petiole short, the sheath sometimes developed into an ant-nesting body: spadices axillary, loosely branched and pendulous, the branches cylindrical and catkin-like; stamens 6 or more: fr. globose or ovoid, small, scale-covered. Little known to hort., and probably not regularly planted in our area; something like Calamus.

KOSTELÉTZKYA. Malvaceæ. Herbs or shrubs somewhat like Hibiscus, with arrow-shaped lvs., pink, purple or white fls., involucels

of linear bracts, and fr. a 5-angled caps.; a few species are native in Amer., 2 in the U. S. and others in Eu. and Afr.

hispida. Herb to 3 ft.: lvs. to 2 in. long, pubescent: fis. yellow, about ½ in. long, 1-3 in the axils. Madagascar.

virginica. Per. to 4 ft.: lvs. to 5 in. long, pubescent: fis. pink, to 2½ in. across, in terminal panicles. Marshes, N. Y. to Fla. and La.

KOUSA: Cornus Kousa.

KOWHAI, RED: Clianthus puniceus.

KRAMÈRIA. Leguminosæ. Shrubs or perherbs with alternate lvs., simple or 3-parted, and irregular purple fls. solitary or in racemes, the 3 upper petals long-clawed; native S. U. S. to Chile.

secundiflora. Per. with decumbent sts. to 1½ ft. long: lanceolate or linear, to 1 in. long; fls. about 1 in. across. Fla. to Mex.

KRAUNHIA: Wisteria.

KRAUSSIA FLORIBUNDA: Tricalysia Kraussiana.

KRÍGIA (Adopogon). Compositæ. Small ann. or per. N. American herbs with mostly basal lvs. and solitary or clustered heads of yellow or orange ligulate fls.; pappus of scales and bristles. Sometimes planted for the bright fl.-heads.

montana. Per. to 1 ft., branched: lvs. linear, to 8 in. long, entire or pinnately cut: heads bright yellow, 1 in. across. N. C. to Ga.

virginica (Cynthia virginica). Ann. to 1 ft. or less, unbranched: lvs. radical, oblong or oval, to 8 in. long, toothed or pinnately cut: heads orange or reddish-orange, ½ in. across. Mass. to 6a. and Kans.

KRISHUM: Iris ensata var. pabularia.

KRYNITZKIA: Cryptantha barbigera.

KUDZU-VINE: Pueraria Thunbergiana.

KÜHNIA. Compositæ. Per. herbs of N. Amer., having alternate resinous-dotted lvs. and heads of white or purplish disk-fls. borne in terminal corymbs; pappus of plumose bristles. Sometimes planted in the border.

eupatorioides. To 3 ft.: lvs. lanceolate, slightly toothed or entire: heads ½ in. long. N. J. to Ga. and Tex.

KUHNISTERA PINNATA: Petalostemum corymbosus.

KULUI: Nototrichium sandwicense.

KUMQUAT: Fortunella; see Citrus Fruits (page 183). Australian Desert: Eremocutrus.

KŪNZEA. Myrtaceæ. Usually heath-like Australian shrubs, with mostly small entire alternate lvs., small fls. with numerous exserted stamens, and capsular frs.; grown in Calif.

ambigua (K. corifolia). Very similar to K. peduncularis but differing in the fls. being sessile.

corifòlia: K. ambigua.

micrántha. Small shrub: lvs. linear, to 1/3 in. long, stiff: fis. in dense terminal heads.

peduncularis. Tall erect shrub: lvs. linear or linear-lanceolate, mostly ½ in. long: fls. white or whitish, short-pedicelled, in axils on upper branches and forming leafy corymbs or racemes.

pomífera. Prostrate shrub: lvs. ovate, to ½ in. long, base cuneate: fis. white, in dense terminal umbels which become lateral due to elongation of the shoots.

recurva. Tall shrub, sts. rigid: lvs. obovate to spatulate, to ½ in. long, obtuse or with minute recurved point: fis. in globose heads, ovary-5-celled, calyx glabrous, rachis woolly.

sericea. Tall shrub: lvs. obovate, to ½ in. long, stiff, silvery-white: fis. polygamous, the bisexual solitary, staminate in terminal clusters.

KUNZIA: Purshia.

KURRAJONG: Brachychiton populneum.

LABIATÆ. MINT FAMILY. Herbs and shrubs of about 160 widely distributed genera; plants aromatic, with usually 4-angled sts., opposite or whorled lvs., irregular 2-lipped bisexual gamopetalous fls. with variously ribbed calyx, 4 or 2 stamens, superior deeply 4-lobed ovary and 2 stigmas, and fr. of 4 one-seeded nutlets. The family is rich in volatile oils which are extracted for medicinal and other purposes. The genera known to hort, are mostly flower-garden subjects and sweet-herbs, as Agastache, Ajuga, Amethystia, Ballota, Blephilia, Brittonastrum, Cedronella, Clinopodium, Coleus, Collinsonia, Colquhounia, Comanthosphace, Conradina, Cunila, Dracocephalum, Elsholtzia, Eremostachys, Galeopsis, Hedeoma, Hemiandra, Horminum, Hyssopus, Iboza, Lallemantia, Lamium, Lavandula, Leonotis, Leonurus, Lycopus, Majorana, Marrubium, Melissa, Melittis, Mentha, Micromeria, Molucella, Monarda, Monardella, Nepeta, Ocimum, Origanum, Perilla, Perovskia, Phlomis, Physostegia, Plectranthus, Prostanthera, Prunella, Pycnanthemum, Pycnostachys, Rosmarinus, Salvia, Satureia, Scutellaria, Sideritis, Sphacele, Stachys, Teucrium, Thymus, Trichostema. Westringia.

LABIATE: lipped; as a noun, a member of the Labiatæ. LABLAB: Dolichos Lablab.

LABURNOCYTISUS. Leguminosæ. Hybrids between the genera Laburnum and Cytisus.

Adamii (Laburnum Adamii). Hybrid between L. anagyroides and C. purpureus: resembles L. anagyroides but has smaller lits. and fls. suffused with purple.

LABÚRNUM. Leguminosæ. Ornamental trees and shrubs with alternate lvs. composed of 3 lfts., yellow papilionaceous fls. in terminal racemes, and flattened pods; native in S. Eu. and W. Asia.

Laburnums are mostly hardy North. Propagated by seeds, layers, and choice varieties by grafting and budding on seedling stocks.

Ádamii: Laburnocytisus Adamii.

alpinum (Cytisus alpinus). Scorrch L. To 30 ft.: racemes to 15 in. long, pendulous, June-July: pods with thin wing on upper margin. S. Eu. Var. péndulum has pendulous branches.

Alschingeri: L. anagyroides var.

anagyroides (L. vulgare. Cytisus Laburnum). Golden-Chain. Bean-Tree. To 30 ft.: racemes 4-8 in. long, pendulous, May-June: pods thickened on upper margin, pubescent. Cent. and S. Eu. Var. Alschingeri (L. Alschingeri) has lits. more silky beneath. Var. attreum has yellow foliage. Var. autumnale blooms again in late summer. Tonage. Var. autumnate brooms again in face summer. Var. bullatum (L. vulgare involutum) has curled lfts. Var. Carlièri, lfts smaller. Var. péndulum, branches pendulous. Var. quercifòlium, lfts. lobed.

Vossii: L. Watereri.

vulgare: L. anagyroides.

Watereri (L. Vossii. L. vulgare var. Parksii). Hybrid between L. alpinum and L. anagyroides.

LACEBARK: Gaya Lyallii.

LACE-FLOWER, BLUE: Trachymene cærulea.

LACE-LEAF: A ponogeton fenestralis.

LACE-VINE: Polygonum Aubertii.

LACHENÀLIA. CAPE-COWSLIP. Liliaceæ. Small bulbous herbs of S. Afr. with usually 2 basal lvs. and red or yellow fls. in racemes or spikes terminating the scape, the perianth-segms. partially united.

Plant in pots of rich loam in August and keep in cold-frame until the last of November when they should be

removed to the greenhouse with a night temperature of 50°. After flowering they should be placed in a light place and watered until ripening after which they should be kept dry and dark until reported. Propagated by cfisets and seeds.

anrea: L. tricolor var.

Báchmannii. To 8 in.: lvs. linear, to 8 in. long, usually only 2, canaliculate: fis. campanulate, to ½ in. long, in dense subspicate racemes to 2 in. long, segms. white with red keel, oblong.

contaminata. To 1 ft.: lvs. 6-10, canaliculate becoming terete along distal half, to 9 in. long, suberect: fis. white, broadly campanulate, to ½ in. long, in dense racemes, inner segms. tipped greenish-brown and outer ones often flushed red and shorter than inner.

glaucina. To 1 ft.: lvs. 1 in. across: fls. to 3/2 in. long. erect, white, red, yellow or tinged blue, inner segms, slightly longer than outer.

lilifiòra. To 1 ft.: lvs. 2, lanceolate, falcate, to 9 in. long and 1½ in. across, heavily pustulate on upper surface: fls. white, oblong-cylindrical, to ¾ in. long, segms. spreading, 12-20 in dense subspicate racemes.

lutèola: L. tricolor var.

mediana. To 1 ft.: lvs. 2, linear-lanceolate to oblong, to 1 ft. long or more, erect, canaliculate: fis. greenish-white, tubular, to 1/2 in. long, outer segms. oblong with pale blue basal blotch, inner ones wedge-shaped with small reddishapical blotch, all obtuse.

mutábilis: L. orchioides.

Nélsonii: L. tricolor var.

orchioldes (L. mutabilis). Similar to L. glaucina but with smaller fls. about 1/3 in. long.

pállida. To 10 in.: lvs. 2, lorate, pustulate or blistered: hs. white, outer segms. tipped green, campanulate, to 1/2 in. long, in rather dense racemes to 3 in. long on peduncle about 6 in. long.—Perhaps not distinct from L. pustulata.

péndula. To 1 ft. and more: lvs. to 2 in. across; fls. to 1½ in. long, drooping, the red-purple-tipped inner segms. only slightly longer than the outer segms, which are yellow and red above. Var. supérba is an improved hort. form.

purpureo-cærulea. To 1 ft.: lvs to 1 in. across: fls. 1/4 in. long, erect, blue-purple, inner segms. slightly longer than outer, stamens much exserted.

pustulata. To 9 in.: lvs. to 1 in. across, blistered: fis. 1/3 in. long, spreading or erect, white or tinged red, in dense spikes 3 in. long, inner segms. slightly shorter than outer, stamens somewhat exserted.

refléxa. To 6 in.: fls. 1 in. long, erect-spreading, yellowish, with swollen oblique tube, inner segms, slightly longer than outer.

Roddes. To 7 in.: lvs. to $1\frac{1}{2}$ in. across, with reddish margins: fis. $\frac{1}{2}$ in. long, purplish, in dense spikes 5 in. long, inner segms. longer than outer, stamens exserted.

rùbida. To 1 ft.: lvs. to 6 in. long and 1 in. wide at middle, lanceolate, spotted, narrowed to clasping base: fis. except the uppermost drooping, outer segms. bright red tipped with green, inner segms. yellow and a little longer than the outer, cylindrical, about 1 in. long and to $\frac{1}{2}$ in. diam., racemes of 6-20 fls.

tricolor. To 1 ft.: lvs. to 1 in. across: fis. 1 in. long, drooping, yellow tipped with red, the outer segms. much shorter than inner. Color variations are: atrea, bright orange-yellow; luteola, lemon-yellow tipped with green; Nélsonii, bright yellow tinged green; quadricolor, red at base, greenish-yellow in middle, the outer segms. tipped with green and the inner with red-purple.

tubiflora: listed name of unknown botanical standing.

unicolor. To 1 ft.: lvs. usually 2, lorate, smooth or pustulate on upper surface, to 6 in. long and 1 in across: fls. ¼ in. long, bright red, campanulate, inner segms. slightly longer than outer, stamens much exserted. Var. fragrans, of more slender habit, fls. white slightly tinged with red. Var. purpurea, outer segms. white tipped with green, inner purple.

unifolia. To 1 ft.: lvs. single, brown toward base: fls. 1/2 in. long, white tinged with red or blue, inner segms. slightly longer than outer.

LACHNANTHES (Gyrotheca). Hæmodoraceæ. One stout per. herb native in swamps from Mass. to Fla. and Cuba, and sometimes transplanted. L. tinctoria. Red Root. To 2½ ft., with red fibrous roots: lvs. linear, the upper reduced to bracts, the lower ones shorter than sts.: fis.

vellowish, in dense white-woolly panicles to 5 in. across, stamens exserted.

LACINARIA: Liatris.

LACINIATE: slashed into narrow pointed lobes.

LACOUER-TREE: Rhus perniciflua.

LACTÙCA. Compositæ. Many tall annuals and perennials of the northern hemisphere, often weedy and invading fields: lvs. alternate, of many forms and often pinnatifid: heads small, in irregular panicles, with yellow, pink, blue or white rays; pappus on a long or short beak terminating the flat ribbed achene or "seed." None is commonly cult. in this country for ornament; one is a garden vegetable, for which see Lettuce.

alpina (Mulgedium alpinum). Erect per. to 4 ft., st. simple and succulent, nearly glabrous: lvs. long-oblong, ovate or broader, to 8 in. across, toothed or lyrate, terminal deltoid: heads 1 in. across, rays pale blue. Arctic and alpine Eu., Siberia.

Bourgeei (Mulgedium Bourgeei). Per. to 6 ft., st. thick: lvs bristly: heads small, the bracts and rays lilac. Medit.

Lessertiana. Per. to 1 ft.: lvs. variable, entire or pinnately lobed: heads blackish, ¾ in. long, rays blue. Him-

perénnis. Glabrous branched per. to 2 ft.: lvs. long-narrow, pinnately lobed, the segms. nearly linear, those on st. clasping: heads long-pedicelled, rays blue or pale violet.

Plumièri. Probably per., to 6 ft.: lvs. broad-oblong, bluish underneath, much cut or lyrate, to 16 in. long: heads terminal and corymbose, large, rays purple. S. France.

terminal and corymbose, large, rays purple. S. France.
satīva. Lettuck. Smooth erect ann., producing leafy
branching st. 3-4 ft. high after making the lf. rosette (the
"lettuce" of gardens): radical lvs. to 10 m. long, narrow to
nearly orbicular, in garden forms variously curled and
crisped: fl. rays light yellow. Cultigen. The different
classes of lettuces may be ranged botanically as follows:
Var. asparagina (angustana), Asparagus lettuce, in which
the thickened st. is used for food; var. capitata, head
lettuces, the lvs. compacted into rather dense rosettes;
var. crispa, loose lettuces with crisped, crinkled or cut
lvs.; var. longifòlia, Cos or Romaine lettuces, with long
upright columns or rolls of foliage, tending to blanch inside.

tenérrima. Sts. simple rough usually l-headed; lvs.

tenérrima. Sts. simple, rough, usually 1-headed: lvs. linear, lower ones pinnatifid: ray-fls. bluish. S. Eu. and

LADIES - SMOCK: Cardamine pratensis. -Tresses: Spiranthes.

LADYBELL: Adenophora.

LADY-FINGERS, PINK: Astragalus utahensis. -of-the-Night: Brunfelsia americana. -Slipper: Cypripedium, Paphiopedilum, Phragmipedium.

LADYS-MANTLE: Alchemilla. -Thumb: Polygonum Persicaria.

LÆLIA. Orchidacex. Trop. American epiphytes with 1- or 2-lvd. pseudobulbs and fls. solitary or in racemes, commonly showy, the sepals and petals similar, the lip 3-lobed. They thrive in an intermediate temperature; see Orchids for

acuminata: L. rubescens.

álbida. Pseudobulbs to 2 in. high, with 2 lvs. to 7 in. long: racemes loosely 3-9-fld., to 20 in. long; fls. about 2 in. across, fragrant, white often tinged with rose; lip with 3 central yellow ribs. Nov.-Jan. Mex.

central yellow ribs. Nov.-Jan. Mex.

**anceps. Pseudobulbs to 4 ¾ in. high, with 1 (rarely 2) Ivs. to 8 in. long: racemes 2-5-fid., to 3 ft. high; fls. about 4 in. or more across; sepals and petals violet-rose; lip with a tawny-yellow throat lined with purple. Nov.-Feb. Mex. Var. Aibs, fls. pure white except yellow spot in throat. Var. Amesiæ, fls. crimson-purple with yellow throat. Var. Ballantiniana has sepals and petals tipped with deep rose. Var. Chamberlainiana has very large fls. with deep crimson-purple lip. Var. Dawsonii has white fls. on scapes to 3 ft. high, lip with purple lines. Var. grandiflora has very large highly colored fls. Var. Hilliana has white sepals and petals with yellow lip of which the front parts are blush-pink. Var. Hollidayana is listed. Var. Percivaliana has small fls. with sepals and petals white tinged with pink, deep purple side lobes of lip and yellowish mid-lobe. Var. rösea has bright rose-colored fls. Var. Sanderiàna has white fls. with

yellow throat and purple-edged lip. Var. Schroederiana has large white fis., the lateral lobes of lip streaked with purple. Var. Stélla has pure white fis. with yellow throat. Var. Veitchiana has white fis. suffused with lılac and lip yellow throat marked with purple. Var. Williamsii has white fis. with yellow throat marked with purple.

Arnoldiana: Læliocattleya callıstoglossa.

autoceps. Hybrid.

autumalis. Pseudobulbs to 6 in. long, with 2-3 leathery lvs. to 7 in. long; infl. to 30 in. long, 4-9-fid.; fls. to 4 in. across, rose-purple with lip white near the base. Oct.-Apr. Mex. Var. fiba has pure white fls. Var. Fosteriana is listed.

Roothians I. lobata

cinnabarina. Pseudobulbs to 10 in. long, 1- rarely 2-lvd.: If. to about 10 in. long: infl. to 20 in. high, 4-15-fld.; fls. about 2½ in. wide or more, orange-red. Mar.-May, Nov. Brazil. Var. crispilabia: L. crispilabia.

cinnabrosa. Hybrid between L. cinnabarina and L. grandis var. tenebrosa.

crispa. Pseudobulbs to 10 in. long, 1-lvd.: lf. to 1 ft. long; infl. to 1 ft. long, 4-7-fdd.; ffs. 4-6 in. across, white; lip yellow in throat, purple edged with white in front, lip and petals much crisped. July-Aug., Dec. Brazil.

crispilabia (L. cunnabarina var. crispilabia). Fls. amethyst-purple, lip crisped and wayy. Brazil.

Davàna: L. mumila var.

Digbyana (Brosavola Digbyana). Pseudobulbs or sts. clavate, 1-lvd.: If. to 8 in. long, fleshy: infl. 1 fld., slightly exceeding the lf., emerging from an elongate compressed sheath; fls. 4-6 in. across, fragrant; sepals and petals pale yellow-green; lip large, cordate, convolute around the column at base, deeply fringed, cream-white. May-July. Cent. Amer.

élegans: Læliocattleya elegans.

Finckeniana Schroederæ. Hybrid between L. albida and L. anceps.

flava. Pseudobulbs to 8 in. high, 1-lvd.: If. to 6 in. long: infl. to 1½ ft long, 5-15-fld.; fls. golden-yellow, to 2½ in. across, the lip crisped. Aug-Feb. Brazil.

glaûca (Brassavola glauca). Pseudobulbs or sts. clavate, to 4 in. high, 1-lvd.: If. to over 6 in. long, fleshy: infl. 1-fld., about as long as the lf., springing from an elongate flattened spathe; fls. 3-5½ in. across; sepals and petals pale olivegreen; lip cordate, convolute around the column at base, white. Dec.-Mar. Cent. Amer.

Gouldiana. Pseudobulbs nearly 4 in. high, 2-lvd.: lvs. to about 1 ft. long; infl. over 1 ft. high, loosely about 3-6fld.; fls. about 4 in. across, purple-rose, lip white or yellowish-white near base. Dec.-Jan. Mex.

grandis. Pseudobulbs or sts. to 1 ft. high, with 1 lf. to 10 in. long: infl. to about 7 in. high, 3-5-fld.; fls. 4-7 in. across; sepals and petals brownish-yellow; lip white veined with rose-purple. May-July. Brazil. Var. tenebrosa, fls. larger, with broader sepals and petals and a deep purple

harpoph fila. Sts. to 1½ ft. high, with 1 lf. to 8 in. long: infl. shorter than lvs., 3-7-fid.; fls to 3 in. across, vermilion, except that anterior lobe of lip is yellow edged with white. Oct.-Apr. Brazil.

Jongheana. Pseudobulbs to $2\frac{1}{2}$ in. high, with 1 lf. to $4\frac{3}{4}$ in. long: infl. shorter than lvs., 1-2-fd.; fls. to 5 in. or more across; sepals and petals rose-purple; lip with a yellow throat, crisped on margin. Mar.-Apr. Brazil.

Latona. Hybrid between L. cinnabarina and L. pur-

Lindleyana. Pseudobulbs to 8 in. high, with 2 leathery lvs. to 5 in. long: infl. shorter than lvs., 2- or more-fld.; fls. white marked with purple, 4 in. across. Brazil.

lobata (L. Boothiana. Cattleya lobata). Pseudobulbs to 8 in. high, with 1 leathery lf. to 10 in. long: infl. to 20 in. high, 2-5-fld.: fls. about 5 in. across, rose-purple with deeper-colored veins. Apr.-May. Brazil.

majàlis: L. speciosa.

monophylla (Tryonidium monophyllum. Octadesmia monophylla). Sts. to 3½ in. high, with 1 lf. to 4 in. long: infl. to 8¾ in. long; fls. 1 or rarely 2, orange-scarlet, to 2 in. across. Aug.—Nov. Jamaica.

Pérrinii. Pseudobulbs to 1 ft. high, with 1 lf. to 14 in. long; infl. to 434 in. long, few-fld; fls. about 5 in. across; sepals and petals rose-lilac; lip purple-vrimson in front with a straw-yellow throat. Oct.—Nov. Brazil.

præstans: L. pumila var. major.

pamila. Pseudobulbs from a creeping rhizome, to 4 in. high, with 1 lf. to about 4½ in. long; infl. to about 3 in. long, 1-fld; fls. 3-4 in. across; sepals and petals rose-purple; lip deep purple in front, with a yellow throat. Sept.-Oct. Brazil. Var. Dayana has bright rose-purple fls. Var. major (L. præstans) has larger fls. with orange-yellow throat.

purpurata. Pseudobulbs to 2 ft. high, with 1 lf. to 16 in. long: infl. to 1 ft. long, 3-7-fld.; fls. 7-8 in. across; sepals and petals white or pale rose; lip purple in front with pale yellow throat marked with purple lines. May-July. Brazil. Var. Russelliàna has sepals and petals white flushed with rose, lip rose-pink, all with deeper colored veins.

rubéscens (L. acuminata). Pseudobulbs to 2½ in. high, with 1 lf. to 8 in. long: infl. to over 20 in. tall, with closely few-fld. raceme at summit; fls. white to rose-purple with dark purple base to lip. Sept.-Mar., July. Cent. Amer. Var. alba has white fls.

speciòsa (L. majalis). Pseudobulbs to 2 in. high, with 1 or 2 lvs. to 6 in. long: infl. as long as lvs., 1- or rarely 2-fld.; fls. about 6 in. across, rose-lulac; lip whitish in the throat, spotted with purple. May. Mex.

supérbiens (Schomburgkia superbiens). Pseudobulbs to over 1 ft. high, with 2 lvs. to about 1 ft. long: infl. to 6 ft. high; fls. 5-7 in. across, clustered at summit of peduncle, fragrant; sepals and petals rose-mauve; lip purple with yellow throat. Dec.-Feb. Cent. Amer.

tenebràsa. L. grandis var

LÆLIOCÁTTLEYA. Orchidaceæ. A group of orchids comprising hybrids between the genera Lælia and Cattleva.

Ármstrongiæ (Lc. G. Woodhouse \times C. Iris).

Hérscentiæ (L. Boothiana \times C. Dowiana).

hivernalis. Parents not known.

Horniana (Lc. Schilleriana X L. purpurata).

Hyeana (L. purpurata X C. Lawrenceana var. Hyeana).

labidsa (Lc. luminosa X C. labiata).

luminòsa: Lc. Truffautiana.

Martinétii (L. grandis var. tenebrosa X C. Mossiæ var. Reineckiana).

McBeaniàna (C. Schroederæ \times L. anceps).

Mossemiliana (C. labiata × Lc. bletchleyensis).

oxfordénsis (Lc. callistoglossa \times C. Tityus).

Rabeiana (C. Dupreana X L. purpurata).

Rothschildiana (Lc. Martinetii $\times C$. Mossiæ).

rubélia (Lc. Nella X Lc. St. Gothard).

Schilleriàna (C. intermedia \times L. purpurata).

Schilleriana alba (C. intermedia alba X L. purpurata).

Schröederæ (C. Maggie Raphael var. alba X Lc. bella var. alba superba).

Sláddenii (Lc. bella \times C. Octave Doin).

Thurgoodiana (Lc. Martinetii X C. Hardyana).

Truffautiàna (Lc. luminosa. L. grandis var. tenebrosa X C. Dowiana var. aurea).

Veitchiàna (C. labiata × L. crisna).

warnhamensis (L. cinnabarina X C. Triangi).

Wélleslevi (C. Warscewiczii X Lc. Martinetii).

Whitinise (C. Harrisoniana X. L. purpurata).

Wriglevi (L. anceps X C. Bowringiana).

LAGENÀRIA. Cucurbitaceæ. Long-running soft scented tender mostly monocious ann. vinc of the Old World tropics but spontaneous elsewhere and widely cult. for ornament, the hard shells of the fr. used for utensils, and young frs. said to be eaten in some countries: fls. solitary, white, long-peduncled. The frs. are commonly known as gourds (see Cucurbita Pepo var. ovifera), as dipper, sugar-trough, Hercules club, calabash, bottle, knob-kerric. Readily grown from seeds. See Gourd.

leucántha: L. siceraria.

sicerària (L. vulgaris. L. leucantha). WHITE-FLOWERED GOURD. To 30 ft. or more, viscid-pubescent: lvs. cordate-ovate or broader, usually not lobed: fr. smooth, hardshelled when ripe, in many shapes and sizes, from 3 in. to 3 ft. long, nearly globular, oblong, long-cylindrical and bent, club-shaped, dumbell-shaped, crooknecked.

vulgăris: L. siceraria.

LAGENÓPHORA. Compositx. Small herbs with mostly basal lvs. and small solitary heads on slender scapes; ray-fls. usually white; pappus none; related to Brachycome.

Billardièri. To 5 in., pubescent: lvs. basal, oblong to obovate, to 2 in. long, sinuate-toothed: scape slender, head to ½ in. across, ray-fis. white. Malasia.

Fórsteri: L. pumila.

pumila (L. Forster:). Tufted, with creeping and rooting stolons, daisy-like: lvs. orbicular or obovate, to 1 in. long, toothed or somewhat lobed: heads ½ in. across, on scapes to 6 in. high. New Zeal.

LAGERSTRŒMIA. Lythraceæ. Ornamental trees and shrubs with mostly opposite entire lvs., showy regular fls. in panicles, and woody capsular frs.

One species is widely and commonly planted for ornament in the southern states. Of easy cultivation, Sometimes grown as pot-plants in the greenhouse. Propagated by seeds or cuttings.

Flos-Reginæ: L. speciosa.

indica. Crape-Myrtle. Deciduous shrub to 20 ft.: lens: elliptic to oblong, to 2 in. long: fls. white, pink or purple as indicated in the varietal names álba, purplrea, rôsea, rûbra, to 1½ in. across, the petals fringed, blooming profusely all summer. China, but widely nat. Var. nâna cærdlea, dwarf with bluish fls. Var. prostrâta, prostrate with pink fls.

speciosa (L. Flos-Reginæ). QUEEN CRAPE-MYRTLE-Showy tree to 60 ft. or more: lvs. oblong to ovate, to 1 ft. long, leathery: fls. mauve to purple, to 3 in. across. India to Australia.—Planted in S. Fla.

LAGOTIS. Scrophulariacex. A small genus of arctic per. herbs having creeping rootstocks, alternate lvs., and bluish tubular fls. in a dense terminal scape: fr. a fleshy drupe-like structure containing 2 nutlets, one of which is often abor-

gladca. To 1 ft.: basal lvs. ovate to oblong, to 4 in. long, obtuse, margins somewhat crenate, upper lvs. smaller becoming bract-like and subtending the fis.: stamens shorter than upper lip of corolla and exceeding the style.

LAGUNÀRIA. Malvacex. One tree native in the S. Pacific Isls. and Australia, planted occasionally in Calif., and evergreen. L. Pátersonii. To 50 ft.: lvs. alternate, ovate to oblong, entire, to 4 in. long, thick, gray beneath: fls. pale rose, 2½ in. across, solitary in axils: fr. a caps. splitting into 5 parts.—Propagated by cuttings in spring over heat.

LAGÙRUS. Gramineæ. One ann. grown for ornament in flower-gardens and pots and for dry bouquets, native in Medit. region and nat. in Calif. L. ovatus. HARES-TAIL-GRASS. RABBIT-TAIL-GRASS. To 1 ft, soft-pubescent: lvs. to 4 in. long and $\frac{3}{2}$ 6 in. wide: spikelets in dense woolly broad heads to 2 in. long, awns $\frac{1}{2}$ 2 in. long. See Grasses

LALLEMÁNTIA. Labiatæ. Small ann. or bien. herbs native in Asia, with opposite toothed lvs. and small blue 2-lipped fls. in whorls; sometimes grown in the flower- or rock-garden.

canéscens. Bien. to 1½ ft., soft-tomentose: lvs. oblong-lanceolate: fls. blue, 1½ in. long, the tube much longer than calyx. W. Asia.

ibérica. Ann., glabrous: lvs. oblong to linear-lanceolate, nearly entire: fls. blue, the tube included in the calyx. W.

peltàta. Ann. to 1 ft. or more, glabrous or slightly pubescent: lvs. ovate to oblong: fis. blue, the tube scarcely longer than calyx. W. Asia.

pulchélia: hort. name.

LAMA: Maha sandwicensis

LAMÁRCKIA (Achyrodes). Gramineæ. One tufted ann. of the Medit. region and nat. in Calif., ornamental. L. aûrea (Chrysurus cynosuroides). Golden-Top. To 1 ft.: lvs. to 6 in. long and ¼ in. wide, soft, glabrous: spikelets awned, in clusters in one-sided glossy panicles to 4 in. long, golden-yellow or purplish. See Grasses.

LAMBÉRTIA. Proteaceæ. Australian shrubs with lvs. commonly in whorls of 3, red or yellow fls. solitary or in clusters surrounded by an involucre of colored bracts, and fr. a hard follicle; a few species intro. in Calif.

ericifòlia. To 10 ft.: lvs. linear, about ½ in. long, margins revolute: fls. 1½ in. long; inner bracts of involuce ½ in. long.

ormòsa. Tall shrub: lvs linear, to 2 in. long, pale beneath, margins recurved: fis. to 2 in. long; inner bracts of involucre to 2 in. long

multiflora. To 4 ft.: lvs. linear, to 2 in. long: fls. 11/2 in. long; mner bracts of involucre 1/2 in. long.

LAMBKILL: Kalmıa angustıfolia.

LAMB, SCYTHIAN: Cibotium Barometz.

LAMBS-EARS: Stachys lanata. -Quarters: Chenopodium album.

LAMIUM. DEAD NETTLE. Labiatæ. Ann. or per. Old World herbs with opposite toothed lvs. and 2-lipped fls. in axillary or terminal whorls; grown in the border or rock-garden. Of simple cult. Propagated by division or by seeds. Some of them are low garden weeds.

album. Per, with ascending sts. to 1½ ft. long: lvs. ovate, to 3 in. long: fls. white, 1 in. long. Eu.; nat. in E. U. S.

longiflòrum. Per., erect: lvs. ovate-cordate: fls. purplish-red, $1\frac{1}{2}$ in long. S. Eu.

maculatum (L. variegatum). Per., with trailing or ascending sts to 1½ ft. long: lvs. cordate-ovate, to 2 in. long, often blotched with white along midrib: fis. purple-red, rarely white (var. álbum), to 1 in. long. Eu., Asia.; nat. in E. U. S.

Orvala. Per. to 2 ft.: lvs. ovate, to 3 in. long: fts. brown-purple, the tube whitish at base and under lip pink spotted with purple, 1½ in. long S. Eu.

purpureum. Ann., with decumbent sts. to 1½ ft. long: lvs. ovate, to 1¼ in. long: fls. purple-red, ½ in. long. Eu., Asia; nat. in N Amer.

variegatum: L. maculatum.

LAMPRÁNTHUS. Aizoaceæ. Segregate from Mesembryanthemum, from which it differs in bearing marginal wings on capsules and other technical characters: lvs. very narrow: fls. large,

mostly brilliantly colored and very showy in sun, among the commonest of the cult. kinds: per. branching plants. S. Afr. For cult. see Mesembruanthemum.

aurantiacus (M. aurantiacum). Differs from L. aureus chiefly in the smaller lvs. and fls.

adreus (M. aureum). Erect, to 1½ ft.: lvs. to 2 in. long and ¼ in. broad, punctate: fls. solitary or in 3's, golden, 2 in across.

blándus (M. blandum). Erect, to $1\frac{1}{2}$ ft.: lvs. 3-angled, to 2 in. long, pale green, punctate: fis. in 3's, pale rose, 2 in. across.

Brownii (M. Brownii). Compact and erect subshrub 1 ft. high: lvs. terete and fleshy, acute, glaucous-green, to 3 in. long: fls. solitary or in 3's, yellowish-red to purplish, to 1½ in. across.

coccineus (M coccineum). Erect and straight, to 3 ft: lvs. somewhat 3-angled, to 1 ½ in. long, prominently dotted: fls. solitary or in 3's, scarlet, 1½ in. across.

Cómptonii (M. Comptonii) To 9 in much branched: ls. 3-angled, turgid, to 1½ in. long and ½ in. thick: fis. white. 1 in. across.

conspicuus (M. conspicuum). Shrub to $1\frac{1}{2}$ ft.: lvs at tips of branches, to 3 in. long and $\frac{1}{2}$ in. wide, with reddish tip: fls. purple, 2 in. across, on stalks to $3\frac{1}{2}$ in. long.

curviflorus (M. curviflorum. M. blandum var. curviflorum). Differs from L. blandus in stronger habit, larger lvs. and larger white fis.

emarginatus (M. emarginatum. M. volaceum). Erect, to about 2 ft.: lvs. crowded, nearly terete, curved, glaucous, strongly dotted, to 1 in. long: fls. violet, petals twice longer than calvx.

falciformis (M. falciforme). To 2 ft., with angled spreading branches: lvs. crowded, acutely 3-angled, falcate, large-dotted: fls. rose, long-peduncled, 1½ in. across.

filicaulis (M. filicaule). Sts. filiform and weak, creeping or prostrate: lvs. crowded, subulate, curved, about 1 in. long: fls. reddish, long-peduncled.

glaucoides (M. glaucoides). Erect or base decumbent, to $1\frac{1}{2}$ ft.; lvs. linear and 3-angled, to 1 in. long, glaucous: fls. orange, about $1\frac{1}{2}$ in. across.

glaucus (M. glaucum). Erect, 2 ft. or more: lvs. 3-angled and flattened, rough-dotted, glaucous, to 1 in. or more: fls. sulfur-yellow, the petals 1 in. long.

glomeratus (M. glomeratum). Subshrubby, with erect slender branches, to 1½ ft.: lvs. linear, green, somewhat incurved, large-dotted, to ¾ in. long: fls. somewhat clustered, reddish-violet, about 1 in. across.

Haworthii: Erepsia Haworthii.

multiradiàtus (*M multiradiatum*). Subshrubby, branches spreading, to 2 ft: lvs. linear, 1 in. or more long, somewhat 3-angled, incurved, glaucous: fls. few together, pale rose, 1½ in. across.

productus (M. productum). To 2 ft, much branched: lvs. to $1\frac{1}{2}$ in. long and $\frac{1}{6}$ in. wide, punctate: fls. in 3's or 5's, pale rose, 1 in. across.

reptans (M. reptans). Sts. prostrate, to 1 ft. long: lvs. to 1 in. long and $\frac{1}{2}$ in. wide, 3-angled, grayish-green with pellucid dots: fls. yellow, $\frac{1}{2}$ in. long, on stalks to 2 in. long.

ròseus (M roseum). Perhaps referable to L. glomeratus but kept distinct by some authorities: fls. rose-color

spectábilis (M. spectabile). Somewhat woody per., with long prostrate flowering sts: lvs. crowded, 3-angled, pointed, glaucous, incurved, to 3 in long: fls. purplish with white filaments; also var. álbus and var. rôseus.

stènus (M. stenum). Much branched shrub to 1½ ft.: lvs. cylindrical, to 1½ in. long and $\frac{1}{12}$ in. wide: fls. 3 or sometimes solitary, pale rose, 1 in. across.

tenuifolius $(M.\ tenuifolium)$. Shrub to 2 ft.: lvs. to $1\frac{1}{2}$ in. long and $\frac{1}{1}$ in thick, with pellucid dots: fis. solitary, bright red, $1\frac{1}{2}$ in. across.

Watermeyeri (M. Watermeyeri). To 10 in. or more, shrubby: lvs. erect or spreading, to 1½ in. long and ½ in. wide and thick: fls. usually 3, white, 1 in. long.

Zèyheri (M. Zeyheri). Erect, to 1½ ft.: lvs. much crowded, terete, incurved, smooth and green, to 1½ in. long: fis. solitary, purplish-violet, petals nearly 1 in. long.

LAMPWICK PLANT: Phlomis Lychnitis.

LANCEOLATE: lance-shaped; much longer than broad, widening above the base and tapering to the apex.

LANCE-POD: Lonchocarpus.

LANDSCAPE-GARDENING, in its original definition, was the making of landscapes to please the imagination by means of gardening designs, practices and materials.

With the development of the profession of the high art of landscape subdivision and design the term landscape architecture has come into use, the word architecture being taken in its larger sense of plan or undertaking, and the tendency is to restrict the term landscape-gardening to the horticultural applications; some persons, however, prefer the latter older term to landscape architecture, the word gardening being taken also in its larger sense as the art associated with buildings and the utilization of the personal or domestic property. In this signification landscape-gardening is no more technical gardening than landscape architecture is technical or professional architecture.

In its restricted sense landscape-gardening is the growing and the adapting of plants in the making of grounds, the application of horticultural materials, forms and methods to the development or improvement of landscapes. It may be practiced independently, complete in itself for certain limited areas or purposes, and may also be considered one of the practical means or subordinates in the interpretation of landscape

architecture.

The landscape-gardener, in whatever sense the term is taken, may or may not be a practiced propagator and grower of plants, but he must certainly know their artistic values and their adaptations to soils, climates, seasons and settings, and the extent to which they may be associated for the making of pleasing and significant harmonies throughout the year.

Every parcel of land under the control of man may derive character and dignity from the proper employment of plant materials. The utilization of such materials to these ends is much more than ornament or than the planting of flowers and showy colored foliage and the making of display: it must have close relation to the essential merits of the area and to the nature of the construction and the setting. The plants are grown not so much for their separate individual merits as for the ways in which they may be adjusted and combined. The landscapegardener is possessed of an artistic quality, and his appreciation of nature should be as pronounced as is his reaction to garden objects and forms.

The arrangement and design of landscapes constitutes one of the noblest of the arts, deserving keener recognition; and the utilization of plant materials is one of the essential factors in the execution of it.

LANGUAS: Alpinia speciosa.

LANTÀNA. Verbenacex. Many shrubs native in warm regions, having opposite or whorled toothed lvs., small red, orange or white or changeable fis. in dense spikes or heads, and little drupaceous frs.

One (L. Camara) is a common florists subject and others may be grown in the South. Plant in a moderate greenhouse and out-of-doors in summer. Propagated by cuttings or soft wood, and also by seeds.

aculeata. To 6 ft., armed with hooked prickles: lvs. ovate to ovate-lanceolate, to 3 in. long: fis. yellow or orange changing to pink or rose. Trop. Amer.

Camara. To 4 ft., sometimes prickly: lvs. ovate, to 5 in. long, rough above: fls. orange-yellow or orange changing to red or white, in flat-topped heads to 2 in. across. Trop. Amer.—Grown under glass and far S., and a bad weed in Hawaii. Several color forms are recognized.

Cràigii: orange-scarlet, probably form of L. Camara.

delicatissima: L. montevidensis.

flava of lists is probably a yellow-fld. race of L. Camara.

fucata (L. lilacina). Erect, with 4-angled branches: lvs. ovate to oblong, to 3 in. long, rough above and tomentose beneath: fis. rose-lilac with yellow throat. Brazil.

hýbrida: a garden name for the dwarf forms of L. Camara.

involucrata. To 6 ft.: lvs. ovate, to $1\frac{1}{2}$ in. long, rough above: fls. lilae or white, in small heads subtended by bracts. Trop. Amer.

lilácina: L. fucata.

montevidensis (L. Sellowana. L. delicatissima). Weep-ING or Trailing L. Shrub with weak vine-like sts. about 3 ft. long: lvs. ovate, 1 in. long: fls. rosy-lilac, in heads 1 in. or more across. S. Amer.—Useful also as a ground-cover far S.

Sellowiana: L. montevidensis.

LANTERN-PLANT, CHINESE: Physalis Alkekengi.

LANÙGIA. Apocynaceæ. Trop. African trees separated from Mascarenhasia by corollalobes pubescent on inside, very narrow terete pods, and other technical characters, and from Funtumia by sessile tuft of hairs at apex of seeds as well as the pubescent inner surface of corolla. L. latifòlia is a tree to 20 ft., intro. in warmest parts as a rubber plant: lvs. long-elliptic, very abruptly acuminate, entire, to 6 in. long: fls. in axillary cymes; corolla-lobes recurving at tip, pubescent on inner face: pods to 4 in. long.

LAOTHOE: Chlorogalum.

LAPAGÈRIA. Liliaceæ. One showy vine from Chile sometimes grown in greenhouses, and out-of-doors in mild climates. L. rôsea. Chilean Bellflower. Chile-Bells. Lvs. alternate, ovate, long-pointed, leathery: fls. rose, to 4 in. long, solitary or few together, the perianth-segms. distinct. Var. albiflora (var. alba) has white fls.—Good drainage and loose soil are necessary and shade from the direct sun. Propagated by layering, cuttings and seeds.

LAPEIROÙSIA. Iridacex. African cormous plants with mostly basal narrow lvs. and red or blue fls. with long or short perianth-tube, blooming in summer.

These plants are hardy in the North with winter protection and grown also under glass for spring bloom. Corms should be lifted and divided every few years.

aculeàta: L. anceps var.

anceps (L. compressa). To 14 in.: If. linear, to 6 in. long: fls. lilac or white, limb ½ in. long or less, 2-5 in lax spike whose st. is much compressed. Var. aculeata has a longer perianth-limb and broader segms.; keel of outer spathevalve finely toothed.

compréssa: L. anceps.

corymbòsa. To 1 ft.: lf. linear, to 6 in.: fls. blue-violet with large black-margined white spot in tube.

cruenta (Anomatheca cruenta). To 1 ft.: lvs. to 1 ft. long and ½ in. wide: fls. red, the very slender tube to 1½ in. long, in a one-sided spike or raceme. Var. álba is listed.

divaricata. To 14 in.: If. linear, to 9 in. long, strongly ribbed: fls. reddish, to 1/4 in. long, 6-10 in short dense spike, elongating in fr.

fissifòlia. Sts. very short: basal if. 1, lanceolate, to 4 in. long: fis. violet or whitish, the slender tube to 1½ in. long, in erect spikes 2-3 in. long.

júncea. To 2 ft.: lvs. to 8 in. long and ¾ in. wide fls. pale red, the slender tube to ¾ in. long, in loose spikes.

purpureo-lutea (L. purpurea). Differs from L. corymbosa in having pale yellow perianth with violet spot on inner side of lower segms.

LAPIDARIA. Aizoaceæ. A monotypic genus allied to Mesembryanthemum. L. Márgaretiæ (M. and Dinteranthus Margaretiæ). Lvs. 3-4 pairs, to ¾ in. long, 1 in. broad and ½ in. thick, firm and smooth, brownish or cream tinged rose, the edges and keel darker or yellowish: fis. bright yellow, paler beneath, to 2 in. across; stigmas 6-7. S. Afr.

LAPPA: Arctium.

LÁPPULA (Echinospermum). Boraginacex.Rough-pubescent herbs of the north temp. zone. most of them weedy, with alternate entire lvs., small blue or white fis. in terminal racemes, and fr. of 4 prickly nutlets; scarcely hort. subjects but one listed as a rock-garden plant and a taller one as a general garden subject.

consanguinea. Ann. to 9 in.: lvs. linear-lanceolate: fis. scarcely longer than calyx. Siberia.

diffusa. Per. to 3½ ft., softly hairy: lvs. narrowly oblanceolate, to 6 in. long, pilose: fis. blue, to ¾ in. across. Man. to B. C., south to New Mex. and Calif.

floribúnda. Bien. or per. to 2 ft. or more: lvs. lanceolate: fls. blue, 1/4 in. across. B. C. to Calif. and Minn.

LARCH: Larıx. Golden-: Pseudolarix amabilis.

LARDIZABÀLA. Lardizabalacex. Evergreen woody vines of Chile with ternately compound lvs.. staminate fls. in drooping racemes, pistillate solitary, and fr. an oblong berry; sometimes grown in S. Calif. Propagated under glass by cuttings of half-ripened wood.

biternata. Lvs. 1-2-ternate into ovate lfts. to 4 in. long, glossy dark green above: fis. purple-brown, about 1 in.

LARDIZABALÀCEÆ. LARDIZABALA FAMILY. Woody climbers with compound lvs., unisexual or polygamous polypetalous fls. having mostly 6 petal-like sepals, 6 stamens, often nectaries but no petals, superior ovary of 3 free carpels, and fr. a berry; 8 genera in Asia and Chile. Only Akebia, Decaisnea, Lardizabala and Stauntonia are known in general cult., although Holboellia grandistora, Sargentodoxa cuneata, and Sino-franchetia chinensis may be grown in botanic gardens.

LÀRIX. LARCH. Pinaceæ. Attractive deciduous trees growing to 60 ft, and more, having short linear needle-like lvs. arranged spirally on young shoots and clustered on the short branches or spurs, and spruce-like cones with woody persistent scales, and solitary staminate fls.; native in colder parts of the northern hemisphere and all hardy in climates like the northeastern states. L luricina and L. Lyallii become 50-60 ft. high, the others taller. With Pseudolarix and Taxodium, the larches comprise the deciduous members of the Pinaceæ. For cult. see Conifers.

americana: L. laricina.

dahùrica: L. Gmelinii.

decidua (L europæa). EUROPEAN L. Lvs. to 1½ in. long, obtuse: cones to 1½ in. long. Eu. Var. péndula has drooping branchlets. Var. pyramidâlis, habit narrowpyramidal with ascending branches.

eurôlepis. Dunkeld L. Hybrid between L. decidua and L. leptolepis.

europæa: L. decidua.

Gmélinii (L. dahurıca). Dahurian L. Lvs. to 1½ in. long, bright green: cones 1½ in. long, with shiny scales. E. Siberia. Var. japonica has bluish-red young branchlets. Saghalm, Kurile Isls. Var. Príncipis-Ruppréchtii has larger cones. N. China, Kotea.

Griffithii. Branches drooping: lvs. obtuse: cones to 4 in long. S. W. China.

Kaémpferi: L. leptolepis.

larkina (L. americana). American L. Tamarack. Hackmatack Lvs. to 1½ in long, obtuse, light bluishgreen: cones to ¾ in. long, with shiny scales. N. Amer. leptôlepis (L. Kaempferi). Japanese L. Lvs. to 1½ in. long, obtuse, light or bluish-green: cones to 1½ in. long. Japan. Var minor (var. Murrayana) is a dwarf form.

Lyallii. Lvs. to 1½ in. long, 4-angled, acute, stiff: cones to 2 in. long, the bracts exserted. B. C. to Mont.

Mastersiana. Lvs to 11/4 in. long, bright green with 2 pale bands below: cones 11/4 in. long, the purple bracts exserted. W. China.

occidentalis. Lvs. to 1¾ in. long, sharp-pointed, stiff: cones to 1½ in. long, the bracts exserted. B. C. to Mont.—Becomes very tall, to 180 ft.

péndula. Hybrid between L. laricina and L. decidua.

Potaninii (L. thibetica). CHINESE L. Branchlets drooping: Ivs. to 1½ in. long, 4-angled, acute, grayish-green: cones to 1¾ in. long, the purple bracts exserted. W. China.

sibírica. Lvs. to 2 in. long: cones 11/2 in. long. Russia.

sudética: listed name. thibética: L. Potaninis. LARKSPUR: Delphinium.

LÁRREA (Covillea). CREOSOTE BUSH. Zygophyllaceæ. Evergreen balsamiferous shrubs of dry regions, with opposite lvs. usually of 2 sessile lfts., yellow solitary terminal fls., and globose white-tomentose frs.

tridentata. To 10 ft., much branched, resinous: lfts. obliquely ovate, ½ in. long, 4-5-nerved: fls. ¼ in. long. Mex., Tex. Var. glutinosa has lanceolate 3-nerved lfts. Utah to N. Mex.

LASERPÍTIUM. Umbelliferæ. European per. herbs with compound lvs., small white or reddish fls. in large umbels, and cylindrical winged frs.: one species is sometimes grown for ornament.

latifòlium. To 5 ft.: lvs. 2-pinnate into oval segms.: fls. white, polygamous, the umbels subtended by short involucral lvs. Cent. Eu.

LASIAGROSTIS: Stana

LASIANDRA: Tibouchina.

LASTHÈNIA. Compositæ. Slightly succulent annuals, native from Ore. to Chile, having opposite entire lvs. and long-stalked heads of yellow ray- and disk-fls.; bracts of involucre united into cup; pappus of scales or none. Sometimes grown in the flower-garden.

califórnica: L. glabrata var.

glabràta. To 1½ ft.: lvs. linear or lanceolate, to 2 in. long, connate at base; heads 1 in. across. June-July. Calif. Var. califórnica (L. californica) has lvs. scarcely connate.

LASTREA: Dryopteris, Polystichum.

LATÀNIA. Palmaceæ. Stout diœcious fan-palms of the Mascarene Isls., Indian Ocean, sometimes grown in the open in S. Fla., and frequently planted in the tropics, unarmed except that petioles and lf.-margins are more or less spiny in young plants: lvs. large, heavy and stiff, long-petioled, strongly many-lobed: spadices among the lvs., several ft. long, the staminate bearing many finger-like dense spikes with 15-30 stamens sunken in pits under scales, these ultimate spikes less than 1 ft. long in the first two species and considerably longer in the third; pistillate spadix with many looser-fld. branches or spikes: fr. a hard somewhat drupe-like body 1-2½ in. long, globose, oblong or ovoid and sometimes angled. They are trees, mostly remaining small in cult. For cult. see Palm.

aurea: L. Verschaffeltii.

borbónica of botanists: L. Commersonii; of hort., Livistona chinensis.

Commersonii (L. rubra). To 40 ft., the petioles and ribs of lvs. crimson, the color striking in young plants in which the petioles and If.-margins are often spiny: petiole 4-6 ft.; blade 5 ft. or more, slightly or not at all glaucous, larger segms. 3 in. or more broad at base on mature lvs.: fr. globose, usually less than 2 in. long, ribbed as also the nut.—A striking plant from the red color.

glaucophýlla: L. Loddigesii.

Lóddigesii (L. glaucophylla). Strong grower: petiole 3-5 ft.; blade glaucous-blue, young plants sometimes with reddish tinge, larger segms. under 2 or 3 in. broad: fr. more than 2 in. long, obovoid or pear-shaped, angled; nut with central ridge and smaller ribs above.

rubra: L. Commersonii.

Verschafféltii (L. aurea). To 40 ft.: petiole 5-8 ft., orange-margined; blade green, segms. usually exceeding 2 in. broad at middle: staminate spikes becoming 1½-2 ft. long: fr. 2 in. long, obovoid, obscurely angled; nut ridged.

LATERAL: on or at the side.

LÁTHYRUS (incl. Orobus). Leguminosæ. Important genus of vines and erect herbs with pinnate lvs., showy papilionaceous fls. which are solitary or in axillary racemes and usually flat pods; grown for ornament, and L. sativus for the edible seeds; some of them have fragrant fls.

The perennial species are propagated by seeds or cuttings and are of easy cultivation in any soil. The annuals require a deep most soil and plenty of sunlight. Propagated by seeds in spring. In the South or under glass seed may be sown in the fall for late winter bloom. Ample support should be provided and the seed-pods picked often to lengthen the blooming season.

álho-ròseus: hort name.

Alefeldii: L. structus.

Aphaca. Climbing to 1 ft.: true lvs. reduced to tendrils, subtended by ovate leaf-like stipules to 1 in. long which are hastate at base: fls. yellow, 1-2 on a peduncle: pod about \$\frac{3}{4}\$ in. long. Eu.

articulatus. Ann. to 3 ft., climbing: lfts. linear-lanceolate: fls rich purple with white or rose-lilac wings, usually solutary Medit. region.—By some considered a var. of L. Clymenum.

aurantiacus: trade name.

azureus: L. sativus var. cæruleus.

canéscens: L. filiformis.

Cicera. Ann to 2 ft.: lfts. linear-oblong: fls. red, 1-2 on a peduncle which is shorter than lys: pod glabrous. Eu.

Clymenum. Climbing ann to 3 ft: lower lvs. not producing lfts, petioles winged, to ½ in. wide; lfts linear-lanceolate, to ½ in. wide: fls. purple-red with blue wings, 2-5 on a peduncle. Medit. region.

cyàneus. Lfts oblong-linear to awl-shaped, stipules sagittate: fis blue, calyx-teeth unequal. Russia.

ensifòlius: L. membranaceus.

filitórmis (L. canescens. Orobus canescens). Per. to 2 ft, glabrous, not climbing: lfts. linear-lanceolate, usually 2-3 pairs: fls. blue, or blue and white, to 34 in. long, usually 4-10 in raceme. pod to 2½ in. long. Cent. Eu. to Asia Minor and Caucasia.

Górgonii. Climbing ann: Ifts. lanceolate: fis. reddishbrown, solitary, peduncle about as long as lvs.: pod glabrous, upper margin 2-winged Sicily.

grandiflorus. Two-flowered or Everlasting Pea. Per to 6 ft, climbing: lfts ovate: fls. rose-purple, large, 2-3 on a peduncle: pod cylindrical. S. Eu.

hirsûtus. Ann. to 4 ft., climbing, sts. narrowly winged: lfts linear-lanceolate: fls. red with paler wings, 1-3 on a peduncle: pod linear, hairy. S. Eu., W. Asia, N. Afr.

incanus. Erect, to 1 ft., densely hairy: stipules smaller than linear or linear-oblong lits:: fls. purple, 1 in. long, in 3-5-fid. racemes. Neb., Colo., Wyo.

japónicus: for very technical reasons this name has been adopted by some for $L.\ maritimus.$

lætiflòrus. Per. to 8 ft.: lfts. elliptic-lanceolate: fls. nearly white veined with purple, many on a peduncle. S Calif.

lathyroides: Vicia oroboides, but some of the material so listed is L. niger.

latifolius. PERENNIAL or EVERLASTING PEA. Per., climbing to 9 ft., sts. winged: lits. ovate-lanceolate: fls. rose-color, large, several to many on a pedundle. Eu. Var. álbus and grandiflorus álbus have white fls. Var. rôseus may not differ from the type. Var. spléndens has dark purple and red fls—Common in gardens.

littoralis. Beach Pea. Sts. decumbent: stipules larger than cuneate-oblong densely silky-hairy lfts.: fls. purple with white wings and keel, 2-6 on a peduncle. Seashore, Wash. to Calif.

lûteus (Orobus luteus). Per. to 3 ft.: lfts. oblong: fis. bright yellow, in 5-15-fid. racemes. Eu.

magellánicus. Lord Anson Pea. Per. to 5 ft., climbing: lfts. ovate to oblong-linear: fls. violet-blue, 3-4 on a peduncle. Straits of Magellan.

marftimus (L. japonicus). Beach Pea. Per. with decumbent wingless sts. to 2 ft. long: stipules broadly ovate; lfts. oblong or ovate: fls. purple, in 6-10-fld. racemes. Sea and lake shores, N. Amer., Eu., Asia.—The species runs into many forms in the wild.

mauritánicus hort name

membranaceus (L. ensifolius). Glabrous climbing per. allied to L. sylvestris, differing in the stipules as wide as the winged st. or nearly so, and pod 3-4 in. long. Cent. Eu.

montanus. Per. with prostrate or upright winged sts. to 1 ft. long, no tendrils present: lits. oblong to lanceolate: fls. purple, greenish at base, in 2-5-fild. racemes, calyx glabrous or glabrescent. Eu. Var. aurantiacus is listed.

nìger (Orobus niger). BLACK VETCHLING. Per. to 2 ft.; Ris, oval, turning black when dried; fis. purple, in racemes.

ochroledcus. Per. with trailing or climbing sts. to 2½ ft. long: lfts. ovate: fls. yellowish-white, in 5-10-fld. racemes. Que. to B. C.

Öchrus. Ann., climbing: petioles broadly winged, lfts. oval: fls. yellowish-white, solitary. S. Eu.

odoratus. Sweet Pea. Ann., climbing to 6 ft.: Ifts. oval or oblong: fls. of many colors, fragrant, large, 1-4 on a peduncle: pod pubescent or hirsute. Italy. Var. nanéllus, Dwarf Sweet Pea, is a compact non-climbing form, known in the Cupid. See Sweet Pea.

ornàtus (L. stipulaceus). Erect per. to 1 ft. or more: lfts. linear: ffs. purple, 1 in. long, in 3-5-fid. racemes. S. D. to Wyo. and Okla.

palistris. Marsh Pea. Per. with trailing winged sts. to 3 ft. long: Ifts. lanceolate to linear: ffs purple, 2-8 on a peduncle. Moist ground, N. N. Amer., Eu., Asia.

pannonicus. Per. to 2 ft.: Ifts. linear-lanceolate: fls. 4-8 in a raceme, ochroleucous often suffused red. S. Eu. Var. varius is small, erect, with narrow pointed lfts., fls. yellow and rose.

praténsis. Per. to 3 ft., pubescent, prostrate: lfts. 2, lanceolate; stipules nearly as long as lfts., sagittate: fts. yellow, to $\frac{5}{16}$ in. long, usually 4-9 in raceme: pod black at maturity. Eu., W. Asia and N. Afr.

pubéscens. Climbing to 6 ft.: lfts. oblong-lanceolate: fls. pale blue, in racemes of 6-14; calyx and pod densely villous-pubescent. Chile.

ròseus (Orobus roseus). Per. to 4 ft.: lfts. 2, oval, tendrils absent: fis. rose, 2 on a peduncle. Asia Minor. Var pállidus has pink fis.

rotundifòlius. Per. to 5 ft., climbing: lfts. ovate to nearly round: fls. rose-pink, many on a peduncle, in racemes shorter than or equalling the lvs. Russia, Asia Minor.

sativus. Grass Pea. Ann, 2 ft. and more, nearly erect: lfts. linear: fls. white tinged with blue, solitary S. Eu. Var. cærûleus (L. azureus) has blue or blue and white fls

setifòlius. Ann , chmbing: líts. linear to ovate-lanceolate, tendrils branched: fis. purple or dark red, solitary, small. S. Eu.

 ${\bf spathulata}.$ Sts. ascending: lfts. narrow linear-lance olate: fls. blue, 5 -8 together. Asia Minor.

spléndens. PRIDE-OF-CALIFORNIA. Per., somewhat shubby: Ifts ovate-oblong: fis. rose, violet or magenta-red, 6-12 on a peduncle. S. Calif.

stipulàceus: L. ornatus.

strictus (L. Alefeldi). Clambering per. vine to 10 ft.: Ifts. 6-11, linear-lanceolate to ovate-elliptic, about 1 in. long, puberulent: fls. rose to purplish, to 1 in. long, in racemes of 6-15, pedicels about ½ in. long. Calif. Var. bárbaræ (L. violaceus) has fls. to ¾ in. long on pedicels to ¼ in. long.

sylvéstris. Flat Pea. Per. to 6 ft., climbing: lfts. lanceolate to linear-lanceolate: ffs. rose variegated with purple and green, 4-10 on a peduncle. Eu. Var. Wägnerl has dark red fis.

tingitanus. TANGIER PEA. Ann., climbing to 6 ft.: lfts. linear-lanceolate: fls. purple with red wings and keel, 2-3 on a peduncle. Medit region. Var. roseus is a color variation.—Resembles some forms of L. odoratus, differing in its glabrous sts. and pods.

tomentòsus. Somewhat shrubby climber: lfts. 2, linear-lanceolate, densely tomentose: fls. blue or violet, 3-4 on a peduncle. Argentina, Brazil.

tuberosus. Per., climbing or trailing to 4 ft., tuberbearing: lfts. oblong to broadly lanceolate: fls. rose, 3-5 on a peduncle. Eu., W. Asia.—Parts of root tubers are edible.

undulatus. Per. to 3 ft., climbing: lfts. 2, oblong, margins undulate or crisped: fls. magenta-red, 5-6 on a peduncle. Turkey.—Similar to *L. latifolius*, differing in lft. margin and styles strongly dilated at apex.

vàrius: L. pannonicus var.

vérnus (Orobus vernus). Spring Vetchling. Per. to 2 ft.: Ifts. ovate: fls. blue-violet, 5-8 on a peduncle. Eu. Var. álbus has white fls. Var. rôseus has rose-pink fls.—Differs from L. montanus in pilose calyx and fewer-fld. racemes.

violaceus: L. strictus var. barbaræ.

LATTICE-LEAF: A ponogeton fenestralis.

LAURACEÆ. LAUREL FAMILY. Aromatic trees and shrubs of about 45 genera mostly in warm climates, with commonly alternate simple lys., small unisexual or bisexual fls. having 6parted perianth, 12 stamens in series, superior 1-celled ovary, and fr. a drupe or berry. The family yields many ornamental genera and others grown for the edible fr. and spices, as Benzoin, Cinnamomum, Cryptocarya, Hufelandia, Laurus, Litsea, Persea, Phœbe, Sassafras, Umbellularia.

LAUREL: Laurus. Alexandrian-: Danaë racemosa. California-: Umbellularia californica. Cherry-: Prunus. Mountain-: Kalma lutyolia. Oak: Quercus lauryolia. Portugal: Prunus lusilanica. Sheep-: Kalma angustifolia. Spurge-: Daphne Laureola.

LAURÈLIA. Monimiaceæ. Tall aromatic trees with opposite leathery lvs. and diccious or polygamous fls. without petals, borne in axillary cymes or racemes; native in Chile and New Zeal., one planted in Calif.

novæ-zealándiæ. To 120 ft., with buttresses at base: lvs. oblong or obovate, to 3 in. long, coarsely toothed, glossy above: fls. 1/4 in. across, in racemes to 1 in. long. New Zeal.

LAURESTINUS: Viburnum Tinus.

LAUROCERASUS: Prunus.

LAURUS. LAUREL. SWEET BAY. Lauraceæ. Medium-sized trees in the Medit.-Canary region, with alternate simple lvs., small bisexual or unisexual fls. in axillary umbels, and fr. a berry one species is a common tub-plant, pruned and trained to various shapes.

Laurel withstands several degrees of frost and thrives in spite of neglect. It thrives in rich peaty soil with plenty of moisture. Propagated mostly by cuttings of ripened wood under glass, and sometimes by seeds.

Camphora: Cinnamomum Camphora

glandulifera: Cinnamomum glanduliferum.

indica: Persea indica.

nóbilis. Evergreen tree to 40 ft.: lvs. lanceolate to oval, to 4 in long, dark glossy green: fls. yellow: fr. black or dark purple. Medit region; the true laurel of florists.—Variable in stature and leafage; various Latin names are applied as var. angustifòlia, latifòlia, salicifòlia.

regalis: a crisped-lvd. form of L. nobilis.

LAVÁNDULA. LAVENDER. Labiatæ. aromatic herbs or shrubs with entire, toothed or dissected lvs. and 2-10-fld. whorls crowded into long-stemmed cylindrical spikes, the fls. blue, violet or lilae; native from Canary Isls. to India.

Lavender is propagated by seeds or division, but preferably from cuttings made in late fall or early spring, of the seasons growth but with a heel of older wood. In the North winter protection is desirable. The plants are grown for ornament and for the pleasant scent; commonly included among the sweet herbs.

alpina: garden name, apparently L. officinalis.

atropurpurea: probably L. officinalis var.

delphinénsis; a listed name of doubtful botanical

dentata. Sts. somewhat woody: lvs. linear, to 1½ in. long, pinnately toothed, pubescent: fis. deep purple, ½ in. long. Medit. region.

latifolia. Similar to L. Spica and often so called, but with broader flat lvs. and linear herbaceous bracts subtending the whorls. Medit. region.

multifida (L. pinnatifida). Bien. to 2 ft., evergreen: lvs. pinnately divided, hoary: fis. lilac. Canary Isls.

nàna: L. officinalis var. compacta.

officialis (L. Spica. L. vera). Subshrub to 3 ft.: lvs. linear to lanceolate, to 2 in. long, entire, the margins revolute, white-tomentose when young: fls. lavender, to ½ in. long, with ovate-pointed bracts at the whorls. Medit. region. Var. álba has white fls. Var. atropurpirea is listed as having dark lavender-purple fls. Var. compacta (var. nana compacta), low and compact, blooming earlier.

pedemontana: hort. name for form listed as having silvery foliage and dark purple fis.

pedunculāta. Shrub to 3 ft., gray-tomentose: lvs. lanceolate, to ½ in. long, margins revolute, entire: fls. dark purple, long-peduncled, calyx about as long as corolla, spike short, thick and lax. Madeira, Canary Isls.

pinnata. To 1½ ft.: lvs. pinnate into wedge-shaped lfts.: fls. purple, fragrant, in imbricated whorls. Madeira, Canary

pinnatífida: L. multifida.

Spica: L. officinalis.

Structures: Shrub to 3 ft., gray-tomentose: lvs. linear, 1/2 in. long, entire: fis. dark purple, short-pedicelled, in dense spikes with tuft of large purple bracts. Medit. region.

vèra: L. officinalis.

LAVÁNGA (or Luvunga). Rutaceæ. A few species of climbing spiny shrubs, India and Malaya to Cochin-China. L. scándens is an evergreen sometimes grown for ornament in the citrus belt: lvs. of 3 lfts., petiole not winged: fls. white and fragrant, in axillary clusters: fr. oval or oblong, resinous, yellowish, about 1 in. thick. with lemon-like rind.

LAVÁTERA. Malvaceæ. TREE-MALLOW. Various herbs and shrubs widely spread in warm countries, with alternate angled or lobed lvs., often maple-like, and showy fls. solitary in the axils or in terminal racemes.

Lavateras are flower-garden subjects or the shrubby species planted for windbreaks. Of easy cultivation. Seeds should be sown where plants are to stand; perennial kinds are also propagated by cuttings.

álba: L. trimestris var.

Alcea: the plant listed under this name is probably Malva Alcea.

arborea. Bien., becoming tree-like shrub to 10 ft.: lvs. orbicular, 5-9-lobed: fls. pale purple-red veined with dark purple at base, 2 in. across, in racemes or clusters. S. Eu.; planted in Calif. Var. variegata has mottled lvs.

assurgentiflora. Shrub to 10 ft.: lvs. with 5 coarsely toothed lobes: fis. rose-purple with darker veins, to 2½ in. across, 1-4 in the axils. Isls. of S Calif., and planted in that state for windbreaks and ornament.

cachemiriàna. Per.: upper lvs. 3–5-lobed, the middle lobe longest: fls. pink, to $1\frac{1}{2}$ in. long, solitary. Himalayas. Davaei. Ann. or bien. to 4 ft., tomentose: lvs. cordate-ovate, 7-lobed: fls. rose-violet, 2-5 together. Portugal.

insularis. Low shrub: lvs. with 7 coarsely toothed lobes: fls. yellowish striped with purple, 1½ in. long, solitary. Coronado Isls., Lower Calif.

mauritánica. Ann. to 2 ft., densely tomentose: lvs. orbicular-cordate, 5-7-lobed: fls. violet, darker at base. N. Afr.

Ólbia. Shrub to 6 ft.: lvs. 3-lobed, the middle lobe longest, or lower lvs. 5-lobed: fls. reddish-purple, 1 in. long, solitary, sessile. S. Eu.

rdsea: L. trimestris.

spléndens: L. trimestris var.

thuringlaca. Per.: lvs. ovate-lanceolate, to 3 in. long or more, 3-lobed, acuminate to acute, base subcordate, margins obtusely serrate: fls. rose-pink, to 2½ in. across, petals retuse. Thuringia.

triméstris (L. rosea). Flower-garden ann. to 6 ft.: lower lvs. nearly round, upper ones angled, toothed: fs. rose or red, 4 in. across, solitary. Medit. regnon. Var. álba has white fis. Var. grandiflòra is sand to have larger rose-pink fls. Var. spléndens is an improved garden strain.

LAVAUXIA; Enothera.

LAVENDER: Lavandula: see also Chrysanthemum Balsamıta. Sea-: Lumonium.

LAWN. In horticulture a lawn may be defined as an area of the landscape carpeted with a greensward designed as a foundation setting for buildings, for border planting or for pleasure grounds. The term is usually sufficiently broad to include both grasses and other plants which require clipping and such low-growing carpeters as vinca, moneywort and others. speaking the lawn is a permanent feature and as such is usually composed of perennial plants.

Many types and kinds of plant materials are

available for lawns. These must be selected with careful consideration for the nature of the environment into which they are to be introduced.

Kentucky blue-grass is probably the most commonly used lawn grass in northeastern United States and is one of the most desirable when the soil is not too acid (i. e. not below a pH of 6). Contrary to general belief, blue-grasses may be grown on more acid soils than indicated here, provided a high degree of fertility is maintained, but this adds unnecessary costs to maintenance.

Bent-grasses, including redtop, are of the genus Agrostis. They form carpets of very fine texture and are bright green in color. The plants do best in the more acid soils and when grown on neutral or sweet soil they require more food materials for optimum growth than do such grasses as Kentucky blue-grass and hence are often crowded out. Frequent clipping appears to be partly responsible for the fine texture often obtained with these grasses. Redtop (Agrostis alba) is the coarsest foliaged of the group and seed is occasionally represented to be that of some of the more costly and more desirable kinds. Like the blue-grasses, the bents do best in the cool rather humid regions of northeastern United States and Pacific coast.

Fescues represent several species of the grass genus Festuca and all are characterized by their fine wire-like leaves and by the fact that the individual plants of all but the red fescue form dense tufts or hummocks which become somewhat undesirable with age. Because of their tough wiry leaves the fescues sometimes present difficulties in clipping. Their chief merit is their ability to compete with tree roots for food and thus they are better able to survive in the shade beneath lawn trees than are many other grasses. Red fescue forms a continuous turf and does well on sandy soils, being used sometimes for putting-greens of golf courses. All the fescues do best in the cooler regions and are best adapted for use in northern United States and Canada.

Bermuda-grass is valuable for pastures and to a lesser extent for lawns, in the southern United States, but is sometimes avoided because of its noxious nature in cultivated areas. In the South it is a coarse perennial turf-forming grass usually spreading readily by underground stems. In these regions it does particularly well in heavy clay soils and responds to moderate applications of lime.

Korean lawn-grass (Zoysia japonica), sometimes known as Palm Beach grass, has been introduced from Korea and is adapted to the sandy soils of the warmer regions in the Atlantic and Gulf states. It is said to be hardy as far north as Connecticut. The plant forms a dense uniform turf and spreads by stolons.

The most beautiful lawns, from the point of view of uniformity of texture and color, are those comprised of a single kind of grass. However, when lawns are established from seed, the seed sown usually represents a mixture of several kinds of grasses. There are two reasons for this; one, the sower may be unaware of the kind of grass best suited to the particular environment and trusts that the commercial mixture will contain seed of at least one grass adapted to the environment; or secondly, a particular kind of grass may be selected for the location but seeds of other grasses are purposely mixed to provide short-lived plants to serve as nurse crops

to shade and protect the usually more delicate and ultimate turf grass. Both reasons are legitimate, but sowings made because of the latter are likely to be more successful. Four important points should be considered in the selection of a lawn grass or the seeds to be used in a lawn mixture. They are: (1) the region, i. e. the North, where low temperatures are encountered, or the South with its warmer conditions; (2) the alkalinity of the soil; (3) degree of exposure to sunlight; and (4) the more unusual situations, such as exposure to salt ocean-spray or fogs. Lawn mixtures for use in the South may include Bermuda-grass, carpetgrass, St. Augustine-grass or Korean lawn-grass as the main turf crop with about 10 per cent of the weight of the mixture comprised of perennial rye-grass (Lolium perenne) as a nurse crop. Mixtures for very acid soils should not contain blue-grass or clover, but are best comprised of the bents or red fescue as the principal ingredient. Here also redtop or perennial ryegrass may be used as a nurse crop. Redto, usually makes a coarser and shorter-lived lawn than do the bents, and either require more care in maintenance than do most blue-grass turfs. Kentucky blue-grass is one of the most widely used grasses in lawn mixtures and is recommended for neutral or alkaline soils. It may be sown alone or any of the usual nurse crops such as redtop or perennial rye-grass may be mixed with it. The incorporation of a light coating of lime into the top soil prior to sowing blue-grass is beneficial unless it is over a limestone substratum. Many lawn grasses do not survive in partial or light shade. The reason for this is more often the inability of the roots to compete for food and water with surface-feeding tree roots than the lack of sunlight for the plants. The production of the lawn turf in partial shade involves three practices: (1) selection of a grass whose sunlight requirements are less, and whose roots are deeper, than most kinds; (2) adequate fertilization of the shade-producing trees or shrubs; and (3) proper thinning and pruning when trees are responsible for the shade. Grasses which do best in shaded situations are red fescue (Festuca rubra), wood meadow-grass (Poa nemoralis) and rough-stalked meadow-grass (Poa trivialis). Many grasses will not survive more or less constant exposure to ocean spray or fogs. However, the creeping and colonial bents may be expected to survive such conditions in the cooler regions.

Plants other than grasses may be used for lawns. Some of these are distinctly superior under situations where the maintenance of a grass lawn becomes difficult, such as dense shade. steep terraces, sandy soils where water is not available and flagstone interstices. Among those plants suitable for dense shade are periwinkle or ground-myrtle (Vinca minor), a hardy perennial with glossy dark green persistent leaves and lavender-blue flowers in spring. Japanese spurge (Pachysandra terminalis) is excellent when once established. Plants are set at intervals of about 8 inches and the soil is best prepared by adding a liberal mixture of equal parts of leafmold, granulated peat and sand plus a quart of bonemeal to every bushel of compost. This mixture should be incorporated into the soil to a depth of at least 10 inches. A peat moss mulch may be used if the basic soil is exceedingly sandy.

English ivy (Hedera Helix) is an evergreen runner available in a large assortment of leaf variants. It is excellent where hardy and in its northern limits is best in a northern exposure where not subject to burning from the winter sun. Lily-of-the-valley (Convallaria) thrives in shade and holds its foliage until autumn. Moneywort (Lysimachia Nummularia) makes a dense cover flat on the ground and produces yellow flowers during the summer; unfortunately it is likely to escape from the shaded regions and actually become a weed in the remainder of the lawn or in the garden.

Of the plants for steep terraces, periwinkle and English ivy described above are very satisfactory, and for terraces not to be much travelled over, some of the sedums are admirably adapted, particularly S. dasyphyllum, S. hispanicum, S. sexangulare, S. stoloniferum, S. monregalense, S. acre and S. sarmentosum. The last two species are likely to escape from the terrace and become weeds in the adjoining lawn or garden. Of the above kinds, S. stoloniferum seems best adapted to shady situations. On very sandy and dry terraces the bearberry (Arctostaphylos Uvaursi) does very well, forming a dense glossy evergreen carpet about 4 inches deep. It may be planted in partial shade or full sun.

For dry sandy areas where water is not available for the maintenance of a grass lawn several substitutes have been proposed. The two most satisfactory are the turfing daisy (Matricaria Tchihatchewii) and the common yarrow or milfoil (Achillea Millefolium). These are spreading fern-like-leaved perennials which form a close tight turf capable of resisting wear and drought. The lawn of the turfing daisy is started by setting out young plants at about 6-8-inch intervals and mowing the tops off after they have become established. A yarrow lawn is often started from seed and in general forms a closer turf than the matricaria. Another substitute for lawn grasses and frequently added to mixtures is Dutch white clover (Trifolium repens). This clover aids in preserving a green color throughout the turf during dry periods, but has the drawback of being the chief source of grassgreen stains on clothing.

There are many species adapted to planting among the interstices of flagstones. Where the walk or court is not surrounded by a grass turf, such plants may be used as the sandwort (Arenaria verna), mazus (M. japonicus and M. replans), thyme (Thymus), dwarf and prostrate veronicas, thrifts (Armeria maritima and A. juniperifolia), sedums (especially S. dasyphyllum and S. hispanicum), and saxifragas (particularly members of the S. decipiens group).

The lawn should be made with the idea of permanence. Therefore, it is essential that time be taken to grade the land properly and to prepare the ground thoroughly before seeds are sown or plants are set. Earth thrown out from a cellar does not grow a good lawn. Care should be taken to make the land deep and loose, so that the grass roots may run far into the soil and not suffer from lack of moisture in a dry time. If the land has not had applications of manure in recent years, it is well to plow in, or to spade in, a liberal quantity of well-rotted litter or similar material. Work this into the ground as deeply as possible. If the hardpan is rather high, it is well to subsoil the area or to

trench it (that is, to spade it up two or three spades deep). If the land is apparently not rich in plant-food, it is well to add a dressing of commercial fertilizer to the surface when the grass seed is sown; the fertilizer should provide nitrogen, phosphoric acid, potash, in approximately the proportions 10-6-4, and 15-20 pounds to 1,000 square feet is a good application.

The lawn may be established by following any one of four practices: (1) seeding, (2) setting turf, (3) planting stolons when a stolon-producing grass is selected, or (4) setting out plants where a non-grass type of lawn is desired.

Grass seed should be sown in the cool of the year. The lawn may be seeded in September and the plants thereby become established before winter; or seed may be sown very early in the spring. In newly made lawns, it is a good plan to grade the area thoroughly in autumn, allowing it to settle in the winter in the North; and then, if the surface remains even, to sow the grass seed on one of the late snows in spring. By sowing it on the snow, one can see that it is distributed evenly; and when the snow melts, the seed is carried into the land and does not meed covering. In sowing seed it is well to use a mixture of two or more kinds. This may be a commercial mixture of unknown kinds or a self-mixed one consisting of seed of the desired kind of grass plus seed of one or more nurse crops. A nurse crop is a quick germinating perennial grass which serves to shade the more tender turf grass and also as a temporary covering, indicating where the borders are and thereby outlining the area for the lawn-mower to cut. When the seed of the nurse crop is considerably larger and bulkier than that of the turf grass, it should be sown separately to make even distribution. The more commonly used grasses for nurse crops are redtop (Agrostis alba) and perennial rye-grass (Lolium perenne). The former is sown at the rate of one quart to the acre and about ten times that quantity for the latter. Oats and rye are sometimes used as nurse crops but they are not recommended because of their coarseness and tendency to overshade the turf grass. On hard lands it is well to sow 2 or 3 quarts to the acre of crimson clover seed. The long roots of this plant tend to improve the physical conditions of the soil; and when they decay they leave nitrogen for the grass to use. As crimson clover is annual, it will not do any permanent mischief in the lawn unless it is allowed to go to seed and become weedy.

Sodding rather than seeding is sometimes employed for the making of a lawn, particularly when quick results are desired. This is also a good means of securing the margins of walks and drives and of outlining small subdivisions. Unless the sod is of the right kind, however, and very carefully laid, the results are not good. Sod adapted to the work is that which comes from an old closely grazed pasture. Sod from a sheep pasture is supposed to be specially good. Such sod has been so closely grazed that it has made a dense close mat, and all the weeds have been destroyed. The droppings of the animals also make the ground fertile. The sod should be cut in thin strips, not more than 1½ or 2 inches in thickness. If it is thicker than that it is heavy and bulky to handle, and is not so easily laid. Ordinarily, the sod is cut in strips 10 inches or a foot wide. A board is laid on the sod and the

strip is cut along either side of it with a sod-cutter or a sharp spade. Two men then roll up the sod. One stands on the strip of sod with his face toward the man who, with the spade, cuts it loose beneath. As it is cut loose, the man on the strip rolls the sod toward him so that the upper surface is on the inside of the roll. Strips longer than 6 or 7 feet make rolls too heavy to handle with ease.

The sod should be pounded down firmly and evenly, and the ground on which it is laid should, therefore, be freshly worked and loose. A heavy pounder should be used, as a block of wood. It is usually impossible to pound down sod with the back of a spade sufficiently firm unless the earth is very mellow. The sod should be pounded until the top is about level with the surrounding surface. This insures contact with the soil beneath, so that there are no air spaces and no likelihood of drying out. Sod pounded down as firmly as this should grow readily. Water the area before and after sodding. If a sod edging is laid along walks and drives, it should be pounded down an inch or more lower than the surrounding loose land which is seeded, because the loose land will finally settle: otherwise the sod border is likely to be higher than adjacent land after a year or two. If there are uneven shallow places on the sodded area, the depressions may be filled with very loose fine earth, and the grass will grow through it. In dry weather, a newly sodded area may be mulched with a half inch or less of fine loam to protect it from drying.

A modification of sodding is the establishing of a new lawn with stolons. In this case a good sod that has been grown and properly maintained as a lawn turf is removed when the ground is dry. All loose soil is shaken from the pieces which are then cut or shredded into small pieces. These may be stored in a cool place for many days when packed into baskets lined with moist sphagnum moss or burlap. They are planted by sowing or broadcasting them on the graded area. The pieces soon establish themselves, spread, and grow together, covering the area as if it were seeded. It is usually more desirable than seeding because it permits the establishment of a uniform turf taken from selected strains of grass and the resulting turf is acquired in a shorter period of time. Any turf used for stolon production must be maintained absolutely weed-free or the weeds will be spread throughout the new lawn from the start. Grasses suited to this method of propagation are the creeping bents, Bermuda-grass and carpet-grass.

Almost all other ground-covers than grass are established by setting out young plants at rather close intervals.

The maintenance of a grass lawn may be divided into four operations: (1) clipping, (2) watering, (3) fertilizing and (4) weed control.

The lawn should be mown frequently when it is growing rapidly—in spring and early summer. In dry weather and autumn mow less frequently, and let it go into the winter with a good coat of grass. If the lawn is mown as often as is needed, it will not be necessary to rake off the clippings. The clippings should not be collected in a catcher attached to the mower nor raked off the lawn for they serve as a mulch to the grass crowns, aiding considerably to conserve soil moisture during dry periods and eventually decomposing to add

humus or organic matter to the soil—an enrichment particularly valuable in sandy and clay soils. In the case of bent-grass lawns the more frequent the mowing the finer the texture of the grass and professional grasskeepers practice daily clipping of such turfs.

In dry times the lawn may be watered; but the common practice of sprinkling lawns is usually injudicious, since the water is not supplied in sufficient amount to wet down very far, and the grass tends to make surface roots; then when the watering is omitted the plants suffer. The more a lawn is sprinkled, the more the grass depends on the sprinkling. If it is necessary to wet the lawn, the water should be allowed to run directly from the hose until the surface area is completely soaked, or merely break its force so that it will not wash away the surface or compact the area. It is best to do this at nightfall. When the water is applied by means of a sprink-ler, a large part of it may evaporate. The fundamental treatment of the lawn is to have the land so deep and porous that the grass roots strike deep into the soil and do not need the surface water. A well-made lawn needs watering only in unusually dry times, unless there are many trees.

Many persons take for granted that once a good lawn turf is established the only care required is to keep it clipped and to water it after it browns. The lawn represents a vast collection of living plants established with a view toward permanence. These plants are competing with each other, with other and less desirable kinds of grasses, and with weeds for their very existence and in order to meet such competition successfully they require regular and adequate feeding. Particularly is this true of turfs on sandy or clay soils where leeching occurs or where root growth is more difficult. It is not probable that a permanent, uniform and weedless turf will exist unless systematic feeding or fertilizing practices are followed.

Fertilizing the lawn may be accomplished in two ways: applications of well-rotted stable dressing (preferably cow or sheep manure) in the fall or early spring; or of commercial fertilizers.

The use of stable dressing is no more economical, when it has to be purchased, than a commercial fertilizer of equivalent food value. It has little to recommend it over the commercial fertilizer, provided the lawn clippings are not removed, and has several disadvantages not found with commercial mixtures. Stable dressing is a primary source for the introduction of weed seeds, it is unsightly and often malodorous for an extended period, its use entails a labor expenditure not only for application but also for removal and its food value is highly variable and too often insufficient to meet the demands of the plants.

The use of commercial fertilizers for feeding lawns has increased considerably in recent years. The time for applying fertilizers depends largely on the region: fall fertilization is advisable in southern and moderately temperate localities and spring fertilization in the North where the ground is usually frozen during the winter. Nitrogen is the fertilizer ingredient largely responsible for vegetative plant growth; inasmuch as this is the kind of growth required of lawns, nitrogen is the element most needed. For this reason a high nitrogen fertilizer, as a

10-8-6, is suggested for lawn use. In the South, this may be applied in the fall at a rate of about 400 pounds to the acre. In the North the practice now is to fertilize in early spring. It is suggested that an early application of a 10-8-6 or 10-6-4 fertilizer be given, while the ground is still frozen, at the rate of 300 pounds to the acre. A second application of 200 pounds to the acre may be made in early to mid-May. mechanics of spreading this smaller quantity may be facilitated by mixing the fertilizer with an equal part of fine sand and distributing this mixture at the rate of 400 pounds to the acre. On large areas a mechanical spreader will give more uniform results than broadcasting by hand. When an added stimulus is desired for the lawn in early summer, an application of nitrate of soda at the rate of 100 pounds to the acre may be advisable. It will be necessary to mix this with twice its volume of fine sand to insure a more uniform distribution; it should be applied just before a rain or followed by a thorough watering in order to prevent burning to the grass.

Bonemeal has long been used as a top dressing for lawns. It is not a complete fertilizer and its use must be supplemented by other materials which are higher in nitrogen. The earlier it is applied in the spring the more quickly available will be its active ingredients. Late spring applications are of little value to the grass plants that season and much is lost by leeching before the next spring arrives. Ground bonemeal should be applied at a rate of about 800 pounds to the acre or 20 pounds to 1,000 square feet. Bonemeal is not recommended for a bent-grass turf as its protracted use may increase the alkalinity of the soil and be deleterious to the turf.

Weeds will probably come up thickly the first season. This is due more to presence of their seeds in the soil than in the lawn mixture. These weeds should not be pulled, for whenever one is pulled out of the ground many grass plants are rooted up and the surface is made uneven. Such weeds should be mown frequently. If prevented from producing seed, they will not appear in any great numbers the second year unless they are perennials or biennials such as dandelion, docks, plantains or winter mustard. One of the best control methods for lawn weeds is to maintain a vigorous turf.

Many kinds of chemicals are advocated for use in lawn weed sprays of which perhaps one of the better and more effective is sodium chlorate. This is a selective spray with the object of cradicating the weeds without causing serious injury to the turf. According to Muens-cher's "Weeds," "a dilute solution of 1½ ounces of sodium chlorate in a gallon of water is sprayed on the lawn at the rate of 1 gallon to 100 square feet. This treatment will kill chickweeds, ground ivy, speedwell and other broad-leaved shallowrooted weeds without permanent injury to the grass. The grass will discolor temporarily, but it will recover after a week or two. If the treatment is made in early spring or late autumn, the injury to the grass will be less evident. This treatment will also kill crab-grass in the seedling stage." Sodium chlorate may become highly inflammable when in contact with organic matter and all equipment for this spray should be thoroughly rinsed after using. It is suggested that the operator wear rubber boots when using the solution, wash them when finished and avoid

spilling on the clothes. This spray is not particularly effective on dandelions. The latter have a deep penetrating tap-root and when the leafy rosette is cut off near the surface the cut end of the root produces several new rosettes for the one removed. Dandelions may be eradicated by cutting or spudding the crown at a depth of two inches or more and a drop or two of kerosene or concentrated sulfuric acid on the cut end will insure killing the plant. On large areas a kerosene emulsion spray may be used, or pure kerosene at the rate of 300 gallons to the acre may be applied. Such applications may be made in late summer with several weeks classing before positive results are apparent.

clapsing before positive results are apparent.

The presence of moss in the lawn is not so much an indication of soil acidity as a lack of soil fertility. The inauguration of an adequate fertilizing program as outlined above will correct the moss problem. When the moss is very extensive it may be necessary to renovate the

entire lawn.

Seldom does one secure a perfectly good and uniform sod from one sowing; particularly is this true if the soil varies in different parts of the area. If the surface contour is satisfactory, it is unwise to dig up the areas on which the seed has not caught. It is best to rake them over with a steel rake in autumn or spring, applying a little chemical fertilizer rather rich in nitrogen, and sow more seed. Nearly every lawn will need patching in this way from year to year. If the lawn is attended to in fall and spring by sowing grass seed, the weeds will rarely do serious mischief. When weeds are troublesome on the lawn, it means that there is not sufficient grass.

LAWN-LEAF: Dichondra carolinensis.

LAWSÔNIA. Lythraceæ. One shrub, native probably in Afr. and Asia, now widely distributed in warm countries, grown for ornament and also yielding henna dye. L. inérmis. Henna. Mignonette-Tree. To 20 ft.: lvs. opposite, elliptie, to 1½ in. long: fls. small, very fragrant, in many-fld. terminal panicles, from white to rose and cinnabar-red as indicated by the varietal names álba and rūbra: fr. a small caps.—Propagated by seeds and cuttings.

LAYERS: see Propagation.

LAYIA. Compositæ. Early blooming low annuals with alternate entire or pinnately lobed lvs. and solitary terminal heads of yellow or white ray- and disk-fls. in spring or early summer; pappus of scales or bristles or none; native in W. N. Amer. Of easy cult. in the flower-garden. Propagated by seeds sown in the open or started indoors.

Calliglóssa (Calliglossa and Callichroa Douglasii). To 1 ft., nearly glabrous: lvs. to 3 in. long: rays yellow tipped white; pappus of awns. Calif.

chrysanthemoides (Oxyura chrysanthemoides). To 14 in., slightly pubescent: lvs. oblong, to 2 in. long: rays yellow tipped white; pappus none. Calif.

élegans. Tidy Tips. To 2 ft., diffusely branching, hairy: lvs. linear, to 3 in. long: rays to ¾ in. long, yellow often white tipped; pappus of hairs and bristles. Calif. Var. álba has all white rays.

glandulosa. White Daisy. To 1½ ft., simple or diffusely branched, hairy and glandular: lvs. lanceolate or linear, 1¼ in. long: heads 1½ in. across, rays white or sometimes tinged rose; pappus of white hairs and scales. B. C. to Ida. and Mex. Var. heterotricha (L. heterotricha), to 2 ft., rough-hairy.

heterôtricha: L. glandulosa var.

platyglóssa (Callichroa platyglossa). To 16 in., hairy

and glandular: lvs. linear: heads to 1¾ in. across, rays yellow tipped white; pappus of bristles. Calif.

LEAD-PLANT: Amorpha canescens.

LEADWORT: Plumbago.

LEAFLET: one part of a compound leaf: secondary leaf.

LEAF-STALK: the stem of a leaf; petiole; foot-stalk.

LEATHER-JACKET: Eucalyptus punctata. -Leaf: Chamædaphne calyculata. -Root: Psoralea macrostachya.

LEATHERWOOD: Dirca. Southern: Curilla racemi-

LEBBEK-TREE: Albizzia Lebbek.

· LECHENAULTIA: see Leschenaultia.

LECYTHIDACEÆ. LECYTHIS FAMILY. Trop. trees or shrubs in both hemispheres, of 18 genera with large alternate simple lvs., regular bisexual polypetalous fls. of striking appearance, having 4-6 sepals and petals, numerous stamens and often a large disk, inferior 2- or more-celled ovary: fr. various, often a large woody caps. or body opening by a lid and known as "monkey pot." Known to hort. chiefly in the Brazil-nut, Bertholletia, and in Barringtonia and Cour-The fruits of oupita. Allied to Myrtaceæ. Lecythis Ollaria and L. Zabucajo, known as Paradise and Monkey-Pot nuts, are sold in N. Amer. as novelties after having their fatty meat injected with a perfume such as the attar of

LÈDUM. Ericacex. Several evergreen low shrubs with alternate entire lvs., small white fls. in terminal clusters in spring, and capsular frs.; petals separate; native in cold parts of the northern hemisphere in sphagnum bogs and damp places, suitable for evergreen borders.

They succeed in sandy peaty moist soil. Propagated by seeds in spring, by layers and division. Plants may also be transplanted from the wild.

columbianum. To 3 ft.: lvs. oblong, to 234 in. long, whitish and glandular beneath, slightly revolute. Wash.,

decúmbens: $L.\ palustre\ var.$

glandulòsum. To 6 ft.: lvs. ovate to oblong, to 2 in. long, glaucous and glandular-lepidote beneath. Alta. to Calif.

greenlandicum (L. latifolium). Labrador-Tea. To 3 ft.: s. oblong, to 2 in. long, rusty-tomentose beneath. N. Amer. Var. compactum is a dwarf form. N. Amer.

latifòlium: L. grænlandıcum.

palústre. CRYSTAL-TEA. WILD ROSEMARY. To 3 ft.: pailisuc. Orintal-1EA. WILD HOSEMARY. To 3 ft.: lvs. linear or linear-oblong, to 1½ in. long, rusty-tomentose beneath. N. Eu., N. Asia. Var. decúmbens (*L. decumbens*) is a decumbent form with small linear lvs. N. Amer., N. Asia.

LEÈA. Vitacex. Shrubs or small trees, not climbing, native in trop. Asia and Afr., with alternate pinnate lvs., fls. in cymes, and fr. a berry; grown as foliage plants in the greenhouse. They succeed in light loam or peaty soil. Propagated by cuttings. Although allied to grapes (Vitis) these plants bear little superficial resemblance to them.

amábilis. Lvs. of 5-7 lanceolate toothed lfts., bronzy-green with white veins and broad white stripe. Borneo. Var. spléndens, st. red, lvs. variegated with bright red.

sambucina. Lvs. 2-3-pinnate, lfts. toothed, tinged with bronze and with rosy veins. Trop. Asia and Australia.

LEECHEE: Litchi chinensis.

LEEK (Allium Porrum). Onion-like plant, very hardy, grown in the vegetable-garden for eating. The leek is used in cookery, the soft bulb and leaves being employed. It is milder than the onion, and the flavor is distinct. The plant is not known truly wild, and is supposed

to be a development from another species of Europe and western Asia. For relationships, see Allium and Onion.

Leek is a long-season plant. Seeds sown in spring give edible plants for late autumn, winter and spring. Usually the rows or drills are hilled up somewhat to blanch the lower part of the plant. Leeks may stand 4-6 inches apart in the row; for the best results, they should be transplanted to this distance from a seed-bed. Plants may be lifted before hard weather and stored in the cellar like celery, and in many parts of the country they are left in the ground all winter.

LEGUME. Technically, the fruit or pod characteristic of the Leguminosæ, well represented in the garden pea. It is a simple pistil, dehiscent or splitting on both edges or sutures. Many of the pods in the Leguminosæ do not conform in all things to the ideal or pattern structure; some of them are indehiscent. As a general agricultural term, a legume is a plant of the Leguminosæ, as clover, vetch, beans, peas, locust. In French horticultural writing it is a garden vegetable or pot-herb.

LEGUMINÒSÆ. PEA or Pulse Family. A very large family, of about 500 widely distributed genera and several thousand species, furnishing many economic, food and forage plants and numerous ornamental subjects; the family characters are varied but all genera produce a leguminous fr. or true pod; the most familiar section of the family in northern regions is that with papilionaceous or butterfly-like (pea-like) fls. and stamens 10 of which 9 are more or less united into a tube: this section is sometimes separated as Fabaceæ, other sections of the general family being segregated as Casalpiniaceæ and Mimosaceæ.

Genera entered here are Abrus, Acacia, Adenanthera, Adenocarpus, Agati, Albizzia, Alysicarpus, Amherstia, Amicia, Amorpha, Amphicarpa, Andira, Anthyllis, Apios, Arachis, Astragalus, Baphia, Baptisia, Barklya, Bauhinia, Bolusanthus, Bossiæa, Brachysema, Brownea, Butea, Cæsalpinia, Caillica, Cajanus, Calliandra, Calophaca, Calpurnia, Calycotome, Camoensia, Campylotropis, Canavalia, Caragana, Carmichælia, Cassia, Castanospermum, Centrosema, Ceratonia, Cercidium, Cercis, Chorizema, Cicer, Cladrastis, Clianthus, Clitoria, Colutea, Colvillea, Coronilla, Crotalaria, Cytisus, Dalbergia, Dalea, Daubentonia, Daviesia, Delonix, Derris, Desmanthus, Desmodium, Detarium, Dillwynia, Dioclea, Dolichos, Dorycnium, Ebenopsis, Ebenus, Enterolobium, Erinacea, Érythrina, Eutaxia, Flemingia, Galega, Genista, Gleditsia, Gliricidia, Glycine, Glycyrrhiza, Gompholobium, Goodia, Gourliea, Gymnocladus, Hæmatoxylon, Halimodendron, Hardenbergia, Hedysarum, Hip-pocrepis, Hovea, Hymenæa, Indigofera, Inga, Kennedia, Krameria, Laburnocytisus, Laburnum, Lathyrus, Lens, Lespedeza, Leucæna, Lonchocarpus, Lotus, Lupinus, Lysiloma, Maackia, Medicago, Melilotus, Millettia, Mimosa, Medicago, Melilotus, Millettia, Mimosa, Mucuna, Myrospermum, Myroxylon, Neptunia, Mucuna, Myrospermum,
Notospartium, Olneya, Onobrychis, Onoms,
Ormosia, Ornithopus, Oxylobium, Oxytropis,
Pachyrhizus, Parkinsonia, Parochetus, PeltophPetalostemon, Petteria, Phaseolus,
Pintadenia, Piptanthorum, Petalostemon, Petteria, Phaseolus, Phyllocarpus, Pickeringia, Piptadenia, Piptanth-Platymiscium, Pisum Pithecellobium, Podalyria, Poinciana, Pongamia, Prosopis, Psophocarpus, Psoralea, Pueraria, Pultenæa, Rhynchosia, Robinia, Sabinea, Samanea, Saraca, Schizolobium, Schotia, Schrankia, Scorpiurus, Securigera, Sesbania, Sophora, Spartium, Stizolobium, Strombocarpa, Strophostyles, Sutherlandia, Swainsona, Tamarindus, Templetonia, Tephrosia, Thermopsis, Tipuana, Trifolium, Trigonella, Ulex, Vicia, Vigna, Virgilia, Wisteria.

LEIOPHÝLLUM (Dendrium). SAND-MYRTLE. Ericacex. N. American low compact evergreen shrubs with small entire lys., small white or pink fls. in terminal corymbs in spring, and capsular

Suitable for borders and rock-gardens where they should be given a peaty or sandy loam soil. Propagated by seeds in a coldframe and by layers,

buxifòlium. Box S. To 2 ft., much branched: lvs. mostly alternate, ½ in. long: pedicels glabrous. N. J. to Fla. in sandy soil; hardy N. Var. prostràtum is L. Lyonii.

Hûgeri. To 3 ft., much branched: lvs. alternate, ½ in. long: pedicels pubescent. N. C., S. C.

Lyonii (L. buxiolium var. prostratum). Allegheny S. Prostrate, densely branched: lvs. mostly opposite, 1/4 in. long: pedicels pubescent. Mts., N. C. and Tenn.

LEITNÈRIA. Leitneriaceæ. One interesting deciduous shrub or tree to 20 ft., sometimes planted. L. floridàna. Corkwood. Lvs. ellipticlanceolate or lanceolate, to 6 in. long, silkypubescent beneath: staminate catkins to $1\frac{1}{2}$ in. long. Mo. to Tex. and Fla.

LEITNERIACEÆ. CORKWOOD FAMILY. Only one monotypic genus, Leitneria, comprises this family: lvs. alternate, entire: fis. dieccious, in axillary catkins before the lvs., without perianth; stamens 8-12; ovary of 1 cell containing 1 ovule: fr. a drupe. The systematic position of the family is near the willows and poplars.

LEMAIREOCÈREUS. Cactaceæ. Large and tree-like or shrub-like mostly columnar and branching cacti of the Cereus group, rarely low or nearly prostrate, spines commonly many and stout: fls. mostly diurnal, of medium size, bellshaped or somewhat funnelform and not widely expanded, white to pink: fr. at first covered with spines: Ariz. and Cuba to Venezuela and Peru. Many of the species are planted in the tropics for the edible fr., but are little known in the U. S. outside collections of institutions and fanciers. See Cacti.

bavdsus: L. Hollianus.

Benéckei (Cereus Benéckei). Cylindrical, erect, to 10 ft. tall and 4 m diam., usually unbranched; ribs 5-9, notched, obtuse; spines red becoming gray, radials 4-6, to 1½ in. long, pointing downwards, central 1: fts. white within, to 1½ in. long. Cent. Mex.—Usually grafted on Harrisia Jusbertii.

Cartwrightianus (Cereus Cartwrightianus). To 15 ft., with woody trunk, branches to 2 ft. long and 6 in. diam.; ribs 7–8; spines about 20 and $\frac{1}{2}$ in. long, to 5 in long on old trunks: fis. white, reddish outside, to 3 in. long. Ecuador.

Chénde (Cereus Chende and del Moralii). To 20 ft., with short trunk and much branched above; ribs 7-9; radial spines usually 5 and brown or yellow: fls. rose, 1½ in. long. Mex.

Chichipe (L. mixtecensis. Cereus Chicipe). To 15 ft., tree-like with trunk 3 ft. diam.; ribs 9-12; radial spines 6-7 and to 4 in. long; central 1; fls. yellowish-green, small.

deficiens (Cereus deficiens). Tree-like with trunk and many glaucous branches; ribs 7-8; spines about 8 and ½ in. long, grayish tipped black, appressed: fls. 2 in. long. Vene-

dél Moralii: L. Chende.

demixta: listed name.

Dumortièri (Cereus Dumortiers). Mostly tree-like, to about 50 ft., but trunk not much exceeding 3 ft. and 1 ft. diam., branches erect and with many constrictions, bluish;

ribs usually 6; radial spines 10-20; centrals 1 or more: fis. 2 in. long, white. Cent. Mex.

ebúrneus: L. ariseus.

Eruca: Machærocereus Eruca.

gládiger: a form not known botanically.

griseus (Cereus churneus and griseus). To 20 or 25 ft., sometimes branching from base and sometimes with trunk 1 ft. dam.; ribs 8-10; spines needle-like: fls. nearly 3 in. long, pinkish. Trinidad and other isls., Venezuela.

gummòsus: Machærocereus gummosus.

Hollianus (Cereus Hollianus and bavosus). To 15 ft., simple or branching only at base; ribs 8-12; radial spines about 12; centrals 3-5, to 4 in. long and deflexed: fls. white, 4 in. long. Mex.

Hystrix (Cereus Hystrix). To 30 ft., with short trunk and branches 4 in. diam.; ribs 9-10; radial spines about 10; centrals 3 and to 1½ in. long: fls. white, to 3½ in. long. W. Indies.

lætus (Cereus lætus). To 20 ft., much branched; ribs -8; spines to 1 in. or rarely 3 in. long; fls. white, 3 in. long. Peru. Ecuador.

marginatus (Cereus gemmatus and marginatus. Pachycereus marginatus). Onean-Pipe Cactus. Sts. branching from base, erect, to 25 ft. tall and 6 in. diam.; ribs 5-6, wide and high; spines stout, subulate, radials 7, to $\frac{1}{28}$ in. long or less, centrals 1-2, to $\frac{5}{28}$ in. long: fls. greenish-white within and reddish outside, campanulate, to 2 in. long. Mex.

mixtecénsis: L. Chichipe.

montanus. Tree-like, to 25 ft. tall, trunk to 5 ft. long without ribs, ultimate branches nearly erect; sts. with about 8 ribs; spines stiff, radials 2-5, central 1, to 1½ in. long; fls. greenish-white within and reddish outside, to 3 in. long. Mex.

Pitahàva: see Cereus variabilis.

pruinosus (Cereus pruinosus). Tall with a trunk, glaucous when young; ribs 5-6; radial spines 5-7; central 1 and 1 in. long: fls. 3½ in. long. Mex. Var. monstrosus is listed.

queretaroénsis (Cereus queretaroensis). To 15 ft., with short trunk and many branches; ribs 6-8, areoles brownwoolly; spines 6-10 and to 2 in. long: fts. 3 in. long. Mex.

stellatus (Cereus stellatus). To 6 or 10 ft., branching mostly at base, bluish-green; ribs 8-12; radials 10-12; centrals several and mostly longer: fls. about 1½ in. long, narrowly bell-shaped, red. S. Mex.

Tetétzo: probably Pachycereus Tetetzo.

Thárberi (Cereus Thurbert). Commonly branching from base, branches often many and to 20 ft. or more and 8 in. damn; ribs 12-17, areoles becoming waxy; spines many and needle-like to awl-like; fls. to 3 in. long, diurnal, light purple with white margins. S. Arız., Mex.

Trelèasei (Cereus and Cephalocereus Treleasei). To 20 ft., simple or slightly branched; ribs about 20; spines short and yellowish: fls. pinkish, 2 in. long. Mex.

Wéberi (Cereus Weberi, C. candelabrum). To 30 ft. or more and often with hundreds of erect branches; ribs mostly 10; radials usually 6-12; central long and solitary: fls. to 4 in. long, white. Mex.

LÉMNA. Duckweed. Lemnaceæ. Minute floating per. or over-wintering herbs with a diskshaped green leaf-like thallus that bears 1 rootlet and minute monœcious fls. consisting of only a stamen or a pistil; grown in ponds as a food for fishes. Plants fall to the bottom of the pond in autumn but rise again in the spring.

minor. Thallus to 1/4 in. long, ovate or orbicular. Cosmopolitan.—Sometimes grown on the surface of aquaria and pools, and more than one species or genus may be involved in such collections, as Spirodela in which the roots are several.

LEMNACEÆ. DUCKWEED FAMILY. Represented in hort. only by the genus Lemna.

LEMON: Citrus Limonia: see Citrus Fruits (page 184).
-Verbena: Lippua citriodora. -Vine: Pereskia aculeata.
Water-: Passifiora laurifolia.

LENOPH YLLUM. Crassulaceæ. Succulent per. herbs of S. N. Amer., with opposite fleshy Ivs. and yellow fls., drying reddish, in terminal racemes or spikes, or solitary.

elongatum: Villadia elongata.

texanum. Branching near base, to 8 in. high: lvs. very fleshy, obovate to ovate-lanceolate: fis. about 1/4 in. across, subsessile, in a spike-like raceme. Tex.

LÉNS. Leguminosæ. Herbs with pinnate lvs., the terminal lft. modified into a tendril or short bristle, small whitish papilionaceous fls. solitary or few together in the axils, and flattened pods.

One species is widely cultivated abroad as a cheap and nutritious source of food and the vines are sometimes utilized as forage. Propagated by seeds sown in drills in early spring.

esculénta. Lentil. Ann. to 134 ft.: lvs. with small lts. and ending in a tendril: pods broad, to 34 in. long. S. Eu.

LENTIBULARIÀCEÆ. BLADDERWORT FAMILY. Aquatic or marsh herbs of wide distribution, of 5 genera or as recently subdivided of about 16 genera: lvs. very diverse: fls. bisexual and irregular, with 2-5-lobed calyx, gamopetalous 2-lipped corolla often spurred, 2 stamens, superior 1-celled ovary: fr. a dehiscent caps. A few genera are grown in moist places and watergardens, as Pinguicula and Utricularia.

LENTIL: Lens esculenta.

LEONOTIS. LIONS-EAR. Labiatæ. Ann. and per. herbs or shrubs of Afr., with white, yellow or orange 2-lipped fls. in dense axillary whorls; grown outdoors in S. Fla. and Calif. and in the greenhouse for winter bloom.

In the North cuttings should be made in early spring, the young plants grown in the open during the summer but frequently pinched to secure a symmetrical growth. If the plants do not bloom before frost, they may be cut back when they are lifted, placed in a cool greenhouse and will flower in November or December. They may also be grown from seed.

dùbia. Per. to 3 ft.: lvs. cordate-ovate, to 2½ in. long, toothed, pubescent beneath: fis. orange-yellow, 1½ in. long

dysophýlla. To 2 ft., shrubby: lvs. ovate-lanceolate, to 3 in. long, toothed, densely yellow-harry: fis. orange-yellow, to 1½ in. long.

laxifòlia. Per.: lvs. broad-ovate, to 4 in. long, toothed, slightly pubescent: fis. orange-yellow, 1½ in. long, the whorls loosely fid.

Leonùrus. Per. to 6 ft.: lvs. lanceolate, 2 in. long, toothed, pubescent: fls. showy, red-yellow or orange-red, in one form white, to 2 in. long, densely hairy.

LEÓNTODON. Compositæ. A rather small genus of per. rosette-forming herbs of Eu. and N. W. Asia, closely allied to Taraxacum from which it differs in the pappus being feathery and not simple. One species, L. autumnälis, may be cult. although, like its relative the common dandelion, it may become noxious in the garden, and it is nat. in this country. To 2 ft.: lvs. all in basal rosettes, narrowly oblong, pinnatifid, to 8 in. long, lobes few and narrow, glabrous or nearly so: heads yellow, scapes naked or with 1-2 lvs. at base, often forked into 2 single-headed branches.—For other names listed here see Taraxacum.

LEONTOPÒDIUM. Compositæ. Several low herbaceous tufted and woolly perennials with entire basal or alternate lvs. and small discoid heads crowded into terminal dense cymes, the subtending bracts often conspicuous and corollalike; pappus of bristles; native in the mts. of Eu., Asia and S. Amer.

One species, the edelweiss, is grown in the rock-garden or sometimes indoors in pots. It requires deep gritty or sandy loam as the roots travel far. Propagated by division of the old plants, wintering them in a coldframe. When seeds are sown about the first of February, by late spring the plants are large enough to be set in their permanent quarters.

alpinum (L. himalayanum. Gnaphalium Leontopodium).
EDELWEISS. To 1 ft., white-woolly, creeping by rootstocks:
lvs. oblong-lanceolate: heads surpassed by very woolly
narrow floral lvs. or bracts. High mts., Pyrenees, Alps,
Cent. Asia.

Amrheinii: hybrid.

himalayanum: L. alpinum.

japônicum. Erect to 1 ft. or more, sts. not stoloniferous, simple or somewhat branched toward apex: lvs. elliptic, to % in. wide at middle, acuminate: heads subtended by elliptic leafy bracts much longer than heads are wide. Japan

lindávicum. Hybrid between L. alpinum and L. japonicum, with longer flowering season.

præcox: listed name.

sibfricum. Differs from L. alpinum in the oblong-linear often webby lvs. and heads nearly twice as large. Russia. transylvánicum: hybrid.

LEONÙRUS. MOTHERWORT. Labiatæ. Herbs native in Eu. and Asia, usually more or less weedy, with opposite toothed or divided lvs. and small white or pink fls. in dense axillary whorls; sometimes grown in the flower-border. Easily raised from seeds.

Cardiaca. Per. to 5 ft.; lower lvs. to 4 in. across, palmately 3-5-parted, upper oblong-lanceolate, divided or toothed: fs $\frac{1}{2}$ in. long, white-woolly outside. Eu., Asia.; nat. in N. Amer.

glaucéscens. Similar to L Cardiaca but glaucous and with more deeply cut narrower floral lvs. Siberia.

sibfricus. Ann or bien to 6 ft.: lvs. to 4 in. long, deeply 3-parted into ovate or lanceolate toothed segms.: fis. red or purple, to ½ in. long, pubescent outside. E. Asia; nat, in N. Amer.

LEOPARD-PLANT: Ligularia Kaempferi var. aureomaculata.

LEOPARDS-BANE: Doronicum, Senecio Doronicum.

LÉPACHYS (Ratibida). Coneflower. Compositæ. N. American mostly per. herbs with alternate pinnately divided lvs. and solitary heads of yellow, brownish or purplish ray-fls. and brown globose or cylindric disks; pappus of teeth or none. Grown in the flower-garden or sometimes as ann. bedding plants. Propagated by seed.

columnaris: L. columnifera.

columnifera (L. and Rudbeckia columnaris). To 2½ ft., rough-hairy: If.-segms. linear: rays yellow, 1 in. or more long, disk columnar. Minn. to Mex. Var. pulchérrima (Obeliscaria pulcherrima), rays partly or wholly brownpurple.—There is a double-fid. form, making an attractive oblong or nearly globular head.

pinnata. To 5 ft, rough-hairy: If.-segms. lanceolate: rays yellow, to 3 m. long, disk oblong. Ont. to Fla. and La.

LEPADENIA: Euphorbia marginata.

LEPARGYREA: Shepherdia.

LEPÍDIUM. PEPPER-GRASS. Cruciferæ. Ann., bien., per. herbs of widespread distribution largely in temp. regions, some of them subshrubby, many of them weedy, one (L. sativum) long known as a piquant salad plant: erect more or less branching, glabrous or pubescent: lvs. various, mostly long rather than broad and dentate to pinnatifid: fls. very small, white or greenish, in terminal racemes: fr. a short broad pod or silicle.

alyssoides. Per. to 20 in.: lower lvs. pinnatifid, segms. linear, glabrous, upper ones entire, linear: fls. whitish. Utah to Tex. and Ariz.

sativum. Garden Cress. Glabrous ann., more or less glaucous, to 2 ft.: basal lvs. pinnatifid and toothed, on st. becoming linear and entire. W. Asia; somewhat escaped in N. Amer.—Some cult. forms have curled and crispate lvs. Sometimes called "Upland Cress" in distinction from water-cress, but that name belongs rather with Barbarea.

LEPÍSMIUM. Cactaceæ. One species, L. crucifórme (Rhipsalis cavernosa), occurring on the rocks along the east coast of Brazil; sts. usually much branched, flat or angled, linear-lanceolate, characterized in part by the presence of a long tuft of white hairs from each areole,

and by the white to pinkish short-tubular fls., the latter usually in clusters of 2-5 and about 1/2 in. long. See Rhipsalis for L. commune.

LEPTÁLOE. Liliaceæ. S. African herbs allied to Aloe, differing in lvs. long, linear and arching, margins minutely spinose-dentate, and smaller fls. in short condensed corymbiform racemes, consisting of 6 free white or rose segms. forming a false tube whose mouth is more or less bilabiate. Cult. as for Aloe except they may require more moisture.

atrovirens. Garden hybrid of which the pollen parent is Aloe structula: to 6 ft. or more high, with yellowish-green fls. tipped dull red.

LEPTANDRA: Veronicastrum virginicum.

LEPTARRHÈNA. Saxifragaceæ. One per. herb native in wet places, Kamtschatka, Alaska to Wash.; sometimes included in Saxifraga. L. pyrolifòlia (L. amplexifolia). Sts. leafy: lvs. alternate, leathery, oblong, to 4 in. long, toothed: fls. white, small, in cymes on scape-like sts. to $1\frac{1}{2}$ ft. high.

LEPTASEA: Saxifraga.

LEPTINELLA: Cotula. L. squarrosa is a listed name.

LEPTOCÈREUS. Cactacex. W. Indian cacti of varied habit, having prominent ribbed joints, slender spines, and small campanulate fls. with short tube. See Cacti.

Leônii (Cereus Leonii). Much branched shrub- or tree-like plant to 18 ft. high, the main st. to 1½ in. diam.; ribs 6-8, crenate, with arcoles to ½ in. apart; spines 6-12, to 3½ in. long, yellowish to gray: fls. pink, to 1½ in. long. Cuba.

quadricostatus (Cereus quadricostatus). To 12 ft., with many lateral branches; ribs usually 4, low; spines to 1½ in. long: fls. greenish- or yellowish-white, 1½ in. long. Puerto Rico.

Weingartianus (Cercus Weingartianus). Branches creeping or climbing to 30 ft.; ribs 4-7, areoles ½ in. apart; radial spines 10-12, ½ in. long: fls. 1½ in. long. Hispaniola.

LEPTOCHLOA. Graminex. Grasses, ann. or per., with flat lvs. and spikelets in slender racemes forming a long panicle; native in warm and temp. parts of the world; one sometimes raised for ornament. See Grasses.

fascicularis (Diplachne fascicularis). Spike-Grass. Tufted ann. to 2½ ft.: lvs. to 8 in. long and ½ in. wide, rough: panicles to 1 ft. long, branches erect or ascending. Fla. to Tex. and Mo., W. Indies, Mex., S. Amer.

LEPTODACTYLON: Gilia.

LEPTODÉRMIS. Rubiacex. Deciduous shrubs from Asia, with opposite entire lvs., tubular 5-lobed fls. in axillary head-like clusters, and capsular frs.; one species is fairly hardy in the N. Propagated by cuttings of green wood in summer and by seeds.

oblonga. To 4 ft.: lvs. oval to oblong, to ¾ in. long fls. violet-purple, ¼ in. long. July-Oct. China.

LEPTOGLOTTIS: Schrankia.

LEPTÓPTERIS. Osmundacex. Ferns with dark green very thin fronds clustered at top of stout rhizome, 2-3-pinnate into small linear segms.; sori on under surface of frond; native Australia, New Zeal. and Pacific Isls., and sometimes planted in warm countries.

hymenophylloides ($Todea\ hymenophylloides$). Fronds to $2\frac{1}{2}$ ft. long and 1 ft. broad, on stipes to 1 ft. long. New Zeal.

supérba (Todea superba). Fronds to 4 ft. long and 10 in. broad, on stipes to 4 in. long, the lower pinnæ gradually reduced in size. New Zeal.

LEPTOPYRUM. Ranunculaceæ. Ann. herb native in Cent. Asia and sometimes planted in the garden for its fine foliage and fls. L. fumarioides (Isopyrum fumarioides). Erect or much spreading, to 6 or 8 in, high, smooth: lvs. whorled on st., also radical, decompound: fls. white, with 4-5 petal-like sepals and many nectaries, about 1/8 in. across.

LEPTOSIPHON: Gilia.

LEPTOSPÉRMUM (Fabricia). Murtacex. Attractive shrubs or small trees native in Australia. New Zeal, and Malaya, having alternate simple lvs., white or pink or red fls. solitary or 2-3 together, and fr. a leathery caps.

Leptospermums are planted out-of-doors in the South, Leptospermums are planted out-of-doors in the South, particularly in California, and sometimes in the greenhouse. L. lævigatum is extensively employed for the reclamation of moving sands. In the greenhouse plants should be kept cool till February or March and then given a temperature of 55-60°. Propagated by seeds in spring, cuttings under glass in May, or mature cuttings in autumn. They make excellent shrubbery in regions where hardy.

Chápmannii: L. scoparium var.

ericoides. To 60 ft.: lvs. to ½ in. long, acute: fis. to ¼ in. across, borne profusely. New Zeal.

flavéscens. Tall shrub: lvs. usually ½ in. or less long, obtuse: fls. white, about ½ in. across. Australia.

flexudsum: Agonis flexuosa.

grandiflorum: L. scoparium var.

lævigàtum. Australian Tea-Tree. To 30 ft.: lvs. to 1 in. long and ½ in. broad, obtuse: fls. white, to ¾ in. across. Australia. Vars. compactum and variegàtum are heted.

lanigerum: L. pubescens.

Níchollsii: L. scoparium var.

pubéscens (L. lanigerum). Tall shrub or tree, often woolly or sitky: lvs. usually ½ in. and less long, obtuse: fis. white, to ¾ in. across. Australia.

Reèvesii: listed name.

Reevesii: listed name.

scoparium. To 18 ft. or sometimes 25 ft., or in dwarf forms only a ft. or two, young parts silky: lvs. ½ in. or less long, acute: fis. white, to ½ in. across, among the foliage. Anstralia, New Zeal. Very variable. Var. bullatum has larger lvs. and fis. Var. Chápmannii has bright rose fis, and brownish lvs. Var. grandifòrum (L. grandifòrum) has large pink or nearly white fis. Var. Juniperinum has narrow lvs and drooping branchlets. Var. Nichollsii has bronzy lvs. and carmine fis. (name first published Nichollii but subsequently corrected). Var. ròseum has rose-pink fis. Var. ritrum has dark red fis. Var. rubrum has dark red fls.

spinéscens. Stiff shrub with spiny branchlets: lvs. to 1/2 in. long, obtuse: fls. solitary. W. Australia.

LEPTOSÝNE. Compositæ. Ann. and per. glabrous herbs or subshrubs, some of them very fleshy, with mostly alternate lvs. divided into narrow segms., and bright yellow long-stalked heads of ray- and disk-fis.; native to S. W. U. S. Although still kept distinct by horticulturists, largely because of the succulent nature of some of the kinds, Leptosyne is by botanists included in Coreopsis, where the consultant may look for the names. The succulent feature does not hold uniformly and the technical characters do not really separate the group from Coreopsis.

LEPTOTÆNIA. Umbelliferæ. W. American per. herbs with fusiform roots, compound lvs. and small yellow or purple fls. in compound umbels: allied to Ferula and Peucedanum, differing in the fr. not winged. Propagated by seed or division and adapted to rockery or hardy border.

purpureum. To 14 in.: lvs. pinnatisect, the segms. linear to filiform, glabrous: fls. purple, in 8-20-rayed umbels to 6 in. across: fr. to 1 in. long and 1/2 in. wide. Columbia River region of Ore. and Wash.

LÉPTOTES. Orchidacex. A genus of small epiphytic orchids native of Brazil, with short monophyllous sts., thick lvs., and 1- to few-fld.

terminal infl. with sepals and petals similar and lip 3-lobed. For cult. see Orchids.

bfcolor (Tetramicra bicolor). Lvs. to 4 in. long, recurved, channelled: peduncle short, 1-3-fld.; sepals and petals white; lip with side lobes white or green and mid-lobe purple with white tip. Mar.-May, Nov.

LESCHENAULTIA (or Lechenaultia). Goodeniaceæ. Australian heath-like herbs or shrubs with linear entire lvs. and yellow, red or violet fls. solitary or in corymbs; may be grown outof-doors in Calif.

biloba. Shrub to 3 ft.: lvs. to ½ in. long: fls. blue, to 1 in. long, the lobes spreading and dark blue veined wings.

floribunda. Shrub to 3 ft.: lvs. to 1/4 in. long: fls. white or blue, rarely violet or yellow, to 3/4 in. long, the lobes spreading and wings not veined.

linarioides. Prostrate shrub to 4 ft., sts. usually incurved at ends: lvs. slender, to % in. long, acute: fls. greenish-yellow and reddish, to 2 in. across, terminating short twigs or sessile in upper axiis and forming a terminal leafy corymb: caps. curved, to 1½ in. long.

Leguminosæ. LESPEDÈZA. Bush Clover. Many herbs or subshrubs with trifoliolate lvs., papilionaceous fls. or sometimes the fertile fls. without petals, and flat pods consisting of only 1 fertile joint; native in N. Amer.. Asia and

The ornamental species are hardy North and thrive in any upland soil. Propagated by division or *L. formosa* by greenwood cuttings under glass. *L. struata* is grown as a by greenwood cuttings under glass. L. striata is grown as a hay and green-manure crop in the South. Seed of it should be sown early in spring.

albiflora: L. Thunbergis var.

bicolor (Desmodrum bicolor). Shrub to 10 ft.: lfts. oval: fls. purple, the calyx-lobes blunt, in racemes. July-Oct. Japan. Var. álba, fls. white.

Buérgeri. Similar to L. Thunbergii but with elliptic-ovate more pubescent lits, and purple to white fls. in shorter racemes. July-Sept. Japan. Var. præcox is L. Maximowiczii.

capitata. Per. to 51/2 ft., silvery-pubescent: lfts. oblong: fls. yellowish-white with purple spot on standard, in dense heads. Ont. to Fla. and La.

chinénsis: Campylotropis macrocarpa.

ciliàta: Campylotropis macrocarpa.

cuneata (L. sericea). Subshrub to 3 ft.: Ifts. linear-oblong to linear, obtuse, to ¾ in. long, pubescent beneath: fls. white, to ¼ in. long, in dense axillary clusters to 1 in. long: pod rarely to ¾ in. long. China and Japan.—Cult. as forage plant.

Dàvidii. Shrub to 7 ft., stout, sts. villous: lfts. obovate to elliptic, to 3 in. long, obtuse, entire, villous beneath: fls. reddish-purple, in axillary racemes: calyx and pod villous. China.

formòsa: L. Thunbergii.

japónica (Desmodium japonicum). Similar to L. Thunbergii but fls. pure white. Japan.

macrocárpa: Campylotropis macrocarpa.

Maximowiczii (L. Buergeri var. præcox). Shrub to 12 ft.: lfts. elliptic-ovate, to 2 in. long, silky-pubescent beneath: fls. purple, in racemes to 3 in. long. Korea.

penduliflòra: L. Thunbergri.

rèpens. Creeping Bush C. Trailing per. with sts. to 2 ft. long: Ifts. oval to obovate, to ¾ in. long: fis. violet-purple, to ¼ in long, few in loose open infl., Aug.-Sept.: pod orbiculate, to ¼ in. long, finely pubescent. Conn. to Minn. south to Fla. and Tex.

ròsea: listed name.

sericea: L. cuneata.

Sièboldii: L. Thunbergii.

stipulàcea: L. striata.

striàta (L. stipulacea). Japan Clover. Ann. to 1½ ft.: lfts. small and numerous: fis. pink or purple, small, axillary. China, Japan; nat. in N. Amer.

Thúnbergii (L. formosa. L. pendulistora. L. Sieboldii. Desmodium pendulistorum). Per. herb or subshrub to 10 fts. Ifts. elliptic: fts. rose-purple, the calyx-lobes long-pointed, in long drooping racemes. Sept.-Oct. Japan. Var. albiflora has smaller lfts. and smaller white fts. with violet reakings. violet markings.

violacea. Per. to 3 ft.: lfts. oval ar oblong: fls. violet-purple, small, in few-fld. clusters. N. H. to Fla. and Mex.

LESQUERÉLLA. Cruciferæ. Small ann. and per. grayish herbs, mostly in W. N. Amer., with the look of Alyssum: lvs. simple, in per. species usually in rosettes as well as on the st.: fls. small but often showy because of numbers, commonly vellow: fr. a short more or less inflated pod.

argentea. SILVERY BLADDER-Pop. Bien. or per. to 11/4 argenices. SILVERY BLADDER-1'OD. Bien. or per. to 1½ ft., stellate-pubescent, not much branched: lvs. linear to oblanceolate, to 3 in. long, usually entire: fls. yellow, to ½ in. across: pods globose to ovoid, to nearly ¼ in. long. Minn. to Wyo. and Ariz.

condensata. To 2 in. tall, many-stemmed: lvs. spatulate, to ¾ in. long: fls. on erect pedicels: pods ovoid, somewhat compressed. Mont. to Wyo.

Engelmannii. Per., cespitose, to 1½ ft.: lower lvs. oblanceolate, upper ones narrow: fis. yellow, in corymbose clusters. Tex., New Mex., Colo.

globòsa. Ann. to 1½ ft.: lvs. obovate to linear, to 1½ in. ng, entire or wavy-toothed: fls. yellow, ½ in. long: pods globose. Ky. to Kans.

spatulata. To 4 in.: basal lvs. oblance olate-spatulate, st.-lvs. linear, to 1 in. long, few: fis. yellow with spatulate petals, on curved pedicels. Neb. to Mont. and Man.

stenophylla. Per. to 8 in.: lvs. oblanceolate or linear: fis. in short racemes: pods globose. Colo. to Tex. and N. Mex.

LESSÍNGIA. Compositæ. W. American ann. herbs with small yellow, purple or white heads composed of both ray- and disk-fls., the former often inconspicuous and marginal disk-fls. much enlarged: fr. an achene with scabrous bristly pappus. Propagated by seed.

lept6clada. To 2 ft., tomentose, branched above, branchlets very slender: lvs. ovate to lanceolate, acute to mucronate, lowest ones usually dentate: heads purple to white, in paniculate infl. Open mountainous slopes, Calif.

LETTSOMIA. Convolvulacex. A good number of climbing shrubs of trop. E. Asia and trop. Afr., allied to Argyreia, one of which has been intro. in S. Fla. L. capitata (L. strigosa) is a tall hairy twiner: lvs. nearly orbicular, cordate, 5 in. long: fls. purple, 2 in. long. India.

LETTUCE (Lactuca sativa and vars.). Leading salad vegetable, grown for its developed thin radical leaves and in one odd race for the thick edible stem. See Lactuca.

Lettuce is a hardy annual of simple culture, but the best results are obtainable only with well-selected strains and on suitable open moisture-holding soil. The plant must grow rapidly and continuously to produce a good crop of terder leaves, but heading is usually better if the growth rate is not too rapid. In the highly developed varieties the leaves form a dense rosette or clump, known as the head or cabbage lettuces in contradistinction to the leaf or loose lettuces in which the basal leaves are hardly consolidated into a ball or head; sometimes the leaf lettuces are crisped and curled. The Cos lettuces, known in Romaine salad, are summer varieties with leaves aggregated into an erect oblong head or column, the leaves being mostly long-oblong rather than the usual broad type. A kind little known in this country and which would hardly pass as a lettuce is the so-called Asparagus lettuce, grown for its long thick main stem before the plant goes to seed; the leaves are long and narrow and tapering to the point; it may be grown to some extent in this country by the Chinese and perhaps by Europeans.

Large areas are now devoted to lettuce for the general market, under intensive methods both as to growing and handling. Muck lands are well adapted to the crop. This large-area growing requires special experience, and is not

covered in the present entry.

Lettuce seed is commonly sown in a seed-bed, either under glass or in the open ground. From this bed the little plants are transferred to their permanent positions 6-12 inches apart in rows far enough asunder to allow of hand tillage; or they may be set closer and thinned as they grow. Lettuce plants that are crowded do not produce the firm rosettes of good substance that the best markets or the best tastes demand.

As lettuce soon runs to seed, particularly in warm weather, only a small space should be grown at each sowing for home use, and the sowings may be made every week or two until summer approaches; and some varieties do well in warm weather. The Cos lettuces are summer varieties but do not thrive in the hot suns and soils in most parts of North America. As a rule, 5 to 8 feet of row supplies sufficient lettuce to each person for each sowing. Head lettuces are more difficult to bring to perfection than the ordinary loose lettuces, unless one has soils and conditions specially adapted. Soils for lettuce should be fertile and well-drained, of the kind known as "quick." The crop is better if cut in the morning before the plants have become soft, and care should be taken not to expose it to the sun. Lettuce is soon ruined by careless cutting and handling.

Lettuce is usually followed by a succession-crop, as cabbages, celery, late beets, snap beans; and sometimes it is grown as a companion-crop along with early cabbages, cauliflowers or other longer-season plants. Good lettuce should be had for the table in six to eight weeks from the sowing, and the thinnings may be used still sooner.

Lettuce does well in hotbeds and in forcinghouses. The forcing of lettuce has come to be a special industry, for the understanding of which the reader should go to treatises written for the purpose.

LETTUCE, WATER-: Pistia Stratiotes.

LEUCADÉNDRON. Proteaceæ. Trees and shrubs of many species in S. Afr., with entire coriaceous lvs., staminate fls. in terminal sessile heads, pistillate in terminal cone-like heads and subtended by woody bracts, and fr. a nut; grown out-of-doors in Calif. and rarely under glass in the N. Propagated by seeds.

argénteum. Silver-Tree. Tree to 30 ft.: lvs. lanceolate, to 6 in. long, sessile, densely covered with silvery silky pubescence: staminate heads to 2½ in. across, the fruiting heads large and heavy.

plumösum. Shrub to 7 ft.: lvs. linear or linear-lanceolate, to 2½ in. long, pubescent: staminate heads ½ in. long, the pistillate to 1¾ in. long.

Stokæi. Lvs. oblong or oblong-lanceolate, to 3½ in. long, glabrous: stammate heads surrounded by brown bracts, 1 in. across.

venosum. Shrub to 4 ft.: lvs. oblanceolate, to 31/4 in. long, glabrous: staminate heads 1 in. across.

LEUCÈNA. Leguminosæ. Trees and shrubs with 2-pinnate lvs., white fls. in globose heads, and flattened broadly linear pods; one species grown in warm countries for ornament, the edible pods and seeds, and for timber. Native in warm parts of Amer. and Pacific Isls.

gladca. White Popinac. Tree to 30 ft. with acacia-like foliage: fl -heads 1 in. or more across: pods to 6 in. long. Tropics, but nat. in Fla. and elsewhere.

LEUCANTHEMUM: Chrysanthemum. LEUCERIA: Leucheria.

LEUCHÈRIA (Leuceria). Compositæ. Ann. and per. more or less white-woolly herbs of S.

Amer., one sometimes grown in the flower-garden: lvs. entire, lobed or dissected: heads small, with rays, paniculate or long-stalked: pappus mostly plumose, united at base. L. senecioides is a gray diffuse ann. to 1½ ft.: lvs. small and narrow, irregularly sinuate-pinnatifid with sharp points, sessile and clasping: heads many, ¼-½ in. across, rays white. Chile.

LEUCHTENBÉRGIA. Cactaceæ. One small simple or tufted cactus native in Mex. L. príncipis. To 8 in. high and $2\frac{1}{2}$ in. diam., with large tap-root; tubercles to 5 in. long and somewhat 3-angled and very woolly in axils, areoles on ends of tubercles; radial spines 8-14 and papery; central spines 1-2 and to 4 in. long: fls. near center of plant, yellow, fragrant, to 4 in. across.

LEUCOCASIA: Colocasia.

LEUCOCORYNE. Liliaceæ. Bulbous herbs native in Chile, with basal lvs. and fls. in bracted umbels terminating the scape; cult. as for Ixia.

ixioides (L. odorata). To 1 ft.: lvs. 1 ft. long: fls. white or pale blue, in 4-6-fld. umbels.

odorata: L. ixioides.

uniflòra: Brodiza uniflora.

LEUCOCRASPEDIUM: Frasera.

LEUCÓCRINUM. Liliacex. One rhizomatous herb native from Neb. to Calif. and Ore., without true st., grown for its spring bloom. L. montânum. Sand- or Star-Lily. Fls. pure white, fragrant, with a tube 1 to 4 in. long, borne near surface of ground in clusters.—Sometimes transferred to gardens.

LEUCÓGENES. Compositæ. About 3 species of New Zeal. per. herbs resembling Leontopodium, but differing in the fl.-heads.

grandiceps. To 8 in, sts. woody at base, branched, decumbent: lvs. in rosettes, oblong-spatulate, to 1/4 in. long, silvery-tomentose, obtuse, tips recurved: heads silvery-white, congested into dense glomerule which is subtended by broadly ovate bracts.

Leontopodium. Differs from above in lvs. linear-oblong, to 34 in. long, tips erect, and glomerule subtended by lanceolate bracts.

LEUCÒJUM. SNOWFLAKE. Amaryllidaceæ. Several small bulbous herbs with basal lys. and white fls. tinged with red or green, solitary or in umbels at top of hollow scape, the perianth-segms. distinct. Hardy and should remain undisturbed for a number of years. Plant 3 in. deep in well-drained soil.

estivum. To 1 ft.: lvs. to 1½ ft. long and ½ in. wide: fis. white tipped with green, ¾ in. long, on long drooping pedicels, 2-8 together, in late spring. Cent. and S. Eu.

autumnale. To 9 in.: lvs. thread-like, after fls.: fls. white tinged with red, ½ in. long, on long drooping pedicels, 1-3 together, in autumn. Medit. region.

vérnum. To 1 ft.: lvs. to 9 in. long and ½ in. wide: fls. white tipped with green, ¾ in. long, on short somewhat drooping pedicels, solitary, in early spring. Cent. Eu. Var. carpáthicum, fls. tipped with yellow. Var. Vágneri, fls. in 2's, early.

LEUCOPHÝLLUM. Scrophulariaceæ. Shrubs native in Tex. and Mex., with alternate entire silvery-tomentose lvs., solitary axillary fis. with tube and 5-lobed limb, and capsular frs.; one is grown as a low ornamental hedge plant in its native region and sometimes as a lawn plant.

texanum. To 8 ft.: lvs. obovate, to 1 in. long: fis. bell-shaped, violet-purple, 1 in. across. Var. glaucum is listed.

LEUCOPHYTA: Calocephalus Brownii.

LEUCOPÒGON. Epacridacex. Shrubs or small trees, mostly Australian but some occurring from Malasia to New Zeal., nearly 150 species: lys. alternate, scattered or imbricate: fls. small. white to pink, usually in axillary or terminal spikes, corolla funnelform to campanulate: fr. a

Fråseri. Low spreading shrub to 6 in., branches decumbent, erect or ascending: lvs. obovate- to linear-oblong, to ½ in. long, closely imbricated and erect, pungently pointed, glossy above fis. pinkish, to ½ in. long, axillary solitary, fragrant: fr. yellowish-orange, to ½ in. long, broadly oblong, edible. Australia, Tasmania and New Zeal.

LEUCOSPÉRMUM. Proteacex. Erect procumbent S. African shrubs with crowded, entire, leathery, hairy lvs. and yellow or reddish fls. in solitary or clustered bracteate heads; ns. In solitary of clustered blacteau heats, perianth tubular, with 2-4 lobes, stamens 4, inserted at base of limb, ovary sessile, 1-ovuled: fr. a whitish nutlet. A few species may be grown in the warmer parts of Calif.

incisum. Lvs. oblong, to 2½ in. long, deeply 6-7-toothed toward apex, densely crowded and concealing the st.: fis. in heads, sessile, 2½ in. long and nearly as wide.

refléxum. Lvs. oblong, to $1\frac{1}{2}$ in. long, 3-toothed or entire, crowded but st. partially exposed: heads on stout peduncle, $2\frac{1}{2}$ in. long.

LEUCÓTHOË. Ericacex.Interesting deciduous and evergreen shrubs of wide distribution in N. Amer., Asia, S. Amer., Madagascar, with alternate short-stalked finely toothed lvs., small fls. in terminal and axillary racemes or panicles in spring, and capsular frs.

The species require protection in the North. They thrive in a moist soil of peat and sand Propagated by seeds under glass in sphagnum and sand and seedlings set out-of-doers, by division, by cuttings and underground runners. Plants may be readily transplanted from the wild.

acuminata: L. populifolia.

axillaris. Closely resembling L. Catesbæi but with abruptly acuminate shorter stalked and more remotely serrulate lvs. Va. to Fla. and Miss.

Cátesbæi (Andromeda Catesbæi). DROOPING L. To 6 ft., evergreen: lvs. ovate-lanceolate to lanceolate, to 7 in. long,

evergreen: lvs. ovate-lanceolate to lanceolate, to 7 in. long, shning: fis. white, in racemes to 3 in. long. Apr.-May. Va to Ga. and Tenn.

Davisiæ. To 3½ ft., erect, evergreen: lvs. ovate to ovate-oblong, to 3 in. long, glossy dark green, glabrous, short-petioled, margins usually serrulate at least toward apex: fis. white, urn-shaped, nodding, to ½ in. long, short-pedicelled, in showy erect terminal panicles 2-4 in. long. Ore, to Calif.

Grapha. To 2 ft. paricular data.

Grayana. To 3 ft., partially evergreen; lvs. elliptic to obovate, to 3 in. long., chiate: fls whitish or pinkish, in racemes to 4 in. long. July-Sept. Japan.

Kelskei. Erect evergreen shrub to 3½ ft.: lvs. ovate to ovate-oblong, to 3 in. long, glabrous, somewhat crenate-serrate: fls white, small, in pendulous terminal axillary racemes to 1 1/2 in. long. Japan.

populifòlia (L. acuminata). To 12 ft., evergreen: lvs. necolate or oyate-lanceolate, to 4 in. long: fls. 1/2 in. long. lanceolate or ovate-lanceolate, to in few-fld. racemes. S. C. to Fla.

racemòsa (Eubotrys racemosa, Andromeda racemosa). Sweethells. Six-12 it., deciduous: lvs. oblong to ovate or elliptic, to 3 in. long, pubescent beneath at least on veins: fis. white or light pink, cylndric, to ½ in. long. Moist places and swamps, Mass. to Fla. and La.

recurva (Eubotrys recurva). RedTwig L. To 12 ft., deciduous: lvs. oval or elliptic, to 4 in. long: fls. white, in curved racemes to 4 in. long. Apr. June. Va. to Ga. and

LEÙZEA. Compositæ. Per. or bien. herbs with basal or alternate lvs. and purple heads of disk-fls.; pappus plumose; native in Eu., Afr., Australia. Sometimes grown for ornament.

conffera (Centaurea conifera). Per. to 1 ft.: lvs. lanceo-late, entire or pinnatifid, white-tomentose beneath: heads solitary, cone-like, to 2 in. long, with showy blunt splitting scales. S. Eu.

LEVÍSTICUM. Umbelliferæ. One per. herb grown for the aromatic frs. which are used in confectionery and also for its striking ornamental character. L. officinale (Hipposelinum Levisticum). Lovage. To 6 ft.: lvs. ternately compound, the segms. coarsely toothed above the middle: fls. greenish-yellow, in compound umbels subtended by narrow deflexed bracts. S. Eu.; nat. Va. to Pa.—Propagated by seeds and division of the root.

LEWISIA. Portulacaceæ. Fleshy per. herbs with thick starchy roots which are sometimes eaten, basal lvs. in rosettes, white, rose or red fls. borne on scapes, and capsular frs.; native in W. N.

Lewisias are planted in rock-gardens and succeed in a Lewisias are planted in rock-gardens and succeed in a deep loose gritty soil made up of about 1 part earth, 2 parts peat moss and 3 parts very coarse sand. The plants do best in situations which are moist during the spring when foliage and flowers are produced, and dry in the summer. Deciduous species (L. brachycalyx, nevadensis, oppositifolia, reduna) thrive in the sum. The flowers are produced early reduva) thrive in the sun. The flowers are produced early in spring. During the summer leaves mature and roots lie dormant. Evergreen species (L. columbiana, Cotyledon, Howellai, Tweedyn) have rosettes of fleshy persistent leaves and perhaps are more hardy. They require good drainage, and a collar of chipped stone to a depth of 1 inch about the crown is desirable. Plant in partial shade, except in damp regions where full sun is desirable. Best effects are obtained when several of a kind are planted in a group rather than singly. Propagated by seeds or division of roots in spring. Storage of seeds at low temperature for three to four weeks before sowing improves and hastens germination. germination.

bernardina is considered distinct from L. nevadensis in the trade because of its somewhat diminutive habit, but by most authorities is treated as synonymous with L. nevadensis.

brachýcalyx (Oreobroma brachycalyx). Lvs. deciduous, spatulate or oblanceolate, to 3 in. long, in rosettes, somewhat fleshy: fls. white, to 2 in. across, solitary on scapes to 2 in. high, usually 2 ovate bracts on scape next to calyx. Utah, N. Mex., Ariz., S. Calif.

columbiana. I.vs. linear-spatulate, to 2 in. long, persistent: fls. white or pink venned with red, 1% in long, in panicles on scapes to 1 ft. high. Mts., Ore., Wash Var. aurantiaca, listed as having pale orange fls. Var. insularis, said to be a dwarf form. Var. rosea, fls. rose. Var. stricta is listed.

Cotyledon. Lvs. spatulate, to 3 in. long, persistent: fls. white veined with pink, ½ in. long, in panicles on scapes to 10 in high. Calif. Var. shastaensis is listed as having narrower lys. in smaller rosettes, fls. very pale pink, striped with rose.

Eastwoodiana. Lvs. spatulate, to 3 in. long, bright green: fls. white with rose anthers, ¼ in. long, in many-fld. branching panicles on scapes to 8 in. high. Ore.—Plants develop a somewhat thickened aerial st. with age.

Einchii. Lvs. to 4 in. long and 1½ in. wide, persistent: fis. pink margined with white, in many-fid. cymes on scapes to 1 ft. high. Calif.

Héckneri (Oreobroma Heckneri). Lvs. spatulate, to 3 in. long, very fleshy and with fleshy teeth, keeled at base, purplish beneath, persistent: fls. rose-red, ¾ in. long, in panicles on scapes about 4 in. high. N. Calif. Var. élegans has larger lvs., fls. more abundant and larger. Var. minus is listed

Howellii. Lvs. oblong to ovate, persistent: fis. deep rose, Howellii. Lvs. oblong to ovate, persistent: 11s, deep rose, 1/2 in. long, in cymes on scapes to 6 in. high. Ore. Var. crenulāta is listed as having lf. margins strongly wavy. Var. Ingramii is listed. Var. longifòlia has narrower lvs. with fis. lemon-yellow to pale pink on longer scapes. Var. mariāna is listed as having dark green lvs. and yellow and white fis. tinged pink. Var. Millardii is said to have fis. of L. Finchii. Var. minus is listed.

Leana. I.vs. narrow-linear, to 2½ in. long, persistent: fls. red, ¼ in. long, in panicles on scapes to 9 in. high. Ore., Calif.

mariàna: L. Howellii var.

mínima. Lvs. to 2 in. long, narrow-linear: fls. white, on a 2-bracted scape usually not exceeding the foliage. Yellow-

nevadensis. To 4 in., the scape with pair of bracts near middle, from a fleshy tuber-like root: lvs. linear, to 2½ in. long, surpassing the scapes, deciduous: fls. white, solitary. Utah, Calif. to Wash.

oppositifòlia. Lvs. linear, to 3 in. long, deciduous: fis. white or pink, ½ in. long, in 2-4-fid. umbels on scapes to 8 in. high. Calif. Var. Richeyi is listed as being dwarf and more floriferous.

Púrdvi: listed name.

pygmæa. Lvs. linear, to 2 in. long: fls. white, ¼ in. long, on scapes to 2 in. high. Sierra Nevada and Rocky Mts.

rediviva. BITTER-ROOT. Lvs. fleshy, linear, 1 in. long, deciduous: fls. rose or white, to 1 in. long, on scapes to 2 in. high. B. C. to Rocky Mts.

ròsea: L. columbiana var.

rupicola: plants under this name may be L. columbiana

triphfila. To 4 in. high, from a globular corm, the scape partly underground: fis. white, in an umbel subtended by 2 or 3 narrowly linear lvs. Ida., Wash. to Calif.

Tweedyi. To 4 in. or more, from a very thick root: lvs. fleshy, obovate, to 4 in. long, persistent: fls. salmon-pink, nearly 2 in. across, 1-3 on scapes that more or less surpass the lvs. Wash.

Whiteæ. To 1 ft.: lvs. spatulate, to 3 in. long, deep green, glabrous: fls. salmon-rose with darker veins. Ore.

LEYCESTÈRIA. Caprifoliaceæ. Himalayan deciduous shrubs with opposite lvs., funnelform 5-lobed fls. in leafy-bracted spikes, and fr. a berry; one species grown out-of-doors in S. U. S. and in protected places N. Propagated by seeds and cuttings.

formosa. Himalaya-Honeysuckle. To 6 ft.: lvs. cordate-ovate to ovate-lanceolate, to 7 in. long: fls. purplish, \$\frac{3}{4}\$ in. long, the bracts purple, in drooping spikes to 4 in. long. Aug.—Sept.

LIÀTRIS (Lacinaria). BLAZING STAR. GAY-FEATHER. BUTTON SNAKEROOT. Compositæ. Per. herbs of strikingly strict habit, although sometimes sparingly branched, usually tuberous at base, with alternate narrow entire lvs. and rosepurple or white heads of disk-fls. borne in spikes or racemes, in late summer and in autumn; pappus of bristles; native in N. Amer. and often transplanted to the wild-garden and border. Propagated by seeds, division of the clumps, and some species by offsets.

acidòta. To 2 ft.: lvs. linear-filiform, punctate, glabrous: heads of 4-6 purple fls. in dense spikes to 6 in. long. Mo. to Kans. and Tex.

callflepis: plants bearing this name are referable to L. spicata or to L. scariosa.

Chápmanii. To 2 ft.: lvs. linear, to 4 in. long: heads ½ in. long, of about 3 purple fls., in dense spikes. Ga. south.

cylindracea. To 11% ft.: lvs. linear, to 8 in. long: heads to 1 in. long, of 15-60 purple fls., in loose spikes. Ont. to Mo.

dùbia: L. graminifolia var.

élegans (Eupatorium speciosum). To 4 ft.: lvs. linear, to 6 in. long: heads ½ in. long, of 4-5 white fis. and rosetipped petul-like inner bracts, in dense spikes to 1½ ft. long. Va. to Fla. and Tex.

fruticosa: Garberia fruticosa.

grácilis. To 3 ft., sts. pubescent: lvs. lanceolate, upper reduced to bracts: heads ¼ in. long, of 5-15 purple fls., in racemes. Ga., Fla., Ala.

graminifòlia. To 3 ft.: lvs. linear, to 1 ft. long: heads ½ in. long, of 5-15 purple fls., in long spikes, racemes or sonetimes panicles. N. J. to Fla. Var. dùbia has narrower involucral bracts.

grandifidra: hort. name, probably for improved form of L scarrosa.

Hélleri. To $1\,\%$ ft.: lvs. linear: heads of 8–12 purple fls. N. C., Va.

intermèdia: L. squarrosa var.

ligulístylis. To 1½ ft., sts. pubescent: lvs. linear-lanceolate, to 5 in. long: heads ¾ in. long. of 50-70 purple fls., the bracts rose-tipped, in corymb-like racemes. Man. to Colo.

macrostachya: L. spicata.

montàna: L. spicata var.

odoratissima: Trilisa odoratissima.

paniculata: Trilisa paniculata.

pauciflora. To 3 ft.: lvs. linear, to 4 in. long: heads ¾ in. long, of 3-5 purple fls., in one-sided racemes. S. C. to Fla. pectinata: hort. name for purple-fld. form to 1 ft. high.

pilòsa. To 3 ft.: lvs. linear, basal 1 ft. or more long: heads to ¾ in. long, of 5-15 purple fls., the bracts purple, in loose racemes. Va. to Ga. and Ala.

punctata. To 214 ft.: lvs. linear, to 6 in. long, very punctate: heads to 34 in. long, of 3-6 purple fis., in dense spikes. Minn. to New Mex.

pycnostachya. To 5 ft., hairy above: lvs. linear-lanceolate, lower to 1 ft. long: heads ½ in. long, of 3-6 purple fls., in dense spikes to 1½ ft. long. Minn. to La. and Tex. Var. magnifica is an improved form.

scarlòsa. To 6 ft., pubescent: lvs. oblong-lanceolate, lower to 1 ft. long; heads to 1 in. long, of 15-45 bluishpurple fls., bracts often purple-tipped, in interrupted racemes. Me. to Fla and Tex. Var. alba is listed. Vars. magnifica and supérba are improved forms. The form known as September Glory belongs here.

spicata (L. macrostachya). To 6 ft.: lvs. linear-lanceolate, lower to 1 ft. long: heads ½ in. long, of 5-13 blue-purple or white fis, in dense spikes to 15 in. long. Mass. to Fla. and La. Var. álba has white fis. Var. montâna, stout and dwarfer, lvs. broader, spike shorter; mts., Va. south. Var. pîmila js lsted.

squarròsa. To 2 ft., pubescent: lvs. linear, to 6 in. long: heads to 1½ in. long, of 15-60 purple fis., solitary or few, subtended by leaf-like bracts. Ont. to Fla. and Tex. Var. alba is listed. Var. intermèdia (L. intermèdia) has narrower heads and less spreading bracts.

tenuifòlia. To 4 ft.: lvs. thread-like, to 10 in. long: heads ½ in. long, of about 5 purple fis., in racemes 1 ft. or more long. N. C. to Fla.

Wèaveri: listed as a large-fid. hybrid.

LIBÉRTIA. Iridaceæ. Per. herbs with fibrous roots, native in Australia, New Zeal. and S. Amer.: lvs. mostly crowded at base of st., linear: fls. clustered in axils of sheathing bracts, without tube, the inner segms. longer. Grown out-of-doors in S. U. S. Propagated by division and seeds.

formòsa. To 3 ft.: lvs. to 1½ ft. long, stiff: fls. white, to ¾ in. long, the outer segms. greenish-brown, the pedicels shorter than bracts. Chile.

grandiflora. To 3 ft.: lvs. to 2½ ft. long, stiff: fls. white, 1 in. or more across, the outer segms. greenish outside, the pedicels longer than bracts. New Zeal.

ixioides. To 2 ft.: lvs. to 1 ft. or more long, with pale midrib; fls. white, to 1 in across, the outer segms. greenish outside, pedicels longer than bracts. New Zeal.

pulchélla. To 10 in. or more: lvs. grass-like, to 6 in. long, tufted: fis. small, in clusters of 3-8, on pedicels to 1 in. long, segms. white, to 1/4 in. long. S. Australia, Tasmania, New Zeal., Gumea.

LIBIDIA: Cæsalpinia coriaria.

LIBOCÉDRUS. INCENSE-CEDAR. Cupressaceæ. Several species of evergreen trees, allied to Thuja, with frond-like branchlets, scale-like lvs. and oblong cones of usually 4 woody scales; of wide distribution and only L. decurrens adapted to the climate of the northeastern states. For cult. see Conifers.

Bidwillii. To 50 ft.: lvs. all alıke: cones to $\frac{1}{2}$ in. long. New Zeal.

chilénsis. To 60 ft.: lateral lvs. larger than facial, with silvery line beneath: cones ½ in. long. Chile.

cupressoides: L. uvifera.

decurrens. To 100 ft. or more; lateral lvs. larger than facial: cones to 1 in. long. Ore, to Lower Calif.; hardy in S. New England in sheltered positions near coast. Var. compacta, dwarf and compact.

Doniàna: L. plumosa.

macrólepis. To 100 ft.: lvs. all alike: cones ¾ in. long, of 6 scales. China, Formosa.

plumosa (L. Doniana). To 100 ft.: lateral lvs. larger than facial, with white band below: cones ½ in. long. New Zeal.

uvifera (L. cupressordes). To 100 ft.: lvs. all alike: cones ovate. Chile to Patagonia.

LIBONIA: Jacobinia pauciflora.

LICORICE: Glycyrrhiza.

LICUALA. Palmaceæ. Mostly small hermaphrodite fan-palms with solitary or clustered somewhat ringed sts., more than 70 species in trop. Asia, Pacific Isls. to Australia: lvs. more or less orbicular in outline, stiffish and plicate,

petiole commonly spiny, blade deeply parted or undivided, edges dentate or erose: spadices among the lvs., simple or branched, often greatly elongated and with many side branches; stamens stigmatic point and I seed. Good tub palms in the juvenile state, but probably do not thrive planted in the open in the continental U.S. See Palm.

grands (Pritchardia grandis). St. solitary, to about 6 ft., when young leaf-bearing nearly half its length: If-blade nearly orbicular or broader (to 3 ft.) than long, platted, lobed only an in. or so along the continuous margin and each lobe 2-toothed, petiole long and slender and spiny. New Britain Isl.—A good greenhouse and tub palm.

hórrida: L. spinosa.

Jeanénceyi. Hort. name for a palm said to come from New Guinea: dwarf, uniform in shape: lvs. deep shining green; segms. 5-8, blunt.

pettata. Sts. usually several, to 15 ft.: lvs. orbicular, 3-5 ft. across, appearing as if peltate; segms. 20-30, extending nearly or quite to center, many-toothed at apex and teeth blifd; peticle long, armed with dark colored thick-based long stout spines: branches of spadix (as also outside of fls.) brown-tomentose; fls. ½ in. or more long, very conspicuous; filaments not united above throat of corolla; fr. ½ in. long, ellipsoid. India.

spinosa (L. horrida). Sts. several, tufted, to 10 ft., the plant making a mass of foliage from top to bottom: If.-blade nearly orbicular to somewhat reniform, 3-4 ft. across, parted to the center into about 18 lobes which are variously toothed at the apex and which become declined or hanging; tootned at the apex and which become declined or hanging; petiole very long and with rather small separated spines: spadix branches more or less scurfy-pubescent; fis. about ½ in. long; filaments united above throat of corolla: fr. obovoid, about ½ in. long. Malaya.—Sometimes grown as L. peltata.

LIFE-PLANT: Kalanchoë (Bryophyllum) pinnata.

LIGNUM-VITÆ: Guaiacum.

LIGULÀRIA. Compositæ. Showy herbaceous perennials with broad alternate or basal lvs. and large reflexed or nodding heads in racemes or corymbs, of long yellow ray-fls.; differs from Senecio chiefly in the bracts of the involucre which are of two forms; native in Eu. and Asia, a few grown in the open or indoors. Of easy cult. and usually propagated by cuttings or division.

clivorum (Senecio clivorum). To 4 ft.: basal lvs. reniform or nearly orbicular, sometimes 20 in. across, sharply toothed: fl.-sts_branched; heads to 4 in. across, rays orange-yellow, disk dark brown. Japan, China

Dòria: Senecio Doria.

Dorônicum: Senecio Doronicum.

Farfùgium: L. Kaempferi.

japónica (Senecio japonicus. Erythrochæte palmatifida). To 5 ft. or more: lvs. 1 ft. or more across, deeply palmately cut into 7-11 narrow-lobed divisions: fl.-sts. branched; heads 3 m. across, orange. Japan.

Kaémpferi (L. Farfugium Farfugium and Senecio Kaempferi). To 2 ft., rhizomatous: lvs. to 10 in. across, cordate-orbicular, wavy-toothed: fl.-sts. branched; heads to 2 in. across, light yellow. Japan. Var. aûreo-maculâta (Farfugium grande. F. maculatum). LEOPARD-PLANT. Lvs. blotched with yellow, white or sometimes light rose. Var. argéntea. Lvs. glaucous-green marked with creamy-white.

macrophfila (Senecio Ledebouri). To 6 ft.: lvs. to 2 ft. long, elliptic or oval-oblong, toothed: heads yellow, in long dense terminal spikes. Caucasus.

pülcher: Senecio pulcher.

sibírica (Senecio sibiricus). To 4 ft.: lvs. reniform or triangular, to 1 ft. across, coarsely toothed: heads in terminal racemes, the yellow rays to ¾ in. long. Eu., Asia.

stenocéphala (Senecio stenocephalus). Lvs. reniform, to 16 in. across, deeply cordate, coarsely toothed: heads in racemes 1 ft. or more long, yellow. China.

tyrolénsis: listed name.

Veitchiana (Senecio Veitchianus). To 6 ft., unbranched: lvs. to 16 in. long, sharply toothed: heads very numerous, 2½ in. across, yellow. China.

Wilsoniana (Senecio Wilsonianus). GIANT GROUNDSEL. To 5 ft.: lvs. reniform-cordate, to 20 in. long, sharply toothed: heads in elongated columnar spikes, 1 in. across, yellow. China.

Umbelliferæ. LIGUSTICUM. Per. herbs with ternately compound lys., white fls. in large compound umbels, and scarcely flattened frs.; native in the northern hemisphere; sometimes planted for ornament in borders.

latifolium; Anisotome latifolia.

pyrenæum. To 4 ft.: lvs. 3-4-pinnate into linear segms.

LIGUSTRUM. PRIVET. Oleacex. Ornamental and popular shrubs or rarely trees, deciduous or evergreen, native in Asia, Australia and Medit. region, having opposite entire often thick lys. mostly oblong or ovate, small white funnelform bisexual fls. in terminal panicles, and fr. a black berry-like drupe with 1-4 seeds.

Privets are commonly planted for hedges and in shrub-beries for ornament, and sometimes as single specimens. They are not particular as to soil. Propagated by cuttings of young or mature wood under glass, by division, by seeds, and varieties by grafting on L. vulgare or L. ownfolum. Many of them are very hardy and durable, and well adapted to mass plantings.

acuminatum (L. ciliatum of some authors). To 6 ft., deciduous: lvs. to 3 in. long, pubescent on midrib beneath: fls. with corolla-tube much longer than lobes, in panicles 2 in. long, anthers exserted. June. Japan. Var. macrocarpum has larger lys, and fr.

amurénse. To 15 ft., deciduous or half-evergreen: lvs. to 234 in. long, pubescent on midrib beneath: fis. with corolla-tube much longer than lobes, in panicles 2 in. long. June-July. China. Var. péndulum is listed.

atróvirens: L. vulgare var.

buxifdlium: L. vulgare var.

californicum: L. ovalifolium.

ciliàtum: L. acuminatum, L. Ibota.

cordifórmis: probably a form of L. lucidum.

coriàceum: L. japonicum var. rotundifolium.

Delavayanum (L. Prattii). To 6 ft., evergreen: lvs. to 1 in. long, shining above, glabrous: fls. with corolla-tube twice longer than lobes, in panicles to 2 in. long. June. China; not hardy N.

excélsum supérbum: probably L. lucidum var.

grácile. To 10 ft., deciduous, the branches gracefully spreading: lvs. 1½ in. long, glabrous: fis with corolla-tube about length of lobes, in panicles to 3 m. long and broad.

Hénryi. To 12 ft., evergreen: lvs. to 2 in. long, shining above, glabrous: fls. with corolla-tube twice longer than lobes, in panicles to 5 in. long. Aug. China; to be planted

Ibòlium. Hybrid between L. ovalifolium and L. obtusifolium; hardy N.

Tbôta (L. chatum of some). To 6 ft., deciduous: lvs. to 2 in. long, pubescent on midrib beneath: fis. with corollatube much longer than lobes, in head-like panicles ½ in. long. June. Japan.—Not ornamental. The plant heretofore known as L. Hota and in common cult. now becomes L. obtusifolium.

indicum (L. nepalense). Evergreen: lvs. to 5 in. long, pubescent beneath: fis. with corolla-tube about length of lobes, in broad panicles. July-Aug. Himalayas; adapted only to warm regions. Var. variegātum is listed.

ionándrum. To 10 ft., evergreen: lvs. ½-1 in. long: fls. with corolla-tube longer than lobes, in dense panicles to 1 in. long. China; adapted far S.

Iwata: probably a form of L. japonicum; listed as a low compact evergreen plant with small rounded lvs. mottled

yellow.

japónicum (L. Kellermannii). To 10 ft. or more, evergreen: lvs. to 3 or 4 in. long, glabrous, leathery, shortpointed or nearly obtuse: fts. with corolla-tube slightly longer than lobes, in panicles to 6 in. long, July-Sept. Japan, Korea; grown in southern states Var. rotundifolium (L. coriaceum). Lvs. nearly orbicular, to 2½ in. long, obtuse or emarginate at tip. Var. variegatum. Lvs. variegated and edged with white. For varieties listed as afreum see L. ordifolium, excéssum supérbum, see L. lucidum, macrocárpum see L. acuminatum.

Kéllermannii: L. japonicum.

lodense: hort. name for dwarf compact form of L. nulaare.

fàcidum (L. japonicum macrophyllum). Glossy P. To 30 ft., evergreen: Ivs. to 4 or 6 in. long, shining, glabrous, acuminate: fis. with corolla-tube as long as lobes, in panieles to 10 in. long. Aug.—Sept. China, Korea, Japan; stands

only far S. The following forms are listed in the trade as vars. of L. lucidum, but may be referable to L. japonicum: aŭreo-marginātum, lvs. yellow margined; ciliātum, small lvs.; compactum, dense growth with dark waxy green lvs.; excélsum supérbum, lvs. variegated creamy-white; grácile and nóbile are fastigiate forms; macroph'flum has larger lvs.; microph'flum is said to have smaller lvs.; nigrifòlium, lvs. very dark green; pyramidāle, of narrow conical habit; recuryifòlium, lf. margin recurved; repāndum, lvs. narrower and crisped; trícolor, lvs. variegated with yellow, pink when

Massalongianum (L. myrtifolium). To 3 ft., evergreen: lvs. linear-lanceolate, to 3 in. long, glabrous: fls. with corolla-tube much longer than lobes, in panicles to 3½ in. long. July-Aug. Himalayas; may be planted far S.

mědium. I. oralifolium

myrtifdlium: L. Massalongianum.

nanum compactum: hort, name.

nepalénse: L. indicum.

nóbile: possibly an upright form of L. lucidum.

obtusifolium. To 10 ft., deciduous: lvs. to 2½ in. long, pubescent beneath: fis with corolla-tube about 3 times length of lobes, in nodding panicles to 1½ in. long. July. Japan. This is the plant commonly known as L. Ibota. Var. Regelianum (L. Regelanum). Regels P. Low, branches spreading horizontally.

ovalifolium (L. californicum. L. medium). California P. To 15 ft., half-evergreen: lvs. to 2½ in. long, shining above, glabrous: fls. with corolla-tube much longer than lobes, in panicles to 4 in. long. July. Japan; not reliable in northern states. Forms are: álbo-marginatum, edged with creamy-white; aireo-marginatum (var. aureum), edged with yellow; compáctum, of denser growth; globòsum; nanum, dwarf; Regelianum is L. obtusfolium var.; variegatum, marbled with pale yellow.

pekinénse: see Syringa pekinensis.

péndulum: listed species name; presumably a pendulous form of L. vulgare, L. amurense, L. Outhoui or L. sinense.

Práttii: L. Delavayanum.

Quihòui. To 6 ft., deciduous: lvs. to 2 in. long, glabrous: fls. with corolla-tube as long as lobes, sessile, in panicles to 8 in. long, Aug.—Sept, stamens exserted. China; not hardy N. Var. péndulum has drooping branches.

Reèvesii: hort. name.

Regelianum: L. obtusifolium var.

repándum is probably a crinkled-lvd. form of L. japonicum or L. lucidum.

sinense. To 12 ft. or more, deciduous: lvs. to 3 in. long, pubescent on midrib beneath: fls. with corolla-tube shorter than lobes, in pubescent panieles to 4 in. long. July. China; not hardy N. Var. pendulum has drooping branches. Var. Stannoni. (L. Staunionu. L. chunense var. nanum). Lower

with broader panicles.
Stauntonii: L. sinense var.

strongylophyllum. Evergreen shrub or tree lvs. rounded to nearly ovate, to 1 in. long, smooth: fls nearly 1/4 in. long, in loose panicles to 4 in. long. Cent. China; not hardy N.

vulgare. Common P. or Prim. To 15 ft., deciduous: lvs. vulgare. COMMON P. or PRIM. To 15 ft., deciduous: lvs. to 2½ in. long, glabrous: fls. with corolla-tube about length of lobes, in dense panicles to 1½ in. long. June-July. Medit. region; nat. in E. U. S. Some of the hort. vars. are: argénteo-variegatum, lvs. variegated white; atrovirens, small-lvd.; atreum, lvs. yellow; atreo-variegatum, lvs. variegated yellow; buxifolium, shrub half-evergreen, lvs. to 1 in. long; foliolsum, an improved more vigorous type; glatcum (var. albo-variegatum), lvs. glaucous edged with white; leucocarpum, fr. white; pyramidale, habit pyramidal; xanthocarpum, fr. yellow. xanthocárpum, fr. yellow.

Wâlkeri. Shrub or small tree, twigs conspicuously white-speckled: lvs. ovate to lanceolate, to 3 in. long, apex and base acute, glabrous, entire: fis. in erect terminal panicles 4-6 in. long, the branches hairy: fr. purple, about 1/2 in. long. Ceylon; not hardy N.

LILAC: Syringa. Indian: Melia Azedarach. Summer: Buddleja Davidii.

LILIACEÆ. LILY FAMILY. More than 200 genera of monocotyledonous per. herbs, many of them having bulbs, corms or a crown of fleshy rootstocks, sometimes woody and tree-like, of wide distribution. The family is characterized by regular fls. with 6-parted or -lobed perianth or 6 separate segms., usually all the parts petallike, 6 or sometimes 3 stamens, commonly superior 3-celled ovary, and fr. a berry or dehiscent caps. Species probably upwards of 2,000, many of them (as the lilies) with very showy fls.,

and some (as the onions) with edible bulbs. Some of the plants known as lilies belong to other families, particularly the Amaryllidaceæ.

The Liliaceæ yields medicinal plants, edible parts, and a wide range of beautiful ornamental subjects. The genera known to hort. are:
Agapanthus, Albuca, Aletris, Allium, Aloe, Androstephium, Amianthium, Anemarrhena. Anthericum, Aphyllanthes, Apicra, Arthropodium, Asparagus, Asphodeline, Asphodelus, Aspidistra, Astelia, Beaucarnea, Bessera, Blandfordia, Bloomeria, Bottionea, Brevoortia, Brodiæa, Bulbine, Bulbinella, Bulbocodium, Calochortus, Camassia, Chamalirium, Chionodoxa, Chionographis, Chlorogalum, Chlorophytum, Clintonia, Colchicum, Convallaria, Cordyline, Danaë, Dasylirion, Dianella, Disporum, Dracæna, Drimia, Drymophila, Eremurus, Erythronium, Eucomis, Eustrephus, Fritillaria, Gagea, Galtonia, Gasteria, Gastrolea, Geitono-plesium, Gloriosa, Haworthia, Helonias, Helon-iopsis, Hemerocallis, Hesperaloe, Hesperocallis, Hesperuyucca, Hosta, Hyacinthus, Kniphofia, Lachenalia, Lapageria, Leptaloe, Leucocoryne, Leucocrinum, Lilium, Liriope, Littonia, Lloydia, Maianthemum, Medeola, Melanthium, Milla, Muilla, Muscari, Narthecium, Nolina, Notholirion, Nothoscordum, Ophiopogon, Ornithogalum, Paradisea, Paris, Pasithea, Philesia, Phormium, Pleea, Polygonatum, Puschkinia, Rein-Sandersonia, Sansevieria, Schizobasopsis, Scilla, Semele, Smilacina, Smilax, Stenanthium, Streptopus, Stypandra, Thysanotus, Tolfieldia, Tricyrtis, Trillium, Tulbaghia, Tulipa, Urginea, Uvularia, Veltheimia, Veratrum, Xanthorrhœa, Xerophyllum, Yucca, Zigadenus.

LÍLIUM. LILY. Liliaceæ. Well known per. leafy-stemmed erect herbs bearing terminal fis. or fl.-clusters, native in the northern hemisphere, having scaly bulbs, scattered or whorled usually narrow lvs. and fls. in a wide range of colors but never true blue, prevailingly white, orange or orange-red, the perianth-segms. distinct; often fragrant. Many of them are among the most stately of garden plants. They are late spring and summer subjects.

spring and summer subjects.

Lilies are usually of easy cultivation and hardy in the North, although sometimes needing winter protection and always profiting by it. In well-prepared ground and a suitable location, the plants may be allowed to stand year after year. Remove the seed-pods immediately after flowering, and allow the foliage to mature naturally. A light fertile sandy or loamy soil is suitable, with some leaf-mold added. As a rule, lilies do better in partial shade or not fully exposed to heat and winds. A handful of sand or gravel may be placed under each bulb and the top of the bulb should be at least 4 inches below the surface in those kinds that make roots above the bulb, or deeper with L. auratum and others with very large bulbs, but shallow planting is the rule with those that make roots only at bottom. Propagated by division of the offsets as soon as the tops die or early in autumn; also by bulb scales or by aerial bulblets, which will produce flowering plants in two or three years. Seeds yield variations.

They may be forced in the greenhouse. The bulbs should be potted and placed in a coldframe and covered with sphagnum, coal ashes or other porous material, until they are well rooted in the pots. They may then be taken to the greenhouse and kept in a temperature of about 50° for ten days, and then when growth begins raised to 60° night temperature. The plants should be in flower in about thirteen weeks.

The lilies are subject to serious diseases, for the nature

The lilies are subject to serious diseases, for the nature and treatment of which consult the most recent literature of the specialists in the subject. Perhaps the most serious is the lily mosaic, a virus disease transmitted from plant to plant by aphids. It infects all parts of the plant except the seed; thus, plants grown from seed are free from the disease until infected. Certain cultivated species are more resistant than others, as L. Martagon and its varieties, L. Hansonii,

L. pardalinum, L. Brownii, L. Henryi, L. Davidii, L. Willmottiæ, L. regale, L. pumilum, L. amabile, L. monadelphum. The most susceptible species include L. auratum, L. canadense, L. concolor, L. dauricum, L. formosanum, L. superbum, L. elegans and L. tugrinum.

Many lilies produce annual fibrous roots from the underground stem above the bulb in addition to those from the base of the bulb. Lilies developing these stem-roots usually bloom well the first summer after planting whereas those which are non-stem-rooting rarely flower until the second summer. Stem-rooting species include the following (names in parenthesis are invalid names placed here because of wide horticultural usage, see enumeration below for correct summer. Stem-rooting species include the following (insides in parenthesis are invalid names placed here because of wide horticultural usage, see enumeration below for correct name in each case): L. amabile, L. auratum, L. Bakeruanum, L. Bakeruanum, L. Batemanniæ, L. Brownin, L. toulbiferum, L. callosum, L. carnolicum, (L. carolinianum), L. concolor, (L. croceum), L. Dalhansonii, L. dauricum, L. distichum, L. Duchartrei, L. elegans, L. formosanium, L. Hansonii, L. Henryi, L. Humboldtii, L. leucanthum, L. medeoloides, L. Michauxii, L. myrophyllum, L. neigherrense, L. nepalense, L. cohraceum, L. philippinense, L. pumillum, L. regale, L. Sargentiæ, L. speciosum, L. superbum, (L. tenisfolium), L. tigrinum, (L. Wallacei), L. Wallichianium, L. Wardii, and L. Willmottiæ. Those producing few or no stem-roots include: (L. Bolanderi), L. callosum, L. canadense, L. candidum, L. chalcedonicum, L. columbianium, L. granteum, L. Grayi, L. Humbolitii, L. Kelloggii, L. maritimum, L. Martagon, L. monadelphum, L. pardalinum, L. pomponium, L. pyrenaicum, L. Roezlii, L. superbum, L. testaceum and L. Washingtonianum.

albánicum: a form of L. carniolicum.

álbum: probably a var. of L. auratum, L. Martagon or L. speciosum.

Alexándræ: L. nobilissimum.

amábile. To 3 ft., pubescent: fls. of the Martagon kind, racemose, red with dark spots, segms. to 2 in. long and strongly reflexed. Korea.

auràtum. Goldband L. To 6 ft.: fls. white spotted with crimson, each segm. with central yellow stripe, to 12 in. across, fragrant, horizontal or drooping. Japan. Var. Album, fls. unspotted. In var. pictum the tip of the band is crimson, and in rübrum the band is crimson and very broad. Var platyphyllum (macranthum) has broader lvs. and less spotted fls. Var. rübro-vittātum, fls. with numerous spots and wide crimson band through each segm.; by some said to be possible hybrid between L. auratum and L. spectosum. Var. virgināle, fls. with yellow spots. Var. Wittei has fls. spotted yellow.

Báckhousei: catalogue name for group of hybrids.

Bakerianum (L. Lowii). To 3 ft.: fls. greenish-yellow changing to creamy-white, spotted with red-brown inside, fragrant, to 2½ in. across. Burma, W. China.

Batemanniae: an improved form of L. dauricum var. nenustum

Bloomerianum: L. Humboldtii var.

Bolánderi: a confused name, incorrectly applied to three plants, two of which are L. Kelloggai and L. occudentale; the third, L. Howellii, is the plant usually in cult. as L. Bolanderi.

Brownii. To 4 ft.: fls. pure white inside and rose-purple outside, to 9 in. long, slightly fragrant, horizontal. China. A very fragrant form is var. Cólchesteri (var. odorum).

bulbiferum. To 4 ft: fls orange-red spotted with purplish-black with yellow center, to 4 in across. Eu.—The plant known as L. cròceum, Orange L., is a variant of this species, growing to 6 ft. tall and fls. spotted crimson.

califórnicum: L. pardalinum var.

callosum. To 2 ft.: fis. bright scarlet dotted with purpleblack, to 2 in. across. Japan.

camschatcense: see Fritillaria camschatcensis.

canadénse. Meadow L. To 5 ft.: fls. orange-yellow to red, spotted with purplish-brown, to 3 in. across, drooping. N. S. to Ga. and Ala. Var coccineum (var. rubrum) has orange-red fls. and var. flavum lemon-yellow fls.

cándidum. Madonna L. To 4 ft: fis. clear waxy-white, to 3 in. long, horizontal. S. Eu., S. W. Asia. Var. cérnuum (var. peregrinum), slender plant, sts. tinged purple, lvs. narrower, segms. narrower and longer. In var. maculâtum the fis. are streaked on the outside with purple. Var. salonikæ has narrower and wavy-margined basal lvs. with more widely spread perianth-segms, and shorter filaments, Turkey.

carniólicum. To 3 ft., with 1 to several nodding fragrant orange-red to scarlet fls. 2 in. or less diam., segms. wholly reflexed and usually dotted purplish-black. S. E. Eu.—A closely related form, albánicum (L. albanicum), differs in having yellow fls. Var. Jánkæ (L. Jankæ) has darker scarlet-red fls.

carolinianum becomes L. Michauxii, as the name was formerly used for the plant now known as L. Catesbei.

Cátesbæi. Southern Red L. To 2 ft.: fls. scarlet, yellow spotted purple at base, to 5 in. long, erect, the segms. with a claw. N. C. to Fla.

a claw. N. C. to Fig.

cathayanum. To 5 ft.: lvs. oblong-ovate, to 8 in. long
and 4 in. wide, base cordate, petiole 2-6 in. long: fis. creamywhite, anterior segms. splashed reddish-brown within, to
4½ in. long, infl. a 3-5-fid. corymbose raceme. E. and Cent.
China.—Does best in partial shade.

centifolium; L. leucanthum var. chloraster.

cérnuum. To 2 ft.: fls. lilac spotted with purple, to 1½ in. long, fragrant, nodding. Korea, Manchuria.

chalcedónicum. Scarlet Turks-Cap L. To 4 ft.: fls. vermilion-scarlet, rarely spotted, to 3 in. across, with rather disagreeable odor, hanging, the segms. strongly reflexed. Greece. Var. maculatum, fls. spotted with purple.

Chinodkii: hort. name for L. pardalinum var. giganteum. colchicum: L. Szovitsianum.

columbianum (L. parviflorum). To 4 ft.; fis. bright reddish-orange thickly spotted with purple, 2 in. long, drooping, the segms. reflexed. B. C. to Calif. Var. Ingramii has larger brighter more numerous fis.

concolor. Star I. To 4 ft.: fls. vermilion, unspotted, 1½ in. long, slightly fragrant, erect. China, Japan. Var. pulchéllum usually has spotted fls.

cordatum (L. cordifolium, L. Glehnii). To 4 ft.: fls. white striped purple inside, greenish outside, to 6 in. long, fragrant, erect. Japan.

cordifolium: a confused name, but most of the material so listed in the trade is referable to L. cordatum

coridion; one of the forms of L. concolor var. pulchellum. Creelmannii. Listed as hybrid of L. regale and L. Sargentiæ with habit and fl. characters intermediate be-

tween the two, and much later flowering. crdceum: a variant of L. bulbiferum.

dahùricum: L. dauricum.

Dalhánsonii. Dalhánsonii. A hybrid between L. Martagon var. Cattaniz and L. Hansonii: fis. of less intense coloration.

dalmáticum: L. Martagon var. Cattaniæ.

dauricum (L. umbellatum). Candlestick L. dauricum (L. umbellatum). Candlestick L. To 3 ft.: fls. orange-red spotted with purplish-black, to 5 in. across, erect. Siberia. In many forms. Var. venústum (L. venustum) has apricot-colored fls. without spots. Var. Wállacei (L. Wallacei) has brown spotted fls. Other hort, forms, some of which are listed under L. umbellatum, are eréctum, grandiflorum, incomparábile, multiflorum, rûbrum, spléndens. For additional vars. see L. elegans.

Dàvidii (L. Thayeræ). To 6 ft.: fls. cinnabar-red or scarlet spotted with black, to 3 in. long, nodding. China.

Davmottiæ. Hybrid between L. Davidii and L. Will-mottiæ: to 6 ft.: fls. cinnabar-red spotted black.

davùricum: L. dauricum.

Duchártrei (L. Farreri). To 4 ft.: fls. marble-white spotted with purple, fragrant, nodding, to 3 in. long. W. China.

China.

6tegans (L. Thunbergianum. L. dauricum subsp. Thunbergianum). To 2 ft.: fis. orange-red slightly spotted with black-purple, to 6 in. across, erect. Japan.—Experimental evidence has confirmed the belief that this plant is a hybrid between L. concolor and L. dauricum: it is not known wild. L. elegans differs from L. dauricum (the seed parent) in its shorter habit and less acuminate lvs. The Latin-named forms of this hybrid include: alutaceum, to 9 in. with apricot-colored fis spotted with purple; atrosanguíneum with dark crimson black-spotted fis; aurantiacum with unspotted salmon fis.; bícolor, yellow fis. tipped bright red and spotted with black-purple; biligulatum blooms earlier with deeper chestnut-red spotted fis.; fáigens with deep red spotted fis.; ffórsmannii, with rich crimson fis. incomparábile with bright crimson-searlet fis.; maculatum, orange fis. searlet toward edge; marmorátum, rich crimson fis. fisked and tipped orange-yellow, slightly spotted and earlier than type; sanguíneum, fis. blood-red slightly tinged orange and spotted purple-black.

Erābu: a form of L. longiforum var. insulare.

Erabu: a form of L. longiflorum var. insulare.

excélsum: see L. testaceum.

Fárreri: L. Duchartrei.

flavum: the material in the trade under this name is probably L. canadense var. flavum, but the name is also a synonym of L. pyrenaucum.

formosanum (L. philippinense var.). To 7 ft., differs from L. philippinense in wider lvs. with 2-4 lateral veins prominent on back: fls. to 4 in. long and 6 in. across, flaments papillose toward base. Formosa. Var. Pricei is of dwarfer habit with fewer fls. which are heavily suffused reddish-purple without, said to be hardier than type. Mt. Morrison, Formosa.

formdsum: L. longistorum var. insulare.

gigantèum. To 12 ft.: fis. white tinged with green out-

side, striped with red-purple inside, to 6 in. long, fragrant, slightly drooping. Himalayas. Var. himalaicum is listed. Var. yunnanense, smaller and with pure white fis.—Plants grown as *L. pyganteum* are often *L. longiforum* var.

Gléhnii: L. cordatum.

Gravi. To 4 ft.: fls. red tinged with yellow, thickly spotted with purplish-brown, to 2 in. long, horizontal or slightly drooping. Va. and N. C.

Hánsonii. To 5 ft.: fls. orange-yellow spotted with purplish-brown, 1½ in. long, fragrant, drooping. Japan.

Hárrisii: L. longiflorum var. eximium.

Hénryi. To 9 ft.: fls. orange spotted with brown, 3 in. across, drooping, the segms. recurved. China.

Horsfordii. Hybrid between L. Leichtlinii var. Maximowiczu and L. Batemannie.

Horsmannii: a form of L. elegans.

Howellii (L. Bolanderi of hort.). THIMBLE L. To 3 ft.: fls. reddish-purple spotted with dark purple, to 1% in. long, horizontal or somewhat drooping. Calif.

Húmboldtii. To 6 ft.: fls. reddish-orange spotted with purple-brown, 3½ in. long, drooping, the segms. strongly revolute. Calif. Var. Bloomerianum (L. Bloomerianum) has the claws of inner perianth-segms, somewhat crested and bulb scales several-jointed. Var. magnificum is a larger form. Var. occilatum has the purple spots of fl. encircled with red.

lánkæ L. carniolicum var

japônicum (L. japonicum var. roseum. L. Krameri). To 3 ft.: fls. rose or pale pink, to 6 in. long, fragrant, horizontal. Janan.

kamtschatcense: see Fritillaria camschatcensis.

Kélloggii. To 4 ft.: fls. pink spotted with purplish-black, 2 in. long, erect, the segms. strongly reflexed. Calif.

Krameri: L. japonicum.

lancifolium of hort, is L. speciosum.

lankongénse. To 4 ft.: fls. white tinged rose-purple, spotted with crimson, 2½ in. long, nodding, fragrant, segms. reflexed. China.

Leichtlinii. To 6 ft.: fls. lemon-yellow spotted with purplish-brown, 3 in. long, drooping, the segms. reflexed. Japan. Var. Maximowiczii (L. Maximowiczii) has salmonred spotted fls.

leucanthum. Chinese White L. To 6 ft.: fls. greenish-white outside, yellow inside tipped with pure white, to 6 in. long, fragrant, slightly drooping. China. Var. chloraster (L. centrolium) has a greenish central mark on the inside of fls. which are sometimes tinged with rose-purple on the outside.

on the outside.

longiflorum. White Trumpet L. To 3 ft.: fls. white, to 7 in. long, fragrant, trumpet-shaped, horizontal. Japan. Var. Alexandres is L. nobilissimum. Var. eximium (L. Hurrisu), Easter L. Bermuda L., is a taller larger-fld. form Var. giganteum of gardens has purple-brown sts. and fls often tinted in bud. Var. insulare (var formosum) is an improved popular strain, of which Erabu (L. Erabu) is a more floriferous form. Var. multiflorum resembles var. eximium—Other listed names applied to hort. forms used in forcing for the Easter trade include nobile, præcox and Vanchanii.

Lòwii: L. Bakerianum.

macrophyllum: Notholirion macrophyllum.

maculatum: material so-named in the trade is probably L. medeoloudes, but the name has been applied also to L. Hansonn and L. elegans.

magnificum: plants in trade under this name are probably variants of L. Humboldti, L. speciosum or L. longi-

marstimum. Coast L. To 4 ft.: fls. reddish-orange spotted with purple inside, 1½ in. long, horizontal, slightly recurved. Calif.

Mårtagon. Martagon or Turks-Cap L. To 6 ft.: fls. rose- or dark purple spotted with purplish-black, 2 in. long, drooping, the segms. strongly reflexed. Eu., W. Asia. Var. álbum has white fls. Var. Câttaniæ (var. dalmaticum, L. dalmaticum), fls very deep rich purple nearly black.

Maximowiczii: L. Leichtlinii yar.

medeoloides (L. maculatum). Wheel L. To 21/4 ft.: fls. apricot to scarlet spotted with black, 2 in. long, drooping, the segms strongly recurved. Japan, China.

Michauxii (L. carolinianum). To 4 ft.: fis. orange-scarlet spotted with purple-brown, to 4 in. long, slightly fragrant, drooping, the segms. strongly reflexed. Va. to Fla. and La.

michiganénse. The westward extension of the L. canadense type, Mich. to Minn and Mo., differing in its recurved segms. that are mostly red.

monadélphum. Caucasian L. To 6 ft.: fls. golden-yellow sometimes tinged or spotted with purple, to 5 in. across,

drooping, the segms. reflexed. Caucasus, Persia. Var. Szovitsianum is L. Szovitsianum.

myriophyllum. To 4 ft.: fts. greenish-white, yellowish within, often red on keel outside, 1 in. long, fragrant, nodding. China. Var. supfrbum (L. sulphureum) has sulfur-yellow fts. reddish outside.—The plants usually cult. as L. myriophyllum are L. regale.

neilgherrense. To 4 ft.: fls. white flushed with yellow, fragrant, horizontal, to 10 in. long. S. India.

nepalénse. To 3 ft.: fls. yellow or greenish-yellow, stained purplish inside, to 6 in. long, fragrant, segms. spreading. Himalayas.—Differs from L. ochraceum in segms. recurved less than half of total length.

nevadénse: L. pardalinum var.

nobile: a hort, form of L. longiflorum.

nobilissimum (L. Alexandræ. L. longiflorum var. Alexandræ). Differs from L. longiflorum in its broader fis., more slender style whose stigma is smaller, not lobed and purplish-brown in color, not greenish-white. Japan.

occidentale. Related to L. pardulnum but lower, 1½ ft. and upward: fls. nodding, orange or red within and mostly spotted, the narrow segms. 2 in. or less long and somewhat revolute to middle or somewhat below. Calif.,

To 6 ft.: fls. yellow or greenish-yellow ochráceum ocmaceum. 10 6 kt. ns. yellow or greensil-yellow spotted red inside, to 5 in long, fragrant, nodding. S. China, Burma.—Very similar to L. nepalense, from which it differs in perianth-segms. reflexed ½-¾ total length.

parda-boldtii: listed as a hybrid between L. pardalinum and L. Humboldti, with recurved orange fis. with darker purple dots and the habit of the latter parent.

pardalinum. Leopard L. To 8 ft.: lvs. to ¾ in. wide: fis. orange-red spotted with purple, yellow at base, 4 in. across, drooping, the segms. strongly reflexed. Ore. to Calif. Var. californicum has smaller lvs. and larger fis. Var. gigantèum, SUNSET L., probably a hybrid of L. pardalinum and L. Humbolditi, having fis yellow tipped bright red and spotted with brown. Var. Jóhnsonii, listed as having a large proportion of bright red in fis. Var. nevadénse is of smaller habit, with fewer fis, shorter anthers and broader lvs. Var. reallidtfüllum is reported having poler and heavier, foliage. palliditòlium is reported having paler and heavier foliage. Var. Roézlii is L. Roezlii.

Párryi. To 4 ft.: fls. pale lemon-yellow, spotted on inside, to 4 in. long, fragrant, horizontal. Calif. Var. Késsleri is said to have heavier foliage and to blossom two

parviflorum: L. columbianum.

párvum. Sierra L. To 5 ft.: fis. bright orange-scarlet, yellow at base, spotted with purplish-brown, 1½ in. long, erect or horizontal. Ore. to Calif. Var. lùteum has bright yellow spotted fls.

philadélphicum. Orangecup L. Wood L. To 3 ft.: fls. orange-red spotted with purple, to 4 in. across, erect, the segms. with long claws. Me. to N. C. and Mo. Var. andinum (L. umbellatum, not of hort.), Western Orangecup L., is smaller, fls. spotted at base of segms. only, and claw smaller. Ont. to Ohio west to B. C. and Ark.

phildauricum. A hybrid between L. philadelphicum and L. dauricum growing to 18 in.; fis. bright red with dark

philippinense. To 1½ ft.: fls. white tinged with green, to 10 in. long, fragrant, horizontal. Philippines. Var. formosanum is L. formosanum.

polyphfilum. To 4 ft.: fls. yellowish outside, white inside spotted with purple, to 3 in. across, fragrant, segms. united about half way in tube, then reflexed. Himalayas.

pomponium. Lesser Turks-Cap L. To 3 ft.: fts. brilliant scarlet spotted with dark purple, to 2 in. across, having disagreeable odor, drooping, the segms. strongly reflexed. S. France, N. Italy.

princeps. Hybrid between L. regale and L. Sargentiæ.

pimilum (L. tenuifolium). Coral L. To 3 ft.; ffs. bright scarlet, sometimes spotted, to 2 in. across, nodding, strongly reflexed. Siberia, China. Var. cérnuum is said to have pale pink ffs.—The name L. tenuifolium was first applied to this plant in 1812 without any description and before being validated by such publication, the name L. pumilum was legitimately published for the same plant.

pyrenlicum. Yellow Turks-Cap L. To 4 ft.: fis. lemonyellow spotted with purplish-black, 2 in. or more across, nodding. Pyrenees. Var. aireum has deeper yellow fis. Var. ribrum has fis. orange-scarlet with maroon spots.

regale (L. myriophyllum of hort). ROYAL L. To 5 ft.: fis. lilac or purple outside, white within but yellow at base, to 6 in. long, fragrant, horizontal. W. China.

Roézlii. Differs from L. pardalinum in its smaller habit, lvs. only to 1/4 in. wide, fls. typically clear yellow with dark spots and sometimes with clear red segm. tips, fls. usually fewer in infl. Calif.—By many authors not considered distinct from L. pardalinum.

rubéllum. To 2 ft.: fls. rose-pink, to 3 in. long, fragrant, horizontal, Japan.

rubéscens. Chaparral L. To 6 ft.: fis. pale lilac turning to rose-purple, to 2 in. long, erect. Ore, to Calif.

rûbrum: L. pomponium, but material so named in trade may be L. canadense var. coccureum or L. canadense var.

Sárgentiæ. To 6 ft.: fls. rose-purple outside, white within, to 6 in. long, fragrant, horizontal. W. China.

Scottise. Hybrid of L. Willmottise and L. elegans var. Mahogany, growing to 3 ft.: fts. deep orange-red shading to orange. sparsely spotted, July.

sinénse: L. tigrinum

sinense: L. tigrinum.

speciòsum (L. lancifolium, in part). Showy Japanese L.
To 4½ ft.: fls. white suffused with rose and spotted with
rose-red, 4 in. long, fragrant, drooping, the segms. reflexed.
Japan. Runs into numerous forms, as: álbum, fls. nearly
white; gloriosoides, with narrower lvs. and much twisted
crimson-spotted perianth-segms.: Kraétzeri, fls. white
tinged green on outside; magnificum, fls. large, suffused
with crimson and spotted with pink; Melpómene, fls. deeper
colored; ròseum, fls. rose; rabrum, fls. carmine-pink.

sulphureum: L. myriophyllum var. superbum.

sulphur-gale. Garden hybrid between L myriophyllum var. superbum and L. regale.

supérbum. American Turks-Cap L. To 8 ft.: fls. orange-scarlet spotted with purplish-brown, to 4 in across, drooping, the segms. strongly reflexed. N. B. to Ga. and Mo.

sutchuénse. A confused name: the original description was based on two plants, one of which has since been identified as L. Willmottee and the other as L. Dandii; material in the trade under this name may be either of these two or occasionally L. pumilum.

Szovitsianum (L. monadelphum var. L. colchicum). Differs from L. monadelphum in its broader less reflexed perianth-segms, which are lemon-yellow densely speckled purple, anthers reddish-brown not yellow and filaments free, not united at base. E. Caucasus Mts.

tenuifòlium: L. pumilum.

testaceum. Nankeen L. To 7 ft.: fls. apricot or nan-keen-yellow often flushed with pink, rarely spotted, to 3 in. across, fragrant, drooping, the segms. strongly reflexed.— This plant, unknown in the wild and erroneously credited to Japan, is now believed to be a hort. hybrid between L. candidum and L. chalcedonicum; it has been listed as I. erceleum

Thayeræ: L. Davidii.

Thomsonianum: Notholirion Thomsonianum.

Thunbergianum: L. elegans.

tigrinum (L. stegons.

tigrinum (L. stegons.). Toor L. To 6 ft.: fls. orange- or salmon-red spotted with purple-black, to 5 in. across, drooping, the segms. refexed. China, Japan; escaped in E. U. S. Var. flore-plèno has double fls. Var. Fortunei has a densely tomentose st. Var. gigantèum is said to be an improved form. Var. nànum is 15-18 in. tall. Var. simplex is listed, but may not be distinct. Var. spléndens has larger and nore abundent fle. and more abundant fls.

umbellatum: a confused name; the materials so listed in the trade represent forms of L. dauricum as well as hybrids of this latter species and of L. bulbiferum; the true L. umbellatum of W. U. S. is L. philadelphicum var. andinum.

Vaughanii: hort. name for form of L. longiflorum.

venústum: L. dauricum var.

Wállacei: L. dauricum var.

Wallichianum. To 7 ft.: fis. creamy-white tinged with green outside, to 10 in. long, fragrant, horizontal, the segms. with long claw. Himalayas.

Wårdii. To 5 ft., stoloniferous: fls. white spotted with pink, drooping, segms. reflexed. Tibet.

warleyénse: L. Willmottiæ.

Washingtonianum. To 6 ft.: fls. white often spotted with purple, to 4 in. long, fragrant, horizontal. Ore. and Calif. Var. minor is listed. Var. purpureum is smaller and the fls. change to lilac-purple.

Wilmottise (L. warleyense). To 5 ft.: fis. orange-red spotted with brown, to 3 in. across, drooping, the segms. strongly recurved. China. Var. unfolor is offered as a spotless form.

LILY: Lilium. Adobe-: Fritillaria pluriflora. African-: Apapanthus africanus. Amazon-: Eucharis grandiflora. Atamasco-: Zephyranthes Atamasco. Belladonna-: Amaryllis Belladonna. Blackberry-: Belamcanda chimensis. Bloode: Hæmanthus. Checkered-: Fritillaria meleagris. Chinese Sacred-: Narcissus Tazetta var. orientalis. Cow-: Nuphar. Day-: Hemerocallis. Desert-: Hesperocallis undulata. Fawn-: Erythronum californicum. Fire-: Pyrolirion. Ginger-: Hedychium. Glory-: Gloriosa. Guernsey-: Nerine sarniensis. Jacobean-: Sprekelia formosissima. Josephines.: Brunsvigia Josephiniæ. Kafir-: Clivia, Schizostylis. Mari-

posa: Calochortus. Mountain: see Ranunculus Lyallis, of-the-Nile: Agapanthus africanus. -of-the-Palace: Hippeastrum aulicum. -of-the-Valley: Convallaria. Plantain: Hosta. Pond-, Yellow: Nuphar. Prairie-: Cooperia. Rain-: Cooperia. St.-Bernard: Anthericum Litago. St.-Bruno-! Paradisea Liliastrum. St.-James: Sprekelia formosissima. Sand-: Leucocrinum montanum. Scarborough: Vallota speciosa. Sego-: Calochorius Nuttallii. Snake-: Brohæa volubius. Spear-: Doryanthes. Spider: Hymenocallis. Star-: Leucocrinum montanum. Toad-: Tricytis. Torch: Kniphofia. Triplet-: Brohæa laza. Trout-: Erythronium.-Tutf: Liriope, Ophiopogon. Water-: Nymph.ca, Victoria. Zephyra: Zephyranthes. Zephyr -: Zephyranthes.

LIMB: the expanded flat part of an organ; in particular, the expanding part of a gamopetalous corolla.

LIME: Citrus aurantifolia; see Citrus Fruits (page 184); also Tilia. -Berry: Triphasia trifolia. Finger-: Microcitrus australasica. Spanish-: Melicocca bijuga.

LIMEQUAT: see Citrus Fruits (page 184).

LIMNANTHACEÆ. LIMNANTHES FAMILY. Only 2 herbaceous genera native in N. Amer., having alternate dissected lvs., bisexual regular solitary fls. with 3-5 sepals and petals, twice as many stamens, superior ovary of mostly 5 carpels which separate into nutlets; allied to Geraniacem. Limnanthes only is cult.

LIMNANTHEMUM: Numphoides.

LIMNÁNTHES. Limnanthaceæ. Small ann. herbs with characters of the family, the parts of the fl. 4 or 5. Of easy cult, and propagated by seeds as a flower-garden subject.

Douglasii (Floerkea Douglasii). Meadow-Foam. To 1 ft.: lvs. finely 2-pinnatifid, yellowish-green: fls. white or pinkish and yellowish toward base, fragrant, sometimes white throughout, to 1 in. across. Calif. to Ore, in low ground, making great display in early spring.

LIMNIA: Montia.

LIMNOBOTRYS: Ribes lacustre.

LIMNÓCHARIS. Butomacex. Two trop American aquatic herbs with basal lvs. and yellow fls. having 3 persistent sepals and 3 fugacious petals.

The plants are grown in tubs or pots or in shallow water out-of-doors. Propagated by seeds or by offsets or suckers from the flower-stem. Usually reproduces itself naturally.

emarginata: L. flava.
flava (L. emarginata. L. Plumieri). Standing 2 ft. out
of water: lvs. lanceolate or broadly ovate, velvety-green:
fls. about 1 in. across, in 2-12-fld. umbels at tip of scape.
W. Indies to Brazil: tender N.

Humboldtii: Hydrocleys nymphoides.

Plumièri: L. flava.

LIMNORCHIS: Habenaria.

LIMODORUM TUBEROSUM: Calopogon pulchellus.

LIMONIUM (Statice of gardens). SEA-LAV-ENDER. Plumbaginaceæ. Many ann. and per. herbs: lvs. radical and tufted or alternate along st. in shrubby forms: fls. in many species in loose panicles, in others in branching spikes, white, yellow, rose, lavender, blue: widely distributed but mostly seacoast plants of the northern hemisphere.

The plants are grown in the border, rockery, greenhouse and for cut-flowers. The more dainty panicled kinds are as useful as gypsophila in mixed bouquets. The flowers may be dried for use with everlastings. They require the usual culture for perennials and annuals.

arboréscens. Shrub to 2 ft.: lvs. ovate-oblong, to 6 in. long: branches of panicles winged; calyx blue; corolla yellow. Teneriffe.

arbòreum: L. fruticans.

asiáticum: listed name.

auriculæfðlium: L. binervosum.

bellidifolium (L. reticula um. Statice caspia). Per. to 8 in.: lvs. obovate to lanceolate, to 1½ in. long: calyx white; corolla pale lilac. Eu., E. Asia. Var. nanum is offered as a dwarf form. binervosum (S. auriculæfolia). Tufted per. to 10 in.: lvs. lanceolate-spatulate, to 4 in. long: calyx white; corolla bluish-purple. Eu.

Bonduellii. Ann. or bien. to 2 ft.: lvs. lyrate-pinnatifid, to 6 in. long: branches of panicles winged, forming linear appendages below the forks; calyx and corolla yellow.

brassicæfölium. Subshrub to 1½ ft.: lvs. lyrate-pinnatifid, with 2-4 small side lobes: branches of panicles with broad wavy wings; calyx purple; corolla yellowishwhite. Canary Isls.

californicum (L. commune var. californicum. S. Limonium var. californicum). Per. to 2 ft.: lvs. obovate, to 10 in. long: fis. violet-purple. Calif.

Dicksonii: hort. name probably for form of L. sinuatum. dumòsum: listed as having dense clusters of silvery-gray fls.—Some of the material in the trade is L. vulgare.

elegantíssimum: L. latifolium var.
exímium (Goniolimon eximium). Per. to 2 ft.: lvs.
oblong to obovate, wavy-edged: calyx green tipped white;
corolla llac-rose. Cent. Asia. Var. álbum has white fls. and
supérbum larger infl.

fruticans (S arborea). Shrub: lvs. ovate, to 2 in. long: branches of panicles with narrow wings; calyx blue; corolla yellow. Teneriffe.

globulariæfòlium. Per. to 8 in. but sometimes growing to 2½ ft.: lvs. oboval or spatulate, in rosettes: corolla pale violet, small. Medit. region.

Gmélinii. Per. to 2 ft.: lvs. ovate or obovate: calyx dark purplish-blue; corolla rose. Caucasus, Siberia —Differs from *L. vulgare* in fls. half as large, shorter petioled lvs., and the lower bracts all membranaceous.

Gougetianum. Per. to 4 in.: lvs. evergreen, obovate, small and in dense rosettes; calyx reddish tipped white; corolla lavender. Italy.

hýbridum: a name of uncertain application.

imbricatum. Subshrub to 1½ ft.: lvs. lyrate-pinnatifid, with 8-9 small side lobes: branches of panicles with broad wavy wings; calyx blue; corolla yellowish-white. Teneriffe.

incanum nanum; L. tataricum var. nanum.

latifolium. Per. to 2 ft., harry: lvs. oblong-elliptic, to 10 in. long: calyx white; corolla blue. E. Eu., W. Asia. Var. álbum has white fls. and roseum rose. Var. elegantissimum is an improved form with larger fls.

leptostachyum. Ann., glaucescent: lvs. to ½ in. long, pinnate into linear segms.: fls. white. Persia.

lychnidifòlium. Per. to 2 ft.: lvs. obovate-lanceolate, large, leathery: corolla rose. S. W. Eu., Morocco.

macrophýllum. Shrub to 3 ft.: Ivs. obovate-spatulate, large: branches of panicles broad-winged; calyx blue or purple; corolla yellow to white. Tenerifie. Var. atrocæruleum is listed.

macrópterum. To 2 ft.: lvs. lyrate-pinnatifid, large, leathery: branches of panicles broad-winged; fis. purple. Canary Isls.

minimum: listed name.

minùtum. Per. to 9 in.; lvs. in rosettes, obovate: calyx white; corolla reddish. S. Eu.

oleifòlium (L. virgatum). Per. to 1½ ft.: lvs. spatulate, obtuse, crowded, glabrous, mostly cuneate: fis. violet, in loose cymose panicles. Medit. region.

Perèzii. Subshrub to 3 ft: lvs. broadly triangular, to 6 in. long, with truncate base and long petioles; calyx purplish-blue; corolla pale yellow. Canary Isls. Var. multiflorum is listed.

perfoliatum. Per. to 2 ft.: lvs. oblong-spatulate, small: fls. white. Shores of Caspian Sea.

Prealxii. Subshrub to 2 ft.: lvs. broadly triangular, to 4 in. long, with truncate base and long petioles: branches of panicles flattened; calyx lavender; corolla pale yellow. Canary Isls.

puberulum. Subshrub to 8 in., white-papillose and pubescent: lvs. ovate-rhomboid, to ¾ in. long: calyx violet; corolla yellowish-white. Canary Isls.

reticulatum: L. bellidifolium.

rupfcolum. Per. to 1 ft.: lvs. densely imbricated, linear-lanceolate: corolla violet. Corsica, Sardinia.

sareptanum: L. tomentellum.

sérbicum: listed name.

sibíricum: Armeria maritima var.

Sièberi (L. spathulatum). Per. to 1½ ft.: lvs. oblong to obovate-spatulate, base wedge-shaped: fis. in secundly branched panicles; corolla violet, much longer than glabrous calyx. Medit. region.

sinense. Per. to 1 ft.: lvs. obovate-lanceolate: calyx white or pale yellow; corolla yellow. China.

sinuatum. Per. or bien. to 2 ft.: Ivs. lyrate-pinnatifid, to 8 in. long: branches of panicles 3-5-winged, forming linear-lanceolate appendages below the forks: calyx blue; corolla yellowish-white. Medit. region. Color forms in the trade are album, atrocæruleum, candidíssimum, carmineum, rôseum.

spathulatum: L. Sieberi.

spicatum. Ann. to 6 in.: lvs. oblong-lanceolate, pinnately lobed: fis. rose or white, in dense cylindrical spikes. W. Asia.

steechifolium: listed name.

supérbum. Hybrid between L. Suworowii and L. leptostachyum: ann. to 2½ ft.: fis. rose-red.

Suworowii. Ann. to 1½ ft.: lvs. basal, oblong-lanceolate, to 8 in. long: fts. in dense cylindrical spikes; calyx green tipped with lavender; corolla lavender. Turkestan. Var. album has white fts.

tatáricum (Goniolimon tataricum). Per, to 1 ft.: lvs. obovate, to 6 in. long: branches of panicle with narrow wings; calyx white; corolla red. S. E. Eu. Var. angustifòlium (S. incana) has lanccolate lvs. Var. álbum is listed as having white corolla. Var. nànum (S. incana var. nana) is dwaft.

tomentéllum (Statice sareptana). Similar to L. Gmelinii from which it differs in the calyx wholly tomentose, larger fis. and longer outer bracts. Siberia.

virgătum: L. olerfolium.

vulgare (S. Limonium). Per. to 1 ft. or more: lvs. elliptic-oblong, to 6 in. long; calyx white or bluish; corolla bluish-lilac. Eu., N. Afr., Asia Minor.

LINACEÆ. FLAX FAMILY. Temp. and trop. herbs or shrubs of wide distribution, with usually alternate lvs., regular polypetalous fls. having an equal number of petals and stamens, superior 2–10-celled ovary, and fr. a caps. or drupe; 14 genera of which only Linum and Reinwardtia are cult. Aside from flax (Linum usitatissimum), the plants are of minor importance in cult., the others being grown for ornament in the open or under glass; the fls. are blue, red, or yellow, brilliant but mostly of short duration.

LINANTHUS: Gilia.

LINÀRIA. TOADFLAX. Scrophulariaceæ. Ann. and per. herbs of north temp. zone: lvs. opposite, in whorls or the upper ones alternate, entire, toothed or lobed: fl.-racemes or spikes terminal and of many colors, the corolla-tube long-spurred at the base.

The linarias are of easy culture. The annuals are propagated by seeds, the perennials usually by division although seeds sown one year should produce flowering plants the following year.

æquitrsloba: Cymbalaria æquitriloba.

alpina. Per. to 6 in., tufted: lvs. linear or lanceolate: fls. blue with orange palate, spur as long as corolla. Alps. Var. rôsea has rose fls. with orange-yellow palate.

amethýstina. Ann. to 6 in.: lvs. linear, lower ones verticillate: fls. lilac, lower lip pale yellow with violet dots or spots. Spain, Portugal and Morocco.

anticaria. Much branched per. with ascending sts. to 1 ft.: lvs. oblong or lanceolate: fls. white with blue throat, spur lilac and shorter than corolla. Spain.

aparinoides: L. heterophylla.

bipartita. CLOVEN-LIP T. Ann. 1 ft.: lvs. linear: ffs. violet-purple with orange palate, upper lip deeply 2-parted, spur curved, slightly shorter than corolla. Portugal, N. Afr. Var. áiba has white ffs. and spléndida deep purple ffs.

Broussonnètii (L. multipunctata). Ann. to 10 in.: lvs. lanceolate or linear: fis. yellow with orange throat and black spots, spur longer than corolla. Medit. region.

canadénsis. Ann. or bien. to 2½ ft.: lvs. linear: ffs. ¼ in. long, blue with white palate, spur filiform, curved, as long as corolla. N., Cent. and S. Amer.

Cymbalaria: Cymbalaria muralis.

dalmática. Per. to 4 ft.: lvs. lanceolate, glaucous: fis. bright yellow, spur straight, shorter than corolla. S. E. Eu. Var. supérba is an improved form.

delphinioldes: L. sapphirina.

Elatine: Kickxia Elatine.

excélsior: L. maroccana var.

faucicola. Ann. to 6 in.: lvs. lanceolate: fis. violet with paler throat. to ¾ in., in few-fid. racemes. Spain.

flava (Antirrhinum pumilum). Ann. to 6 in.: lvs. ovate to lanceolate, to $\frac{3}{3}$ in. long, sessile: fls. yellow to pale orange, to $\frac{1}{2}$ in. long, usually 1-5 in small terminal clusters. Medit. region.

genistifòlia. Per. to 4 ft.; lvs. lanceolate: fls. citron-vellow with orange palate, to % in, long, spur shorter than

gharbénsis. Ann. to 16 in., sts. glabrous, branched at base: lvs. linear, to 1½ in. long, obtuse: fls. yellowish-white with violet spur, about 1 in. long, in racemes to 10 in. long. Morocco.

globòsa: Cumbalaria muralis var.

hederæfðlia: hort, name for a species of Cymbalaria.

Héndersonii: hort, name,

hepaticæfòlia: Cymbalaria hepaticæfolia.

heterophylla (L. aparınoides). Ann. to 3 ft.: lvs. linear or lanceolate: fts. straw-colored with a vellow palate. 1 in. long. Morocco.

italica. Per. to 2 ft: lvs. linear-lanceolate: fls. yellow, spur slightly shorter than corolla. Eu.

Jattæ. Per. to 3 ft.: lvs. lanceolate to ovate, to 1½ in. long and nearly 1 in. wide, incurved at base, entire, acute: fls. yellow, to 1 in. long, corolla-tube somewhat swollen, spur straight, to ½ in. long. Italy.—Perhaps not distinct from L. dalmatica.

macedonica. Stout per. to 3 ft., grayish-green: lvs. ovate to lanceolate: fls. bright yellow marked with orange on palate, ¾ in. long, spur as long as corolla. Macedonia. Var. speciosa is showy and large-fld.

macroura. Per. to 2 ft., glaucous: lvs. oblong-linear: fls. yellow with orange palate, about 1½ in. long, spur as long as corolla. Caucasus.

maroccana. Ann. to 1½ ft.: lvs. narrow-linear: fls. bright violet-purple with small yellow patch on palate, spur pointed, half as long again as corolla. Morocco. Var. excélsior, garden name for hort. mixture whose fls. vary from pink to dark blue, perhaps of mixed origin.

melanántha: L. tristis.

minor: Chænorrhinum minus.

multipunctata: L. Broussonnetti.

origanifòlia: Chænorrhinum origanifolium.

pállida: Cymbalaria pallida,

Pancicii: hort. form, dwarf with large canary-yellow fis; said to come from Orient. Some of the material in cult. under this name belongs to L. macedonica.

Perèzii: L. Tournefortii.

pilòsa: Cymbalaria pilosa. purpurea. Per. to 3 ft.: lvs. linear or linear-lanceolate: fls. bright purple with white-bearded palate, 1/4 in. long, spur curved and about length of corolla. S. Eu.

rèpens. Erect per., or decumbent at base, 1-2 ft., with creeping rootstocks: lvs. linear, mostly crowded near base and scattered above: fis. less than ½ in. long, white with purplish veins, fragrant. Eu.

reticulata. Purplener T. Ann. to 4 ft., glaucous: lvs. linear: fls. purple, netted-veined, palate orange or yellow, spur as long as corolla. Portugal. N. Afr. Var. aureopurpurea is deeper in color.

sapphirina (L. delphinioides). Ann. to 1 ft.: lvs. linear: fls. blue, to ¾ in. long, spur much longer than corolla. Spain, Portugal.

spårtea (Antirrhinum præcox). Ann. to 2 ft.: lvs. narrowly linear, to ¾ in. long, not dense: fls. yellow, darker on the palate, to ¾ in. long, spur straight, as long as corolla. W. Medit. region.

spùria: Kıckxia spuria.

striata: name of doubtful application; perhaps a form of L. bipartita is meant.

supina. Per. with decumbent sts. to 9 in. long: lvs. linear: fls. pale yellow, nearly 1 in. long, spur about length of corolla. Eu., nat. in E. U. S.

syriaca: listed name.

Tournefortii (L. Perezii). Ann. or per. to 1½ ft.: lvs. linear or lanceolate: fls. deep yellow with orange palate, spur about length of corolla. Spain.

triornithophora. Per. to 4 ft., glaucous: lvs. ovate-lanceolate: fls. violet striped purple with orange palate, 1½ in. long, spur longer than corolla. Spain, Portugal.

triphýlla. Ann. to 2 ft., glaucous: lvs. ovate or oval: fis. yellowish-white with orange palate and violet curved spur, ¾ in. long. Medit. region.

tristis (L. melanantha). Per. to 1 ft.: lvs. linear-oblong: fls. brown or yellow with orange bearded palate, spur curved, shorter than corolla. Medit. region.

ventricosa. Per. to 3½ ft.: lvs. lanceolate-attenuate, 3-nerved: fis. pale yellow with reddish veins, to ¾ in. long,

corolla-tube broadly swollen, spur half as long as corolla. Morocco

vulgaris. Common T. Butter-and-Eggs. Per. to 3 ft.: lvs. linear: fis. yellow with orange bearded palate, 1½ in. long, spur about length of corolla. Eu., Asia, nat. in N.

LINDELÒFIA. Boraginaceæ. Erect per. herbs with alternate simple lvs. and blue or purple fls. like forget-me-not in dense long racemes.

One species is sometimes grown in rock-gardens. It thrives in any soil but requires a sheltered position and winter protection in the North. Propagated by division and seeds.

longiflora (L. spectabilis). To 1½ ft., leafy: lvs. lanceo-late or oblong-lanceolate: fis. deep blue, ¾ in. long, in racemes to 6 in. long. Himalayas.

nervòsa: listed name.

spectábilis: L. longiflora.

LINDEN: Tilia.

LINDÈRA. Lauracex. Aromatic trees and shrubs native in Asia and N. Amer., with alternate lvs., unisexual or bisexual little fls. in axillary clusters, and fr. a drupe. The older name Benzoin has been rejected by botanical legislation and the more widely established name of Lindera has been conserved in accordance with the International Rules of Botanical Nomenclature. Propagated by seeds sown as soon as ripe, by layers, and by cuttings of green wood under glass.

wood under glass.

æstivålis: L. Benzoin.

Bénzoin (Benzoin æstivale. B. odoriferum). SpiceBush. Deciduous shrub to 15 ft.: lvs. oblong-obovate, to
5 in. long, turning yellow in autumn, petiole usually less
than ¾ in. long: fts. before the lvs. in early spring, greenishyellow: fr. scarlet. Moist places and lowlands, Me. to Fla. and Tex.

grandifòlia: L. megaphylla.

megaphýlla (L. grandifolia). Evergreen shrub or tree to 60 ft.: lvs. oblanceolate, to 8 in. long, shining: fis. yellow: fr. black. China.

melissæfðlia (Benzoin melissæfolium). Shrub to 10 ft., twigs pubescent: lvs. elliptic-ovate, to 5 in. long, rounded or cordate at base, hairy: fls. yellow, appearing before lvs. N. C. to Fla. west to Ill. and Mo.

obtusíloba (Benzoin obtusílobum). Deciduous shrub or tree to 30 ft.: lvs. broad-ovate, to 5 in. long, entire or 3-lobed at apex, lobes obtuse when present: fis. yellow: fr. black, about ½ in. diam. Japan, Korea, China.

odorifera: L. Benzoin.

præcox (Benzoin præcox). Deciduous shrub or tree to 30 ft: lvs. ovate-elliptic, to 3½ in. long, petiole to 1 in. long; fls. greenish-yellow, to ¾ in. across: fr. yellowish to reddish-brown. Japan.

touyunénsis: a form of L. megaphylla with under side of lvs. pubescent.

trīloba (Benzoin trilobum). Allied to L. obtusiloba, differing in lvs. deeply 3-lobed with lobes acuminate and fr. greenish-yellow, about 1/2 in. across. Japan.

umbellata (Benzoin umbellatum). Shrub to 16 ft.: lvs. elliptic-obovate, to 5 in. long, acute, lower side glaucous with pubescent midrib, cuneate at base: fls. yellow, appearing with lvs.: fr. black, subglobose, about 1/2 in. long. Japan, China.

LINDHEIMERA. Composite. Small genus of S. W. American annuals with usually opposite sessile lvs. with heads of both ray- and disk-fls., the former pistillate and fertile and latter perfect but sterile; fr. a much compressed and flattened winged achene. Propagated by seeds.

texãns. To 2 ft., plant hispid throughout except in fis., st. usually simple at base, becoming branched above: basal lanceolate, to 1½ in. long, acuminate, entire to somewhat dentate: heads to 1 in. across, ray-fis. golden-yellow to cream and broadly ovate to obovate, acute, entire or naarly so, subtended by ovate foliaceous bracts. W. Tex.

LINDLEYELLA: Bifrenaria aurantiaca.

LINEAR: long and narrow, the sides parallel or nearly so, as grass leaves.

LINNÈA. Caprifoliaceæ. Trailing evergreen subshrub suitable for the rock-garden where it thrives in moist peaty or woodsy soil. Propagated by division and cuttings under glass. L. borealis. Twin-flower. Lvs. opposite, roundish, to 1 in. long: fls. in pairs, bell-shaped, to ½ in. long, rose or white, fragrant: fr. yellow, ½ in. long. N. Eu., N. Asia, Alaska. Var. americana (L. americana) differs in the more tubular fls. to ½ in. long. N. Amer.—The plant in the trade as L. canadensis probably belongs here.

LINOMA. Palmaceæ. An alternative name for the Princess palms, now retained under Dictyosperma, which see. It has been supposed that the genus Dictyospermum of Wight 1853 (Commelinaceæ) invalidates Dictyosperma of Wendland & Drude 1875 (Palmaceæ) and in 1917 the name Linoma was proposed for the palm. Under the Rules as now interpreted, the names Dictyospermum and Dictyosperma do not conflict, nor the earlier Dyctisperma of Rafinesque. Combination of the words Linoma alba has been made but the other names under Dictyosperma have not been carried over. The generic name Linoma is not adopted, even though cross-reference has been made to it from Areca.

LINOSPADIX. Palmacex. Probably a dozen species in New Guinea, unarmed small monoccious palms with lvs. pinnate-ribbed, pinnatisect or pinnate: spadix among the lvs., simple, the fls. spirally arranged and immersed, in 3's, the middle one pistillate; stamens 6 or 9: fr. small, ellipsoid, with stigmatic point at apex. Perhaps not regularly planted in our territory. See Palm for cult.

Petrickiana. Lvs. bifid in juvenile form, later pinnate and arching; pinna about 30, narrow, long-acuminate, entire, strongly ribbed and nerved, more or less brown-scaly underneath. Described from juvenile specimens, and the botanical position uncertain.—Good tub-plant, and will probably stand in S. Fla.

LINÓSYRIS. Compositæ. Old World herbaceous perennials with alternate narrow lvs. and yellow heads of disk-fls. either solitary or in corymbose terminal clusters; pappus of bristles. Propagated by division and suited to any good soil

vulgaris (Aster Linosyris). Goldilocks. To 2 ft., glabrous: lvs. linear, 1 in. long, entire: heads about ½ in. across, corymbose, late summer or autumn. Eu.

LÎNUM (incl. Cathartolinum). FLAX. Linaceæ. Herbs or subshrubs with alternate narrow lvs., red, yellow, blue or white fis. with fugacious petals, 5-celled (or apparently 10-celled) ovary with 2 ovules in each cell and 5 styles; about 90 species chiefly in temp. regions, one (L. usitatissimum) furnishing fiber and linseed oil and others grown for the summer bloom. The foliage is very similar in most of the species, being small, narrow, sessile, usually entire or essentially so.

The annuals may be grown from seeds sown where the plants are to stand. The perennials are propagated by seeds or division or by cuttings. They are of simple cultural requirements.

abyssinicum: L. strictum.

africanum. Shrubby per. to 3 ft.: lvs. opposite, except uppermost, linear to ovate, acute: fis. yellow, small, in lax or contracted dichotomous corymbs. Trop. Afr.

alpinum. Per. to 10 in., occasionally to 20 in.: lvs. linear-subulate, to 3/2 in. long, usually close together along lower third of st.: fls. deep chicory-blue, to 3/2 in. across, outer sepals acute, inner obtuse, all shorter than caps. Eu.—Distinguished from L. perenne by its smaller narrower

lvs. and less diffusely branched infl., and petals overlapping entire length.

altàicum: a confused name.

americanum: unidentified name for an American species. angustifolium. Ann. or per. to 2 ft.: lvs. linear-aciculate, to ½ in. long, absent or scattered on lower third of st.: fls. blue, to ½ in. across, sepals all acute, ½ as long as petals, inner ones ciliate, as long as caps. or nearly so. Medit. region.

arboreum. Shrub to 2 ft.: lvs. obovate, base cuneate, apex obtuse to mucronate, to 1½ in. long, glaucous, persistent: fls. clear yellow, to 1½ in. across, in erect few-fid. heads, sepals narrow-acuminate. E. Medit. region.—Not hardy at low temperatures.

austriacum. Per. to 2 ft.: lvs. linear-subulate, to ½ in. long: fls. bluish-purple to pale wine-red, to ¾ in. across, sepals oval, obtuse rarely mucronate, to ½ caps. length. S. Eu

cærùleum: L. grandiflorum var.

campanulatum. Per. to 15 in., woody at base: lvs. spatulate or lanceolate, margins with narrow transparent membranes, minute spherical gland on each side of lf. base: fls. pale yellow with orange veins, to 1½ in. across, sepals lanceolate-acuminate, white-margined. S. Eu.

capitâtum. Per. to 18 in., sts. stout: lvs. broadly spatulate to oblong-lanceolate, apex obtuse to acute, gland on each side of lf. base: fls. golden-yellow, to 1 in. across, usually 5-12 in infl, sepals lanceolate-acuminate, strongly ciliate on lower half. S. Eu.—Much of the material so named in the trade is L. flavum.

coccineum: L. grandiflorum var.

collinum. Perhaps not distinct from L. austriacum except in its lower habit. Var. Lôreyi is listed.

corymbiferum. Bien. to 20 in., sts. pilose: lvs. linearlanceolate, to 34 in. long, erect, margins and midrib ciliate, no glands present: fis. yellow, to 24 in. across, sepals glandular-ciliate, infl. a subcorymbose panicle. S. Eu.

corymbosum: probably a misspelling of L. corymbulosum, a synonym of L. strictum.

crépitans: L. usitatissimum var.

flavum. Golden F. Per. to 2 ft., sts. stout, somewhat woody: lower lvs. obovate, obtuse, upper lvs. narrower and acute, gland on each side of lf. base: fls. yellow, to 1 in. across, usually 20-50 in infl., sepals lanceolate-acuminate, glandular-ciliate and keeled. S. and Cent. Eu. Var. compactum is advertised as a dwarf form.—See also Reinwardtia indica.

flexuosum: name of uncertain botanical] application. gállicum. Ann. to 15 in.: lvs. somewhat lanceolate, acute, to nearly ¾ in. long, glands absent, margins slightly revolute: fls. yellow, to nearly ¼ in. across, in open lax infl., sepals not longer than caps. Cent. Eu. and Medit. region.

glabréscens: listed name.

grandifibrum. FLOWERING F. Ann. to 2 ft.: lvs. linear-lanceolate to ovate-acuminate, to 1½ in. long, margins remotely chate: fls. red to bluish-purple, to 1½ in. across, sepals lanceolate-acuminate, to ½ in. long, margins membranous and ciliate. N. Afr. Var. cærûleum, fls. bluish-purple. Var. coccineum (L. coccineum), fls. scarlet. Var. roseum, fls. rose-pink. Var. rubrum, fls. bright red.

hirsutum. Per. to 2 ft., entire plant except petals and caps. hirsute: lvs. broadly lanceolate, to % in. long: fis. lavender-blue rarely white, to ½ in. across, sepals broadly lanceolate, densely hirsute. Cent. Eu. and Medit. region.— A form with almost glabrous lvs. may be in cult.

hológynum. Per. to 2 ft., glabrous: lvs. linear-lanceolate, 1-nerved: fls. blue, to 1 in. across, petals 2-3 times as long as calyx, styles twisted or fused about ½ their length. Mts. of Cent. Eu.

Lèwisii. Prairie F. Per. to 3 ft., differing from L. perenne in its slightly more robust habit, lvs. to 1½ in. long and somewhat larger sepals and capsules; perhaps not distinct. W. N. Amer.

monógynum. Per. to 2 ft.: lvs. linear-lanceolate, to ¾ in. long, all acute: fls. white, to 1 in. across, sepals broadly lanceolate, white-margined, as long as caps. New Zeal.

narbonnénse. Per. to 2 ft.: lvs. linear-lanceolate, to ¾ in. long, somewhat dense on stout st.: fls. azure-blue with white eye, to 1¾ in. across, on stout pedicels, sepals lanceolate-acuminate, white-margined, Ionger than caps. Medit. region. Var. álbum has white fls.—Distinguished from L. perenne and its relatives by its long stigmas, longer sepals and stouter habit.

nervosum. Per. to 1½ ft., st. pubescent at base: lvs. lanceolate-cuspidate, 3-5-veined: fls. blue, to 1½ in. across, sepals cuspidate, serrate on lower third, infl. a lax panicle. E. Eu.—Entirely glabrous forms may be in cult.

perénne (L. sibiricum). Per. to 2 ft.: lvs. linear-subulate to lanceolate, to 1 in. long, lower part of st. usually leafless

or nearly so: fis. deep chicory-blue, to 1 in. across, petals not overlapping, infl. usually a much branched panicle. Eu. Var. album, fis. white.—See L. alpinum.

rigidum. Glabrous per. to 20 in.: lvs. linear, few, erect: fis. yellow, to 1½ in. across, sepals with marginal glands, inner ones shorter than outer. Man. to Alta. south to Tex. and Colo

rubrum: L. grandiflorum var.

salsoloides. Evergreen per. to 16 in.: lvs. linear-subulate to linear-lance olate, to 1 3/4 in. long but typically needle-like and less than 1/4 in. long, often clustered at apex: fis white and less than ½ in. long, often clustered at apex: fls white with purple veins, to 1 in. across, petals rounded at apex, sepals ovate-cuspidate, somewhat glandular-ciliate, longer than caps. S. Eu. Var. nānum is of prostrate habit, to 3 in. forming low clumps to 18 in. diam., lvs. usually longer than in type and plant less hardy.—Does not withstand severe cold.

sibíricum: L. perenne.

strictum (L. abussinicum). Ann. to 18 in.: lvs. linearstrictum (L. adyssinicum). Ann. to 18 in.; Ivs. inear-lanceolate, to 1 in. long, margins strongly revolute; fis. yellow, to nearly ¼ in. across, in tight compact head-like clusters, sepals much longer than caps. Cent. Eu. and Medit. region.

suffrutiosum. Shrubby per. to 8 in., densely puberulous, much branched from woody base: lvs. hnear-subulate, to ¾ in. long, closely clustered on young shoots: fls. blue, to 1 in. across, in few-fld. infl., sepals ovate-cuspidate, longer than caps, glandular-ciliate. S. Eu.

sulcatum. Ann. to 2½ ft.: lvs. linear-lanceolate to subulate, to nearly 1 in. long, minute glands present on each side of lf. base: fls. yellow, to ½ in. across, sepals obtuse-cuspidate, minutely serrulate, longer than caps. Ont. to Ga. and Tex.

tenuifòlium. Shrubby per. to 1 ft.: lvs linear-lanceolate to subulate, to ¾ in. long: fls. pınk-lılac or white with purple veins or center, to 1 in. across, petals very briefly acuminate, sepals ovate-cuspidate, strongly glandular-ciliate, longer than caps. Cent. Eu. and Medit. region.—Of coarser habit and taller and more diffuse infl. than L.

trígynum: Reinwardtia indica.

usitatissimum. Flax (which see). Ann. to 4 ft., sts. erect: lvs. linear-lanceolate: fls. blue, to ½ in. across, sepals ½ as long as petals, glabrous, nearly as long as caps.: caps. to ¾ in. across. Probably Asia; run wild in N. Amer. and Eu. Var. crépitans is lower with larger fls.

viscosum. Glandular-hairy per. to 2 ft.: lvs oblong-lanceolate, to % in. long, margins densely glandular-ciliate: fls. pink with violet veins, to 1½ in. across, sepals lanceolate, margins glandular-ciliate. S. Eu.

LIONS-EAR: Leonotis.

LIP: one of the parts in an unequally divided corolla or calyx; these parts are usually 2, the upper lip and the lower lip, although one lip is sometimes wanting; the upper lip of orchids is by a twist of the stipe made to appear as the lower; a labium. Lipped or labiate corollas are as the lower; a labium. Li characteristic of the Labiate.

LÍPARIS. TWAYBLADE. Orchidacex. mopolitan terrestrial herbs with pseudobulbs or sts. swollen at base, bearing a few commonly broad lvs. and terminal racemes of usually small fls.; petals commonly much narrower than sepals. Sometimes transplanted to the wildgarden; see Orchids.

liliifòlia. To 10 in. high: lvs. 2, to 7½ in. long: infl. to 6 in. high, commonly many-fld.; fl. about ¾ in. across; sepals greenish-white; petals much narrower, flinform, madder-purple; lip mauve-purple tinged with green. May-July. Me. to Ga. and Ala. west to Minn. and Mo.

Loesèlii. To 10¼ in. high: lvs. 2, to 7¼ in. long: infl. to 4 in. high, few-fid.; fls. yellowish-green or whitish, about ¼ in. across. May-Aug. N. Amer., Eu., N. Asia.

longines: L. viridiflora.

viridiflora (L. longipes). Pseudobulbs to 6 in. high, with 2 lvs. to 12½ in. long: racemes to 12 in. long, dense; fls. very small, greenish-white or cream-color, with green to orange lip. Sept.-Mar. India, Indo-China, Malaya, China, Philippines.

Verbenaceæ. Herbs and shrubs having mostly opposite or whorled lvs. and small white, rose or purplish fis. in heads or spikes; native mostly in warm countries.

One (L. canescens) is grown as a ground-cover in warm climates and the lemon-verbena is a popular greenhouse subject. The latter should be grown in a temperature

of about 55° and the pots planted out in summer. Propagated by cuttings from the new growth. V. canescens is best increased by planting small sods a few feet apart.

canescens (L. repens). Creeping and spreading: lvs. opposite or whorled, oblong to lanceolate, to 34 in. long, toothed toward tip: fis. lilac with yellow throat, in heads to 35 in. across. S. Amer.—Used as a lawn cover in S. to 1/2 in. across. S. Calif. and elsewhere.

citriodora (Aloysia citriodora and triphyllu). Lemon-Verbena. Shrub to 10 ft.:lvs. in whorls of 3 or 4, lanceolate, to 3 in. long, entire or toothed, with odor of lemon: fis. white, in spikes or terminal panicles. Argentina, Chile.

ligustring (L. lycioides. Aloysia hyustrina). Shrub to 14 ft.: lvs. opposite, oblong-lanceolate, to 1 in. long, entire: fts. white or tinged with violet, fragrant, in abundant spikes to 3 in. long. Tex. to Argentina.—Sometimes planted far S.

lycioides: L. liquitrina.

rèpens: L. canescens.

urticoides. Shrub to 10 ft.:lvs. opposite, ovate to oblong, to 3 in long, toothed: fls. white, fragrant, in panicled spikes. S. Amer.

LIOUIDÁMBAR. Hamamelidacex. Attractive deciduous trees native in Asia and Amer., with palmately lobed toothed maple-like lys., unisexual fls. without petals borne in globose heads, and fr. a dense spiny hanging head of compacted capsules. Propagated by seeds which may not germinate until the second year.

formosana. To 120 ft.: lvs. 3-lobed. China. Formosa: hardy only in southern states.

Styraciflua. Sweet Gum. To 140 ft., the branches becoming corky; lvs. 5-7-lobed. Conn. to Fla. and Mex.: reliably hardy only in its natural range.

LIOUORICE: Glucurrhiza.

LIRIODÉNDRON. TULIP-TREE. Magnoliaceæ. Two notable deciduous trees native in N. Amer. and China, the former often planted and an important timber tree: lvs. alternate, long-stalked, lobed and with broad truncate apex: fls. bell-shaped, solitary, terminal: fr. cone-like, of long narrow carpels.

Tulip-trees do not transplant readily, and the moving should be undertaken in spring. They thrive on rich moist land. Propagated by seeds stratified and sown in spring, or horticultural forms by layering and grafting.

chinénse. Tree to 50 ft: lvs. 5-6 in. long, with 4 acuminate lobes: fls. to 1½ in. long. Cent. China.

Tulipifera. To 200 ft, with eventually columnar unbranched trunk: Ivs. to 5 in. long and broad, pale beneath: fls. greensh-yellow with orange at base, to 2 in. long: fr. brown, to 3 in. long. Mass. to Fla. and Miss—One of the noblest of American trees; sometimes known as Whitewood and to lumber dealers erroneously as "poplar." Var. aùreo-marginàtum has lvs. margined with yellow. Var. fastigiatum (var. mramidale) of narrow-pyramidal form, Var. integrifòlium, lvs. unlobed.

LIRÎOPE. LILY-TURF. Liliacex. Asian species of stemless glabrous evergreen per. herbs, prized for their attractive grass-like foliage forming mats or sods and the small lilac-purple to whitish fls. which are sessile or ascending or erect, in spikes or racemes that may or may not overtop the clump; ovary superior; filaments equalling or exceeding the blunt anthers: fr. 1-seeded, berry-like, blue or black. The species make good ground-cover in both shade and sun, and are hardy in parts of N. Y. Propagated readily by division. See Ophiopogon.

graminifòlia: the plant grown under this name is L. spicata, the true graminifolia apparently not being in cult.

Muscari (L. graminifolia var. densiflora). Bio Blue L. Muscari (L. gramini)olia var. densifora). Bio Bille L. Root-system an upright stock, with thick tubers and many fibers: Ivs. firm, to 18 in. long and to ½ or ½ in. broad: scapes mostly not exceeding Ivs., dense: fis. lilac-purple: fr. black. Japan, China.—There are cockscombed and fasciated forms. The plant sometimes passes as Ophiopogon (or Mondo) Jaburan. Var. exilifibra is a slender form with lax spikes. Var. variegata has Ivs yellow-striped.

spicata. Creeping L. Root-system shallow, with many slender jointed rootstocks and tubers: lvs. narrow, about

¼ in. or less broad, grassy: spike slender and open, light hise to almost white: fr. becoming black. Japan, China.

LISIANTHUS: Eustoma Russellianum.

LISSOCHÌLUS. Orchidaceæ. Terrestrial African orchids with creeping rhizomes and short leafy sts. thickened in a pseudobulb: lvs. long and usually narrow, plicate scapes lateral, tall, leafless, bearing above loose racemes of mediumsized or large fis. with lip having a saccate or spurred base. Differs from the closely allied genus Eulophia by having the petals much broader than and differently colored from the senals

Lindleyanus. To 6 ft. high: rhizome creeping: lvs. lanceolate-linear, to 3 ft. long and 1 in. wide, acute: racemes loose; fls. yellow, to about 1½ in. across; sepals subspatulate, petals elliptic-oblong; lip entire or remotely 3-lobed. Swamps. trop. Afr.

LISTÈRA. Orchidacex. Terrestrial orchids native in the north temp. zone, with 2 opposite lvs. and small fls. in terminal racemes, the sepals and petals similar, the lip entire or 2-lobed. Sometimes planted in wild or protected places; see Orchids.

cordata (Ophrys cordata). Heart-leaved Twayblade. To 10 in. high: lvs. sessile, cordate-ovate or deltoid, to 1½ in. long: fis. purplish- to yellow-green, about ½ in long; lip narrowly oblong, very deeply eleft into 2 narrow lobes, about twice as long as sepals and petals. May-Aug. Newf. to N. C. west to Alaska and N. Mex., Greenland, Iceland, Eu., Asia.

ovata. To about 29 in. high: lvs. oval to subrotund, to 5¼ in. long: fls. greenish-yellow with often brownish lip, about ½ in. long. Eu, Asia.

LITCHI. Sapindaceæ. Chinese tree widely grown in oriental warm regions for the edible fresh or dried fr., particularly prized in China. L. chinénsis (Nephelium Litchi). Litchi. Litchie. Lychee. To 40 ft.: lvs. of 2-4 pairs of oblong to lanceolate lfts. to 4 in. long, leathery and shining: fls. small, greenish-white or yellowish, in terminal panicles to 1 ft. long: fr. bright red, to 1½ in. across, covered with angular tubercles, the white flesh or aril juicy and edible, the seed single and large.—When well established, the litchi will stand a few degrees of frost. It requires abundant moisture and thrives on deep loamy soil. Trees should be set 30-40 ft. apart. Propagated by seeds, air-layering and inarching. The tree stands in S. Fla. and S. Calif.

LITHOCÁRPUS (Pasania). Fagaceæ. Evergreen oak-like trees native in Asia and W. N. Amer., with alternate lvs., unisexual fls. in erect catkins, and fr. a solitary nut partly or wholly inclosed by a cup-like spineless involucre. Sometimes grown in the S. and Calif. Propagated by cuttings, layers, or seeds. The species have also been named in Quercus.

cleistocarpa $(Quercus\ Wilsoni)$. Lvs. to 5 in. long, entire, glaucescent and becoming glabrous beneath. China.

comea (Quercus cornea). Livs. to 4 in. long, toothed above the middle, usually only pubescent on veins beneath. China.

densifièra (Quercus densifiera). TANBARK OAK. Tree 60 or 80 ft., sometimes 150 ft.: lvs. to 5 in. long, toothed, rusty-tomentose beneath but becoming glabrous. Ore, N. Calif.

edùlis. Lvs. to 6 in. long, entire, glabrous. Japan.

glàbra (L. thalassica. Quercus glabra). Lvs. to 5 in. long, entire or sometimes toothed toward tip, grayish-tomentose beneath. China, Japan.

Hénryi. Lvs. to 10 in. long, entire, becoming glabrous beneath. China.

thalássica: L. glabra.

LITHODORA: Lithospermum.

LITHOFRÁGMA. Saxifragaceæ. Simple-stemmed rather small per. herbs with tuberous rootstocks, sometimes named in Tellima: fls. small, white or pink, with clawed petals and 3 styles, in simple terminal racemes: lvs. mostly radical, nearly orbicular or very broad. A few species in W. N. Amer., useful in wild-gardens and rockeries.

affinis (Tellima affinis). Woodland Star. To 16 in., glandular-hairy: lvs. crenately lobed, often bronzed: fis. white. Calif.

parviflora (Tellima parviflora). To 1 ft., glandular-hairy: lvs. divided to base into 3-5 parts which are ternately out into oblong or linear segms.: petals deeply 3-5-lobed. Alta. to Calif.

tenélla. To 6 in., glandular-hairy: lvs. 3-parted about half way, lobes 3-toothed: petals 3-lobed at apex. Alta. to Wvo.

LÍTHOPS. STONEFACE. Aizoacæ. Segregate from the great group Mesembryanthemum, native in S. Afr.: lvs. thick, in pairs, mostly buried as they grow in nature, the exposed top flat or concave and stone-like as if a single st. or body with a fissure across the top, in the juvenile state with only a central orifice at the apex after the manner of Conophytum: fls. solitary, yellow or white, issuing from the fissure, the petals many and tube none; stamens numerous in an erect column; stigmas 4–7. The plants resemble pebbles when not in bloom.

alpina. Growths about ½ in. high and broad, lined and spotted with brown: fis. yellow.

All campiæ. Growths to ½ in. high, 2 in. broad at apex, with sprinkling of small blackish dots: petals in 3 or 4 series, obtuse or emarginate or interior ones acute, golden.

bélla (M. bellum) Growths to 1 in. high and broad, ½ in. thick, top brownish with darker markings: fis white, to 1¼ in. across,

Cómptonii. Growths 1½ in. thick, olive-green: fls. vellow, 1 in. across

Éberlanzii (M. Eberlanzii). Growths to 1½ in high and 1½ in. broad, grayish marked with lines, fissure nearly ½ in deep: fis. white.

Edithiæ. Differs from L. bella in the flat top with chocolate-brown markings, and dove-gray color.

Elizabethiæ. Growths about ½ in. high and broad, brick-red, spotted with dark green and with red lines: fis. probably yellow.

Erniana. Growths to 1 in. high and nearly as broad, the halves unequal, reddish-green with brown lines: fis. white, about 1 in. across.

farindsa: L. pseudotruncatella.

flòre-álbis: listed name.

Fràmesii. Growths pinkish-dove-gray, about 2 in. long: fis. about 1 in. across, petals white, obtuse, many in about 3 series, filaments white, anthers yellow.

Franciscii (M. Franciscii). Growths to 1½ in. high and broad, ¾ in. thick, grayish-white marked and dotted with darker green: fls. yellow, to ¾ in. across.

Fúlleri. Growths to 1 in. high and broad, ¾ in. thick, fissure ¼ in. deep, light gray or brownish, rough on top with row of dark brown spots around margin: fis. white, 1 in. across.

fúlviceps. Growths about 1 in. high and broad, brown and spotted: fls. yellow, whitish beneath, 1 in across.

Hélmutii. Growths about 1 in. wide, bright green: fls. golden-yellow, 1 in. across.

Hérrei. Forming clumps growths 1 in. high and ½ in. wide, brownish-green: fls. yellow, ½ in. across.

Julii. Tufted: growths 1 in. high and 34 in. broad, with deep fissure, pale gray spotted and lined on top with brown: fis. white, 1 in. across.

karasmontana (M. karasmontanum). Growths to 1 in. broad and 3/4 in. thick, pale gray or brown marked with darker lines and spots: fis. white with yellow anthers, 11/4 in. across.

kewbéscens: catalogue name.

Koegrabie: listed name.

kuibisénsis. Growths in clumps, 1½ in. high and broad, yellow-brown with red-brown sunken markings: fis. yellow.

kunjasénsis. Tufted: growths about 1 in. high and broad, grooved, with dark spots: fls. yellow.

láctea. Growths about 1 in. high and nearly as broad, rough, greenish-white lined and spotted with red-brown: fls. white, 1 in. across.

lateritia. Tufted: growths 1 in. high and ¾ in. broad, grooved. brick-red.

Lericheana (M. Lericheanum). Tufted: growths to 11/2 in, high and broad, reddish-gray, with transparent dots:

Lésliei (M. Lesliei). Growths to $2\frac{1}{2}$ in. long, $1\frac{1}{2}$ in. across, and 1 in. thick, flat on top, olive-green spotted with orange: fls. bright yellow, whitish or pinkish on back, to $1\frac{3}{2}$

Lýdiæ: name without description.

marmorata (M. marmoratum). Growths to 1½ in. high and broad, 1 in. thick, grayish-green and mottled with cream or yellow: fis. white with yellow anthers, shining, fragrant, 1½ in. across.

Marthæ. Growths about 1 in. high and broad, top slightly convex, grayish-yellow or pale brown, with transparent dots and often reddish lines: fls. yellow, petals many and narrow.

Meveri. Forming clumps: growths about 1 in. high and broad, deeply fissured, dark gray-green: fis. yellow, 11/2 in.

mickbergénsis. Tufted: growths broad-oval, about 34 in. high and broad, reddish-gray, grooves yellow-brown: fis. white.

Mundtii: L. pseudotruncatella var.

olivacea. Similar to L. Fulleri but smaller, top greenish with row of cream-colored dots parallel to fissure: fis. yellow, ¾ in. across.

opalina. Growths to 11/4 in. high and 1 in. broad, grayblue: fls. white.

optica (M. opticum). Growths to ¾ in. high and broad, yellowish-white with greenish-white top usually without markings: fls. white or pinkish with yellow anthers, ¾ in.

Peèrsii. Growths to 1½ in. high and ¾ in. broad and thick, pale reddish-brown, rough, unspotted: fls. yellow, 1 in across.

pseudotruncatélla (M. pseudotruncatéllum. L. farinosa). Tufted: growths to 1½ in. across, with fissure across top which is a central orifice when young, grayish or brownish with brown lines: fls. bright yellow, paler in center, to 2 in. across. Var. Mundtii (L. Mundti) has 1-2 growths together, yellow or orange fls., petals edged and tipped with

pulmonuncula. Similar to L. pseudotruncatella but more reddish with red-brown lines.

rugosa. Tufted: growths broad-oval, to ¾ in. high and ½ in broad, grooved, reddish-gray with transparent spots: fls. yellow.

Ruschiorum (M. Ruschiorum). Forming clumps: growths 11/6 in. high and broad, gray-green without distinct to 1½ in. high and broad, gray markings; fls. yellow, 1 in. across.

Schwantesii. Tufted: growths to 1½ in. high and 1 in. across, reddish-gray spotted and edged with red: fis. yellow.

summitatum. Growths about 1 in. high and broad, yellow-brown with broad brown markings: fis. white.

terricolor. Growths to 1¼ in. high, 1 in. broad and ¾ in. thick, grayish dotted with red-brown: fis. bright yellow with white stamens, 1 in. across.

Trièbneri. Growths 34 in. high and broad and 1 in. thick, grayish with red-brown lines: fis. yellow, 114 in.

turbiniformis (M. turbiniforme). Growths to about 11/2 in. high and broad, irregularly tuberculate, gray marked with dark brown: fls. bright yellow, 11/2 in. across.

umdausénsis. Similar to L. Fulleri but of drab olivegreen color: fls. white, 1 in. across.

urikosénsis. Growths conical, about 1 in. high and ½ in. broad, gray-green marked with brown: fls. yellow.

Vállis-Marke. Forming clumps: growths to 1½ in. high and 2 in. broad, pitted, blue-gray: fls. yellow, 1½ in. across.

Vanzijlii. Growths 1-11/2 in. thick, greenish-brown irregularly marked with dark brown: fis. orange-yellow, 1/2 in. across.

LITHOSPÉRMUM. GROMWELL. Boraginacex. Hairy ann. and per. herbs, or sometimes subshrubs, mostly in northern hemisphere, with alternate entire lvs. and white, yellow, blue or violet fls. in bracted racemes or spikes; corolla funnelform or salverform, naked in throat, often showy; planted in rock-gardens and borders. Propagated by seeds and cuttings.

angustifòlium (L. linearifolium). Per. to 2 ft.: lvs. linear: fis. of two kinds, the earlier ones bright yellow, to 1 in long, later fis. pale yellow. Ind. to B. C. and Ariz. on dry land.

breviflorum. Per. to 1½ ft.: lvs. narrowly linear, to 2 in. long, usually ascending: fis. deep yellow, to ½ in. long, corolla-lobes fringed or finely toothed. Ark. to Colo. and New Mex.

canescens. Puccoon. Per. to 11/2 ft., hairy: lvs. oblong to linear: fis. orange-yellow, 1/2 in. long, corolla-lobes entire, tube not hairy. Ont. to Tex.

carolinense. Per. to 2½ ft., sts. leafy, clustered and branched: lvs. narrowly lanceolate: fis. orange-yellow, to 34 in. long, corolla-lobes entire, tube long, hairy at base. N. Y. to Mont. south to Fla. and New Mex.

N. Y. to Mont. south to Fig. and INEW MAEX.
diffusum (L. prostratum. Lathodora diffusa). Dwarf or
prostrate evergreen subshrub: Ivs. linear-lanceolate: fis.
deep blue striped with reddish-violet, ½ in. long. S. Eu.

distichum. Per., erect, silky-hairy: lvs. oblong-lanceolate: fls. white with yellow throat. Mex.

Froebellii: listed as a "dwarf compact plant to 10 in. with rosemary-like lvs. and dark blue fls."; it may be a Moltkia.

fruticosum (Lithodora fruticosa). To 10 in.: lvs. narrow, revolute, white-tomentose beneath: fis. blue. S. Eu.—The plant commonly cult. under this name is L. diffusum.

Gástonii. Per. to 10 in.: lvs. ovate-lanceolate, to 3 in. long, acuminate, somewhat spreading and recurved: fls. dark blue with white center, few, corolla-tube short, hairy at base. Pyrenees.

Gmélinii (L. hirtum). Per. to 2 ft.: lvs. lanceolate or oblong, hairy: fls. orange, ¾ in. across. N. Y. to Fla. and New Mex.

graminifdlium: Moltkia suffruticosa.

hirsùtum: listed name.

hirtum: L. Gmelinii.

intermèdium. Subshrub to 10 in.: lvs. narrow, slightly hoary: fls. blue, drooping. Of uncertain botanical position and country not recognized.

lanigerum: listed name.

linearifolium: L. angustifolium.

multiflorum. Per. to 2 ft.: lvs. linear or linear-lanceolate: fls. light yellow, ½ in. long. Wyo. to Mex.

oblóngum. Per. to 8 in.: lvs. spatulate to linear-oblong, rough-hairy: fls. ½ in. across. Wyo. to New Mex.

officinale. Per. to 4 ft.: lvs. lanceolate or ovate-lanceolate: fis. yellowish-white, 1/6 in. long. Eu.; widely nat. in E. U. S.

oleifolium. Prostrate subshrub: lvs. elliptic-oblong, 1/2 in. long: fls. 1/2 in. long. Pyrenees.

petræum: Moltkia petræa.

pilosum. Per. to 1 ft., usually unbranched: lvs. linear-lanceolate, to 4 in. long: fis. greenish-yellow, in leafy infi., calyx about as long as corolla. W. N. Amer.

prostratum: L. diffusum.

purpuráscens: L. purpureo-cæruleum.

purpureo-cærûleum (L. purpurascens). Per. with procumbent sts. to 2 ft. long: lvs. lanceolate: fis. rich blue, ½ in. across. Eu.

rosmarinifolium. Tufted suffrutescent per. to 2 ft., sts. hairy: lvs. linear-lanceolate, margins revolute, white-silky beneath: fls. blue, hairy outside, in short solitary terminal racemes, calyx white-woolly. Italy and Greece.

sibíricum: Mertensia sibirica.

tenuiflorum. Sts. decumbent, to 1 ft. long: lvs. oblong-linear: fls. blue or rarely white, 1/4 in. long. S. E. Eu. to

LITHRÀA. Anacardiacex. Evergreen trees and shrubs with leathery simple or pinnate lvs. small fls. in panicles, 10 stamens, fr. a 1-celled drupe; 3 species in S. Amer., planted in Calif.

caústica. Shrub: lvs. simple, oval or oblong-ovate: fis. white: fr. white and lustrous, small. Chile.

molleoides. Shrub to 12 ft.: lvs. pinnate, of 3-5 lfts.: fls. greenish or whitish: fr. whitish and lustrous, small. S. Brazil, Argentina, Bolivia.

Lauraceæ. Dioccious trees and shrubs mostly of the Old World tropics, having commonly alternate lvs., small fls. in umbels, and fr. a berry; sometimes planted in S. Calif. for ornament and interest.

calicaris. Tree to 40 ft.: lvs. ovate to ovate-oblong, to 5 in. long, entire: umbels in racemes: fr. reddish, ¾ in. long. New Zeal.

ferruginea. Tree to 80 ft.: lvs. oblong, to 7 in. long, red-tomentose on nerves beneath: fr. globose, small. Singapore, Java.

glauca. Lvs. elliptic to lanceolate-oblong, to 5 in. long, acute to acuminate, minutely silvery- to yellow-hairy beneath or sometimes subglaucous: fis. in dense umbels or glomerules: fr. subglobose, to 1/4 in. diam. Japan.

LITTÆA HYSTRIX: Agave stricta.

LITTÒNIA. Liliacex. Small genus of tender plants mostly in trop. Afr. and Arabia, having a tuberous non-bulbous rootstock, an erect or prostrate leafy st., with campanulate fls. solitary in axils: allied to Gloriosa from which it differs technically in its more climbing sts. and perianthesegms. not clawed nor strongly reflexed. Cult. as for Gloriosa.

modésta. St. simple, suberect, often prostrate or runner-like: lvs. ovate, lanceolate or linear, tip produced into tendril, central ones whorled: fls. bright orange, to 1½ in. long, pedicel to 2 in. long. S. Afr.

LIVE-FOR-EVER: Sedum.

LIVERLEAF: Hepatica.

LIVING ROCK: Roseocactus fissuratus.

LIVISTONA. Palmacex. Hermaphrodite more or less ringed fan-palms in trop. Asia, Malaya, Philippines, New Guinea, and Australia, unarmed except on the petioles of some species, mostly tall, with branching long-peduncled spadices among the heavy foliage: lvs. more or less orbicular, plicate, deeply cut into narrow often bifid lobes: fls. small, numerous; stamens 6, filaments united: fr. drupe-like, small, globose or somewhat oblong, with thin flesh, variously colored; seed 1. The Livistonas are sometimes yet known to planters as Corypha. The species are much confused among cultivators, particularly the immature plants. Only one of the Livistonas, L. chinensis, is much known in the U.S. For cult. see Palm.

altissima: L. rotundifolia.

austrâlis (Corypha australis). To 60 or 80 ft., bearing a dense crown: lvs. orbicular in outline, 3-5 ft. across, divided to middle into narrow entire or bifid lobes, without threads between the lobes when mature; petiole broad at base, to 5 ft. long, bearing stout short curved spines: spadix much branched, glabrous, spathe densely tomentose: fr. spherical, ½-34 in. diam. Australia.

spherical, ½-¾ in. diam. Australia.

chinensis (L. oliveformis). CHINESE FAN or FOUNTAIN PALM. Trunk stout and obscurely ringed, 20-30 ft., bearing a heavy dense globular crown with the lower lvs. declined or hanging: It-blade 3-6 ft. across, rotundate-reniform, cut ½ to ½ the depth into many narrow 1-ribbed segms, which in young plants are bifid an in. deep but on mature trees are parted a ft. or two deep and the narrow parts hang like a fringe; filaments usually none; petiole 2-6 ft. long, armed below with small spines (which may disappear); spathes scurfy: fr. olive-form, about ½ in. long, dull blue. Cent. China. Var. subglobosa (L. subglobosa), fr. globose, little if any longer than thick.—The Chinese fan palm is the commonest palmate palm in cult. in N. Amer., being prized as a tub-plant and for decorations as well as an outdoor tree in most regions where palms will grow. It is very easy of cult. The plant is still sometimes known by the misapplied name Latania borbonica: this name should now be dropped from the lists.

be dropped from the lists.

cochinchinénsis (L. Hoogendorpii). Tall and relatively slender, to 40 or 50 ft., the lf.-bases soon falling and leaving triangular scars: lvs. dark green, 3-6 ft. across; pinnæ very deeply bifd, with 2 strong side ribs; petiole bearing many dark colored very stout long sometimes branched spines or thorns that are thickened at base: fr. globose or somewhat broader than long, about ½ in. diam., blue. Malaya.

decipiens. Small or medium-sized palm making a loose open head: It-blade 2-5 ft. across, somewhat glaucous underneath, cut to the base into many narrow deeply bifid pendent segms.; petiole slender, bearing scattered small prickles: fr. spherical, about ½ in. diam. Probably Australian.

Hodgendorpii: L. cochinchinensis.

himilis. Low, trunk 6-15 ft.: lvs. rather small, blade about 1½ ft. in radius, rather stiff, deeply divided, filaments very short or wanting; petiole bearing small prickles: fr. ovoid-oblong, about ¾ in. long. Australia.—Decorative when young.

Jenkinsiàna. To 30 ft.: lvs. 5-6 ft. across, glaucous underneath; segms. 70-80, very narrow, shortly bifid; petiole spiny whole length; fr. 1 in. or less diam., blue. Assam.

Marise. To 40 ft., bearing a loose head: lvs. glaucous, when young the petiole and blade red or tinged; blade 3-6 ft. long, nearly orbicular and contracted toward base, split to middle and beyond, with a thread in each sinus; segms. deeply bifid, but the segm. itself rather than its lobes hanging; petiole with many stout but short spines: fr. spherical, about ½-¾ in. diam. Inland palm in Australia.

olivæfórmis; L. chinensis.

rotundifòlia (L. altissima. Corypha rotundifòlia). Trunk to 80 ft. and more, rather slender, obscurely ringed: If.-blade nearly orbicular, with short segms. bifid at apex; petiole of young If. bearing spines, that of older lvs. nearly to quite spineless: fr. spherical, about ¾ in. long, black. Malayan region; variable.

subglobòsa: L. chinensis var.

LIZARDS-TAIL: Saururus.

LLÓYDIA. Liliaceæ. Bulbous herbs of the Erythronium group, with narrow grass-like lvs. and small white fls., the perianth-segms. distinct; suitable for the alpine-garden.

serótina. To 6 in.: lvs. to 4 in. long: fls. yellowish-white veined with purple, 1/2 in. long. Rocky Mts.; mts. of Eu. and Asia.

LOASA. Loasaceæ. Herbs or subshrubs native in S. Amer. and Mex., usually with stinging hairs, the fis. yellow, white or red, with hooded petals and colored nectar-scales so that the coloration may be complex, and fr. a caps.; sometimes grown in flower-gardens. Propagated by seeds and cuttings.

acanthifolia. Erect per. covered with stinging hispid hairs: lvs. 3-5-pinnate, to 4 in. long, lobes coarsely sinuate, dark green: fls. yellow, to ¾ in. across, petals sac-like, recurved; calyx-lobes longer than petals, linear-lanceolate, serrate-hispid. Chile.

aurantiàca: Caiophora lateritia.

híspida: L. urens.

lateritia: Carophora lateritia.

tricolor. Ann. to 2 ft.: lvs. opposite, 2-pinnate: fls. yellow with a red crown and white stamens. Chile.

triphýlia. To $1\frac{1}{2}$ ft.: lvs. alternate, 3- or rarely 4-5-lobed: fls. few. Peru.

ûrens (L. hispida). Ann. to 1½ ft.: lvs. alternate, pinnatifid: fls. yellow, 1 in. across. Peru.

vulcânica (L. Wallisii). Ann. to 3 ft.: lvs. palmately 3-5-lobed: fls. white with deep yellow crown barred with red and white. Ecuador, Colombia.—Some of the material offered as Blumenbachia Hieronymii belongs here.

Wállisii: L. milcanica.

LOASACEÆ. Loasa Family. Mostly herbaceous sometimes twining plants, of 13 genera mostly in N. and S. Amer., usually armed with rough bristly and often stinging hairs: fls. regular and bisexual, polypetalous, having 4-5 sepals and petals, numerous stamens, inferior 1-3-celled ovary, and capsular fr. Species cult. for ornament are in the genera Blumenbachia, Caiophora, Eucnide, Loasa, Mentzelia.

LOBE: any part or segment of an organ; specifically a part of petal or calyx or leaf that represents a division to about the middle more or less.

LOBÈLIA. Lobeliaceæ. Showy ann. and per. herbs with alternate lvs., fls. in terminal racemes, spikes or panicles, the corolla-tube split down one side and the 5-lobed limb 2-lipped, and capsular fra

Lobelias are grown in borders and the flower-garden. The native perennial horticultural species thrive in moist locations. Seeds of the annual kinds sown in early winter

will produce flowering plants by April or May. Propagated also by cuttings, and the perennials by division.

absolve determines, and the perennian by division.

aberdárica. To 9 ft.: lvs. oblong-lanceolate, to 16 in. long and 2 in. wide, obtuse, sessile, entire: fls. French-blue to lilac-blue and white, to 1½ in. long, in spikes to 4 ft. or more long. Kenya, E. Afr., said to grow in swampy places at elevations of 8,000-10,000 ft.

campanulata: Monopsis campanulata.

cardinalis. CARDINAL-FLOWER. INDIAN-PINK. Per. to 3 and 4 ft., glabrous: lvs. oblong-ovate or -lanceolate toothed: fls. bright cardinal, to 1½ in. long. N. B. to Fla. and Ter.

Cavanillesii: L. laxiflora var. angustifolia.

compácta: L. Erinus var.

Dàvidii. Ann. to 3 ft.: lvs. ovate oblong to linearlanceolate, to 6 in. long including petiole, doubly and sharply dentate to serrulate, glabrescent: fls. violet, to 1 in. long, subtended by long leafy bracts, in dense elongated racemes. China.

Erinus. Edging L. Ann. 4-12 in. high, partially trailing, nearly glabrous: Ivs. obovate to linear, toothed: fis. pale blue or violet with white or yellowish throat, to ¾ in. across. S. Afr. Some of the hort. vars are: Alba, fis. white; compacta, low and dense; erécta, of low compact habit; flore-plèno, fis. double; grácilis, sts. long and slender; kermesina, fis. crimson; Lindleyana, fis. rose with white throat; Paxtoniana, fis. light blue with white throat; pàmila, very dwarf; speciòsa, fis. azure-blue with white throat.

fülgens. Per. to 3 ft., usually pubescent and tinged brown or bronze: lvs. lanceolate, toothed: fis. deep red, about 1½ in. long. Mex.

Gerârdii. Hybrid between L. siphilitica and a form of L. fulgens: fis. rich violet, 1½ in. long. Var. lugdunénsis has rose-colored fis.

glandulòsa. Per. to 4 ft.: lvs. linear or narrow-lanceolate, toothed: fls. blue, to 1 in. long. Swamps, Va. to Fla.

grácilis. To 1 ft., glabrous: lvs. ovate to linear, the lower pinnatifid: fls. blue with whitish throat, to ¾ in. across. Australia.

heterophylla. Resembling L. graculis but with larger fls. and winged seeds. Australia.

hybrida. A group name comprising garden hybrids between various or several species.

inflata. Indian Tobacco. Ann. to 3 ft., hairy: lvs. oval to ovate-lanceolate, toothed: fis. light blue, 1/4 in. long: caps. inflated. Lab. to Ga. and Ark.

Kálmii. Per. to 20 in., sts. slender, somewhat branched: lower lvs. spatulate, obtuse, upper lvs. narrower: fls. light blue, about ½ in long, in loose racemes, on pedicels to 1 in. long: caps. subglobose, to ½ in. long, not inflated. N. S. to N. J. west to Man. and Ohio.

laxiflòra. Per. to 5 ft., hairy: lvs. lanceolate or ovate-lanceolate, toothed: fls. red and yellow, 1½ in. long, cylindric, stamens exserted at one side. Mex. Var. angustifòlia (L. Cavanillesis) has lanceolate to linear lvs.

Lindleyana: L. Erinus var.

linarioides. Ann. to 6 in : lvs. obovate-oblong to lanceolate, to ¾ in. long, remotely serrulate, acute: fls. blue, small, on erect pedicels ½ in. long: caps. obovoid, to ¼ in. long. S. Afr.

lugdunénsis: L. Gerardii var.

péndula: probably represents a pendulous form of L. Erinus.

pùmila: L. Erinus var.

ramòsa: L. tenutor.

speciòsa: L. Erinus var.

spicata. Per. or bien. to 4 ft.: lvs. oval to lanceolate, wavy-toothed or entire: fis. pale blue, ¼ in. long. P. E. I. to N. C. and La.

siphilitica. Per. to 3 ft, nearly glabrous: lvs. oblongoval to lanceolate, toothed: fls. deep blue or purplish, 1 in. long. Me. to La. Var. álba has nearly white fls. Var. nana is lasted as a dwarf form.

spléndens. Per. to 4 ft., nearly glabrous: lvs. linear or linear-lanceolate, toothed: fls. deep red. Tex. to Mex.

tendior (L. ramosa). Ann. to 1½ ft., pubescent: lvs. ternately divided or upper entire: fis. bright blue, 1 in. long. Australia. Var. compacta is listed.

triquètra. Ann. to 2 ft.: lvs. linear-lanceolate, toothed: fls. blue, small. S. Afr.

Tupa. Per. or subshrub to 7 ft.: lvs. oblong-oval, toothed, tomentose and wrinkled: fls blood-red, 2 in. long, the lobes of corolla united at tips. Chile.—Grown in Calif.

LOBELIACEÆ. LOBELIA FAMILY. About 20 genera of herbs, shrubs or trees of wide dis-

tribution, separated from the closely related Campanulaceæ chiefly because of the irregular fls. and the anthers united into a ring or tube. A few genera are grown for ornament, as Centropogon, Downingia, Hypsela, Isotoma, Lobelia, Monopsis. Palmerella. Pratia.

LOBÍVIA. Cactaceæ. About 60 species of Peru, Bolivia and Argentina, differing from Echinopsis (among other things) by fl. short-funnelform to bell-shaped and the tube short. See Cacti.

Allegraiana. Usually solitary, globose, to 3½ in. diam., somewhat glaucous green; ribs spiralled, crenate, tubercled; spines about 12, to 1½ in. long, curved, yellow to brownish: fls. red, to 2 in. long. S. W. Peru.

atrévirens. To 3 in. long and 3/4 in. diam.; ribs about 15, flattish; radial spines 9-12, to 3/4 in. long, whitish to brown. Argentina.

aurea (Echinopsis aurea). Globular to cylindrical, to 4 in. tall and 2)₂ in. diam; ribs 14-15, acute, high; spines yellowish-brown, radials 8-10, divergent, centrals 3-6, to 1½ in. long: fls. glossy lemon-yellow, segms. acute. W. Argentina.

Bâckebergii (Echinopsis Backebergii). Simple or branched at base, globose or ovoid, 2 in diam.; ribs about 15; spones all radial, usually 5, to 2 in. long: fis. carmine, 1½ in. long. Bolivia.

Binghamiana. Solitary or cespitose, depressed-globose, to $3\frac{1}{2}$ in. diam., pale green with white dots; ribs about 22, wavy, to $\frac{1}{2}$ in. high; radial spines 9-12, unequal, orange-yellow, pungent; centrals 3, to $\frac{5}{8}$ in. long: fis. purplish-red, to 2 in. long. S. E. Peru.

boliviénsis. Clustered, globose, to 4 in. diam.; ribs about 20 and tubercled, spines 6-8 and to 3½ in. long. Bolivia.

brevifiòra. Usually solitary, depressed-globose, grayish-green; ribs 22-25, somewhat wavy, obtuse to acute, areoles white-woolly; radial spines about 25, pectinate, to ½ in. long, brownish to gray; central erect, often swollen at base: fls. cinnabar-red, to 1½ in. long.

cæspitôsa (Echnopsis cæspitôsa). Cylindrical, to 4 in. tall or more and about 13/ in. diam., usually spineless on top; ribs 10-12, sharply angled, straight and notched; spines brownish, radials 11-13, to 3/4 in. long, central 1, to 2 in. long, curved: fis. carmine inside with darker red throat, reddish-yellow without, stigma 8-lobed. Bolivia.

chionantha (Echinopsis chionantha). Depressed-globose, to 3 in diam., pale green; ribs about 15, to ½ in. tall, acute, notched; spines brown to black, becoming gray, subulate, radials 6-10, centrals 2, to 1½ in. long: fis. white, to 2½ in. long, slightly fragrant. Argentina.

chrysantha. Solitary, globose, gray-green; ribs about 13, to ½ in high, areoles ½ in. apart, becoming glabrous; spines all radial, 5–8, to ¾ in. long, reddish-brown to gray, often dark tipped: fls. golden-yellow with wine-colored throat, to 2 in. long, fragrant, stigma 9-lobed, purple. Argentina.

cinnabarina (Echinopsis cinnabarina). Simple, broader than high; ribs about 20 and tubercled; radial spines 8-10 and curved backward; central spines 2-3; fls. near top of plant, scarlet, 1¾ in. across. Bohvia.

córbula (Mammillaria corbula). Cespitose, globular, usually 5-8 plants together; ribs 12-18, wavy; spines often absent, when present usually 6-9 in areole, to 2 in long, yellowish: fis. nocturnal, salmon-red, to 1½ in. long. Peru.

cylindrica. Solitary, cylindrical, to 5 in. high and 2½ in. diam.; ribs about 11, to ½ in. high and as wide; radial spines about 7, to ½ in. long, awl-shaped, pinkish with black base; central 1, to 1½ in. long, stiff: fls. yellow, to 2½ in. long. N. Argentina.

densispina; probably the same as L. famatimensis var. longiseta.

Driyeriana. Solitary, root somewhat fleshy and fusiform, st. globular, about 3 in. diam.; ribs low, obtuse; spines curved, radials 10-12, bristly, gray-white, centrals 1-4, to 34 in. long: fls. pale yellow, style green. Argentina. Var. aurantiaca has orange fls. with purple style. Var. nobilis has dark orange fls. with pale purple style.

Dûcis-Paûlii. Globose becoming cylindrical, to nearly 3 in. diam., dark to gray-green; ribs 18-21, to ½ in. high, acute, notched; radial spines 6-8, to ¾ in. long, spreading, slender, purplish-brown to gray; centrals 2-4, to 1 in. long: fls. white. Argentina.

euanthema. Globular to obconical with distinct taproot, sts. dull green, to 2 in. tall and 1½ in. diam., usually less; ribs usually 8-12, low, somewhat tubercled; spines glossy white with reddish base, radials about 10, centrals 2, to ½ in. long: fis. orange-red within with carnine throat, dark red without. Bolivia. famatimensis (Echinopsis famatimensis). Solitary or clustered, to 1½ in. high and 1 in. diam.; ribs 24; spines small and whitish: fls. on side near middle of plant, from yellowish-white to deep red, 1¾ in. long. Argentina. The listed vars. are: cinnabarina, with carmine-to cinnabar-red fls.; hæmatántha, with blood-red fls.; longisèta, spines to 1¾ in. long; rosifòra, with fls. rose-pink; and setòsa, spines more numerous and bristly.

fèrox (Echinopsis ferox). Globose with fibrous roots, to 1 ft. diam.; ribs 23-31, undulate, notched into tubercles to 1½ in. long; spines curved, radials 10-12, slender, to 3½ in. long, centrals 3-4, to 6 in. long, weak: fis. not seen. Bolivia

formòsa: probably Echinopsis formosa.

grandiflora. Globose to subcylindric, to 8 in. tall and 5 in. diam.; ribs usually 14, notched; spines all radial, about 4-16, awl-shaped, to ½ in. long, yellowish: fis. pink, to 4 in. long. Argentina.

grandis (Echinopsis grandis). Globose, to 10 in. high; ribs 14-16; spines 10-15, to 3 in. long: fis. lateral, white, 2½ in. long. Argentina.

Graulichii: Echinopsis Kratochviliana.

Haageana. Cespitose, st. probably cylindrical, to 12 in. tall; ribs 11-13, acute; spines yellowish, radials usually 10, to 34 in. long, centrals 3-4, to 234 in. long; fls. clear yellow to 24 in long, centrais 3-4, to 2.94 in long; iss. clear yeard with red stamens, usually campanulate, to nearly 3 in. long. Argentina-Bolivia. Var. albihepática has purplish-to orange red throat. Var. chrysántha has flesh-colored fis. Other listed vars. are: albicéphala, bícolor, cinnabarina, croceántha, durispina and leucoerythrántha.

hæmatántha. Globose, 2 in. high; ribs 11; radial spines 6-8 and small; central spines 3 and 2 in. long: fls. purplish, 11/2 in. across. Argentina.

Hermanniana. Clump-forming, sts. cylindrical to 8 in. tall and 2 in. diam., bright green; ribs about 13, straight, obtuse to acute; spines numerous, the upper ones to ½ in. long, flexible, slender, the lower ones to 2½ in. long, gray: fls. rose-violet to carmine, to 3¼ in. long, style and stamens yellow. N. E. Bolivia.

Hertrichiana (Echinopsis Hertrichiana). Solitary in the wild but cespitose when propagated from seed, st. de-pressed-globose, to 4 in. across; ribs 10-12, pale glossy green, obtuse, about ½ in. across; tubercled; spines pale to dark yellow, radials usually 7, to ½ in long, spreading, central 1, to 1 in. long; fis. scarlet, to nearly 3 in. long and as wide. S. E. Peru.

Higginsiàna (Echinopsis Higginsiana). Usually solitary, depressed-globose, to 4 in. diam., gray-green; ribs commonly 16, acute, tubercled; spines grayish, radials 9-11, usually contorted and curved, to nearly 2 in. long, central 1, to 3 in. long; fis. yellow-red inside and dark red without, to about 2½ in. long, funnelform, stigma green, 8-lobed. Bolivia.

Hôssei (Echinopsis Hossei. L. Marsoneri). Solitary, cylindrical; ribs about 13, to ¼ in. high; spines reddish becoming gray, radials 7-8, to ¾ in. long, centrals 1-3, to 1¼ in. long; fls. yellowish-orange, slightly fragrant, stigma green, 10-12-lobed. Argentina.

incaica. Solitary, globose to cylindrical, occasionally branched, to 6 in. high and 3 in. diam., green, minutely spotted white; ribs about 15, usually to ½ in. wide, acute, wavy; radial spines usually 14-20, unequal, ½-¾ in. long, stiff, pungent, brown to reddish, centrals about 7, stouter: fls. blood-red, to 1½ in. long. S. E. Peru.

Jajoiàna. Usually solitary, subcylindrical, light green, to 2 in. diam. or more; ribs usually 14-20, rarely more than 24, acute, tubercles acute; radial spines about 10, pinkishwhite, to ½ in. long; central 1, blackish, to ¾ in. long: fls. dark wine-red tinged purplish-blue, to 2½ in. long and nearly as wide. Argentina.

Janseniana. Solitary, usually to 3 in. tall and 2 in. diam., rarely to 8 in. tall, gray-green; ribs 11-14, about 1½ in. high, straight, acutish; radial spines 10-14, to ½ in. long, black, base somewhat swollen; centrals about 4, longer: fis. yellow, throat reddish, to 2½ in. across. Argentina. Var. leucacántha, st. light colored, spines brownish to gray.

Johnsoniana. Cespitose, depressed-globose, to $2\frac{1}{2}$ in. diam. and $1\frac{1}{2}$ in. high; ribs about 16, to $\frac{1}{2}$ in. high, are oles to $1\frac{1}{2}$ in. apart; spines 1-7, the central one to $1\frac{1}{2}$ in. long, the others to $\frac{1}{2}$ in. long: fis. to 2 in. across. Bolivia.

lateritia. Globose to subcylindrical, to 3 in. tall and nearly as thick; ribs 16-18, obtuse, to 1/2 in. across and as high, gray-green; spines curved, radials about 10, to 1/2 in. long, centrals 1-2, stout at base, to 1 in. long; fis. dark red, to 2 in. long, funnelform, stigma green, 8-9-lobed. Bolivia.

leucorhòdon. Globose, base somewhat tuber-like, to 2 in. diam. or more, top spineless or nearly so; ribs 20-22, acutish, notched, high, tubercles acutely angled; spines curved, radials about 7, adpressed, central 1, stouter to ¾ in. long: fis. lilac with white throat. Bolivia.

longispina (Echinopsis longispina). Globose to cylin-

drical, to 10 in. tall and 4 in. diam.; ribs usually 24-30, strongly tubercled; spines brown to gray, radials 8-10, centrals 1-4, to 314 in. long; fis. white, to 134 in. long. N. Argentina.

Mársoneri: L. Hossei

mistiénsis (Echinopsis mistiensis). Usually solitary, globose to subconical; ribs 25-30, acute, narrow, to ½ in. high; spines all radial, usually 7-9, to 2 in. long, red becoming gray, darker toward tip: fis. pink. S. Peru.

Nealeana (Echinopsis Nealeana). Solitary, cylindrical, to 3 in. tall and 1½ in. diam., usually spineless and reddish-brown toward base; ribs commonly 13-15, inconspicuous; spines radial, usually 7-9, to nearly ½ in. long, yellow or reddish: fis. brilliant red, to 2 in. long and as wide. Peru.

neo-Haageana. Usually cepitose, globose, to 1½ in. diam., roots tuberous; ribs 10-11, low, to ½ in. wide, obtuse, gray to blue-green, tubercled; spines all radial, usually 10-12, bristly, to ½ in. long, glossy white with reddish base: fls. pale to dark salmon-pink, about 1½ in. diam., rotate. N. Argentina.

nigra: see Echinopsis nigra.

orurénsis. Cespitose, sts. about ¾ in. diam., olive-green; ribs about 9, to ¼ in. tall, tubercled; spines commonly 10, less than ¼ in. long, usually pectinate, yellowish-white: fls. probably red. Bolivia.

pampana. Somewhat cespitose, sts. globose, to 3 in. diam.; ribs 17-21, somewhat undulate; spines 5-20, usually curved, to 2 in. long: fis. red, to 2 ½ in long. S. Peru.— Cult. forms are frequently spineless or nearly so

Péntlandii (Echinopsis Pentlandii). Simple, ellipsoidal, to 6 in. diam., often somewhat glaucous; ribs about 12; spines 5-8 and all radial, about 1 in. or less long: fls. about 11/2 in. long, rose-colored inside. Bolivia.

polycéphala. Plant compressed-globose with fusiform root, dull gray-green becoming olive-green; ribs about 16, rounded becoming acute, areoles about ½ in. apart, whitewoolly; radial spines about 10, ½4 in. long; centrals 3-4, slightly longer and stouter: fls. bright brick-red, 1½ in. long and slightly wider. Argentina.

potosina (Echnopsis potosina). Solitary, globose, to 3½ in. diam., bright green; ribs usually 13, acute, to ¾ in. high; spines stiff, to 1½ in. long, white to reddish becoming grayish-brown, radials 8-9, centrals 1-4 usually hooked: fls. dark pink to red. Bolivia.

pseudocachénsis (Echnopsis pseudocachensis). Cespitose, depressed-globose, with prominent tap-root, st. to 2½ in. diam.; ribs 12-14, obtuse; spines curved, radials about 10, brownsh-yellow, to ½ in. long, central 1, to ¾ in long, nearly black; fls. bright dark red, to 2½ in. long. Argentina. Vars. cinnabarina and sanguínea are listed.

pygmæa. Short-cylindric, to 2 in. long and 1 in. diam, and perhaps larger; ribs 8-12, low, areoles close, whitewoolly; spines 9-11, all radal, tiny, glossy white: fls. pale purple, to 1½ in. long, tube white-hairy. Argentina.

raphidacántha. Cespitose, depressed-globose; ribs acute; spines usually 7, the radials spreading and curved, the central 1, to 3 in. long. Bolivia.

rebutioides. Cespitose, forming broad tufts, sts. depressed-globose, to 34 in. dam., dull bluish-green; ribs 12-14, acute, straight, densely tubercled; spines all radial, about 8-9, bristly, glossy white, to 34 in. long, a pseudocentral one to 1½ in. long; fis. bright red, to 1½ in. long. Argentina. Var. citriniflora has pale yellow fis.

rubéscens. Similar to L. Haageana, differing in having 12 radial spines and 4 centrals, the latter to 1 3/4 in. long, the fis. reddish. Argentina.

Rùmii: listed name.

salténsis (*Echinopsis saltensis*). Becoming clustered, shining light green; ribs 17–18; radial spines 12–14; centrals 1–4 and $\frac{1}{2}$ in. long: fis. on side near middle of plant, red, $1\frac{1}{2}$ in. long. Argentina.

Schreiteri (Echinopsis Schreiteri) Cespitose forming tuits to 1 ft. or more across, sts. globose to 1½ in. diam; ribs 9-14, low; spines to ½ in. long, radials 6-8, slender, curved, central 1 or absent, short: fis. purple, to 1½ in. long. N. Argentina.

Shaferi. Cylindrical, to 6 in. tall and 1¾ in. diam, very spiny; ribs 10, obtuse, low; radials 10-15, to ½ in. long, slender; centrals 3-5, to 1¼ in. long: fis. pale yellow, to 21/2 in. long. Argentina.

spinifldra: Acanthocalycium spiniflorum.

Steinmannii (Echinocactus and Rebutia Steinmannii).
To ¼ in. high and ¼ in. across, areoles circular; spines about 8: fis. from side of plant, campanulate. Bolivia.

Tegleriàna: listed name.

thionántha: Acanthocalycium thionanthum.

Wegheians. Solitary, globose with long tap-root, st. to 2 in. diam., gray-green; ribs about 20, acute, sharply tubercled, to ¼ in. high; spines dark brown becoming

gray, radials 7-8, to 11/2 in. long, central 1, to about 11/2 in. long: fls. white to very pale lavender, to 21/2 in. long. Bolivia.

LOBULÀRIA (Koniga). Cruciferæ. Per. herbs and subshrubs differing from Alyssum in clear white fls. and in technical points; Medit. region; one is a favorite flower-garden subject.

marítima (Alyssum maritimum). Sweet Alyssum. Per. but grown as an ann., sometimes escaped, passing the winter in mild climates, diffuse and much spreading, rising to 1 ft.: lvs. lanceolate to linear, entire, 1–3 in. long: fls. small but many in lengthening racemes, white but sometimes running to violet, fragrant, produced over a long season.—There are many forms in cult., as Benthamis, compacta, gigantea, minima, Tom Thumb, also with variegated lvs. and double fls.; sometimes grown under glass, Raised from seeds.

LOCHNERA: Vinca rosea.

LOCKHÁRTIA. Orchidaceæ. Trop. American epiphytes with simple clustered sts. covered with short imbricated equitant lvs., and axillary 1-2-fld. infl., the sepals and petals similar, the lip commonly 3-lobed. For cult. see Orchids.

élegans. Sts. to 4 in. high: lvs. broadly triangular, about 1½ in. long: infl. short, but surpassing the lvs., 1-2-fld.; fls. pale green with hp yellow spotted with red-purple. Sept.-Jan. Trinidad, N. Brazil.

lunifera. Sts. to 14 in. long, thickly covered with lvs. to about ¾ in. long: infl. small, 1-2-fld.; fls. golden-yellow, lip spotted with purple-red. Jan.-Aug. Brazil.

LOCO WEED: Oxytropis Lambertii.

LOCUST: Robinia. Honey: Gleditsia. Swamp: Gleditsia aquatica. Sweet: Gleditsia triacanthos. Water: Gleditsia aquatica. West Indian; Hymenæ Coubaril.

LODOÌCEA. DOUBLE COCONUT. Palmacex. Diœcious unarmed fan-palm of the Seychelles, not regularly planted in the U.S. unless under test, and little known in cult. under glass but of interest because of the great 2-lobed drupe that reaches a length of 18 in. and contains 1 great 2-lobed seed and is one of the most remarkable frs. of the vegetable world. The staminate fls. are borne underneath scales in a dense catkinlike spike 2-6 ft. long and 4-5 in. thick; pistillate fls. on an open spike 4-6 ft. long; all spadices are borne in the lf.-axils, and on low trees the great frs. may rest on the ground. The lvs. are several ft. across, thick and heavy, on petioles 5-10 ft. long. The tree rises to 100 ft. in its native place. The floating nuts were once supposed to come from the Maldive Isls., an error preserved in the name L. maldivica (L. seychellurum). A small tree is standing in S. Fla., with protection when needed.

LOESÈLIA. Polemoniaceæ. Herbs or sometimes subshrubs with alternate or opposite toothed lvs. and red or violet bright funnelform fls. solitary or in clusters; grown in the open in warm climates and under glass; Tex. and Calif. to S. Amer.

coccinea: L. mexicana.

mexicana (L. coccinea). Attractive per. to 3 ft.: lvs. oval to lanceolate, to 2 in. long: fls. tubular, brilliant rosered, 1 in. long. Mex.

LOGANBERRY. A blackberry-like red acid fruit (Rubus ursinus var. loganobaccus) originated in California, with very long prostrate canes, much grown in Oregon and other parts of the Pacific coast country. The loganberry is used in the canned and dried product and in fruit juice. The plant is propagated by rooting tips. It is grown in rows 6 feet or more apart and usually trained on wires after the manner of dewberries. In the rows the plants are 8 feet or more apart.

as it is a long and vigorous grower. The loganberry is not hardy in the northeastern states although the roots may pass the winter.

LOGANIA. Loganiaceæ. Herbs or shrubs with opposite lvs., small white or pink fls. mostly in terminal cymes or panicles, and capsular dehiscent frs.; native in Australia and 1 in New Zeal.

longifòlia. Shrub to 6 ft. or more: lvs. elliptic or lanceolate, to 3 in. long: fls. in leafy panicles. Australia; intro. in Calif.

LOGANIACEÆ. Logania Family. About 30 genera of herbs, shrubs and trees widely distributed in warm and trop. regions of both hemispheres, having commonly opposite simple Ivs., bisexual regular gamopetalous fls. in panicles, cymes, heads or spikes, or sometimes solitary, with 4–5-lobed calyx and corolla, 4–5 stamens, superior 2-celled ovary, and fr. a caps., berry or drupe. Several genera yield drugs and poisons and others are grown for ornament as Buddleja, Desfontainea, Gelsemium, Geniostoma, Logania, Spigelia, Strychnos.

LOGWOOD: Hæmatoxylum campechianum.

LOISELEÙRIA. ALPINE-AZALEA. Ericaceæ. Depressed glabrous evergreen subshrub, L. procúmbens, of circumpolar regions, extending southward to the White Mts. and Mt. Katahdin, useful in alpine-gardening and cold rockery: 6-8 in., making mats: lvs. mostly less than 1/4 in. long, oblong, revolute: fls. very small, white or rose.

LÒLIUM. RYE-GRASS. Gramineæ. Ann. and per. grasses grown in pastures and meadows, native in the Old World: lvs. flat: spikelets flat, in terminal interrupted spikes. See Grasses.

itálicum: L. multiflorum.

multiflorum (L. italicum). ITALIAN R. Per. to 3 ft.: lvs. to 8 in. long and 1/5 in. wide: spikelets 20-30-fld., awned, in spikes to 1 ft. long. Eu.; nat. in N. Amer.

perénne. Perennial or English R. Tufted per. to 2½ ft.: lvs. to 5 in. long and ½ in. wide: spikelets 5-10-fld., awnless, in spikes to 1 ft. long. Eu., Asia; nat. in N. Amer.

temuléntum. DARNEL. Per. to 4 ft.: lvs. to 10 in. long and ¼ in. wide: spikelets 4-8-fid., shorter than the outer glume, in spikes to 1 ft. long. Eu.; nat. in N. Amer.

LOMARIA: Blechnum.

LOMATIA. Proteaceæ. Trees and shrubs with alternate, entire or pinnate lvs., bisexual fls. borne in pairs in simple or branched loose racemes, and fr. a leathery follicle; differs from Grevillea in having several instead of 2 seeds. Native in Australia and Chile; they require cool greenhouse treatment or are grown out-of-doors in warm regions. Propagated by cuttings of well-ripened wood.

fraxinifòlia. Small tree: lvs. pinnate into 3-7 ovate or ovate-lanceolate toothed stalked segms. to 3 in. long, leathery and shining: racemes to 8 in. long. Australia.

ilicifòlia. Shrub or small tree: lvs. ovate to lanceolate, to 3 in. or more long, prickly-toothed or lobed, silky-pubescent beneath, rarely pinnate. Australia.

obliqua. Lvs. ovate, to 4 in. long, crenate-toothed, bright green and leathery: fls. white, about 1/2 in. long. Chile.

silaifòlia. Shrub to 3 ft.: lvs. to 8 in. long, 2-3-pinnate into linear or lanceolate toothed sessile segms. Australia.—Dyed sprays are employed by florists and decorators, as "crinkle-bush."

LOMATIUM (Cogswellia). Umbelliferæ. Several short-stemmed or stemless per. herbs with thickened roots, dissected lvs., small yellow, white or purple fls. in umbels, and flattened frs.;

mostly native in W. N. Amer.; sometimes planted in wild-gardens or similar places.

ambiguum. To 1 ft.: lvs. 1-2-pinnate into linear lfts.: fls. vellow: fr. glabrous. B. C. to Ore. and Utah.

angustatum: L. Martindalei var.

feniculaceum (Cogswellia millosa). Stemless per. to 1 ft.: lvs. pinnately decompound, finely dissected: fis. yellow: fr. pubescent. N. D. to Wyo. and Tex.

Mártindalei var. angustatum (L. angustatum). Short-stemmed plant to 2½ ft. or more: lvs. bipinnate, narrow in outline, much dissected: fis. pale yellow: fr. glabrous. B. C. to Ore.—The typical form is of lower stature, has less dissected lys, and is not known to be in cult.

nudicaulis. To 2 ft., glabrous: lvs. biternate, segms. ovate to lanceolate, entire or toothed, to 2 in. long: glabrous, to ½ in. long. Ida. to B. C. and Calif. fr. elliptic,

triternāta. To 2½ ft., puberulous: lvs. 2-3-ternate, segms. linear to linear-lanceolate, to 4 in. long: fr. narrowly oblong, to ½ in. long. Wyo. to B. C. and Calif.

utriculatum. Spring Gold. Low, nearly stemless plant to 1 ft.: lvs. pinnately decompound with linear segms. to 3 in. long: fls. yellow, bractlets obovate, often toothed: fr. glabrous. B. C. to Calif.

villòsa. Lvs. several times pinnate, villous: bractlets of infl. very tomentose: fr. oval, puberulent, to 1/2 in. long. Kans. to Wyo. north to Alta. and Sask.

LONAS. Compositæ. Branching ann. to 1 ft. high, native in the Medit. region, and sometimes grown for ornament. L. inodora (Athanasia annua). African Daisy. Lvs. alternate, pinnately divided into linear entire segms.: heads 3/8 in. across, of yellow disk-fls., borne in dense corvmbs to 2 in. across; pappus cup-shaped.

LONCHOCÁRPUS, LANCE-POD, Leguminosæ, Trop, trees or climbing shrubs with alternate pinnate lvs., papilionaceous white, violet or purple fls. in racemes, and flat few-seeded indehiscent pods; sometimes planted in warm regions.

speciosus: Bolusanthus speciosus.

violaceus. Tree to 12 ft.: Ifts. ovate, commonly 4 pairs: ffs. violet. Farther W. Indies.

LONDON PRIDE: Saxifraga umbrosa.

LONGAN: Euphoria Longana

Honeysuckle. Caprifoliacex. LONICERA. Well known and favorite erect or climbing neat shrubs with opposite short-stalked or sessile lvs., rather small but showy fls. in axillary pairs subtended by 2 bracts and 4 bractlets, or in sessile whorls, followed by attractive berry-like often twin frs., widely spread in northern hemissphere. The name honeysuckle is sometimes applied erroneously to native azaleas (rhododendrons.)

Honeysuckles are very popular ornamental subjects and most of them are hardy North with the exception of the Himalayan species which require winter protection. They thrive in any good garden soil. Propagated by seeds in autumn or stratified, by cuttings of ripe wood, by layers, or by cuttings of green wood under glass.

Álbertii: L. spinosa var.

álbida: L. bella var.

albiflora. Somewhat climbing: lvs. oval or ovate, to 1½ in. long: fls. yellowish-white, 2-lipped, 1 in. long, in clusters, spring: fr. orange. Ark., Tex.

alpigena. To 10 ft.: lvs. elliptic to oblong, to 4 in. long: fts. yellowish tinged red, 2-lipped, ½ in. long, in pairs, May: fr. scarlet. Eu.

alseuosmoldes. Twining shrub: lvs. lanceolate, to 2½ in. long and ½ in. wide, base rounded: fls. orange-red, to ½ in. long, corolla-tube longer than limb, June-Aug.: fr. reddish. W. China.—Similar to L. Henryi.

Altmannii. To 6 ft.: lvs. ovate, to 2 in. long, pubescent beneath: fls. whitish, 2-lipped, ½ in. long, in pairs, May: fr. orange-red. Turkestan.

americans. Hybrid between L. Caprifolium and L. etrusca: climbing: lvs. oval or obovate, to 4 in. long, the upper connate: fis. yellowish, purple outside, 2-lipped, 2 in. long, in whorls, fragrant, June-July.

amcens. Hybrid between L. tatarica and L. Korolkowii: lvs. ovate, to 2 in. long: fis. pink or white, 2-lipped, 34 in. long, in pairs, May-July.

atrosanguinea: a form of L. Caprifolium.

aureo-reticulata: L. japonica var.

bélgica: a form of L. Periclymenum.

bélia. Hybrid between L. tatarica and L. Morrowin: lvs. ovate, to 2 in. long; fls. white or pink changing to yellow, 2-lipped, ½ in. long, in pairs, May-July: fr. red. Vars. álbida (L. albida) and cándida have white fls. Var. chrysántha is listed as having yellow fls. Var. incarnata and rôsea have rose fls.

bicolor: probably L. tatarica var.

Billardii: listed name of unknown botanical application. brachypoda: L. japonica var. repens.

Brownii. Hybrid between L. sempervirens and L. hirsuta, and closely resembling the former but the fis. somewhat 2-lipped. Var. fuchsioides (L. fuchsioides), fis. scarlet outside. Var. plantierensis, fis. coral-red with orange lobes. Var. punicea, fis. orange-red.

cærùlea (Xylosteon cæruleum). To 5 ft., much branched: cerilea (Xylosteon cæruleum). To 5 ft., much branched: lvs. ovate to oblong, to 3 in long, bright green: fs. yellowish-white, ½ in. long, paired, Apr.—May: fr dark blue and bloomy. Eu., Asia; nat. N. Amer. Var. atlàica has lvs. pubescent on both sides. Var. edulis has lvs. pubescent, oblong-lanceolate, and stamens longer than limb. Var. graciliflora (L. Karelini) has blush-green pubescent lvs. less than 2 in. long. Turkestan. Var. viridifòlia (L. Kirilowi) has bright green smaller lvs.

califórnica: L. hispidula var. vacillans.

canadénsis (L. ciliata). Fl.y H. To 5 ft.: lvs. ovate or oval, to 3 m. long, ciliate: fls. yellowish or tinged red, to 34 in. long, paired, Apr.-May: fr. red. Que. to Pa. and Minn.

Caprifolium (L. verna). Twining to 20 ft: lvs. oval, to 4 in. long, bluish-green beneath, the upper connate: fls. white or purplish, 2-lipped, 2 in. long, fragrant, in whorls, May-June: fr. orange-red. Eu., W. Asia; nat. in E. U. S. Var. atrosanguinea (L. sanguanea) has fis. reddish-purple without and somewhat yellowish within.

caucásica: L orientalis var.

chætocárpa. Shrub to 7 ft., twigs glandular-hispid: lvs. mostly oblong-ovate, to 3 in. long, acutish, harry above and densely so beneath: fls. yellowish-white, to 1¾ in. long: fr. red. W. China.

Chamissòl. Erect shrub to 3 ft., twigs glabrous: lvs. ovate to elliptic, to 2 in. long, usually obtuse, glabrous, subsessile: fls. dark violet, to ½ in. long: fr. red. N. E. Asia.

chinénsis: L. japonica var.

chrysantha. To 12 ft.: lvs. ovate to ovate-lanceolate, to 5 in. long: fis. yellowish-white changing to yellow, 2-lipped, to 3/4 in. long, in pairs, May-June: fr. coral-red. Asia. Var. latifolia (var. turkestanıca) has broad-oval lvs.

ciliàta: L. canadensis.

ciliòsa. Usually twining: lvs. deciduous or persistent, ovate to oblong-elliptic, to 4 in. long, cihate, blue-green beneath, upper pairs connate: fls. yellow, sometimes tinged purple, to 1½ in. long, in terminal 3-fld. sessile head-like cymes: fr. red. Mont. to Utah west to B. C. and Calif.

confusa. Twining: Ivs. somewhat persistent, ovate, to 2½ in. long, gray-green and pubescent beneath, apex acute, petioles to ½ in long; fls. white changing to yellow, 2-lipped, to 1¾ in. long, fragrant, in short panicles, ovaries pubescent, June Sept.: fr. black. China.

conjugiàlis. Erect and much branched, to 5 ft.: lvs. elliptic to obovate, to 2 in. long, acute, ciliate: fls. dark red, about 1/3 in. long, June: fr. red. Nev. to Calif. and Wash.

demíssa. To 12 ft., much branched: lvs. obovate, to 1¼ in. long, pubescent: fls. whitish changing to yellow, 2-lipped, ½ in. long, in pairs, May-June: fr. scarlet. Japan.

diolca (L. glauca. L. parviflora). Branches often twining: lvs. oval or oblong, to 3 in. long, glaucous beneath, upper pair connate: fis. greenish or yellowish, 2-lipped, ½ in. long, in whorls, style usually glabrous, May-June: fr. red. Que. to N. C. and Ia.

etrúsca. Climbing, evergreen or partially so: lvs. obovate or oval, to 3 in. long, glaucous and pubescent beneath, upper connate: fis. yellowish-white, 2-lipped, 2 in. long, fragrant, in dense spikes, June-July. Medit. region. Var. grandiflora is listed. Var. pubescens has lvs. pubescent on both sides. Var. supérba (L. gigantea) has large lvs. and deep yellow fis.

flava. Climbing: lvs. oval, to 3 in. long, bluish-green beneath, upper connate: fls. orange-yellow, 2-lipped, 1½ in. long, fragrant, in whorls, May-June. N. C. to Okla.

fragrantissima (L. Magnevillez. L. odoratissima). To 8 ft., partially evergreen: lvs. ovate or oval, to 3 in. long, bluish-green beneath: fis. creamy-white, 2-lipped, ½ in. long, very fragrant, in pairs, Mar.—Apr.: fr. red. China.—Fis. partly or wholly in advance of lvs. where deciduous. fuchsioides: L. Brownii var.

gigantèa: L. etrusca var. superba.

Giráldii. Clumbing: lvs. oblong-lanceolate, to 3 in. long, pulpescent: fis. purplish-red with yellow pulpescense outside, 34 in. long, June-Aug.: fr. purple-black. China.

glaùca: L. dioica.

glaucéscens. Similar to L. dioica, differing in lvs. pubescent beneath, corolla about ¾ in. long, style usually pubescent. Que. to Alta. south to Va. and Neb.

gracilipes. To 6 ft.: lvs. ovate, to 3 in. long, bluish-green beneath: fls. pink to carmine, ½ in. long, usually solitary and drooping, Apr.-May: fr. scarlet. Japan.

grandiflòra: perhaps L. tatarica var.

Halliana: L. naponica var.

Héckrottii. Probably hybrid between L. americana and L. sempervirens: Ivs. oval, to 2 in. long, glaucous beneath: fls. purple outside, yellow inside, 2-lipped, to 2 in. long, in

Hénryi. Twining or prostrate, partially evergreen: lvs. oblong-lanceolate, to 3 in. long, ciliate: fls. yellowishor purple-red, to 34 in. long, in pairs, June-Aug.: fr. black. China.

Hildebrandtiana. Climbing, evergreen: lvs. ovate, to 6 in long; fls yellow changing to orange-red, to 7 in. long, the tube very slender. Burma; not hardy N.; thrives in S. Calif.

hirsùta. Climbing: lvs. oval, to 4 in. long, gray-pubescent beneath, upper connate: fls. orange-yellow, 2-lipped, 1 in. long, in short spikes, June-July: fr. red. Que. to Pa. and

hispida. Shrub to 5 ft., twigs hispid to glabrate: lvs. elliptic to oblong, to 3 in. long, acute, glabrous to somewhat hispid, margins setose-ciliate: fls. yellowish-white, to 1½ in. long. fr. red, oblong. W. China to Turkestan.

hispídula. Branches surmentose: lvs. ovate or ovate-oblong, to $2\frac{1}{2}$ in. long, pubescent beneath, upper connate: fls. whitish or purplish, 2-lipped, $\frac{1}{2}$ in. long, in whorls, June-July: fr red. B. C. to Calif. Var. vacillans (L. californica) is more vigorous with larger lvs. and fls.

ibérica. To 6 ft., much branched: lvs. orbicular-ovate, to 1½ in. long, hairy: fls yellowish-white, 2-lipped, ½ in. long, in pairs, June: fr. bright red. W. Asia.

impléxa. Twining or bushy, evergreen: lvs. ovate or oblong, to 3 in. long: fls yellowish-white tinged red, 2-lipped, to 1¼ in. long, in whorls, June-Aug. Medit. region.

involucrata (Distegua involucrata). To 3 ft.: lvs. ovate to oblong-lanceolate, to 5 in. long: fls. yellow or tinged red, ½ in. long, in pairs, May-June: fr. purple-black, shining. Que. to Alaska and Mex. Var. faréscens, lvs. light green. Var. serótina, fls. orange-yellow tinged scarlet.

Var. serôtina, fis. orange-yellow tinged scarict.
japônica. Climbing, wholly or partially evergreen: lvs.
ovate, to 3 in long: fis. white or purplish, 2-lipped, to 1½ in.
long, fragrant, in pairs, June-Sept.: fr black. E. Asia; nat.
in N Amer Var aûreo-reticûlata, lvs smaller, veined with
yellow Var. chinénsis (L. charensis), fis. carmine outside.
Var Halliana (L. Halluana), fis. pure white changing to
yellow. Vars. purpûrea and rûbra are color forms. Var.
rèpens (var. flexuosa, L. brachypoda), lower, often veined
with purple. Var. variegâta has ivs. variegated yellow.

Karelinii: L. cærulea var. graciliflora.

Késselringii: L. orientalis var. longifolia.

Kirildwii; L. cærulea var. viridifolia.

Koehneana. To 12 ft.: lvs. ovate, to 4 in. long, densely pubescent beneath: fls. yellowish-white, ¾ in. long, 2-lipped, in pairs: fr. dark red. China.

Korolkowii. To 12 ft.: lvs. ovate or oval, to 1 in. long. bluish-green and pubescent beneath: fls. rose or rarely white, 2-lipped, ½ in. long, in pairs, May-June: fr. bright red. Turkestan. Var. floribúnda has broad-ovate lvs. Var. Zabelii has lvs. glabrous and broadly ovate, base subcordate.

Ledeboùri. To 9 ft.: lvs. ovate-oblong, to 5 in. long, pubescent beneath: fls. orange tinged with scarlet, to ¾ in. long, in pairs, June–July: fr. black. Calif.

Lindleyana: catalogue name.

longiflora. Climbing, evergreen: lvs. oblong-lanceolate, to 2½ in. long, pale beneath: fls. white changing to yellow, to 4 in. long, fragrant: fr. white. China; not hardy N.

Maackii. To 15 ft.: lvs. ovate to ovate-lanceolate, to 3 in. long: fls. white changing to yellowish, 2-lipped, ¾ in. long, in pairs, June: fr. dark red. Asia. Var. erubéscens is similar to var. podocarpa with larger pale pink fls. Var. podocarpa is of more spreading habit and has smaller fls. pubescent outside.

Mágnevilleæ: L. fragrantissima.

magnifica: L. sempervirens var.

Maximowiczii. To 10 ft.: lvs. ovate, to 2½ in. long, pubescent beneath: fls. violet-red, ½ in. long, 2-lipped, in

pairs, May-June: fr. red. Manchuria, Korea. Var. sacha-linénsis has dark purple fis.

micrántha: L. xulosteoides.

microphfila. Shrub to 3 ft., twigs glabrous to puberulous: lvs. obovate to oblong-elliptic, to 1 in. long, obtuse or acutish, usually puberulous: fis. yellowish-white, nearly ½ in. long: fr. orange-red, fused in pairs. Cent Asia.

minutiflora. Hybrid between L. Morrowsi and L. xylosteoides: lvs. oblong, to 1½ in. long: fls. whitish, 2-lipped, ½ in. long, May-June: fr. red.

modésta. Shrub to 7 ft., branches brownish-gray, fibrous: lvs. rhombic-ovate to oblong, to 1 3/4 in. long, obtuse norous: ivs. monitor-ovate to onlong, to 1/2, in. long, obtuse to mucronate, dull green and glabrous above, pale green and villous-pubescent beneath at least on veins: fls. white, becoming yellowish with reddish base, to ½ in. long, in pairs on short peduncles in axils of upper lvs. W. China.

Mórrowii. To 8 ft.: lvs. oval to oblong, to 2 in long, pubescent beneath: fls. white changing to yellow, 2-lipped, 3/2 in. long, in pairs, May-June: fr. red. Japan. Var. zanthocárpa has yellow fr.

muendeniénsis. Hybrid between L. bella and L. Ru-prechtiana, resembling the former but lys. darker green and more acuminate.

muscaviénsis. Hybrid between L. Morrowii and L. Ruprechtiana: lvs. ovate, to 2 m. long, pubescent beneath: fls. white, 2-hpped: fr. red.

nervôsa. Shrub to 10 ft.: lvs. elliptic to ovate-oblong, to 2½ in. long, acute, reddish when young becoming green except at midrib and primary veins, bluish-green beneath: fls. light pink, to ½ in. long: fr. black. N. W. China.

nttida. To 6 ft., evergreen: lvs. ovate, to ½ in. long, shining above: fls. creamy-white, ½ in. long, fragrant, in pairs: fr. blue-purple, transparent. China.

nótha. Hybrid between L. Ruprechtiana and L. tatarica: lvs. ovate-oblong, to 2½ in. long: fis. pinkish changing to yellowish, 2-lipped, ¾ in. long, in pairs: fr. red.

oblongifolia. Swamp Fly H. To 5 ft.: lvs. oblong, to 3 in long, gray-pubescent beneath: fls. yellowish-white, 2-lipped, ½ in. long, in pairs, May: fr. red. N. B. to Pa. and Minn. Var. altissima is nearly glabrous.

obovata. Shrub to 7 ft., twigs glabrous: lvs. obovate, $\frac{1}{1}$ - $\frac{1}{2}$ in. long, tapering toward base, whitish beneath: fls. whitish, nearly $\frac{1}{2}$ in. long: fr. blue-black. Cent. Asia.

odoratissima: L. fragrantissima.

orientalis. To 10 ft.: lvs. ovate or ovate-lanceolate. onentalis. To 10 It.: Ivs. ovate or ovate-lanceolate, to 4 in. long, pale and pubescent beneath; fis pink or violet, 2-lipped, ½ in. long, in pairs; fr. black. Asia Minor. Var. caucăsica (L. caucasıca) has elliptic lvs. glabrous beneath. Var. longifòlia (L. Kesselringii) has oblong or lanceolate lvs.; fls. smaller and reddish.

parviflòra: L. dioica.

Periclymenum. Woodbine. Climbing: lvs. ovate or ovate-oblong, to 3 in. long, bluish-green beneath: fls. yellow-ish-white, 2-lipped, to 2 in. long, in whorls, June-Aug: fr. red. Eu, N. Afr., W. Asia. Var. aûrea, lvs. yellowish. Var. bélgica, Durch W., fls. purple outside. Var. serótina, fls. dark purple outside, yellow inside.

pileata. Evergreen or partially so, branches often prostrate: lvs. ovate to oblong-lanceolate, to $1\frac{1}{2}$ in. long, shining above: fis. whitish, $\frac{1}{2}$ in. long, fragrant, in pairs, Apr.—May: fr. purple, translucent. China. Var. yunnanénsis has lvs. thicker and more nearly orbicular.

prolifera (L. Sullivantii). Climbing: lvs. oval or oblong, to 4 in. long, very glaucous, the upper connate: fis. pale yellow marked with purple, 2-lipped, 1 in. long, in whorls, June-July: fr. red. Ohio to Tenn. and Mo.

prostrata. Prostrate: lvs. ovate or oval, to 3/4 in. long, pale green: fis. small: fr. bright red. China.

punícea: perhaps L. Brownii var. punicea.

Parpusii. Hybrid of L. fragrantissima and L. Standishii: lvs. to 3 in. long and 1½ in. wide, dark green above and light beneath, midrib hairy: fis. mostly as in L. fragran-

pyrenàica. To 3 ft.: lvs. oblong to oblong-lanceolate, to $1\frac{1}{4}$ in. long, pale beneath: fls. white, to $\frac{3}{4}$ in. long, in pairs, May: fr. red. Pyrenees.

quinqueloculàris. To 15 ft.: lvs. ovate or oval, to 3 in. long, grayish and pubescent beneath: fls. yellowish, 2-lipped, $\frac{1}{2}$ in. long, in pairs, June: fr. translucent white. W. Asia.

reticulata. Similar to L. confusa, from which it differs chiefly in its glabrous non-hairy ovary, lvs. obtusish and strongly netted beneath and petioles $\frac{1}{2}$ — $\frac{1}{2}$ % in. long. S. E. China. Var. airea is listed.

Ruprechtians. To 12 ft.: lvs. oblong to lanceolate, to 4 in. long, pale and pubescent beneath: fis. white changing to yellow, 2-lipped, ½ in. long, in pairs, May-June: fr. red. Manchuria. Var. xanthocarpa has yellow fr.

saccata. To 6 ft.: lvs. oblong, to 2 in. long: fls. pinkish, ½ in. long, in pairs. May: fr. scarlet. China.

sachalinénsis: L. Maximowiczni var.

salicifòlia. Hybrid between L. Ruprechtiana and L. xylosteoules: lvs. narrow and pointed.

sanguinea: L. Caprifolium var. atrosanguinea.

sempérvirens. Trumper H. Climbing: lvs. ovate to oblong, to 3 in. long, glaucous beneath, upper connate: fis. orange-scarlet, yellow inside, 2 in. long, in spikes, May-Aug: fr. red. Conn. to Fla. and Tex. Var. fuchsioides is L. Brownii var. Var magnifica, an improved late-flowering form. Var. minor, partially evergreen. Var. sulphurea, fis. yellow. Var. sulpérba, fis. bright scarlet.—The species is evergreen in the South.

sibfrica: a confused name, the plants so listed are probably forms of L, heterophylla or L. tatarica.

similis. Climbing, partially evergreen: lvs. lanceolate, to 4 in. long, whitish-tomentose beneath: fls. white, 2-lpped, 2 in. long, in pairs, Aug.: fr. black. China. Var. Delavayi differs in being glabrous except lvs. underneath.

sinénsis: L. Standishii.

speciòsa: a form of L. sempervirens, perhaps not distinct from its var. superba.

spinôsa. To 4 ft., the branches somewhat spiny: lvs. linear-oblong, to 1 in. long: fls. in pairs, ¾ in. long: fr. whitish or purplish, bloomy. Ilimalayas. Var. Albertii. Lvs. glaucous: fls rose, ½ in. long, fragrant. Turkestan.

Stándishii (L. sinensis). To 8 ft., partially evergreen: lvs. ovate-oblong to lanceolate, to 4 in. long, harry: fls. white, 2-lipped, ½ in. long, fragrant, in pairs, Mar.-Apr.: fr. red. China. Var. lancifòlia has narrow-lanceolate lvs.

strophióphora. Shrub to 7 ft., twigs glandular-pilose: lvs ovate to elliptic-ovate, to 3 in. long, acuminate, densely pilose beneath and glabrous to harry above: fls. white, to 34 in long; fr. red, pilose. Japan.

subséssilis. To 6 ft.: lvs. ovate, to 2 in. long, pale beneath: fls. white to yellowish, ½ in. long, 2-lipped, in pairs, June: fr. bright red. Korea.

Súllivantii: L. prolifera.

syringantha. To 10 ft.: lvs. oval to oblong, to 1 in. long: fls. pinkish or hlac, ½ in. long, fragrant, in pairs, May June: fr. red. China. Var. Wolfli has larger narrower lvs. and carmine fls.

tangitica. Low: lvs. obovate, to 1¼ in. long, pale beneath: fls. yellowish-white, to ½ in. long, drooping, in pairs, May-June: fr. scarlet. China.

May-June: fr. searlet. China.

tatárica. Tatarian II. To 10 ft.: lvs. ovate or ovatelanceolate, to 2½ in. long, pale beneath: fis. pink or white,
2-lipped, to 1 in. long, in pairs, May-June: fr red. Russia
to Turkestan. Cult. vars. are: alba, fis. pure white; angustifòlia, lvs. narrow; bícolor, fis. pink within, red outside;
grandiflora, fis. pure white, large; latifòlia (var. spiendens),
lvs. to 4 in. long and 2 in. wide; lûtea, fr. yellow; parvifòlia
(var. graculis), lvs. to 2 in. long; punícea (var. pulcherrima),
fis. deep pink; rôsea, fis. rose outside, pink inside; sibírica
(var. rubra), fis. deep pink; virginàlis, fis. white; Zàbelii
is probably L, Korolkowii var.

Tellmanniana. Hybrid between L. tragophylla and L. sempervirens; showy.

ténuipes. Shrub to 7 ft., twigs glabrescent to pilose: lvs. elliptic to oblong or ovate, to 1½ in. long, pilose above and densely so beneath, petiole glandular-hary: fls. red, to ¾ in. long, pilose outside: fr. red. Japan.

thibética. To 5 ft.: lvs. oblong-lanceolate, to 1¼ in. long, shining above, white-tomentose beneath: fs. pale purple, ¼ in long, pubescent outside, in pairs, May-June: fr. red. China.

tragophýlla. Climbing: lvs. oblong, to 5 in. long, glaucous beneath, upper connate: fls. bright yellow, 2-lipped, to 3 in. long, in heads, June: fr. red. China.

trichosántha. To 6 ft.: lvs. ovate or obovate, to 2 in. long, hairy on veins beneath: fis. yellow, 1/4 in. long, 2-lipped, in pairs, June: fr. bright red. China, Tibet.

utahénsis (Xylosteon utahense). Low: lvs. ovate to oblong, to 2 in. long: fis. pale yellow, to ¾ in. long, in pairs: fr. red. B. C. to Ore. and Utah.

vérna: L. Caprifolium.

virginalis: L. tatarica var.

xylosteoides (L. micrantha). Hybrid between L. tatarica and L. Xylosteum: lvs. rhombic-ovate, bluish-green: fis. pinkish, small.

Xylósteum. EUROPEAN FLY H. To 10 ft.: lvs. ovate or obovate, to 2½ in. long, pale and pubescent beneath: fls. yellowish-white, 2-lipped, ½ in. long, pubescent outside, in pairs, May-June: fr. dark red. Eu., Asia. Var. móllis has lvs. pubescent on both sides.

yunnanénsis. Sts. twining: lvs. oblong to obovate-lanceolate, to 3 in. long, acutish, glaucous, upper ones connate: fls. yellow, to 1 in. long, hairy within. S. W. China.

LOOSESTRIFE: Lysimachia, Steironema. Purple: Lythrum Salicaria. Swamp: Decodon verticillatus.

LOPÈZIA. Onagraceæ. A few small shrubs or herbs with alternate simple lvs. or the lower ones opposite, small attractive fls. in leafy racemes, and capsular frs.; grown under glass or in the open in mild climates. Propagated by seeds and cuttings of firm wood.

albiflora. Per. to 2 ft.: lvs ovate to ovate-lanceolate: fls. white, often tinged with pink at the base. Mex.

coronata. Ann. to 3 ft.: lvs. ovate to lanceolate: fls. rose or hlac. Mex.

lineata. Subshrub to 3 ft.: lvs. ovate to lanceolate: fis. red. Mex.

ròsea: listed name.

LOPHANTHUS: Agastache.

LOPHIOLA. Hæmodoraceæ. One per. herb native in wet pine barrens, N. J. to Fla. L. americana (L. aurea). To 2 ft.: lvs. mostly basal, linear, much shorter than st.: fls. yellowish, small, in densely white-woolly panicles.

LOPHOCÈREUS. Cactaceæ. One columnar cactus usually branching only at base, native in S. Ariz., Mex. and Lower Calif. L. Schöttii (L. australis. Cereus Schottii). To 20 ft.; ribs commonly 5-7, flowering areoles with many straight gray bristles to $2\frac{1}{2}$ in. long: fls. pink, greenish outside, nocturnal, to $1\frac{1}{2}$ in. long. Var. Gâtesii (L. Gatesii) has more slender sts. with obtuse ribs. Var. monstròsus is listed. Var. Sargentiànus (L. Sargentianus) has spines and fls. to $\frac{3}{2}$ in. long.

LOPHÓPHORA. Cactaceæ. Small depressed-globose or top-shaped often proliferous plants spineless except in seedlings, covered with ribs of conical tubercles that are white-hairy at apex: fls. from center of plant. One or two species. See Cacti.

Williamsii (Echinocactus and Anhalonium Williamsii). Peyote. Plant dull bluish-green, depressed-globose, to 3 in. diam., with a thick tap-root; ribs 5-13, low and wide, with narrow intercostal spaces, tubercles conspicuously white-tufted: fls pale pink to white, 1 in. broad when expanded. S. Tex., Mex.

Ziègleri. Similar to L. Williamsu, differing in its more globose st., lower shorter-tufted tubercles and pale yellow fis. S. Tex. Mex.

LOPHOSPERMUM SCANDENS: Maurandia Lophospermum.

LOPHOTOCÁRPUS. Alismaceæ. Aquatic ann. herbs with tuberous rootstocks and perfect or staminate hypogynous fls. Grown in aquatic gardens in Calif.

guyanénsis (Sagittaria guyanensis). Lvs. floating, to 2 in. long, broadly ovate, base strongly cordate, apex obtuse; submersed lvs. linear, to 18 in. long or more: fls. inconspicuous, on erect or procumbent scapes. Mex. and other trop. regions.

LOQUAT. Evergreen broad-leaved tree (Eriobotrya japonica) of China and Japan sometimes seen as an ornamental pot subject under glass but grown in California, the lower Gulf regions and Florida for its yellow oblong-pyriform to spherical acid fruits that are eaten raw or in jellies, jams, pies and preserves. The fruits attain to a length of 3 inches in large varieties. The fragrant white panicled flowers appear in autumn, followed by ripe fruits in spring. The trees attain to a height of 25 feet. In orchard formation they may be set 20 to 24 feet apart either way. The requirements are not peculiar. In northern Florida and similar regions frost may limit fruitfulness some seasons. For best results improved varieties should be grown, being budded on seedling stocks; but as

commonly seen in yards the trees are unimproved seedlings.

LORANTHÀCEÆ. MISTLETOE FAMILY. ASsociation comprising more than a half thousand species in about a score of genera, arranged with Urticaceæ and Aristolochiaceæ series. They are green parasites with jointed sts., mostly woody and on trees, inhabitants of temp. and trop. climates in many parts of the world: lvs. mostly broad and conspicuous but sometimes reduced to scales: fls. small, in clusters or solitary. unisexual and the plants monœcious or diœcious. or bisexual: fr. a berry, which germinates on the host, and the haustoria (or roots) appropriate the juices. They are not hort, subjects. The mistletoe of literature is Viscum album, native from Great Britain to N. Asia, parasitic on many kinds of trees. The mistletoe of the N. American holiday markets is Phoradendron flavescens (first known as Viscum flavescens), parasitic on many deciduous trees from N. J. to Fla. and westward; there are more than 200 species of Phoradendron, all in the western hemisphere, whereas Viscum is confined to the Old World and Australia. Arceuthobium (or Razoumofskya) pusillum is a very small parasite on coniferous trees in E. N. Amer.; lvs. scale-like. The genus Loranthus, with many species, inhabits the warm belt mostly in the eastern hemisphere and is absent from N. Amer.

LORANTHUS: see Loranthaceæ.

LORATE: strap-shaped.

LORDS-AND-LADIES: Arum maculatum.

LORINSERIA: Woodwardia areolata.

LOROMA: Archontophænix.

LOROPÉTALUM. Hamamelidacex. Evergreen shrubs of China with alternate entire lvs., white or yellowish fls. in clusters, and woody capsular frs.

Grown out-of-doors in mild climates and in a cool greenhouse in the North, although the root may withstand rather severe regions. Propagated by seeds and by grafting on Hamamelis.

chinense. To 12 ft: lvs. ovate, to 2 in. long: fls. with strap-shaped petals to 1 in. long, Mar.-Apr.

LÒTUS. Leguminosæ. Herbs or subshrubs of Eurasia and N. Amer., with pinnate lvs., papilionaceous fls. in axillary umbels or sometimes solitary, and cylindrical pods; grown for ornament and some species for the edible pods and for forage. Propagated by seeds and the woody kinds also by cuttings, divisions and layers.

Berthelòtii (L. peliorhynchus). Silvery shrub to 2 ft.: Ifts. 3-7, very narrow: fls. scarlet, the standard narrow and recurved. Cape Verde and Canary Isls. Var. atrococcíneus has darker red fls. spotted with black.

bicolor: L. pinnatus.

corniculatus. Birds-foot Trefoil. Per. to 2 ft., often decumbent: lfts. 3, obovate, short: fls. yellow or tinged with red. Eu., Asia.—Sometimes grown for forage.

eriophorus (Hosackia eriophora. Syrmatium eriophorum). Woolly mat-forming per., sts. to 4 ft. long, gray-hairy, hairs mostly erect and not appressed: lfts. 4-6, obovate to oblanceolate, about ½ in. long; fls. to ½ in. long, in subsessile leafy umbels of 4-10: pods curved. Calif. Var. Heérmannii (L., Hosackia and Syrmatium Heermannii) has lfts. thinly pubescent to glabrate with fls. to ½ in. long.—The typical form not known to be in cult.

formosissimus (Hosackia gracilis). Witchs-Teeth. Per., sts. weak, to 1 ft. long: lfts. 3-7, to ½ in. long, obovate or oblanceolate: fls. to ¾ in. long, rose, upper petal yellow: pods cylindrical, to 1 in. long. Wash. to Calif.

glaber of hort. lists is probably L. scoparius.

glaucus. Per., sts prostrate, glaucous-gray and pubescent: lfts. obovate, fleshy, small and crowded: pods irregularly beaded or moniliform. Madeira. Heérmannii: L. eriophorus var.

jacobæus. St. James Trefoil. Per. to 3 ft.: lfts. 3-5, linear: fis. black-purple to yellow on same plant. Cape Verde Isls.

mascaénsis. Silvery shrub: lfts. very narrow: fls. bright yellow. Teneriffe.

nigricans: Kennedia nigricans.

ornithopioides. Ann., usually roots with small tubercles: lfts. rhombic: fis. yellow. S. Eu.

peliorhýnchus: L. Berthelotii.

pinnatus (Hosackia bicolor). Per.: lvs. glabrous, lfts. 5-9, to 3/4 in. long, obovate: ffs. yellow, wings white: pods cylindrical, linear, to 21/4 in. long. Cent. Calif. to Wash.

scoparius (Hosackia glabra). Defin-Weed. Erect suffrutescent per, to 5 ft. high, sts. green, mostly glabrescent: Ifts. 3-5, oblong to oblanceolate: fls. in sessile umbels, corolla to ½ in. long: pods slightly curved. Calif.

siliquòsus (Tetragonolobus siliquosus). To 1 ft., sts. often decumbent: lfts. obovate: fls. pale yellow: pods 4-angled S Eu

tenuifòlius: L. tenuis.

ténuis (L. tenuifolius). Per., sts. to 20 in. long, spreading with ascending tips: lfts. 3, to \% in. long, oblong-oblanceolate: fls. yellow, to \% in. long, usually 3-7 in head: pods to 1 in. long. Eu.; escaped from cult. in Ida.—By some authors considered a variant of L. corniculatus.

tetragonólobus (Tetragonolobus purpureus). Winged-Pea. Trailing ann.: líts. 3, ovate: fis. purplish-red: pods 4-angled, the seeds and young pods edible. S. Eu.

LOTUS: Nelumbium, Nymphæa.

LOUSEWORT: Pedicularis.

LOVAGE: Levisticum officinale.

LOVE-IN-A-MIST: Nigella damascena.

LOVE-LIES-BLEEDING: Amaranthus caudatus.

LUCERNE: Medicago sativa.

LUCULIA. Rubiacex. Shrubs bearing opposite leathery lvs., white or pink salverform 5-lobed fls. in terminal corymbs, and fr. a caps. with winged seeds; native India to Yunnan (in China). Grown in the greenhouse and planted out in summer. Propagated by cuttings of ripe wood.

gratissima. To 16 ft.: lvs. ovate-oblong, to 6 in. long: fls. pink or rose, 1½ in. across, in corymbs to 8 in. across.

intermedia. To 12 ft.: lvs. oblong or oblong-lanceolate, to 6 in long; fls. reddish, to 2 in. long, distinguished from other species by the flap-like processes between the lobes of the corolla.

limoncélla: listed name of unknown botanical application. speciòsa: hort. name for a larger form with deeper rose fls.

LUCUMA. Sapotacex. Shrubs and trees bearing alternate leathery entire lvs., small fls. and fr. a berry; differs from Achras in having 4 or 5 sepals in 1 or 2 series rather than 10 sepals in several series.

The canistel is grown in the tropics and southern Florida for the edible fruit. It is not particular as to soil. Propagated by seeds from which the husks should be removed, and probably also by budding.

mammòsa: Achras Zapota.

nervosa (L. Rivicoa var. angustifolia). Canistel. Ti-Es. Egg-Fruit. Tree to 25 ft.: Ivs. oblong-obovate, to 8 in. long: fls. greenish-white, in small clusters: fr. to 4 in. long, orange-yellow, with 2-3 shining seeds and soft orange flesh. N. S. Amer.; nat. in S. Fla. and S.

Rivicda var. angustifdlia: L. nervosa.

spindsa: Gourliea spinosa.

LUDOVIA: Carludovica Laucheana.

LUDWIGIA (or Ludvigia). Onagraceæ. Paludose or aquatic per. herbs with alternate or opposite usually entire lvs., yellow or greenish inconspicuous fls. solitary or in spikes or racemes, and capsular frs.; planted in bog-gardens or aquaria. Propagated by seeds and cuttings.

alternifòlia. Rattle-box Erect glabrous shrub to 4 ft.: lvs. lanceolate to oblanceolate, to 4 in. long, usually entire, alternate: fis. yellow, to ½ in. across. E. U. S.

califórnica: listed name of unknown botanical standing.

Milerttii. Sts. rooting at nodes: lvs. opposite, oval, glossy above and crimson-purple beneath: fis. yellow, solitary in the axils. A garden plant said to have come from S. Amer.; probably L. (or lenardae) palustris.

LIJETKEA. Rosaceæ. Tufted undershrub with trailing branches, adapted to the rock-garden. Propagated by cuttings of green wood and by division. L. pectinata (Spiræa pectinata). Herblike: lvs. alternate, 1-2 three-parted into linear lobes: fls. white, $\frac{1}{3}$ in. across, in terminal racemes to 2 in. long. High mts., Calif. north to Alaska.

LUFFA. Cucurbitaceæ. Monœcious tender tendriliferous vines of trop, regions, with angled or lobed lvs., fls. large and conspicuous, yellow or whitish, pistillate solitary and staminate racemose, the corolla of 5 petals: fr. not hairy, becoming dry and more or less papery, eaten when young in some countries, grown by us mostly for ornament or for the "vegetable sponge" provided by the dry interior; called also disheloth gourd and rag gourd. They grow easily from seeds. The two commonly cult. species are annuals from the Old World tropics, bearing green frs.

acutángula. Lvs. angled but little if at all lobed except on young shoots; fr. club-shaped, 1 ft. or less long, strongly ridged.

cylindrica. The prevailing species cult with us, under several names: Ivs. mostly 3-7-lobed: fr. cylindric, to 2 ft. long, sometimes curved, not ridged; variable and grown under different names as L. gigantea, L. macrocarpa, L. marylandica.

LUINA. Compositæ. One species native in the Cascade Mts. of Wash. L. hypoleùca. Tufted per. to 1 ft., white-tomentose: lvs. ovate, 1 in. long, shining above: fls. cream-colored, ½ in. long, in corymbose heads; pappus of soft white bristles. The genus belongs to the Arnica and Doronicum group.

LUNÀRIA. MOONWORT. SATIN-FLOWER. HON-ESTY. Crucifera. Herbs of Eu. and Asia, one ann. or bien., one per., both cult. and also somewhat escaped: plants erect, branching: lvs. broad and simple: fis. purple to white: seed-pods or silicles moon-shaped, the septum papery and satiny after the valves drop away late in the season, and which are used in dry bouquets. Plants come readily from seed; partial shade is desirable.

ánnua (L. biennis). Honesty. Ann. or bien., 1½-3 ft. high: lvs. ovate or narrower, coarsely toothed: fls. white and purple: pods to 2 in. long and nearly as broad, obtuse or rounded at both ends. There is a variegated-lvd. form, and a var. álba is offered.

biénnis: L. annua

rediviva. Perennial H. Per. with more closely and sharply toothed lvs.: seed-pods oblong-lanceolate, tapering at both ends, much longer than broad.

LUNGAN: Euphoria Longana.

LUNGWORT: Pulmonaria.

LUPINE: Lupinus.

LUPINUS. LUPINE. Leguminosæ. Ann. and per. herbs, sometimes subshrubs, with digitately compound lvs., showy papilionaceous fls. in terminal spikes or racemes, and flattened pods often constricted between the seeds; a few species grown for cover-crops, forage and human food but in Amer. mostly known as ornamental subjects in the flower-garden.

Lupines may be grown on any well-drained soil, thriving even on poor sandy lands. Propagated by seeds sown where the plants are to stand or the perennial kinds also by division.

affinis. Ann. to 2 ft., nearly glabrous: fls. deep bluishpurple, in spring: pods 1 in. long, the seeds small. Calif.

albifrons. Woody per. to 5 ft., often with hard trunk: lfts. 7-10, spatulate to obovate, silvery-silky, to 1 in. long: fls. about ½ in. long, blue or purplish with white or yellow center: pods yellowish, to 2 in. Calif. Var. Douglasii (L. Douglasii) differs in floral bracts much exceeding buds. Var. éminens (L. Brittonii) has slightly larger fls.

albococcineus: L. pubescens.

álbus. White L. Ann. to 4 ft., hairy: fls. white or slightly tinted: pods to 4 in. long, the seeds large. Levant.—A: agricultural species.

alpestris Erect per. to 2½ ft.: lfts. 5-9, linear-oblan-ceolate, to 2¾ in. long, glabrous above, hairy beneath: fls. blue, to ¾ in. long: pods to 1¼ in. long. Colo., Utah

angustifòlius. Ann. to 1 ft. or more, hairy: fls. dark blue, in early summer: pods ½ in. wide. Medit. region. Var. ròseus, fls. rose.

arboréscens: listed name

arboreus. Tree L. Shrub to 8 ft., slightly pubescent: fls. sulfur-yellow, in summer: pods to 3 in. long, the seeds small. Calif. Var. Snow Queen has pure white fls. and also albus. Var. Paynei is L. Paynei.

arcticus. Per. to 1 ft., allied to L. nootkatensis and differing in sts. erect not decumbent, petioles much longer than lfts., fls. on pedicels to 1/2 in. long and not longer, and seeds usually 5-7 rather than 9-12. Alaska to N. Wash. and B. C.

argénteus (L. decumbens. L. tenellus). Per. to 3 ft., silvery-pubescent: fls. violet, rose or white, in summer: pods ¾ in. long. W. N. Amer.

atrococcineus: L. pubescens.

bicolor. Ann. or bien to 1½ ft., erect, villous: Ifts. 5-7, to 1 in. long; fls. blue and white, to ½ in. long, verticillate on naked peduncle: pods less than I in. long, pubescent. Pacific coast.—A variable species, perhaps not in cult. L. bicolor of trade may be L. polyphyllus var.

Breweri. Low, prostrate or decumbent shrubby per. to fls. violet with yellow or whitish center, to $\frac{3}{2}$ in long; fls. violet with yellow or whitish center, to $\frac{3}{2}$ in. long, in dense racemes to 2 in. long; pods 3-4-seeded, to $\frac{1}{2}$ in. long. Mts. of Calif. to S. Ore.

Brittonii: L. albifrons var. eminens.

califórnicus: L. pubescens.

Chamissònis. Shrubby, to 3 ft., silky-tomentose: fls. blue or lavender with yellow spot on standard, in spring and at other seasons. Calif.

columbianus: L. latifolius var.

concinnus. Ann. to 6 in., densely hairy: fls. violet with yellow spot on standard. S. Calif.

confértus. Per to 114 ft, silky-pubescent, similar to L. Torrey but with larger fis. 14 in. long. Calif., Nev.

Crückshanksii: L. mutabilis var.

cytisoides. Broom L. Per. to 6 ft., minutely hairy: fis. rose-purple. Apr.-Aug. S. Calif.

decumbens: L. argenteus.

densifibrus (L. Menzuesii). Ann. to 2 ft., hairy: lfts. 7-9, glabrous above, to ¾ in. long, obtuse to mucronate: fls. white, yellow or rose, ealyx subtended by narrow reflexed bracts, in spring. Calif. Var. crinitus, low, to 6 in. high. Var. lacteus, fls. nearly white.

diffusus. Deen-Cabbage. Decumbent per., silky sts. woody at base, to 2 ft. long: lvs. entire, oblanceolate, to 4 in. long: fis. light blue with yellow spot in center of standard, on spikes to 12 in. long: pods woolly. N. C. to Fla., sandy soil.

Douglasii: L. albifrons var.

Dúnnettii: L. pubescens.

dùplex: L. pubescens.

élegans: L. pubescens. excubitus: see L. Paynei.

formòsus. Per. to 2½ ft., sometimes decumbent, silky-pubescent: fls. purple, blue, lilac or white, ½ in. long: pods 1½ in. long, seeds mottled. Calif.

guatemalénsis: L. pubescens.

Hártwegii. Ann. to 3 ft., with shaggy hairs: fis. blue with standard partially rose-colored, July-Sept.: pods about 1 in. long, the seeds small. Mex. Vars. álbus, cœléstinus, rôseus and rûber are color forms.

hirsutissimus. Ann. to 1 ft., very hairy with stinging hairs: fis. reddish-purple, in spring: pods to 1½ in. long.

hirsùtus. Blue L. Ann. to 2 ft., brown-hairy: fis. blue, the keel usually tipped with white, July-Aug.: pods large with large seeds. S. Eu. Vars. álbus, cærdleus, cárneus and rûber are color forms.

hébridus: L. pubescens and L. mutabilis.

insignis: L. pubescens.

Institution. Erect per. to 4 ft.: lfts. 5-8, to 4 in. long, acute, glabrous above or nearly so: fis. blue to purple, rarely yellowish, to ½ in. long, in lax racemes to 18 in. long; pods to 1½ in. long, dark brown. S. Calif. Var. columbianus (L. columbianus). To 2 ft.: fis. with broader wings than type covering most of the keel. Calif. to Wash.

lépidus. Per. to 1 ft., densely tufted: fs. violet, 1/2 in. long: pods to 3/4 in. long. B. C. to Ida. and Cahf.

longifolius. Shrubby, to 5 ft., graysh-pubescent: fls. deep blue to nearly white with a whitish or rose-purple spot on standard, in winter and spring: pods to 1½ in. long. S. Calif.

ludovicianus. Erect per. to 2 ft., densely woolly: lfts. 4-8, spatulate, to 4 in.: fls. purplish, to ½ in. long: pods to 1 in. long. S. Calif.

lûteus. Yellow L. Ann. to 2 ft.: lfts. 7-10, lanceolate, acute: fls. yellow, fragrant, in verticillate whorls on long pubescent stalks, June-July. S. Eu.—Differs from L. densiforus chiefly in calyx not subtended by bracts, and much longer pods.

Lyallii. Per. to 4 in, silky-pubescent: fls. blue, nearly 1/2 in, long: pods 1/2 in, long. Wash, to Calif.

Ménziesii: L. densiflorus.

micranthus. Ann. to 1½ ft., hairy: fls. blue and white, very small: pods about 1 in. long. B. C. to Calif.

microcárpus. Ann. 4-20 in. high, sts. often branched: lfts. 5-8, to ¾ in. long, glabrous above, long-petioled: fls. usually pink to dull red, to ¾ in. long, in racennes of 2-10 whorls: pods usually hairy, to ¾ in. long. Calif.

mínimus. Per. to 6 in , densely tufted, sılky-pubescent: fis. blue or purple, 1/4 in long. Alta. to Ore.

Mderheimii: L polyphyllus var.

Moritzianus: L. pubescens.

mutabilis. Ann to 6 ft., glabrous: fls. white with yellow or violet on standard, June-Aug.: pods to 3 in. long, the seeds large Mts. of S. Amer. Var. Crúckshanksii (L. Cruckshanksii) has bluish fls. shaded with violet and purple. Peru. Vars. rôseus and versícolor are color forms. L. pantelericus and L. hybridus nurescens are probably forms

nanus. Ann. to 15 in., pubescent: fis. blue with white purple-dotted spot on standard, fragrant, May-July: pods 34 in. long, the seeds small. Calif. Vars. albus, alboroseus and albo-violaceus are color variations.

nootkaténsis. Per. to 3 ft., hairy: fls. blue variegated with red and yellow, May-July: pods 1½ in. long. Near sea, Wash. to Aleutian Isls.

odoratus. Ann: fis blue or purple with yellow on standard, % in. long: pods % in long. Calif., Ariz., Nev.

ornàtus. Per. to 3 ft, silky-pubescent: fls. dark blue with light spot on standard, ¾ in. long: pods to 1½ in. long. Wash., Ida.

panteléricus: L. mutabilis.

Paynei. Shrub to 8 ft., with silvery foliage: fls. blue, lavender, pink or white with yellow blotch on standard, fragrant, in spring Calif.—Sometimes treated as a synonym of L. excubitus var. Hallii.

perénnis. Sun-Dial L. Per. to 2 ft., pubescent: fls. blue varying to pink and white, May-June: pods 1½ in. long. Me. to Fla.

pilòsus. Ann. to 4 ft., hairy: fls. rose with red spot on standard. Levant.

Piperi. Per. to 11/4 ft., silky-pubercent: lfts. 5-8, oblanceolate, acute, to 11/4 in. long, petioles to 4 in. long; fis. deep blue, in showy loose racemes: pods to 1 in. long. Wash.

plattensis. Per to 2 ft., hairy: fls. pale blue with dark spot on standard, June-July: pods to 1 1/4 in. long. Wyo. to Kans.

polyphyllus. Per. to 5 ft., glabrous except the woolly pods: fls. purplish with blue wings, in compact racemes, June Sept.: pods 1½ in. long, the seeds small. Wash to Calif. Var. Moerheimii is more compact and has various colored fls. Listed color forms are albiflorus, álbus, atroviolàceus, bícolor, cærileus, carmíneus, lúteus, rôseus, salmòneus. Vars. élegans and trícolor belong to the hybrids of L. wybaccase. brids of L. pubescens.

pubescens. Ann. to 3 ft., pubescent: fis, violet-blue with white center: pods 1 in. long, the seeds small. Mex. and Guatemala.—Here belongs the group known as L. hfbridus, comprising such names as albococineus, atrococcineus, californicus, Dunnettii, duplex, elegans, guatemalensis, hybridus roseus, insignis, Moritaianus, pulcherrimus, speciosus, succulentus, superbus, tricolor, venustus.

pulchérrimus: L. pubescens.

pusillus. Ann. to 10 in., sts. hairy: lfts. 5-8, oblanceolate-oblong, smooth above, hirsute beneath: fls. white to

pale rose-purple, in racemes to 3 in. long: pods about ¾ in. long, 2-seeded. Sask. to Wash. south to New Mex. and Nev.

rivularis. Per. to 3 ft., hairy: fls. blue or variegated, marked with yellow: pods to 2 in. long. Wash, to Calif.

rdseus: L. polyphyllus and L. pubescens.

speciòsus: L. pubescens.

Stiversii. Ann. to 1½ ft.: fis. with bright yellow standard and rose or purple wings, ½ in. long: pods ¾ in. long.

subcarnosus (L. texensis). Ann. to 1 ft., silky-pubescent: fis. blue with white or yellow spot on standard, in spring: pods 1½ in. long, the seeds small. Tex.

succuléntus: L. pub scens.

sulphreus. Per: Ifts. 13-15, narrowly lanceolate, densely pubescent on both sides: fls. sulfur-yellow, small, in dense racemes, calyx without bracts. Blue Mts. of Ore.—Probably not in cult., plants so listed may be L. densificrus or a form of L. pubescens.

supérbus: L. pubescens.

tenéllus: L. argenteus.

Térmis. EGYPTIAN L. Ann. to 5 ft., silky-hairy: fls. white tinted with blue: seeds large. Levant.—An agricultural species.

texénsis: L. subcarnosus.

Torreyi. Per. to 8 in., silky-pubescent: fis. violet-blue with center of standard yellow to purple, ½ in. long: pods ½ in. long. Wash. to Calif.

tricolor: L. pubescens.

truncatus. Ann. to 2 ft., slightly hairy: fls. violet: pods 1 in. long. S. Calif.

variscolor. Per. with decumbent or prostrate sts. to 2½ ft. long: fls. yellow, white, pink, blue, purple, ½ in. long: pods to 1½ in. long, seeds mottled. Calif.

vàrius. Ann. to 3 ft.: fls. red and blue. S. Eu.

venústus: L. mibescens.

villòsus. Lady L. Per. to 3 ft.: lvs. entire, elliptic-lanceolate to oblanceolate, to 6 in. long, long-petioled: fls. cream-colored to deep purple, the keel usually darker than wings, in erect dense panicles: pods to 1½ in. long. N. C. to Fla. west to Miss.

LUVUNGA: Lavanga.

LÙZULA. WOOD RUSH. Juncacex. Glabrous or somewhat pubescent per. herbs with grass-like lvs., differing from the closely related Juneus in the 1-celled 3-seeded caps., Juneus having a caps. with 1-3 cells and many seeds. Plants of dry shaded woods adapted to naturalizing in colonies or for the border. Propagated by seeds and division.

campéstris (L. pilosa). Common W. Tufted, to 1½ ft.: lvs. to ½ in. across fis brown, to nearly ½ in long, crowded into erect infl. of 2-12 spike-like clusters. N. Amer., Eu.,

pildsa: L. campestris.

LYCÁSTE. Orchidacex. Trop. American epiphytic orchids with pseudobulbs bearing 1 to several plaited lvs., and solitary fls. on basal shoots, the lateral sepals united with the foot of the column to form a spur-like body or chin, the lip 3-lobed. Grown in intermediate temperature and shade: see Orchids for cult.

aromática. Pseudobulbs to about 3 in. high, with 2-3 lvs. to about 20 in. long: fls. very fragrant, to 2½ in. across, orange-yellow, the lip often spotted with red and with a broad callus. Jan., Apr.-Oct. Cent. Amer.

Bárringtoniæ. Pseudobulbs ellipsoidal, to about 3 in. tall: lvs. 2-3, elliptical, to nearly 2 ft. long and 4 ½ in. wide: fls. olive-green to tawny-yellow, lip 3-lobed and fimbriate. Apr.-June. W. Indies.

brevispatha (L. candida). Pseudobulbs to 2½ in. high, commonly 2-lvd.: lvs. to 1 ft. long: fls. 2½-3 in. across; sepals pale green; petals white; lip white tinted with yellow, all parts of perianth often dotted with red-brown. Feb.—May. Costa Rica, Panama.

cándida: L. brevispatha.

cruenta. Pseudobulbs to 31/4 in. high, 2-3-lvd.: lvs. to 11/4 ft. long: sepals brownish- or yellowish-green; petals orange-yellow; lip orange-yellow with blood-red at base. Blooms almost all year. Cent. Amer.

Déppei. Pseudobulbs to 3½ in. high, with 3-4 lvs.: fis. to over 4 in. across; sepals greenish spotted with red;

petals ivory-white; lip white and yellow spotted with red. June-Sept. Mex.

fulvéscens. Pseudobulbs to 5 in. high, with 2 lvs. to 20 in, long: fis. yellowish tinged with brown, the lip 3-lobed, fringed in front. May-June. Colombia.

Hárrisoniæ: Bifrenaria Harrisoniæ.

lánipes. Pseudobulbs subcylindric, to 6 in. long, with 2-3 lvs. to 25 in. long: fis. about 4 in. across, greenish-white to ivory-white, lip fringed in front. Autumn. Ecuador.

lasioglóssa. Pseudobulbs to 5 in. high, 2-3-lvd.: lvs. to 2 ft. long: fls. to 5 in. across, with brown sepals, yellow petals and lip with hairy red-spotted mid-lobe. Guatemala.

Lawrenceana: a form of L. brevispatha with petals and lip white tinted rose-pink.

leucântha. Pseudobulbs to 3 in. tall, 2-3-lvd.: lvs. to 25 in. long: fls. to 4 in. across; sepals greenish-brown, petals yellowish-white; lip pale yellow suffused with white. Cent. Amer.—This name is occasionally misapplied to L. brevi-

Skinneri. Pseudobulbs to 3 in. high, with 2-3 lvs. to 2 ft. long: fls. the largest in the genus, to 6 in. across, with white or rose sepals, rose petals, and lip rose or crimson-carmine of many shades often mottled with white. Jan.- May, Nov. Mex., Guatemala, Honduras.

LYCHEE: Litchi chinensis.

LÝCHNIS. Caryophyllaceæ. Herbaceous annuals and perennials, many of which are good garden subjects: fls. solitary or in clusters, often very showy, white, pink, purple, shades of red, the petals usually 2-notched: lvs. commonly opposite and entire: native in the north temp. and arctic zones. All are easily grown from seed, the perennials being propagated also by division.

Alba (L. vespertina. Melandrium album). Evening Campion. Bien, or per. to 2 ft., sticky-hury: lvs. ovatelanceolate to oblong: fls. white and fragrant, to 1 m. across, opening in the evening, in loose few-fld. panicles. Eu.; adventive in E. U.S.

alpina (Viscuria alpina). Arctic Campion. Per, smooth, tufted, 1 ft. or less: lvs. linear-lanceolate: fis. pink, ½ in. across, in dense terminal heads. Apr. Arctic and alpine regions in Eu., Asia, N. Amer. Color vars. are alba, rosea and rubra.

apétala (Viscaria parviflora). Per. to 8 in., glandular-pubescent above: lvs. linear to oblanceolate, to $2\frac{1}{2}$ in. long, sessile: fls. solitary, nodding, petals inconspicuous and shorter than the deeply purple-veined calyx. Arctic regions of northern hemisphere.

Arkwrightii. Hybrid between L. Haageana and L. chalcedonica, with fis. in shades of scarlet.

atropurpurea (Viscaria atropurpurea). Perhaps not distinct from L. Viscaria, from which it supposedly differs in its shorter fr. and smaller darker purple fls. S. Hungary to Bulgaria.

cándida: hort, name for a white-fld, form,

caramánica: see Silene caramanica.

cardinalis: plants listed as Viscaria cardinalis are L. Cæli-rosa

chalcedónica. Maltese Cross. Jerusalem Cross. Scarlet Lightning. Per., 2-3 ft., usually loosely hairy: lvs. ovate to lanceolate, mostly clasping: fis. scarlet, about 1 in. across, in dense terminal heads. June-July. Russia and Siberia; escaped in E U.S. There are vars. with white, rose or flesh-colored fis. as áiba, rôsea, and salmònea, and sometimes double forms. Var. grandiflòra is listed.

Cœli-ròsa (Agrostemma Cœli-rosa. Viscaria cardinalis). Rose-or-Heaven. Ann. to 1½ ft.: lvs. linear: fis. nearly 1 in. across, rose-red, solitary, terminal. Medit. region. Var. álba, fis. white. Var. fimbriàta, petals toothed. Var. kermesina, fis. red. Var. oculàta (Viscaria oculata), fis. purple-eyed.

compácta: hort. name.

Coronaria (Agrostemma Coronaria. Coronaria tomentosa).
MULLEIN-PINK. DUSTY MILLER. ROSE CAMPION. Bien. or
per. to 3 ft., densely white-woolly: lvs. oval or oblong: fls.
crimson, 1 in. or more across, terminal and solitary. JuneJuly. S. Eu.; escaped in N. Amer. Color forms listed are
álba, atrosanguínea and bícolor.

coronata (L. grandistora). Bien. or per. to 1½ ft.: lvs. oval-elliptic: fls. brick-red, salmon or cinnabar, 2 in. or more across, in open panicles. China, Japan. Var. Sièboldii, large pure white fis.

córsica. Ann. to 3 ft: fls. pink changing to reddish, in panicles. Corsica.

dioica (L. diurna. Melandrium dioicum, M. rubrum and M. silvestre). RED or MORNING CAMPION. To 2 ft., coarse,

hairy and usually somewhat sticky: lvs. oblong to ovate: fls. normally red, to 1 in. across, in loose clusters, opening in the morning. Eu. and Asia; escaped in E. U. S. There are white and double-fld. vars.

differe L. dimen

fimbriàta: L. Cæli-rosa var.

Flós-càculi (Agrostemma Flos-cuculi. Coronaria Flos-cuculi). Cuckoo-Flower. Ragged Robin. Per., slender, floriferous, sott-hairy below, sticky above: Ivs. narrow-lanceolate: fls. red or pink, to 1 in. across, in loose panicles. May-Aug. Eu., N. Asia; nat. in E. U. S. There are doublefld. and white vars.

Flos-Jovis (Agrostemma and Coronaria Flos-Jovis).
FLOWER-OF-JOVE. Per. to 1½ ft., white-tomentose: lvs.
oval-lanceolate: fls. pink, to ½ in. across, in dense umbellike clusters. June-July. Mts. of S. Eu. Var. alpina is

Forrestii. A strain of bybrids with fis. in shades of crimson, carmine, pink and white: 1½-2 ft. high.

fülgens. Per. to 2 ft., hairy: lvs. ovate to ovate-oblong: fls. bright scarlet, to 2 in. across, in few-fld. dense terminal clusters. Siberia.

Githago: Agrostemma Githago.

grandiflòra: L. coronata.

Haageana, Hybrid between L. fulgens and L. coronata var. Sieboldu: per, somewhat hairy, to 1 ft., intermediate in characters between the parents: fls. orange-red, scarlet or crimson, about 2 in. across, in 2's or 3's. May-June. Lagáscæ: Petrocopius Lagascæ.

lappónica: listed as a plant 6 in. high with bright rose fis. macrocárpa. Per. to 3 ft., glandular-pubescent: lvs. ovate to ovate-lanceolate, to 2½ in. long or more, undulate fts. white to rose-pink, diœcious, the fruting calyx-lobes narrowly lanceolate. Eu., W. Asia, N. Afr.

Miqueliàna. Similar to L. coronata from which it differs in its more spreading infl., shorter bructs, and petals not eroded nor toothed but 2-hipped: fls. salmon-red. Japan.

mongólica. To about 2 ft., sts. hairy: lower lvs. short-petioled, lanceolate, to 5 in long, obtuse, upper lvs. briefly connate, linear-oblong: fls. 1-3, probably white, about ¾ in. long. Mongolia.

montana. Per. to nearly 6 in., glabrous below and glandular-hairy above: Ivs. linear-oblanceolate, to 2 in. long, petioles cluate: fis. white to pink, usually soltary, petals shorter than calyx. Mts. of Colo. and Wyo.

oculàta: L. Cæli-rosa var.

parvifldra: see L. apetala.

Préslii. Per. to 1½ ft.: lvs. ovate-lanceolate to obovate, acuminate to obtuse, entire, decurrent, dark green: fls. purplish, about 1 m. across, abundant in panicled clusters.

pyrendica: Petrocoptis pyrenaica.

Sártori. To 1 ft.: lvs. lanceolate: fls. purple, 1/2 in. across. China? Botanical position uncertain.

segitàlis: Agrostemma Githago.

Sénno. Per. to 2 ft, sts. pubescent to villous: lvs. ovate to ovate-lanceolate, to 3 in. long, acute, entire, villous: fls. scarlet, white or sometimes scarlet striped with white, to 21½ in across, in cymes of 3-7, petals broadly cordate, overlapping, margins sharply toothed. Japan.

Sièboldii: L. coronata var.

tristis. Per. to 1½ ft. or more, sts. black-glandular above, viscid: basal lvs oblong-lanceolate, to 6 in. long, petioled; st.-lvs. linear-oblong, to 4 in. long, acute, ciliate: fts. dark brownish-purple, in terminal clusters of 1-3, petals narrowly obcordate. Caucasus.

Vaccaria: Saponaria Vaccaria.

vespertina: L. alba.

Viscária (Viscaria viscosa). GERMAN CATCHFLY. Per. to 1½ ft, smooth with sticky patches beneath the ficusters: lvs. long and narrow: fts. red or purple, about ½ in. across, in loose panicles. May-June. Eu., N. Asis. Vars. are álba, grandiflóra álba, nana, rosea, spléndens, spléndens flore-plèno.

Walkeri. Hybrid between L. Coronaria and L. Flos-Jovis: silvery-hairy, with carmine-red fls. from June to Oct.

yunnanénsis. Tufted per. 8 in. tall or less, sts. hairy, slender: lvs. linear to lanceolate, sessile, acute, hairy: fis. white, petals exceeding calyx, 2-lobed, calyx mostly 10-nerved, segms, ovate, glandular, margins reddish. China.

LÝCIUM. Box-Thorn. MATRIMONY-VINE. Solanaceæ. Ornamental deciduous and evergreen shrubs, often clambering and requiring support, with alternate or clustered small lvs., usually grayish-green: fls. funnel-shaped, greenish, whitish, purplish, or violet, solitary or clustered, the stamens commonly exserted: berries usually scarlet.

Lyciums grow in all usual soils. As suckers are generally produced, the plants should not be set near flower-beds. They may be propagated by hardwood cuttings, by suckers, by layers, and by seed.

bárbarum. Often confused with L. halimifolium but differing in the smaller narrow lvs. and the glabrous filaments. N. Afr.

carolinianum. To 5 ft, spiny: lvs. spatulate, thick and fleshy, to 1 in. long: fls. 1/4 in. long, limb as long as tube, the filaments woolly at base: fr. red, 1/4 in. across. S. C. to Fls. and Tex.

chinénse. Shrub with arching and often prostrate branches to 12 ft. long, usually unarmed, branchiets yellowish-gray: lvs. ovate or ovate-lanceolate, to 3 m. long, remaining green until late in autumn: fis. purple, ½ in. long, the limb longer than corolla-tube, filaments pubescent at base: fr. scarlet to orange-red, to 1 in. long. E. Asia. Var. ovatum has lvs. to 4 in. long.—Very like L. halum-folium and perhaps not distinct as commonly defined; the fl characters of separation are not constant; in L. chinense the lvs. on flowering branchlets are prominently broad and short while those of L. halimifolium are long and very

europæum. Differs from L. halimifolium in the smaller narrower lvs., more slender corolla-tube, and glabrous filaments. Medit. region.

halimifolium (L. vulgare). Upright or spreading shrub to 10 ft, arching or recurving branches, usually spiny; branchlets light gray: lvs commonly lanceolate, to 2½ in. long, thickish: fls. dull lilac-purple, the limb shorter than tube, filaments pubescent at base: fr. to ¾ in. long, scarlet to orange-red. S. E. Eu, W. Asia.

horridum. To 3 ft., much branched, spiny: lvs. spatulate, ¼ in long; fls. whitish, ¼ in long, the filaments pubescent at base. S Afr, where it is planted for hedges.

pállidum. To 6 ft, much branched, spiny: lvs. lanceolate, to 2 in. long, glaucous and fleshy: fis nodding, greenishyellow tinged purple, 34 in long, tube 3 times longer than lobes, filaments glabrous: fr. scarlet, ½ in. across. Utah to Mex.

ruthénicum. Spiny: lvs. linear to linear-lanceolate, to $1\frac{1}{4}$ in. long: fis. $\frac{1}{2}$ in. long, lobes much shorter than tube, filaments pubescent at base: fr. black. E. Eu., W. Asia.

vulgare: L. halimifolium.

LYCOPÉRSICON. Tomato. Solanaceæ. Herbaceous annuals and perennials, the lvs. pinnately compound, fls. yellow, fr. a pulpy berry, 2- or few-celled, the cells multiplied under cult.; native in S. Amer. but spontaneous in smallfruited forms in many warm regions. Linnæus placed the tomato in the genus Solanum and it was first separated as a genus by John Hill in his Vegetable System who spelled the generic name Lycopersicum. Because Hill did not follow the binomial system of nomenclature consistently in this work, the names are not valid and it is necessary to take up the name and spelling as next given by Philip Miller, namely Lycopersicon. Certain modern authors have reunited Lycopersicon with Solanum. Relationship of tomato and potato is close, as shown by the fact that one may be grafted on the other: see Potomato.

esculéntum. Tender per. but treated as an ann., to 6 ft. and more, more or less hairy, with strong odor: lvs. to 1½ ft. long, of 5–9 more or less curled toothed lfts. to 3 in. long: fls. nodding, ½ in. across; fr. red or yellow, to 3 in. across, usually flattened at the ends, sides grooved or furrowed. W. S. Amer. Var. cerasifórme. Cherry T. Lvs thinner and smaller: fls. in longer clusters: fr. globular and regular, about ¾ in. diam., red or yellow; forms with oblong fr. are Plum T. Var. commine (var. vulgare). Common T. Lfts. little if at all curled: plants heavier and more lopping: fr. mostly globular or only flattened a little, the sides not furrowed or grooved, many-celled. Var. grandifòlium. Large-leaved or Potato-leaved T. Lvs. large and plane, lfts. fewer. Var. pyrifórme. Pear T. Fr. pear-shaped, about 1½ in. long. Var. välidum. Uprioht T. Stout, erect, very compact: lvs. crowded and curled.

pimpinellifòlium (L. racemiforme. L. racemigerum). Currant T. Weak, sts. slender, finely pubescent, without pronounced odor: lvs. of 5-7 lfts, to 1½ in. long: fls. 10-25 in an elongated raceme: fr. red, currant-like, about 1/2 in. diam., 2-celled. Peru.

racemiforme: L. pimpinellifolium. racemigerum: L. pimpinellifolium.

LYCOPODIACEÆ. Club-Moss Family. Three genera of moss-like evergreen herbs with numerous small lvs. and minute spores borne either in terminal spikes or in lf.-axils, often picked for decorations, particularly in the holiday season. They are pteridophytes or "flowerless" plants, belonging with the fern allies. Only Lycopodium is known to hort.

LYCOPÒDIUM. Club-Moss. Lycopodiaceæ. Per. evergreen herbs with needle- or scale-like lvs., widely scattered over the world, the native ones often used for Christmas greens. Grown in moist shady places. Propagated by cuttings.

Billardièri. Usually growing on trees or rocks, sts. to 5 ft. long, much branched: spikes numerous, terminal, to 4 in. long. New Zeal.

clavatum. Running-Pine. Sts. creeping to 9 ft., with very leafy ascending branches: spikes 1-4, on sts. to 4 in. long. N. Amer., Eu., Asia.

complanatum. Ground-Cedar. Sts trailing, the ascending branches often fan-like (var. flabelliforme) and lvs. 4-ranked: spikes 1-4, on sts. to 5 in. long. N. Amer., Eu, Asia.

dendroideum: L. obscurum.

lucidulum. Shining C. Sts to 10 in. high, decumbent at base: lvs. glossy green: sporangia in axils of lvs. N. Amer.

obscurum (L. dendroideum). Ground-Pine. Main st. creeping underground, branches to 10 in. high, tree-like: spikes nearly sessile. N. Amer, Asia.

Selago. Sts. stiff and erect, forming tufts to 8 in. high, the sporophylls shorter than other lvs. and not in spikes. Alaska to Ore. and mts. of N. C., Eurasia.

tristachyum. Sts creeping underground, with narrow glaucous branches and 4-ranked imbricated lvs.: spikes on sts. to 5 in, long. Me. to Ga. and Minn., Eu.

LÝCOPUS. WATER HOARHOUND. Labiatæ. Per. mint-like herbs making stolons at base, in north temp. zone, with small white, tinted or purplish fls. in close axillary clusters, adapted to moist places and wild-gardens: lvs. opposite, sessile or short-stalked, variously dentate, mostly nearons.

americanus ($L.\ sinuatus$). To 2 ft., erect: lvs. lanceolate or somewhat broader, short-petioled, incised to pinnatifid, to 4 in. long: corolla little exceeding calyx, pale with crimson spots. Moist ground, Newf. to Fla. and Calif.

europæus. To 2½ ft., more pubescent than above: lvs. ovate to oblong-lanceolate, to 3 in. long, coarsely dentate: fls. as above. Eu., nat. in U. S. from Mass. to Va.

sinuatus: L. americanus.

LÝCORIS. Amaryllidaceæ. Bulbous herbs with narrow basal lvs. disappearing before the fls. which are yellow or red and borne in an umbel at tip of solid scape, the perianth-segms. united into a short tube; Chinese and Japanese. Hardy out-of-doors with winter protection, and also grown under glass.

aurea (Amaryllis aurea). Lys. to $\frac{3}{4}$ in. across: fis. yellow, 3 in. long, in summer. China.

incarnata. To 1% ft.: lvs. somewhat linear: fls. salmon to bright rose, fragrant, large, segms. only slightly reflexed and undulate. Cent. China.

purpurea: probably L. squamıgera var.

radiàta (Amaryllis radiata). Lvs. linear: fis. bright red or white in var. álba, 1½ in. long, in autumn. China, Japan.

sanguínea. Lvs. linear: fls. bright red, 2 in. long, in summer. Japan.

squamigera (Amaryllis Hallii). Lvs. to 1 in. across: frose-lilae or pink, 3 in. long, in summer, fragrant. Japan. Var. purpùrea is listed.

LYGISTUM: Manettia.

LYGÒDIUM. CLIMBING-FERN. Schizæaceæ. Twining vine-like ferns with palmately or pinnately lobed or divided lfts. or secondary pinnæ; sori borne on contracted divisions of frond, often forming panicles; mostly native in tropics. The twining st. is really petiole and rachis.

circinatum (L. dichotomum). Lfts. deeply palmately divided into entire segms. to 1 ft. long, bright green. Trop. Asia. Malaya.

dichôtomum: L. circinatum.

japônicum. Lits. pinnate into pinnatifid or lobed segms., margins toothed, pale green. E. Indies, E. Asia, Australia.

palmatum. Hartford-Fern. Lits. nearly orbicular, palmately 4-7-lobed, margins entire, fertile lits. forming terminal paniele. Mass. to Fla. and Tenn.

scándens. Lits. pinnate into ovate or ovate-lanceolate segms. to 2 in. long, sometimes lobed, bluish-green. E. Asia.

volubile. Lfts. pinnate into lanceolate segms, to 1 ft. long. Trop. Amer.

LYŌNIA (Xolisma). Ericaceæ. Shrubs, evergreen and deciduous, with alternate lvs., white or pinkish fls. in clusters or panicles, and capsular frs.; cult. as for Leucothoë. Adapted for colonizing and in shrubby collections; mostly plants of moist soil. Asian species may be expected to appear in general cult.

ligustrina (Andromeda ligustrina and paniculata. Arsenococcus ligustrinus). Male-Berry. He-Huckleberry. To 12 ft., deciduous: lvs. to 3 m. long, entire or finely toothed: fls. in panicles to 6 in. long. May-July. Me. to Fla. and Tex.

hcida (L. mitida. Pieris lucida and nitida. Neopieris nitida. Andromeda nitida. Desmothamnus lucidus). Fetterbush. To 6 ft., evergreen: lvs. to 3 in. long, entire, shining above: fis in terminal leafy racemes. Mar.-May. Va. to Fla. and La, in low woods and barrens.

mariana (Andromeda, Neopieris and Pieris mariana). Stagger-Bush. To 6 ft., deciduous: lvs. to 2½ in. long, entire: fls. nodding, in terminal leafless racemes. May-June. R. I. to Fls. and Ark.

nitida: L. lucida.

LYONOTHÁMNUS. Lyon-Shrub. Rosaceæ. One evergreen tree confined to the isls. off coast of S. Calif. and planted in warm regions. L. floribúndus. Catalina Ironwood. To 55 ft.: lvs. lanceolate, to 8 in. long, nearly entire or pinnately cut or sometimes pinnately compound, dark green and shining above: fls. small, white, in corymbs to 8 in. across. In var. asplenifòlius the lvs. are pinnately divided into lobed líts.—Propagated by basal sprouts, with difficulty by cuttings or by seeds when produced.

LYON-SHRUB: Lyonothamnus.

LYRATE: pinnatifid, but with an enlarged terminal lobe and smaller lower and sometimes intermediate lobes.

LYSIAS: Habenaria.

LYSICHÌTUM. Araceæ. Two stemless illscented herbs native in swamps of W. Asia to W. N. Amer. L. americanum. Yellow Skunk-Cabbage. Lvs. from thick rootstocks, to 5 ft. long, oblong-lanceolate: fls. greenish- to golden-yellow, borne on a spadix; spathe yellowish, the blade to 4 in. long.—The L. camtschatcense of E. Asia is odorless or sweet-scented, has a white spathe, and is the plant sometimes cult. as var. album of that species.

LYSILOMA. Leguminosæ. A small genus of trop. American trees or shrubs with 2-pinnately compound lvs. and greenish-white to white fls. in capitate heads or cylindrical spikes, with the numerous stamens partly united into a tube: fr. an elliptic to linear dehiscent pod. One species may be in cult. in Fla. for ornament.

latisfliqua (L. Sabicii). Tree to 65 ft. or more, usually much smaller, twigs glabrous: lvs. to 8 in. long, lfts., 3-7 pairs, ovate to obovate, to 1 in. long, obtuse, to ½ in. wide: fis. greenish-white, in solitary long-peduncled axillary heads: pods to 6 in. long and 1½ in. wide. Bahamas, Cuba, Hispaniola.—The tree has been confused with L. bahamensis which differs in its smaller linear-oblong lfts.

Sàbicii: L. latisiliqua.

LYSIMACHIA. Loosestrife. Primulaceæ. Ann. and per. summer-blooming herbs, bearing yellow or white, rarely purple or blue, fls. singly or in spikes or racemes, sometimes whorled, wheel- or bell-shaped corolla, and fr. opening by 5 valves; of temp. and subtrop. distribution, a few grown for ornament in moist situations. Propagated by division.

atropurpurea. Ann. to 2 ft.: lvs. lanceolate: fls. red with dark purple anthers, in dense spikes. Greece, Asia Minor.

barýstachys (L. brachystachys). To 2½ ft.: lvs. linear to lanceolate, glaucous beneath: fis. white, in dense racemes at first nodding. E. Asia.

brachýstachys: L. barystachys.

ciliàta: Sterronema ciliatum.

clethroides. To 3 ft., pubescent: lvs. ovate-lanceolate: fls. white, in slender terminal spikes. China, Japan.

dùbia. To 2 ft.: lvs. linear-lanceolate: fls. rose, in spikes. S. E. Eu., W. Asia—Similar to L. atropurpurea, differing in all the lvs. briefly petioled and not sessile, and in fls. rose-colored.

Ephémerum. To 3½ ft.: lvs. linear-lanceolate, glaucous: fls. white, in racemes. Medit. region.

Fórtunei. To 2 ft., glabrous: lvs. oblong-lanceolate: fls. white, in many-fld. racemes. China, Japan.

Fraseri. To 7 ft.: lvs. lanceolate or oblanceolate: fls. yellow, in broad terminal panicles. S. C. to Ga.

japónica. Decumbent or ascending to 5 in.: lvs. ovate, punctate: fls. yellow, solitary in the axils. E. Asia to Sumatra

lobeliafòlia: listed name.

lobelioides. To 1 ft., sts. slender, erect or ascending: lvs. ovate to orbicular-ovate, to nearly 2 in long, glabrous, opposite; fls. white, broadly campanulate. N. W. Himalayas.

minoricénsis. To 2 ft., sts. erect, rarely branched: lvs. lanceolate, alternate, glabrous: fis. in clusters of 5-8. Balearian Isls.

Nummulària. Moneywort. Creeping Jennie or Charle. Creeping: lvs. round: fls. yellow, solitary in the axils. Eu.; nat. in E. N. Amer. Var. aurea has yellow foliage.

punctàta (L. verticillata). To 3 ft.: lvs. in 3's or 4's, ovate-lanceolate: fls. yellow, in axillary whorls, petals margined with minute glandular hairs. Eu, nat. in E. U. S.

quadrifòlia. To 3 ft.: lvs. usually in 4's or 5's, lanceolate to ovate: fls. yellow with dark streaks, axillary, long-stalked. N. B. to Ga. and Tenn.

terréstris. Glabrous, erect, to 2 ft.: lvs. mostly opposite, lanceolate, acute, to 3 in. long, with minute black dots: fts. yellow, in terminal racemes. Moist ground, Newf. to Ga. and west.

thyrsiflòra. To 2 ft.: lvs. opposite, sessile, lanceolate: ffs. yellow, in short axillary heads. Swamps, Eu., Asia, N. Amer.

verticillàta: L. punctata.

vulgàris. Bushy, 3-5 ft.: lvs. whorled or opposite, ovate-lanceolate: fls. yellow, in leafy panicles. Eu., Asia; nat. in E. U. S. Var. dahurica is listed, and may not be distinct from the type.

LYTHRACEÆ. LOOSESTRIFE FAMILY. About 21 widely distributed genera of herbs, shrubs or trees, many of them in trop. Amer., with mostly alternate or whorled lvs., bisexual polypetalous fls. having tubular calyx, 4–6 petals or sometimes without petals, few to many stamens, superior 2–6-celled ovary, and capsular fr. Several genera furnish medicinal and dye products, others timber, and the following are grown with us for ornament: Cuphea, Decodon, Heimia, Lagerstræmia, Lawsonia, Lythrum.

LYTHRUM. Lythracex. Ann. and per. herbs with mostly opposite entire lvs. and 4-angled

branches, purple to white fls. solitary or in racemes or spikes, and capsular frs.; planted in borders and wild-gardens. Of easy cult. in moist soil. Propagated by division and by seeds when available.

alàtum. Per., erect, to 4 ft., st. angled or winged: lvs. opposite or alternate, sessile, oblong to lanceolate, to 1½ in. long: fls. small, purple, solitary in axils. New England to Ark.

flexudsum (L. Graeffer). Per., sts. to $2\frac{1}{2}$ ft. long, prostrate or ascending: lvs. to $1\frac{1}{4}$ in long and $\frac{1}{4}$ in. wide: fls. purple, usually solitary. Eu., N. Afr., Asia Minor.

Graefferi: L. flexuosum.

Hyssopifòlia. Ann. to 2 ft.: lvs. to ¾ in. long and ¼ in. wide: fls. pink-purple, very small, solitary. Temp. regions of world.—Hyssopifolia is an old substantive adopted by Linnæus.

ròseum supérbum: L. Salicaria var.

Salicaria. Purple Loosestrife. Per. to 3 ft. with a hard and woody root: lvs. lanceolate, to 4 in. long, broad at base: fls. purple, to ½ in. across, in dense leafy terminal spikes. Old World; nat. in N. Amer. Var. atropurpareum is listed with dark purple fls. Var. roseum supérbum has larger rose-colored fls. and in var. tomentosum the whole plant is white-tomentose.

virgåtum. Closely resembling L. Salicaria but with lvs. narrow at base and smaller fls. in leafy open racemes. Eu., Asia; somewhat nat. in Mass.

MAACKIA. Leguminosæ. A few deciduous trees with pinnate lvs., white papilionaceous fls. and flattened pods; native in E. Asia. Cult. as for Cladrastis from which the genus differs in lfts. opposite or nearly so and fls. in dense upright panieled racemes.

amurénsis (Cladrastis amurensis). To 40 ft.: lvs. of 7-11 ovate líts.: fls. 1/3 in. long, July-Aug.: pods to 2 in. long. Manchuria. Var. Buérgeri has more obtuse líts. which are pubescent beneath.

chinénsis (M. hupehensis). To 50 ft.: lvs. of 11-13 ovate lfts, pubescent beneath: fts. 1/4 in. long. China.

Fabriei. To 30 ft.: lfts. 9-17, elliptic to oblong, to 2 in. long, glabrous: fls. ½ in. long. Korea.

hupehénsis: M. chinensis.

MABA. Ebenacex. Trees and shrubs differing from Diospyros in technical floral characters, native in warm and trop. regions, two of them having been intro. into southern parts of U. S. for ornament; mostly dioecous.

natalénsis (Ebenus natalensis). Evergreen shrub to 20 ft.: lvs. small, ovate, oblong or elliptic, obtuse or mucronate, glabrous: berries black, in bunches, chestnut-color, about ½ in. long. S. Afr.

sandwicensis (Ebenus sandwicensis). Lama. Tree to 40 ft.: lvs. thick, elliptic to ovate-oblong, to 2 in. long, glabrous or becoming so: berries reddish-yellow when mature, about ½ in. long, edible. Hawaii, Fiji.

MACADAMIA. Proteacex. Trees or shrubs in Australia with whorled lvs., small bisexual fls. borne in pairs in simple racemes, and fr. a hard globose drupe; one species grown in S. Calif. and S. Fla. for the edible nuts.

The Queensland nut withstands slight frosts; it succeeds in fertile loamy moist soils. Propagated by seeds planted singly in pots or stratified in sand; germination under glass is slow unless artificial heat is employed.

alternifòlia: a listed name of no botanical standing; it is probably a misspelling for M. ternifolia.

ternifolia. Queensland Nur. To 50 ft.: lvs. in whorls of 3-4, oblong or lanceolate, to 1 ft. long, toothed, shining: fls white, in racemes to 1 ft. long: nuts 1 in. across, smooth and shining, globular or hemispherical. Queensland, New S. Wales.

MACE: see Nutmeg.

MACFADYENA: Dolichandra cynanchoides.

MACHÆRANTHÊRA. Compositæ. A genus of midwestern American ann., bien. or per. herbs having alternate bristle-tipped entire to pinnatifid lvs. and corymbose or paniculate radiate heads whose involueral bracts are in several series, the pistillate ray-fls. blue-violet to purple and disk-fls. yellow to red or brown; achenes with pappus of bristles. One species is cult., M. tanacetifòlia. Tahoka Daisy. Bien or winter ann. to 2 ft., sts. glandular-pubescent: lvs. 2—3-pinnatifid, to 3 in. long, lobes linear-oblong, acute, often mucronate: heads to 2 in. across, ray-fls. blue-violet, disk-fls. yellow. S. D. to Mont. south to Mex. and Calif.—Desirable for cutting or in border, best treated as winter ann., sowing seeds in autumn or very early spring. For other species see Aster.

MACHÆRIUM: Tipuana Tipu.

MACHÆROCÈREUS. Cactaceæ. Prostrate or low and bushy cacti of Lower Calif. (Mex.), of two species, often with long horizontal branches, very spiny, ribs low, the central spines daggerlike: fls. diurnal, long and slender, the perianth persisting on the fr. See Cacti.

Eruca (Cereus and Lemaireocereus Eruca). Prostrate, tips

ascending: fis. 4 in. or more long, yellow.—A creeping plant, dying back at basal end, and therefore should not be grown in a pot but on a bed or large flat box.

gummòsus (Cereus and Lemaireocereus gummosus) Bushy and erect, 3 ft. or less: fls. to 5 in. long, purple.

MACHAIROPHÝLLUM. Aizoaceæ. Stemless S. African succulents of the Mesembryanthemum group: lvs. decussate, 3-angled, united at base: fls. large, usually in 3's, long-stalked; stigmas 7-15.

albidum (M. albidum). Lvs. to 4 in. long and 3/4 in. wide, with short spine at tip, whitish: fls. reddish outside, yellow inside, 21/2 in. across.

Bifili (Perissolobus Bijlii). Lvs. crowded, to 1 in. long, ½ in. wide and ½ in. thick, edges often purplish, having many stiff dead lvs. under living ones: fis. solitary, terminal, stamens with white filaments and yellow anthers.

MACKAW-TREE: Acrocomia fusiformis.

MACKÀYA. Acanthaceæ. Shrubs native in India and Afr., with opposite simple lvs. and tubular fls. much dilated above; one species grown in the open in S. U. S. and under glass. Propagated by cuttings in spring or summer.

bélla (Asystasa bella). To 4 ft, erect: lvs. oblong, to 5 in. long, toothed: fis. lavender, to 2½ in. long, in terminal racemes to 6 in. long. S. Afr.

MACLEAYA. Papaveracex. Per. herbs, sometimes shrubby, with pinnately lobed lvs. and many small cream-colored fls. without petals borne in terminal panieles, known in cult. as Bocconia; commonly glaucous; grown in borders and as specimen plants for the bold attractive habit and appearance. Propagated by suckers.

cordata (Bocconia cordata and japonica). Plume-Poppy. Thee Celandine. To 8 ft.: lvs. to 8 in. across, white beneath: panicles to 1 ft. long. China, Japan — Common in cult.

microcárpa (Bocconia microcarpa). Differs from M cordata in the lvs. pubescent beneath, 8-12 instead of 24-30 stamens, and 1-seeded rather than 4-6-seeded caps. Cent Assa

MACLÙRA (Toxylon). Moraceæ. Deciduous spiny tree native from Ark. to Tex., M. pomífera (M. aurantiaca). Osage-Orange. To 60 ft.: lvs. ovate to oblong-lanceolate, to 5 in. long, entire, slender-stalked: staminate fls. in short racemes, pistillate in small dense heads: fr. a rough heavy syncarp, orange, to 5 in. across.—A popular hedge plant and succeeds on land not very rich. Hardy as far north as Cent. N. Y. and New England. Propagated easily by seeds, also by cuttings of young wood and root-cuttings under glass.

MACRADÈNIA. Orchidaceæ. Trop. American epiphytes with 1-lvd. pseudobulbs and fls. in lateral pendulous racemes, the sepals and petals similar, the lip 3-lobed, the side lobes surrounding the column. Grown in the warm greenhouse; see Orchids.

modésta (Serrastylis modesta). Lvs. to 834 in. long: fls. in many-fld. racemes to 10 in. long; sepals and petals redbrown edged with pale yellow; lip yellowish-white. Jan.—Mar. Colombia.

MACROPIPER. Piperacex. Woody plants native in New Zeal. and the S. Seas, having alternate entire lvs. and very small fls. without perianth, in dense axillary unisexual spikes; sometimes grown in the greenhouse for ornament. Propagated by cuttings.

excélsum. To 20 ft., aromatic: lvs. broad-ovate, to

5 in. long, yellow-green, palmately nerved from base: spikes to 3 in. long.

MACROPLECTRUM: Angræcum sesquipedale.

MACROZÀMIA. Cucadaceæ. Australian species often with underground trunks, having pinnate lvs. without distinct midvein in the pinnæ and striate underneath, and fls. borne in cones. They differ in technical non-horticultural characters from Cycas, which see; more closely related to Dion and Encephalartos.

Dénisonii: M. Peroffskyana.

flexuôsa. Trunk mostly underground: lvs. erect, flexuous, the rachs spirally twisted, rarely more than 3 ft. long; lfts. very narrow, about ½ in. broad, to 8 in. long, entire, base usually red New S. Wales.

Peroffskyana (M. Denisonii). Trunk to 20 ft. high and 1½ ft. dam: lvs. to 12 ft. long; lfts. to 2 ft. long and ½ in. broad. Queensland, New S. Wales.

spiralis. Trunk mostly subterranean but sometimes to spiralis. I funk mostly subtermined but sometimes to 6 ft. and 2 ft. diam: lvs. more than 3 ft. long; lfts. to 10 in. long, flat, somewhat decurrent on lower margin, pale green at base, apex acuminate, parallel-veined bereath. New S. Wales.

MADDÈNIA. Rosacex. Deciduous trees or shrubs in Asia with alternate toothed lys., dicecious fls. without petals borne in racemes, and fr. a drupe; infrequently planted and hardy N.

hypoleuca. Madden-Cherry. To 20 ft.: lvs oblong, to 3 in. long; racemes to 2 in. long. Apr.-May. China.

hypoxántha. Differs from M hypoleuca in lvs. yellowish rather than whitish beneath and somewhat hairy on nerves. China.—This is the usual species in cult.

MADDER: Rubia tinctorum.

MADEIRA-VINE: Boussingaultia baselloides.

TARWEED. Compositæ. heavy-scented ann. and per. herbs, glandular: lys, mostly alternate: heads axillary or terminal, of yellow ray- and disk-fls. closing in the sunshine; pappus none; native W. N. Amer. to-Chile.

corymbòsa: M. elegans.

dissitiflora. Ann. to 2 ft.: lvs. linear, to 2½ in. long: heads sulfur-yellow, rays to ½ in. long. Calif.

diversifòlia: listed name.

élegans (M. corymbosa). Common T. Ann. to 2 ft.: lvs linear, to 5 in. long: heads long-stalked, rays yellow throughout or with a brown spot at base, to 34 in. long. Calif and Ore. to Nev.

sativa. Chile T. Ann. to 4 ft.: lvs. lanceolate to linear. to 2 in. long: heads sessile or short-stalked, rays honey-yellow, ½ in. long. Chile; a coarse plant, nat. in Ore., Calif.

MADRE: Gliricidia sevium.

MADRONA: Arbutus Menziesii. MADRONELLA: Monardella.

MADWORT: Alyssum.

MÆSA. Myrsinaceæ. Trees or shrubs native in the tropics of the Old World, bearing alternate lys., small white fls. in racemes, and berry-like fr.; one species is grown under glass, and in the open in warm countries. Propagated by seeds and cuttings.

indica. Tree to 30 ft.: lvs. oval to lanceolate, to 5 in. long, leathery: racemes to 4 in. long. India.

MAGA: Montezuma.

MAGNÒLIA. Magnoliacex. Attractive deciduous and evergreen trees and shrubs with entire lvs., large solitary terminal often very showy fls. which are white, pink, purple or yellow and cone-like frs. composed of aggregated carpels; native in Asia, N. and Cent. Amer.

Magnolias are very ornamental as specimen trees and sometimes are planted in avenues. The evergreen sorts are not hardy far North. The species that bloom in early spring in advance of the leaves are most striking in appear-

Fertile soil that holds moisture is best. They transance. Fertile soil that holds moisture is best. They transplant usually with difficulty and this should be undertaken before new growth starts. Propagated by seeds sown in fall or stratified; also by green cuttings under glass, by layers put down in spring and transplanted to pots the following summer, and named varieties by grating on M. acuminata. In the following list, the plants are deciduous unless otherwise stated.

acuminata. Cucumber-Tree. Tree to 100 ft., twigs mostly glabrescent: lvs. elliptic to oblong-ovate, to 10 in. long, pubescent beneath: fls. with the lvs, greenish-yellow, to 3 in. long: fr red, to 4 in. long. N. Y. to Ga. and Ark. Var. cordata is M. cordata.

álba supérba: M. Soulangeana var. alba.

Alexandrina: M. Soulangeana var.

Ashei. Similar to M. macrophylla from which it differs in its smaller habit, corolla $1\frac{1}{4}-1\frac{1}{2}$ in. wide, fr. cylindricovoid, and petals less irregular. W. Fla. and Tex.

auriculata: M. Fraseri.

Cámpbellii. Tree to 80 ft.: lvs. elliptic-oblong to ovate, to 1 ft. long, glaucous beneath: fls. before the lvs., pink outside, pink and white inside, to 10 in. across: fr. greenishbrown, to 8 in. long. Himalayas.

Candolleana: M. Soulangeana var.

compréssa: Michelia compressa.

conspicua: M. denudata.

cordata (M. acuminata var. cordata). Differs from M. acuminata in the twigs densely pubescent, lvs. broader and fls. canary-yellow. Ga.

Delavayi. Tree to 35 ft., evergreen, allied to M. grandiflora: I'vs. ovate-oblong to ovate, about 10 in long, glaures-cent beneath: fls. white, 6-8 in. across: fr. about 5 in. long. S. W. China.

denudata (M. conspicua). Tree to 50 ft: lvs. obovate, to 7 in. long, slightly pulescent beneath: fis. before lvs. white, fragrant, to 6 in. across: fr. brownish, to 5 in. long.

exoniénsis: M. grandiflora var. lanceolata.

fct da: M. grandiflora.

Fråseri (M. auriculata). Tree to 50 ft.: lvs. spatulate-obovate, to 1½ ft. long, the base cordate-auriculate: fls. with lvs., white, fragrant, to 10 in across: fr. rose-red, to 5 in. long. Va. to Ga and Ala.

fuscata: Michelia fuscata.

glauca: M. virginiana.

gloridsa: M. grandiflora var.

grácilis: M. liliflora var.

grachis: M. Intifiora var.
grandiflora (M. fætula). Bull Bay. Noble evergreen
variable tree to 100 ft.: lvs. obovate-oblong, to 8 in. long,
very thick, shining above, mostly rusty-tomentose beneath
at least when young: fls. white, fragrant, to 8 in. across: fr.
rusty-tomentose, to 4 m. long. N. C. to Fla. and Tex. Var.
gallissoniënsis is very hardy. Var. gloriòsa has larger
fls., to 1 ft. or more across. Var. lanceolàta (var. exoniensis,
var. stricta) has narrower lvs and pyramidal habit. Var.
rotundifòtia has very broad nearly blunt lvs.

Halliana; M. stellata.

hypoleùca: M. obovata.

Kôbus (M. Thurbert). Tree to 30 ft.: lvs. obovate, to 4 in. long, pale beneath: fls. before the lvs., white, 4 in. across: fr brown, to 5 in long. Japan. Var. borealis is a pyramidal form with larger lvs.

Lénnei: M. Soulangeana var.

lilifiòra (M. purpurea. M. discolor). Shrub to 10 ft.: lvs. obovate to oval, to 7 in. long, pale beneath: fls. before the lvs., purple outside, white inside, to 4 in. long: fr. brownish China. Var. grácilis (M. gracilis), lvs. nairower, fls. dark purple, smaller. Var. nigra (M. Soulangeana var. nigra) has larger fls. dark puiple outside, pale purple inside.

macrophylla. LARGE-LEAVED CUCUMBER-TREE. Tree to 50 ft.: lvs. oblong-obovate, to 3 ft. long, cordate-auriculate at base, glaucous and pubescent beneath: fls. with the lys., white, fragrant, to 1 ft. across: fr. rose, to 3 in. long. Ky. to Fla. and La.

major: plants of this name may be M. Thompsoniana. nìgra: M. liliflora var.

nigricans: catalogue name for dark rose-purple-fld. form. Norbertiana: M. Soulangeana var.

obovata (M. hypoleuca). Tree to 100 ft.: lvs. obovate, 1 ft. and more long, glaucous and pubescent beneath: fls. with the lvs., white, fragrant, to 7 in. across: fr. scarlet, to 8 in. long. Japan.

parviflòra: M. Sieboldii.

purpurea: M. liliflora.

rústica: M. Soulangeana var. rubra.

salicifòlia. Tree to 30 ft.: lys. elliptic to oblong-lanceolate. to 5 m. long, glaucous beneath; fis. before the lvs., white or sometimes purplish at base, fragrant, to 5 in. across: fr. rose, to 3 in. long. Japan.

Sièboldii (M. parvifora). Tree to 30 ft.: lvs. elliptic to oboyate, to 6 in. long, glaucous beneath: fis. with the lvs., white, fragrant, to 4 in. across, sepals pink: fr. crimson, to 1½ in. long. Japan, Korea.

Soulangeana. Hybrid between M. denudata and M Soulangeana. Hybrid between M. denudata and M. lulufura, common in cult. in many forms and hardy N.: small tree: lvs obovate: fls. before the lvs., purplish outside, white inside, to 6 in. across. Some of the hort. vars. are: flba (var. alba superba), fls. white; Alexandrina, deep purple at base outside; amábilis, fls. white; Candolleana, fls. white tinged with purple at base; Lénnei (M. Lennet), lvs. broader, fls. rosy-purple outside; Norbertiana, late-blooming; rubra (M. rustica rubra), fls. rose-red; speciosa, fls. white striped outside with purple; spectabilis, fls. white.

speciòsa; M. Soulangeana var.

stellåta (M. Halliana). STARRY M. Shrub or tree to 15 ft.: lvs. obovate-oblong, to 5 in. long, dull green above: fls. before the lvs., white, fragrant, 3 in. across: fr. red, 2 in. long. Japan. Var. rosea has fls. pink outside.

stricta: M. grandi flora var. lanceolata.

subrotunda: a form of M. grandiflora.

Thompsoniana. Hybrid between M. tripetala and M. virginiana, with fragrant fls. to 6 in, across.

Thurberi: M. Kobus.

tripétala. UMBRELLA-TREE. Tree to 40 ft.: lvs. oblong-obovate, to 2 ft. long, pale and pubescent beneath: fls. with the lvs., white, of unpleasant odor, to 10 in. across: fr. rose, to 4 in. long. Pa. to Ala. and Miss.

Veitchii. Hybrid between M. Campbellii and M. denudata, having larger lys, than latter and blush-pink fis. to 10 in. across.

Victoria: form of M. grandiflora, lvs. very red-rusty underneath.

virginiana (M. glauca). Sweet Bay. Shrub or tree to 60 ft. half-evergreen in the S.: lvs. oblong or elliptic, to 5 in long, glaucous-gray beneath: fls. with the lvs., white, frugrant, to 3 in. across: fr. red, to 2 in. long. Mass. to fragrant, to 3 Fla. and Tex.

Wátsonii. Tree to 25 ft.: lvs. obovate, to 7 in. long, glaucous and pubescent beneath: fts. with the lvs., white with pink sepals, fragrant, to 6 in. across: fts. crimson, about 2 in. long. Habitat unknown, perhaps a hybrid.

Wilsonii. Tree to 25 ft.: lvs. oblong, to 5 in. long, silky-tomentose beneath: fls. with the lvs., white, fragrant, to 5 in. across: fr. crimson, 2½ in. long. China.

MAGNOLIÀCEÆ. MAGNOLIA FAMILY. Trees, shrubs or vines, of 10 genera in N. Amer. and Asia, with entire or lobed lvs., usually bisexual fls. with 3 sepals, 6 or more petals, numerous stamens, 1-celled ovary, and fr. a follicle or samara often aggregated into cones. The family contains many ornamental genera, as Drimys, Illicium, Kadsura, Liriodendron, Magnolia, Michelia, Schizandra, Talauma, Tetracentron.

MA-HAI: Eleocharis dulcis.

MAHALA MAT: Ceanothus prostratus.

MAHÉRNIA. Sterculiacex. Herbs and subshrubs in Afr., with alternate usually deeply cut lvs., drooping bell-shaped fls., and capsular frs. One is an ornamental subject for the greenhouse, hanging-baskets, or out-of-doors in the S. Of easy cult. Propagated by cuttings.

odorata: M. verticillata.

verticillata (M. odorata). Honey-Bell. Straggly subshrub, mostly with an herbaceous appearance under glass, with branches to 1 ft. high: lys. to 1 in. long, cut into linear divisions: ffs. yellow, very fragrant, 2 on a st., in winter and spring. S. Afr.

MAHOBÉRBERIS. Berberidacex. Hybrid between Mahonia Aquifolium and Berberis vulgaris. M. Neubertii (Berberis Neubertii). Shrub to 6 ft., evergreen or nearly so, without spines: lvs. simple, to 3 in. long, toothed or spiny, or sometimes of 3-5 lfts. all on same plant: not known to bloom. Var. latifolia (Berberis latifolia and ilicifolia) has broader lvs. Hardy N.

MAHOE: Hibiscus tiliaceus.

MAHOGANY: Swietenia. Bastard: Eucalyptus botry-oides. Mountain: Cercocarpus. Red: Eucalyptus resmifera. Swamp: Eucaluptus robusta.

MAHÒNIA (Odostemon). Berberidacex. Many evergreen thornless shrubs with alternate pinnate lvs. with mostly spiny-toothed lfts. (in which they are distinguished from the true barberries), vellow fls. in racemes or panicles, and fr. commonly a dark blue bloomy berry; native in Asia, N. and Cent. Amer.; by some writers included in Berberis.

Some of the mahonias are hardy in the northern states in sheltered places or with protection. They should be guarded from the wind and hot sun. They are excellent for ground-cover and similar uses wherever hardy, for the foliage is attractive and durable. Propagated by seeds, suckers, layers and cuttings of half-ripe wood under glass.

Aquifolium (Berberis Aquifolium. M. Murrayana).
HOLLY M. or BARBERRY. To 3 ft. or more: Ifts. 5-9, ovate, to 3 in. long, the petioles to 2 in. long, glossy dark green above: racemes to 3 in. long. B. C. to Ore; hardy in N. Y. and S. New England. Var. dictyota. To 1 ft. or less: Ifts. broad-ovate, netted, shining and yellow above, with 10-20 spines terminating teeth: racemes dense, 1 in. or less long. Calif. Var. grácilis, Ifts. narrower and more cuneate at

Bèalei (Berberis Bealei; see M. japonica). To 12 ft.: lfts. 9-15, ovate, to 5 in. long, with few large teeth, stiff, petioles ½ in. or less long: racemes to 6 in. long, fragrant. China; less hardy than M. Aquifolium, but roots persist.—Lvs. somewhat glaucous underneath.

fascicularis: M. pinnata.

Fortunei (Berberis Fortunei). To 6 ft.: lfts. 5-9, lanceolate, to 5 in. long: racemes to 6 in. long. China; adapted to Calif. and other mild climates.

Frèmontii (Berberis Fremontii). DESERT M. To 12 ft.: lits. 3-7, ovate-oblong to lanceolate, to 1½ in. long, with few large teeth, stiff, petioles very short: racemes few-fid. Colo. to Tex. and Calif; hardy in Va region.

grácilis (Berberis gracilis). To 3 ft. or more: lfts 3-5, to 1½ in. long, margins undulate, spiny-toothed: fis. on short pedicels in lax subfasciculate racemes. Mex.

hæmatocárpa (Berberis hæmatocarpa). To 12 ft.: lfts. 3-7, lateruls lanceolate, to 2 in. long, terminal lft. to 3 in. long, petroles very short: racemes few-fld.: fr. red, to ½ in. across. Colo. and New Mex.

ilicifòlia: listed name, perhaps for Berberis ilicifolia.

japónica. The plant grown under this name is M. Bealei, the true M japonica is probably not in cult. in N. Amer.: it has less stiff or rigid lfts. yellowish-green underneath, and longer lax raceines and drooping fis.

Murrayana: M. Aquifolium.

napaulénsis (Berberts nepalensis). To 10 ft. and more: lfts. 5-25, ovate-oblong, to 4 in. long, with few teeth: racemes to 1 ft. long. Himalayas; planted in Calif. and other mild climates.

nervosa (Berberis nervosa). OREGON-GRAPE. To 2 ft.: lfts. 11-19, ovate to ovate-lanceolate, to 3 in. long, stiff, pettoles to 5 m. long, shinng, pale beneath: racemes to 8 in. long. B. C. to Calif; hardy in N. Y. and S. New England.

Nèvinii (Berberis Nevinii). To 8 ft.: lfts. 5, oblong, to 1½ in. long, petioles very short: racemes few-fid. Calif., where it is now planted.

pinnata (M. fascicularis. Berberis fascicularis and pinnata). To 12 ft.: Ifts. 7-13, ovate or ovate-lanceolate, to 214 in. long, petioles very short: racemes to 3 in. long. Calif. to Mex.; adapted to warmer parts of the country.

pùmila (Berberis pumila). To 1 ft., sts. erect, not stoloniferous: lfts. ovate, 1-5, coarsely toothed, prominent veins on both surfaces: fls. in short terminal and axillary racemes: fr. very small. Ore., Calif.

rèpens (Berberis repens). To 1 ft., stoloniferous: lfts. 3-7, ovate, to 2½ in. long, bluish-green, petioles to 1 in. long; racemes to 3 in. long. B. C. to Calif.; hardy in N. Y. and New England.

Swaseyi (Berberis Swaseyi). To 4 or 5 ft.: Ifts. 5-11, oblong-lanceolate, rather thin, netted, to ¾ in. long: infl. bearing broad ovate bracts: fr. red. Tex.

trifoliolata (Berberis trifoliolata). Agarita, Algerita. To 8 ft.: Ifts. 3, oblong or lanceolate, coarsely toothed, stiff, petioles to 2 in. long: racemes few-fid.: fr. red. Tex., New Mex., Mex.; somewhat planted in Tex., etc., berries gathered for jelly; known to Mexicans as Agrito.

MAÍANTHEMUM (Unifolium). Liliaceæ. Humble per. herbs with slender roots and creeping rhizomes, simple 2-3-lvd. sts., and small white fls. in terminal racemes, the 4 segms. distinct; useful for colonizing in shady places and of easy cult. Propagated by division.

bifòlium (M. Convallaria. Smilacina bifolia). To 9 in., pubescent: st.-lvs. triangular-ovate, cordate with deep and open sinus, petiole to 1 in long: racemes about 1 in. long. Eu., Asia. Var. kamtschâticum is listed.

canadénse. To 7 in , pubescent: lvs. 1-3, ovate, heart-shaped at base, very short-petioled: racemes to 2 in. long. Newf. to N. C. and S. D.

Convallaria: M. bifolium.

dilatatum. Prevailingly larger than the others, glabrous, with stouter rootstock: st.-lvs. often 3, broadly ovate-cordate, nearly or quite as broad as long, with very deep sinus, margins crenulate: fls. large, truncate or retuse at base. Calif. to Alaska and Japan.

MAILE: Alyxia olivæformis,

MAIRANIA: Arctous.

MAIZE: Zea Mays.

MAJORÀNA. Labiatæ. Per. herbs or subshrubs with aromatic herbage, usually woolly or hairy, and 2-lipped fls. in whorls in thick clustered spikes; grown as sweet-herbs.

Sweet marjoram is grown as an annual as it winter-kills easily unless carefully protected. Propagated by seed; the young seedlings are tender and require shading. Successional plantings are usually made during the summer in hotbeds or coldframes. Plants should not be closer than 6 inches in rows 12 inches apart. They are harvested just before blooming.

horténsis (Origanum Majorana). Sweet or Annual Marjoram. Per. but cult. as an ann., to 2 ft.: lvs. oval, to 1 in. long, entire, petioled: fls. purplish or whitish. Eu.

Onites (Origanum Onites). Per.: lvs. ovate, sessile, slightly toothed: fis. a little larger than in M. hortensis. S. E. Eu., Asia Minor, Syria.

MALACHE: Pavonia.

MALACHODENDRON: Stewartia pentagyna.

MALÁCHRA. Malvaceæ. Trop. American hairy per. herbs or shrubs with toothed or lobed lvs. and fls. in heads; one species may be grown under glass or in the open far S. for ornament.

radiata. To 8 ft., with stiff yellowish hairs: lvs. to 5 in. across, deeply 3-5-parted: fls. rose, subtended by involucre of narrow bracts. Trop. Amer., trop. Afr.

MALACOCÁRPUS. Cactaceæ. Short-cylindric or globose plants, simple or clustered, ribs usually straight, areoles felted: fls. from the center of the plant, short and broad, commonly yellow, the ovary bearing scales with wool and perhaps bristles in the axils: fr. soft, berry-like and not dehiscing at maturity as in Notocactus: S. American, about 15 species. Treatment as for Echinocactus. See Cacti.

catamarcénsis: Parodia catamarcensis.

chrysacanthion: Parodia chrysacanthion.

concinnus: Notocactus concinnus.
floricomus: Notocactus floricomus.

Graessneri: Notocactus Graessneri. Grossei: Notocactus Grossei.

Háselbergii: Notocactus Haselbergii.

Hénnisii: listed name.

islayensis: Parodia islayensis.

Léninghausii: Notocactus Leninghausii.

Maassii: Parodia Maassii.

mammillarioides: Pyrrhocactus centeterius.

mammuldsus: Notocactus mammulosus.

microspérmus: Parodia microsperma.

Ottonis: Notocactus Ottonis.

pampeanus: Notocactus pampeanus.

pulchérrimus: Frailea pulcherrima.

Schumannianus: Notocactus Schumannianus.

Scopa: Notocactus Scopa.

Séllowii (M. tephracanthus. Echinocactus tephracanthus and Sellowii). Globular or depressed, to 6 in. across, woolly at top; ribs 18-22; spines 4-6 and to ¾ in. long, straight or recurved: fls. yellow, 1¾ in. long, at top of plant. Brazil, Arrentina, Paraguay.

Strausianus: Pyrrhocactus Strausianus.

submammuldsus: Notocactus submammulosus.

tabulàris: Notocactus tabularis.

Vorwerkianus (Echnocactus Vorwerkianus). Depressed, to 2 in high and 3 in. diam., white-woolly at top; ribs about 20, areoles densely woolly; radial spines 5 and 1/4 in. long; central 1: fis. yellow, 11/4 in. long. Colombia.

MALACÓTHRIX. Compositæ. Herbs or woody-based plants of W. N. Amer. with mostly basal lvs. and heads of yellow, white or pinkish ligulate fls. on scape-like sts.; pappus of bristles. Sometimes grown for ornament.

arachnoidea. Per. to 2 ft, densely woolly-pubescent: lvs broadly to linear-lanceolate, to 4 in. long, sessile: fis. white to pink, heads to 1½ in. across. Calif.

californica. Ann. to 1 ft.: lvs. all basal, woolly at least when young, pinnately parted into narrow-linear segms.: sts. not branched above: heads to 1 % in. across, canary-yellow, Sonchus-like. Apr.—June. Calif.

glabràta (M. californica var. glabrata). Sts. usually branched above; plant glabrous except involucre. Nev., Calif., Ore.

MALANGA: Xanthosoma.

MALÁXIS (Microstylis). Orchidaceæ. A large genus of cosmopolitan terrestrial orchids, mostly low herbs commonly having a bulbous swelling at the base of the st., few membranaceous lvs., and terminal racemes of small fls. with linear or filiform petals and entire or lobed lip. Planted in the wild-garden or in woodsy places.

unifolia (Microstylis ophioglossoides and unifolia). To 12¾ in. tall: If. solitary at about the middle of st., round-ovate to ovate-lanceolate or oval, to 3½ in. long; infl. to 4¼ in. long, with a densely-fld. raceme of minute greenish fls. with a 3-lobed lip. Newf. to Fla. west to Minn.; Mex., W. Indies.

MALCOMIA. MALCOLM STOCKS. Cruciferæ. Ann. and per. plants of the Medit. region and eastward, mostly grayish, with entire or pinnatifid lvs. and elongated pods or siliques. One or two of them grown as flower-garden subjects for the lilac, pink-purple or white small but profuse fls.; not scented. The genus is distinguished by technical characters. Propagated by seeds, either started indoors or sown where plants are to stand.

flexuosa. Ann., with obovate or oblong entire lvs. and pedicels as thick as the pods which are fleshy and recurved.

—Plants grown under this name are likely to be M. maritima.

litt**òrea.** Per., white-tomentose, rather stiff, to 12 in.: lvs. very narrow, entire: fls. purple.—Will bloom first year from seed.

maritima (Cheiranthus maritimus). VIRGINIAN STOCK. Diffuse ann., with broadened petioled entire obtuse oblong or elliptic lvs.: fls. lilac and reddish to white, about ½ in. long: pods erect or spreading, not fleshy.

MALE-BERRY: Lyonia ligustrina.

MALEPHORA: see Hymenocyclus.

MALLOTUS. Euphorbiaceæ. Shrubs or trees native in trop. Asia and Afr., with mostly alternate simple lvs., diœcious apetalous fls. in panicles, racemes or spikes, and capsular frs.; sometimes planted in S. Calif. for ornament.

ricinoldes. High shrub or spreading tree: lvs. broadly ovate, to 10 in. across: fis. in spikes 6 in. or more long: caps. densely tomentose, ½ in. across. Australia.

japónicus. Small tree, twigs scurfy: lvs. ovate, reddish

often 3-lobed, glandular: fls. to ¼ in. across, in branched terminal spikes: caps pubescent, weakly prickly, ¼ in. across. China, Japan.

MALLOW: Malva. False-: Malvastrum. Globe-: Sphæralcea. Jews-: Corchorus olitorius. Marsh-: Althæa officunalis Musk-: Hibiscus Abelmoschus. Poppy-: Callirhoe. Prairie-: Malvastrum coccineum. Rose-: Hibiscus. Tree-: Lavatera. Virginia-: Sida hermaphrodita.

MÁLOPE. Malvaceæ. Showy ann. herbs native in the Medit. region, having alternate simple lvs. and large fls. solitary in the axils; of simple cult. in the flower-garden. Propagated by seeds. The generic name is pronounced in three sylla-

grandiflora: M. triflda var.

trifida. To 3 ft.: lvs 3-lobed, toothed: fls. rose or purple, to 3 in. across. Spain, N. Afr. Var. álba has white fls.; grandiflora large deep rose-red fls. with darker veins; purparea deep purple-red fls.; rosea rose-colored fls.

MALORTIEA. Palmacex. Diminutive pinnate-lyd, or -veined shade palms of Cent. Amer.. allied to Chamædorea; monocious; fl.-clusters in lower axils, near the ground, probably not in cult. in our territory unless under test.

MALPÍGHIA. Malpighiacex.and shrubs, in trop. Amer. and reaching the southernmost U. S., with opposite simple lvs., red, purple or white fls. usually in axillary umbels or corymbs, and fr. a drupe with 3 winged or crested seeds; grown for ornament and M. glabra for the edible fr. which is made into jam or preserves. Propagated by seeds and cuttings.

coccigera. Bush to 3 ft.: lvs. small, to 34 in. long, with coarse spiny teeth resembling holly: fis pink, solitary or 2 together: frs. red, about 1/3 in. diam. W. Indies.

glàbra. Bahbados-Cherry. Variable shrub to 10 ft.: lvs. ovate to lanceolate, to 3 in long, entire: fls. rose, in 3-8-fld. umbels: frs. red or scarlet. acid, size of a small cherry or less. S. Tex. and trop. Amer.

MALPIGHIÀCEÆ. MALPIGHIA Trees or shrubs or sometimes woody herbs, of about 55 genera widely distributed mostly in the tropics, characterized by usually opposite simple lvs., bisexual somewhat irregular polypetalous fls. with 5 sepals and mostly prominently clawed petals, 5 or 10 stamens, prevailingly superior 3-celled or -parted ovary, and fr. commonly of 3 nut-like parts or sometimes a samara or a drupe. The following genera are grown for ornament or the edible fr.: Malpighia, Stigmaphyllon, Thryallis, but the family has small hort. significance in the U.S.

MALTESE CROSS: Lychnis chalcedonica.

MALU CREEPER: Bauhinia Vahlii.

MALUS. APPLE. Rosacex. About 35 low spring-blooming broad-headed trees and large bushes of the north temp. zone, insufficiently distinguished botanically from Pyrus by the more or less uniform joining of the styles at base, the mostly more globular fr. in which grit cells are commonly not present at maturity. In the pomological apples the styles form a solid stipe by their union at the base, but the stipe varies in length in different varieties. In the pears the styles are pressed together at base but not joined (Beal, Proc. Amer. Pom. Soc. xvii, xviii, 1880, 1882). Taxonomy in Malus is still confused. Cult. as for Pyrus and Apple.

The most important fruit-trees of cool temperate regions are the various descendants from *M. sylvestris*, the wild or original apple; the pomological crab-apples may be *M. baccata* or other derivatives, and *M. ioensis* has been amalgamated with cultivated apples. The native crab-apples, not pomologically ameliorated, are ornamental in stature,

habit, pink-white flowers and fruits. The oriental crabs, of the *M. floribunda* group, are amongst the choicest of hardy decorative small trees; both bloom and fruit are produced in abundance and are satisfying to the eye. They may be grown directly from seeds or budded on closely related stocks

Many of the binomials of cultivated races are difficult of determination, and supposed to represent hybrid forms; they may be closs in some cases, perpetuated asexually.

adstringens (Pyrus adstringens). MAJOR CRAB-APPLES. Many forms of crab- and semi-crab-apples, at least some of them hybrids with M. sylvestris as a base, comprising Transcendent, Martha, Hyslop, and the red-fid. Hopa which is assumed to be a cross with M. sylvestris var. Niedzwetskyuna lvs. pubescent underneath and larger than those of M. baccata: fr. large for a crab, the calyx-lobes often or usually persisting.

aldenhaménsis; M. sylvestris var.

angustifolia (Pyrus angustifolia). Southern Crab-Apple. To 25 ft., partially evergreen: lvs. lance-oblong to narrow-obovate, closely serrate or entire, glabrous or sometimes slightly pubescent on veins underneath: fls. about 1 in. across, pink or rose, fragrant: fr. 1 in. or less diam., depressed both ends. Va. to Fla. and Miss.

Arnoldiana: M. floribunda var.

astracánica: M. sulvestris var.

atrosanguinea: see under M Halliana.

atrosanguínea: see under M Halhana. baccàta (Pyrus buccata. M. baccata var. sibirica) Siberian Crab-Apple. Glabrous tree to 40 ft., with hard wiry branchlets: lvs. oval to ovate-lanceolate, with callous serratures, long-petioled. fls. about ½ in. across, white, on slender pedicels: fr. ¾ in. or less diam, war-like, yellow or red, calyx-lobes falling. Siberia, Manchuria, China—Has supposedly entered into a number of hybrids. Var. columnaris, tree columnar in growth, lvs. large, glabrous. Var. mandshirica (M. cerusifera in part) has pubescent calyx, pedicels and petioles, lvs. remotely servulate, frs. mostly larger. Var. Jáckii is like var. mandshurica but glabrous, fr. red. M. robústa (Pyrus robusta, M. cerusifera in part) is probably a hybrid of M. baccata and M. prumfolia: vigorous plant with large oblong or oblong-ovate lvs. glabrous or pubescent underneath: fls. white or pinkish, on slender stalks, fr. about ¾ in. or less diam, yellow and red. Such pomological vars. as Red. Siberian crab-apple belong here. belong here

brévipes (Pyrus brevipes). Related to M. floribunda, perhaps a hybrid: small tree of dense habit: lvs. very closely serrate: fls. whitish, on pedicels ½ in or less long: fr. about ½ in diam., nearly globose, on short stalks.

calocárpa: M. Zumi var.

cerasifera: see under M. baccata.

communis: M. sylvestris.

coronains: M. Spicearis.

coronains (Pyrus coronaria). Garland Crab-Apple.

Wild Sweet Crab. Tree to 30 ft., soon becoming glabrous
lvs. ovate to oval, more or less acuminate, green underneath, sharp-serrate and perhaps notehed, on shoots somewhat lobed toward apex: fls 1 in. or less across, rose changin, to white: fr. 1 in. diam, oblate, yellowish, hard and
sour, long-stemmed. N. Y. and Ont. to Ala. and Mo.—
There is a spotted-lvd. and a semi-double form and other
departures. departures.

cratægifòlia; M florentina.

Dawsoniana (Pyrus Dawsoniana). Slender tree, supposedly cross between M. fusca and M. sylvestris: lvs. oval to elliptic-oblong, seldom lobed. fis 1 in. or more across, white, slender-pedicelled, with the lvs.: fr. 1 in. or more diam., yellow. Raised at Arnold Arboretum.

Eleyi: M. sylvestris var.

florentina (M. cratæyifolia. P. florentina. Cratæyus florentina). Small close-headed crab-apple with lobed hawthorn-like sharp-toothed lvs. soft-pubescent underneath: fls. 34 in. across, white, on slender pedicels: fr. about ½ in. long, red. Italy.

floribinda (Pyrus floribunda. P. pulcherrima). Showy Crab-Apple. Profusely blooming, becoming nearly or quite glabrous, large bush or tree 25 ft. or more: lvs. ovate to oblong, acuminate, not lobed but sometimes angled on young shoots, sharp-serrate: fls. 1½ in. or less across, rose-red changing to nearly white: fr. about ½ in. diam., red, calyx falling. Probably Japan or China, or perhaps a race of hybrids. Var Arnoldiana has larger lvs. and fls., the latter lighter colored, fr larger and yellow; thought to be a hybrid of M. floribunda and M. baccata. Var. Scheideckeri, lvs ovate, fls. pale pink and commonly semidouble, fr. ¾ in. diam., yellow, calyx usually persistent; supposed hybrid.

formosana (Pyrus formosana). Tree to 50 ft.: lvs. elongated (to 6 in.), oblong or elliptic-oblong, acute, coarsely serrate, white-tomentose when young: fis. about I in. across, the pedicels white-tomentose; fr. to 2 in. diam, apple-like in shape, yellowish-red, the calyx persistent,

rather astringent but eaten by natives of Formosa when cooked or pickled. Planted in Calif.

fúsca (Pyrus fusca. P. rivularis). OREGON CRAB-APPLE. Tree to 30 ft. or more: lvs. ovate-lanceolate, acute, sharply and perhaps glandular-serrate, pubescent underneath, slightly 3-lobed on young shoots: fls. ¾ in. across, white, with the lvs.: fr. ¾ in. or less long, yellow to reddish. N. Calif. to Alaska.

glabrata (Pyrus glabrata). A southern representative of M. glaucescens, the lvs. not glaucescent, glabrous, deeply lobed, cordate, lowest pair of lateral veins issuing from very base of blade. N. C. to Ala.

glaucéscens (Pyrus glaucescens). Small tree or large shrub distinguished from M. coronaria by broader lvs. somewhat glaucous underneath and all of them slightly lobed, the calyx somewhat hairy. N. Y. to Ala.

Halliana (Pyrus Halliana). HALL Crab-Apple. Attractive essentially glabrous shrub or small tree to 18 ft., with somewhat purplish twigs and other parts: lvs. long-ovate to oblong, acuminate, closely crenate-serrate to entire, glossy above: fls. 1½ in. or less across, deep rose, calyx-lobes nearly obtuse, styles 4 or 5: fr. about ½ in. diam., purplish. Probably China; hardy N. Var. Parkmanii is double-fld. M. atrosanguinea is apparently a hybrid of M. Halliana and M. Sieboldii: fls. rose-purple not fading to white; calyx-lobes short, acute: lvs. nearly glabrous.

heterophylla. Like M. Soulardı but lvs. broader and smoother, pedicels lightly pubescent; includes Matthew's crab-apple; hybrid between M. coronaria and derivative of M. sulvestris.

hupehénsis (M. theifera. Pyrus hupehensis). Small stiff-branched tree distinguished from M. Halliana by larger and broader ovate to elliptic-ovate thinner sharply serrate lvs., white or blush fls., calyx-lobes acute rather than obtusish, styles commonly 3, fr. about ½ in. long, pyriform. Himalayas to China; hardy N.

ioénsis (*Pyrus ioensis*). Prairie Crab-Apple. Tree to 30 ft., tomentose on young parts and mostly on under side of the oblong-ovate, short-acute, serrate and sometimes side-lobed lvs.: fls. 1-2 in. across, white or tinted: fr. about 1 in. long, short-oblong, slender-pedicelled. Ind. to Minn. and Mo—Bechtel's crab is a double-fld. form. Var. Pálmeri, lvs. smaller, oblong, obtuse or nearly so, floral ones more or less crenate.

Kàido: M. micromalus.

kansuénsis (Pyrus kansuensis). Tree to 25 ft.: lvs. broad-ovate, serrate, 3-5-lobed, 3-nerved at base, more or less pubescent underneath: fls. about ½ in. across, white, styles 3: fr. about ½ in. long, reddish or yellow. China; hardy N.

lancifolia (Pyrus lancifolia). Distinguished from M. coronaria by the narrow more acuminate lvs. which are ovate-lanceolate to oblong-lanceolate, and longer narrower calyx-lobes: fr. subglobose, about 1 in. diam., on slender drooping pedicels, green. Pa. and Va. to Mo.

Lemdinei: M. sylvestris var.

Malus: M. sulvestris.

mandshùrica: M. baccata var.

micromalus (Pyrus Micromalus. P. and M. Kaido). Kaido Crab-Apple. Small tree allied to M. spectabilis but distinguished by narrower lvs. attenuate at base, slender petiole, deeper pink fis about 1½ in. across, pubescent pedicels and callyx, fr. subglobose and with cavity at base and callyx sometimes falling. Probably a hybrid, with M. spectabilis as one parent.

Niedzwetzkyana: M. sylvestris var.

paradisiaca: M. sylvestris var.

plateforpa (Pyrus platicarpa). One of the M. coronaria kind of crab-apple, but lvs. broad and large, ovate to elliptic, rounded at base, short-acute, sharp-serrate, glabrous or pubescent on veins underneath, those on vigorous shoots with several pairs of triangular lobes: fls. about 1½ in. across, white: fr. about 2 in dam., flattened or hollowed at ends. N. C. to Ga. Var. Hoopesii. Lvs. only slightly if at all lobed: calyx and pedicels pubescent.

Práttii (Pyrus Prattii). Tree to 30 ft.: lvs. ovate to elliptic-lanceolate, acuminate, finely serrate, slightly pubescent on veins underneath: fls. about ¾ in. across, white: fr. about ½ in. long, red or yellow. China; hardy N.

prunifolia (Pyrus prunifolia). Small tree: lvs. ovate to broad-oval, short-acuminate, serrate, pubescent underneath or at length glabrous: fls. about 1½ in. across, white, calyx mostly glabrous and lobes longer than tube: fr. about 1 in. diam., yellow or red, hanging long. Probably N. E. Asia, perhaps a range of hybrids. Var. Rínkii (M. and Pyrus Ringo). Ringo Crab-Apple. Lvs. pubescent underneath and fls. pink, calyx somewhat hairy.

pulchérrima: M. floribunda.

pùmila: M. sylvestris var. paradisiaca.

purpurea. Accounted a hybrid between M. sylvestris

var. Niedzwetzkyana and M. atrosangumea (Halliana var.): lvs. small, shining, purple when young: fr. small, calyx sometimes deciduous.

Ringo: M. prunifolia var. Rinkii.

Rínkii: M. prunifolia var.

Ríversii: M. spectabilis var.

rivulàris: M. fusca.

robústa: see under M. baccata.

Sårgentii (Pyrus Sargentii). More or less spiny shrub to 6 ft.: lvs. ovate to elliptic-oblong, short-pointed to acuminate, sharply serrate, pubescent at first but becoming nearly glabrous, those on shoots 3-lobed and broader: fts 1 in. across, clear white: fr. about ½ in. diam., dark red, calyx falling. Japan; hardy N.

Scheideckeri: M. floribunda var.

Sièboldii (Pyrus Sieboldii. P. and Malus Toringo). TORINGO CRAB-APPLE. Shrub, or a tree to 15 ft.: lvs. ovate to oblong-ovate, short-acuminate, sharp-serrate becoming glabrous or nearly so underneath, those on shoots lobed or strongly notched at or below the middle: fls. ¾ in. across, pink to blush: fr. ¼ in. dam., red or yellowish, calyx falling. Japan; hardy N. Var. arboréscens. Tree to 30 ft., with larger less deeply lobed less pubescent lvs.: fls. sometimes nearly white. For var. calocarpa see M. Zumi.

Soulardii (Pyrus Soulardii). Soulard Crab-Apple. Much like the apple-tree: lvs. round-ovate to oblong-ovate, mostly blunt at apex, coarsely and bluntly toothed, more or less shallowly lobed along sides, densely pubescent underneath: fls. blush, in close clusters of woolly pedicels: fr. 2 m. more or less diam, flattened on ends, yellowish, fairly edible. Natural hybrid, west of Great Lakes, between Malus sylvestris and M. ioensis.

spectabilis (Pyrus spectabilis). Tree to 25 ft.: lvs. oval to elliptic or oblong, short-pointed, broad or often narrowing at base, crenate-serrate, glossy above and becoming glabrous or nearly so underneath: fls. showy, 2 in. or less across, rose to pink, lobes of calyx not longer than tube: fr. 1 in. or less diam., yellow, without basal cavity, calyx persistent. China, but not known native; hardy N. Var. Riversii has large double pink fls. and large lvs.

sublobata (Pyrus sublobata). Accounted a hybrid between M. Sieboldii and M prunifolia: tree with narrow entire or only indifferently lobed lvs. pubescent underneath: fls. pinkish: fr. 34 in. or less diam., yellow, calyx either persistent or deciduous.

fis. pinkish: fr. ¾ in. or less diam., yellow, calyx either persistent or deciduous.

sylvéstris (Pyrus Malus. M. communis). Apple. Tree to 40 ft. or more, with young branches and under side of lvs tomentose or pubescent: lvs. oval or elliptic to broad-ovate, acute or nearly so, becoming smooth and often glossy above, obtusely serrate: fis usually appearing with first foliage, 2 in. or less across, white and pink: fr. various, without grit cells, on thick pubescent stalks, calyx persistent. Eu., W. Asia. Cult. in many orchard vars, and in double-fid. and other forms. Var. aldenhaménsis (M. floribunda var. aldenhamensis. M. purpurea var. aldenhamensis). Small tree with ovate or ovate-oblong lvs. with purple rib and more or less pubescent underneath; fis. partially double, light red: fr. purple-red. Offshoot of M. sylvestris var. Niedzwetzkyana, perhaps hybrid with M. atrosanyuinea. Var. apétala, the Bloomless apple, has fis. without good stamens and showy petals, styles 10-15 and ovary more than 5-celled, calyx end of fr. not closed. Var. astracánica, supposed to be a hybrid between Malus sylvestris and M. prunifolia, has sharply and coarsely serrate lvs. and long-stalked fr. Var. Eleyi, lvs. reddish when young, rib purple, fis. and small fr. purple-red. Var. Niedzwetzkyana has bark and wood reddish, lvs. tinged red on nerves, fis. deep red, fr. purple-red inside and out. Var. paradisiaca (M. pumila) is the Paradise apple, a self-continuing race of very small stature. Var. Lemòinei has lvs. purple and fis. dark crimson.—There is no generally accepted Latin name for the apple when it is separated in the genus Malus. The earliest binomial is undoubtedly M. sylvestris, applied to the sour wild or spontaneous apple of Eu., presumably not specifically distinct from the common cult. apples. Probably the earliest name for the cultivated and wild apple together as a class or group is M. communis. The duplicate name, Mulus Malus, is a recent combination and such repetitions are not allowed by the International Rules of N

theffera: M. hupehensis.

Toringo: M. Sieboldii.

toringoldes (M. transitoria var. toringoides. Pyrus toringoides). Tree to 25 ft. or shrub: lvs. ovate to oblong, serrate, mostly with two pairs of lobes, becoming glabrous underneath except on veins: fls. creamy-white, 1 in. or less across, styles glabrous at base, petals very broad and rounded: fr. ½ in. diam., yellow and reddish in sun. China; hardy N.

transcéndens: hort. name, probably for Transcendent and similar crab-apples, product apparently of *M. baccata* and forms of *M. sylvestris*.

transitòria (Pyrus transitoria). Smaller and more slender plant than M. toringoides: lvs. more deeply and more narrowly lobed: petals narrower, broad-oblong. China.

trilobata (Purus trilobata). Shrub with strongly 3-lobed serulate lvs. becoming glabrous and also glossy above: fis. more than 1 in. across, white: fr. \(\frac{3}{4} \) m. or less diam., red, callyx persistent. W. Asia; hardy N.—Not to be confounded with var. tribolate (a lobed-lvd. form) of Pyrus communs.

Tschonóskii (Pyrus Tschonosku). Erect tree to 30 or 40 ft.: lvs. ovate to elliptic, broad at base, acuminate, coarsely sharp-serrate, remaining pubescent underneath: fls. about 1 in. across, white tinged rose, on stout pubescent pedicels: fr. about 1 in. diam., globose or obovoid, yellow with rosy cheek, calyx persistent. Japan; hardy N.

Veltchii: M. yunnanensıs var.

yunnanénsis (Pyrus yunnanensis). Tree to 30 ft.: lvs. ovate to oblong, broad at base or subcordate, short-pointed, sharp-serrate, often 3-5-lobed on each side, thick-pubescent underneath: fis. small, about ½ in. across, white, many in a close cluster: fr. about ½ in. dam., nearly globose, red. China; hardy N. Var. Veitchii (Pyrus Veitchi) has lvs. cordate at base and all more or less lobed and becoming nearly glabrous underneath.

nearly glabrous underneath.

Zûmi (Pyrus Zumi). Tree to 20 ft. or more, pyramidal: lvs oblong to ovate-oblong, acute, crenate to entire or serrate and sometimes somewhat lobed on shoots, becoming glabrous underneath: fls. about 1 m. across, pink in bud but becoming white, the calyx-lobes acuminate: fr. about ½ in. diam., globose, red, calyx falling. Japan; hardy N.—Thought to be hybrid of a form of M. baccata and M. Siebolhii. Var. calocárpa (Pyrus Siebolhii var. calocarpa), of more spreading habit: lvs. on shoots more deeply lobed: fls. smaller.

MÁLVA. Mallow. Malvacex. Erect or spreading herbs with alternate lobed or dissected lvs. and rose or white fls. solitary or clustered in

Mallows are of easy cultivation in the flower-garden or border. Sow seed where plants are to stand. The perennials may also be propagated by division and cuttings.

Alcea. Per. to 2 ft., making a clump: st.-lvs. 5-parted, the lobes toothed or cut: its deep rose to white, to 2 in. across. Eu.; nat. in E. U. S. Var. fastigiata, sts. more erect and usually closer together.

borealis. Ann. or bien. to 3 ft.: lvs. rounded, wavy-margined, slightly lobed: fls. pinkish, about ½ in. across. Eu.; nat. in Calif.

capénsis: Malvastrum capense.

chinénsis: M. verticillata.

crispa. Curled M. Unbranched thick-stemmed straight ann. to 8 ft.; lvs. rounded, 5-7-lobed or -angled, with crisped and curled margins: fls. whitish, ¼ in. across. Eu.

Dùrisei: the plant grown under this name is M. sylvestris var mauritiana

liménsis: Malvastrum limense.

mauritiana: M. sylvestris var.

miniata: Sphæralcea cisplatina.

moschata. Musk M. Per. to 2 ft.: st.-lvs. 5-parted, the lobes again cut into narrow divisions: fls. rose or white, to 2 in. across. Eu.; nat. in N. Amer. Var. álba has white and ròsea rose-pink fis.

nicæénsis. Ann. to 1½ ft., sts. erect or ascending, setose to pubescent: lvs. entire and remform to 3-5-lobed, the lobes sharply serrate and usually acute: fis. pale blue, small, in axillary fascicles. Medit, region.

parviflora. Ann. or bien. to 3 ft.: lvs. round, shallowly 7-lobed: fls. pinkish, about 1/2 in. long. Eu.; nat. in N. Amer.

pulchélla: M. verticillata.

setòsa. Similar to M. niczensis, differing in its slightly larger habit and more setaceous on lf. petioles and veins. Italy.

sylvéstris. Bien., usually grown as ann., to 3 ft.: lvs. rounded, with 5-7 wavy lobes: fls. purple-rose, 1 in. and more across. Eu.; nat. in N. Amer. Var. mauritaina grows to 4 ft., with large more showy purple fls. sometimes have ing deeper lines.

verticillata (M. chinensis. M. pulchella). Ann. or per. to 4 ft.: lvs. 5-6-lobed: fls. pink, sessile. Eu. to China.

MALVACEÆ. MALLOW FAMILY. Some 40-50 genera in temp, and trop, regions around the world, furnishing many ornamental subjects, a few food, fiber and medicinal plants, and one the cotton of commerce; it is a well-marked family. Herbs, shrubs or trees with alternate simple lys. which are sometimes deeply palmately lobed or almost compound, regular polypetalous mostly bisexual fls. having 5 sepals and petals, many stamens that are united into a column around the pistil, superior several-celled ovary, and fr. sometimes berry-like but usually capsular or the carpels cohering and falling away as separates. The following genera are herein treated: Abutilon, Althæa, Anoda, Callirhoë, Cienfuegosia, Cristaria, Gaya, Gossypium, Hibiscus, Hoheria, Ingenhouzia, Kitaibelia, Kokia, Kosteletzkya, Lagunaria, Lavatera, Malachra, Malope, Malva, Malvastrum, Malvaviscus, Montezuma, Pavonia, Plagianthus, Robinsonella, Sida, Sidalcea, Sphæralcea, Thespesia, Thurberia, Wercklea.

MALVÁSTRUM. False-Mallow. cex. Mallow-like herbs and subshrubs with alternate entire or lobed lvs. and purple, red or yellow fls. axillary or in terminal spikes; carpels falling away from the axis at maturity; cult, in the flower-garden or sometimes in the greenhouse. Propagated by cuttings under glass or by seeds.

capense (Malva capensis). To 4 ft, shrubby: lvs. toothed, 3-lobed or angled: fls. purple, 1-2 in the axils. S. Afr.

coccineum (Sphæraleea coccinea). Phairie-Mallow. Per., with woody tap-root, branching silvery-pubescent top to 6 or 10 in high: lvs. parted into narrow divisions; fis brick-red, to nearly 1 in. across, in short close terminal spikes or racemes. Man. to B. C. and to Tex. and New Mex.

fasciculatum (M. Thurberi. Spheralcaa fasciculatu. To 15 ft. and sometimes tree-like: lvs. entire or lobed, densely pubescent: fls. rose-purple, in spikes or clusters. S. Calif., Ariz. Var. laxiflorum has fragrant fls. in a loose panicle.

hypomadarum. To 10 ft.: lvs. variable, commonly 3-lobed and toothed: fts. white with rose-purple eye, solitary or few in axils. S. Afr.

liménse (Malra limensis). Erect ann.: lvs. orbicular-ovate, 7-lobed, rugose: fls. bluish-purple, many in secund axillary spikes: fr. glabrous. Peru.

Thurberi: M. fasciculatum.

tricuspidâtum. Per. to 3 ft., somewhat woody at base: lvs. broadly ovate to lanceolate, to 2 in. long, toothed, pubescent, long-petioled: fls. yellow, axillary or clustered at ends of sts. Australia.

MALVAVÍSCUS (Achania). Malvaceæ. Trees and shrubs of trop. Amer. with alternate toothed or lobed lvs. and showy red fls. solitary in the axils or in racemes; planted in the greenhouse or out-of-doors in the S. Propagated by seeds and greenwood cuttings.

arboreus (Achania arborea). The plants usually grown under this name are probably M. mollis from which M. arboreus differs in the smaller lys, which are hairy but not velvety and the smaller fls. Trop. Amer.

cándidus. Shrub or tree to 20 ft.: lvs. 3-5-lobed: fls. white, to 3 in long. Mex.

Conzáttii. Shrub: lvs. cordate-ovate or the upper ones oval, short-petioled, usually not lobed, crenate, nearly or quite obtuse, glabrous or with only a few scattered hairs on either side: fis. red, to 2 in. long. Mex., Guatemala.—Prob-ably not in cult. in N. Amer., the plant so named being M. grandiflorus.

Drimmondii. To 9 ft.: lvs. usually slightly lobed or angled, obtuse or acute: fis. to 1 in. long: fr. edible, red and berry-like. Mex., Tex.
grandiflorus. To 15 ft.: lvs. toothed, sometimes indistinctly lobed, ovate-oblong, long-acuminate: fis. to 2½ in. long, red. Mex.; commonly planted in the S.

móllis. Low shrub: lvs. often angled or lobed, toothed

or wavy-margined, velvety-pubescent beneath: fls. to 11/2 in, long. Mex. to Colombia.

MAMEY: Mammea americana.

MAMILLÓPSIS. Cactaceæ. Small globular or short-cylindric cespitose cacti, the body hidden in a mass of soft white hair-like spines, separated from Mammillaria; 2 species. See Cacti.

senilis (Mammillaria senilis). To 6 in, high and about half as thick; tubercles more or less conic and not in ribs; spines 30-40: fls. orange-yellow, about 2½ in. long and nearly as broad. Mex.

MAMMEA. Guttiferæ. Trop. trees with opposite simple lvs., polygamous fls. solitary or few in the axils, and drupaceous fr.; widely cult. in the tropics for the edible fr. and a liqueur is also distilled from the fls.

The mamey will not stand more than two or three degrees of frost. Propagated by seeds and probably also by inarching and budding.

americana. Mamer. Mammee-Apple. To 60 ft.: lvs. to 8 in. long, thick and glossy, with many cross-veins, blunt: fls. white, fragrant, 1 in. across: fr to 6 in across, with russet roughened skin and bright yellow juicy flesh. W. Indies, N. S. Amer.

MAMMILLÀRIA (Neomammillaria). Cactaceæ. Hemispherical or short-cylindric or depressed spiny cacti of about 215 species in Mex. and a few in the S. W. U. S., one in N. S. Amer., popular as fanciers' pot-plants for conservatory and house, many of which are in the collections: surface broken up into prominent tubercles standing more or less spirally that commonly bear wool or hairs or bristles and crowned by spine-areoles; spines all alike or differentiated as radials and centrals: fls. diurnal, small, from axils of old tubercles, somewhat bell-shaped, red, pink, yellow or white: juice milky in some kinds. Cult. as for Echinocactus. See Cacti.

By some writers the name is spelled Mamillaria; it was not so spelled by Haworth who founded the genus on Cactus mammillaris of Linnaus, who also wrote the double m. The two m's are accepted by Britton and Rose in the standard monograph of the family, although they adopt the name Neomammillaria because of the existence of an older but unused Mammillaria amongst the algæ. The International Rules conserve Mammillaria as against Cactus.

The genus Mammillaria has been divided into two sections, Hydrochylus and Galactochylus. Sect. Hydrochylus is much the larger and contains those plants having a watery sap and a green stem. Sect. Galactochylus contains those plants whose sap is milky, although not always evident on wounding of the tubercles. The stems of these latter are usually gray-green or gray in color.

Section Hydrochylus is in turn subdivided into six smaller groups or series named and characterized as follows:

latter are usually gray-green or gray in color.

Section Hydrochylus is in turn subdivided into six smaller groups or series, named and characterized as follows:

Leptoclatodæ: plants always cespitose (clustered), usually cylindrical, the different stems of a given cluster of unequal height; spines yellow or reddish, radiating.

Candadæ: plants cespitose or solitary, but when cespitose the stems of approximately equal height, cylindrical or globose; spines very numerous, of a uniform color, the centrals about as long as radials, all generally white, arranged horizontally in irregular manner, somewhat interwoven and often completely covering the stem.

Polyacanthæ: differs from Candidæ in spines reddishbrown and all obliquely pointed upward.

Heterochloræ: plants cespitose or solitary, but when cespitose the stems of nearly equal height, cylindrical or globose; spines less numerous than in the above series, the central spines distinct from the radials and usually erect, straight, both centrals and radials of same color.

Styllothele: differs from Heterochloræ in having one or more of the central spines hooked or recurved and differing in color from the radials; tubercles usually more or less slender cylindrical and occasionally to slightly globose.

Ancistracanthæ: similar to Stylothele, from which it differs in robust globose tubercles, and one or more of the central spines always hooked.

central spines always hooked.

Section Galactochylus is divided into four series as follows:

Elegantes: tubercles not exuding milky sap on wounding.

Leucocephalæ: tubercles exuding miky sap on wounding, as it occurs only in the inner parts of the stem.

Leucocephalæ: tubercles exuding miky sap on wounding; spines white, radials very numerous and radiating outwards

Macrothele: differs from Leucocephalæ in having few radials which are never white nor do they radiate; tubercles large and angular, the axils naked or somewhat woolly, never setose nor bristly.

polyedræ: similar to Macrothele from which it differs in its somewhat smaller tubercles, the axils woolly and setose or bristly.

setose or bristly.

To economize space in the following brief diagnoses, letters are employed to distinguish the section and series into which the plant falls according to the delimitations given above: A, Ancistracanthæ; C, Candidæ; E, Elegantes; G, Galactochylus; H, Hydrochylus; He, Heterochlore; Lep, Leptocladodæ; Leu, Leucocephalæ; M, Macrothele; Pa, Polyacanthæ; Pe, Polyedræ; S, Stylothele.

acanthophlégma: M. elegans.

aggregata: Coruphantha aggregata.

albéscens. H: cespitose, globose to ovoid, to 3½ in. high and 2 in. diam.; tubercles about ¾ in. long, arcoles white, woolly; radial spines 5 or more, to ¾ in. long, spreading, white; centrals rarely present: fis. white, stigma 5lobed, yellow. Mex.

albicans. II. Pa; globose or cylindric, to 8 in, long and 2½ in. diam., often clustered; radial spines numerous and white; centrals several. Lower Calif.

albicoma. H, Lep: clustered, globose, to 2 in. diam. or more, axils setose; spines white, straight, radials 30-40, hair-like to ½ in. long, glabrous, centrals 1-4, to ½ in. long, brown tipped, but often absent: fls. white or yellowish, to 1/2 in. long. Mex.

álbida: M. discolor. aljibénsis: listed name.

Andreæ: Coruphantha Andreæ.

anguinea: M. elongata. angulàris: M. compressa.

angularis: M. compresse.

applanata. G. M: plant much flattened endwise; tubercles somewhat angled and axils naked; radials 10-18; central 1: fls. cream-colored, inner segms. 1 in. long, green-striped in center. Tex.—Early-flowering.

árida. G. M: similar to M. Brandegeei from which it differs in its more slender longer spines, entire outer peri-anth-segms. and crimson-red fruit. Lower Calif.

arizónica: Corunhantha arizonica.

armillata. II, A: clustered, cylindric, to 1 ft. high; tubercles bluish-green; radial spines 9-15 and to $\frac{1}{2}$ in. long; centrals usually 2 and the lowest hooked: fls. greenish or pink, to $\frac{1}{2}$ in. long. Lower Calif.

asperispina: probably Neobesseya asperispina.

Astèrias: Coryphantha Asterias.

aurèiceps. H, He: globose or short-oblong, to 4 in diam.; tubercles woolly and bristly in axils; radial spines 20, white and bristle-like; central spines several and yellow: fis. dark red. Mex.

aurihamata. H, S: globose or ovoid, to 2½ in. high and 1½ in. diam.; tubercles shining; radial spines 15-20 and yellowish-white; central spines 4, the lower to 1 in. long: fis. yellow, ½ in. long. Mex.

Bachmannii. G, M: similar to M. Orcuttii from which it differs in its larger 4-sided tubercles, black central spines and smaller pale pink fls. Cent. Mex.

balsasénsis. H. A: solitary, globose, glossy, to 2½ in. diam.; tubercles about ¼ in. long; spines straight, stiff, radials spreading, usually 15, white, about ½ in. long, centrals 4, brown, the lowest hooked, to ½ in. long; fis. centrals 4, brownot seen. Mex.

barbata. H, A: often clustered, sts. globose, to 1½ in. diam., axils glabrous; radial spines usually 20-30, straight, white often brown-tipped, centrals usually 3-6, brown, a few hooked: fls. pale greenish-yellow to nearly green, outer segms. ciliate. Mex.

Bahmii. H, C: clustered, sts. subcylindrical, to 3½ in. tall and 2½ in. diam.; tubercles soft, about ½ in. long, axils glabrous; radials 30-35, to ½ in. long, unequal; centrals 5-6, to 1½ in. long; fls. yellow within, outer segms. greenishyellow with pink midrib, to 1 in. long. Mex.

Baxteriana. G, M: usually solitary, to 4 in. diam.; tubercles yellowish-green, axils briefly white-woolly; spines acicular, radials 8-10, to ½ in. long, centrals usually 1 occasionally 2, about ¾ in. long; fls. yellow, marked reddish on outer perianth-segms: fr. purplish-red, to ¾ in. long, club-shaped. Lower Calif.

bélla: probably Becobaria bella.

bicolor: M. geminispina.

Blossfeldiana. H. A: cespitose, globose, to 11/2 in. diam straight, to ¼ in. long; centrals 4, stiff: fis. reddish-pink, to ¾ in. across. Lower Calif.

bocasana. H, S: eespitose, forming mounds, the individuals globose and to 1½ in. diam.; tubercles slender and terete, axils setose; radials 50 or more, harr-like and silky; central 1, hooked, brown: fis white. Mex. Var. inérmis is said to be of the habit of M. albicoma with fls. of the type and is reported to be a sport.

Boedekeriana. H. A: globose or becoming cylindric, to 6 in tall, axils glabrous; radial spines 20 and white; central spines 3 and brownish-black, glabrous, not puberulent, one of them hooked: fis. white with brown stripes. Mex.

bogoténsis. H. He: usually solitary, globose to somewhat club-shaped, to 4 in. tall and 2 in diam., axils not bristly; radials 20-30, to 1/4 in. long, straight, white; centrals usually 6, bulbous at base, nearly 3/8 in. long: fis. not seen. Colombia

Golombia. Brándegeei (M. Gabbir). G, M: solitary or forking, st. depressed-globose, to 3½ in. diam, axils white-woolly; tubercles elongeted, usually rounded and not angular; spines slightly curved, radials 9-14, to ½ in. long, white to gray, centrals 3-7, less frequently 1 or 2, to ¾ in. long, reddish-brown: fis. to 1 in. long, outer segms, tun-colored, ciliate; inner segms, yellowish-green with rose stripe: fr. white Lower Calif.

Brauneana. G, Leu: usually solitary, globose, to about 3 in. dam, axils with numerous bristles; tubercles short, conical; radials 25-30, lower ones about ½ in long with upper ones shorter, radiating, glossy white; centrals 2-4, awl-like, red to nearly black: fls. reddish-violet, to ½ in. diam. Mex.

Brownii: Coryphantha robustispina.

Bullardiana. H. A: cespitose, sts. narrowly cylindrical, to 5 in. tall and 1½ in. dam, axils usually naked; tubercles conical, olive-green, about ½ in. long; spines to ½ in. long, radials 20-30, white and often tipped brown, central 1, brown, usually hooked or recurved at tip: fls. pale rosepink, to ¾ in. long. Mex.

bumámma: Coruphantha bumamma.

calacántha. II, He: solitary, globose to subcylindrical, to about 3 in. diam; tubercles to $\frac{1}{2}$ in long; radials about 25, yellowish; centrals 2, rarely 4, to $\frac{5}{8}$ in long, brownish-red; fis carmine, to $\frac{1}{2}$ in. long or slightly more. Mex.

campótricha. H, S: cespitose, globose, 2 in. across; tubercles often curved with bristles in axils; spines 4-8, twisted, yellowish and bristle-like; fis white, greenish outside, 1/2 in. long. Mex. Var seni is is listed.

cándicans: listed name.

cándida. II, C: cespitose, the individuals globose and 2 in or more dam; radials numerous, more than 50; centrals 8-12; fls rose-colored, nearly 1 in. long. Cent. Mex. Var. rosea is listed.

capénsis. H. A: cylindric, to 10 in high and 2 in. diam, clustered; radial spines 13 and white tipped brown; central 1 and to 8 in. long and strongly hooked: fls. pink, 34 in. long. Lower Calif. Var pállida is listed.

Cáput-Medùsæ: M. sempervivi.

cárnea. G. M. solitary, cylindric, to 3½ in. high; tubercles 4-angled, to neurly ½ in. long, milky with woolly axils, areoles lacking brustles; spines 4, unequal in length: flssh-colored, nearly or quite 1 in. long. Cent. and S. Mex.

Cârretii. II, A: solitary, globose and depressed, 2 in. or more diam.; tubercles cylindric and axils naked; radials 15; central 1: fis. 1 in. long, white and rose. Mex.

Celsiàna. G. E: subglobose and becoming cylindric, to 5 in high; tubercles come and woolly in axils; radials 24-26; centrals 4-7, yellow, about ½ in. long: fis. red. S. Mex.

centricirrha: M. magnimamma.

cephalophora. H, C: solitary, globose to subcylindrical, to 3 in. diam., dull green; tubercles cylindrical, axils glabrous; spines arranged in two series, about ½ in. long, silky and hair-like, centrals absent: fis. pale rose-pink, about ½ in. across. Mex.

ceratites: Neolloydia ceratites.

chinocéphala. G. Pe: solitary, becoming cespitose with age, globose, to 3 in. diam., nearly hidden by white spines; tubercles milky and axils woolly and bristly; radial spines 35-40, about ½ in. long, almost pectinate; centrals 2-7, shorter and stiff: fls. rose, ½ in. long. Mex.

chlorántha: Coryphantha chlorantha.

cirrhífera: M. compressa clava: Coryphantha clava clavata: Neolloydia clavata.

collina. H, He: globose, 5 in. diam.; tubercles woolly in axils; radial spines 16-18 and white; central spines 1-2; fis. rose, ½ in. long. Mex.

compréssa (M. angularis. M. cirrhifera). G, l'e: in clumps, individuals cylindric, bluish-green; tubercles short and axils woolly; principal spines commonly 4, to $2\frac{1}{2}$ in. long. Cent. Mex.

conoídea: Neolloydia conoidea.

conspicua. G. E: solutary, globose to subcylindrical, to 6 in. tall and 4½ in. diam, gray-green, axils woolly; radials 14-20, less frequently to 25, about ½ in. long, white; centrals 2-4, pade brown, to ½ in. long: fis. carmine-red, to ¾ in. long Mex.

córbula: Lohma corbula

cornifera: Coryphantha cornifera.

coronària. II, IIe: cespitose, globose to cylindrical, to 6 in. tull and 3 in diam, axils bare; radials 12-18, to ½ in. long, white; centrals 6, to ¼ in. long, dark crimson to yellow and gray: fis. crimson, inner segms. with darker mid-rib, stigma 4-lobed. Mex.

Craigiana: listed name

crassispina: form of M. rhodantha with thick vellowishbrown central spines.

crocidata. G. M.: solitary, becoming cespitose, globose to subcylindrical and somewhat flattened on top, to 3 in. diam., bluish-green; tubercles short, at least not narrowly elongated, areoles bristly; spines 3-4, alike and usually equal in length, pale to dark brown: fis. carmine-red within, to ½ in. long. Mex.

crucígera. G. E. cylindric, to 6 in. high; tubercles woolly in axis; radial spines 20 or more and bristle-like; centrals 4 and yellowish: fis crimson or purple. Mex.

dasvacántha: Escobarra dasvacantha.

dealbata. G, E: globose or short-cylindric, glaucous; tubercles woolly in axils; radial spines 20, about 1/8 in long, white; centrals 1-2, to 1/2 in long; fis. carmine, stigmalobes yellow. Mex.

decipiens. II, S: mostly cespitose, globose; tubercles soft and cylindric with 2 or 3 bristles in axils; radials 7-9, white; central 1, straight; fls. white tinged pink, about 1/2 in. long Mex.

Delaetiana: Coryphantha Delaetiana.

densispina. II, He: globose, to 4 in. diam, hidden by spines; radial spines 25 or more, to $\frac{3}{8}$ in long, white or pale yellow; centrals 5-6, to $\frac{3}{4}$ in long: fis. yellowish inside, purple outside, $\frac{1}{2}$ in. long. Mex.

denudata. G. C: globose, 1 in. diam.; spines 50-80 and short: fis light purple margined with white, ½ in. long W. Tex., Mex.

déserti: ('oryphantha deserti.

didicata: listed name.

Diètrichiæ. G: solitary, depressed-globose, to 2 in. high and 3 in diam, blue-green, white-woolly on top; tubercles 4-sided, arcoles white-woolly when young; radial spines 30 or more, to ½ in. long, white, spreading and covering the st.; centrals 3-4, stouter than radials, 1-1½ in. long, flesh-colored tipped brown fls. not known. Mex.

difficilis: Coryphantha difficilis.

dioica. II, A: solitary or clustered, cylindric, to 10 in. or more high; tubercle axils woolly and setose; radials 11-22, white; centrals 3 or 4: fis yellowish-white with purplish ribs, to about 1 in. long, somewhat dicerious, stigma-lobes yellow to greenish. S. Calif and adjacent Lower Calif

discifórmis: Strombocactus disciformis.

discolor (M. albida). H, He: globose, 3 in. diam., axils glabrous; radial spines 16-20, white and bristle-like; centrals 6, yellow to brownish: fls. white striped with rose, ½ in. across, stigma 6-7-lobed Mex.

dolichocéntra: M. tetracantha.

Dònatii. G. E. globose, glaucous, sometimes cespitose; radial spines 16-18 and ½ in. long; centrals 2 and yellow-ish-black: fls. reddish, ½ in. long. Mex.

durispina. II, He: globose or short-cylindric, to 12 in. high and 4 in. diam.; spines 6-8, radiating and star-like, central spines none: fis. carmine, green below, ½ in. long. Mex.

Dyckiana: Coryphantha Dyckiana.

Echaussièri: listed name.

echinaria (M. graculis). H, Lep: cespitose, individuals short-cylindric and about 4 in. long; tubercles terete and with naked axils; spines light colored, the radials about 15 and central 1: fls. yellow with salmon-colored outer segms., to ½ in. long, stigma-lobes 4, yellow. Mex.

echinoidea: Coryphantha echinoidea.

Echinus: Coryphantha Echinus.

Edmundtsiana: listed name

élegans (M. acanthophlegma. M. Kunthii). G. E. simple, obovoid to globose, 2 in diam.; tubercles ovoid and axils somewhat woolly, rarely naked; radials 25-30, bristle-

like, white, about ½ in. long; centrals 1-3. Cent. Mex.—Different plants may pass as M. elegans.

elephántidens: Coruphantha elephantidens.

elongata (M. anguinea. M. stella-aurata. M. tenuis). H, Lep: making dense small clumps, individuals erect or ascending or prostrate to 4 in. long, with many interlacing spines; tubercles short and axis naked; spines usually all radial: fis. white or nearly so, about ½ in. long. E. Mex. Listed vars. include aurea, echinata, longispina, microthèle and Schmödlii.

erécta: Coruphantha erecta.

erectohamàta. H. S: cespitose, globular, to 2½ in. diam, axils setose; radial spines 20-25, white, to ½ in. long, bristly; centrals usually 2, dark red to brownish: fis. white, stugma 5-6-lobed, white. Mex.

eriacantha. H. He: solitary or cespitose, cylindric, to 6 in. high; tubercles spiral in 22 rows, compast; radials about 20, yellow to brown; centrals 2: fls. yellow, about ½ in. across. Cent. Mex.

erythrocárpa: listed name.

erythrosperma. H. A: by some considered synonymous with M. Painteri; by others it is reported to differ in having a few bristles in the axils, radial spines often less than 20, centrals rarely more than 3, and fls. carmine-red with red stigma. Mex.

Essaussièri: listed name.

exsùdans: Coruphantha exsudans.

fasciculata. II, A: cospitose, cylindrical; radials 13-20, white; central usually 1, rarely 2-3, brown, hooked, to 34 in. long: fis. pink, to 1½ in. across. S. Ariz.

férro-rubra: M. rhodantha var.

fértilis. H, He: cespitose, globose or short-cylindric; tubercles rather woolly in axils; radial spines 7-10, white; centrals 1-2, to ½ in. long; fis. deep crimson, ¾ in. long, stigma red, 4-lobed. Mex.

Fischeri. G, Pe: by some considered a variety of M. Karwinskuana or synonymous with it; others state it to differ in its reddish radial spines and pale yellow fls., the segms. with pink midrib. Mex.

fissurata: Roseocactus fissuratus.

flavóvirens. G, M: usually solitary, globose to subcylindrical, to 3½ in. tall, yellowish-green; tubercles slightly angular at apex, elongated, axils bare; radial spines 5, subulate, equal in length; central 1: fls. white with rosered stripe on inner segms. Mex.

formòsa. G, E: body somewhat club-shaped and sunken at apex; tubercles 4-angled, axils bare; radials 20-22; centrals 2-6: fls. red. Mex.

fortispina: listed name.

frágilis. II, Lep: globose, sprouting toward top and breaking off easily; radial spines 12-14, white and spreading; central spines usually none: fls. cream-colored, pinkish outside. Probably Mex. Vars. cristata and mínima are listed

Fraileana. H, A: cylindric, to 6 in. high; central spines brown and one strongly hooked: fls. pink, 1 in. or more long. Lower Calif.

fulgindsa: probably referable to M. mammillaris.

fuscata: form of M rhodantha with yellowish spines.

Gábbii: M. Brandegeei.

Galeóttii. H. S. globose, often cespitose; radial bristles 8-14 and soon falling; centrals 4 and 1 m. long and yellowish; fis rose. Mex.

Gâtesii. G. M: solitary becoming cespitose with age, globose to subcylindrical, to 8 in tall and 6 in diam.; tubercles to about % in long, blue-green, axils woolly; radials 8, to ½ in long, yellow becoming white; central 1, to nearly 1½ in long, stout: fis golden-to greenish-yellow, campanulate, to ¾ in across, stigma 5-lobed, green. Lower Calif.

geminispina (M. bicolor. M. nivca). G, Leu: naturally cespitose, cylindric and somewhat glaucous; tubercles terete and axils woolly and setose, the bristles few; radials 16-20 and very short; centrals 2-4 and longer: fis. dark red. Cent. Mex.

Geórgii: see Coryphantha Georgii.

gigantèa. G, M: solitary or cespitose, depressed-globose, to 4 in. high and of great diam.; tubercles elongated, somewhat angular at apex, axils woolly; radials 12, nearly equal in length; centrals 4-6: fls. yellowish-green. Mex.

gladiispina: Coryphantha gladiispina.

globdsa: Dolichothele longimamma.

glochidiata. H, S: densely cespitose, globose, to nearly 1½ in. diam., few bristles in axils; radials 8-20, to ½ in. long, white; centrals 3-4, yellowish-brown, the lower one hooked: fis. pink or rarely white: seed black. Mex.

grácilis: M. echinaria.

Grahamii: M. microcarpa.

grandiflora: Neolloydia grandiflora.

Gréggii: Epithelantha micromeris var.

Guelzowiana. H. A: globose, to 2½ in. high and diam., single or cespitose, axils bure, radial spines 60-80, white and harr-like; central spine 1: fils. purple, 2 in. long. Mex. guirocobénsis: listed name.

gummifera. (i, M: body depressed-globose, to 4 in. or more high; tubercles angled, elongated, rounded at apex; radials 10-12; centrals 1, 2 or 4: fls. brownish outside and reddish-white inside, about 1 in. long, outer segms. more or less fimbriated. N. Mex.

Hageana. G. E. globose becoming cylindrical with age, cespitose, axils woolly; radial spines about 20, radiating and white; central spines 2, to 1/4 in. long, black: fis. carminerose. Mex.

Hanniana. H, Leu: globose, to 4 in. high and diam., cespitose, axils woolly, with about 20 white bristles to 1½ in. long which completely cover st.; radial spines 20-30 and of soft white curly hairs to ½ in. long; central spine usually 1: fls. rose-carmine. Mex. Var. Giselana is listed.

Hàlei: Cochemiea Halei.

Hamiltonhoytea. G. M: usually solitary, depressed-globose, to 7 in. diam., axils bare; tubercles short and symmetrical; radials usually 5, about ¾ in long, white tipped brown; centrals 3, to 1¼ in. long, red to gray: fls. purplish-violet, to ¾ in. long. Mex.

Heeseana: M. Petterssonii.

hemisphærica. G. M: hemispheric, to 5 in. diam.; tubercles elongated, somewhat angular but rounded at apex; radial spines 9–13 and to ½ in long, yellowish; central spine 1: fls. cream-colored, ½ in. long. S. Tex., N. Mex.

Hérreræ. H. C: cespitose, globose, to 1½ m. diam., axils bare; spines all radial, about 90–100, radiating uniformly and star-like, to nearly ½ m. long; fls. pink or purplish, to 1 in. long, with long tube. Mex. Var. albiflòra has larger white fls. and sts. less cespitose.

Heyderi. G, M: globose or at apex somewhat flattened; tubercles come and woolly in axils; radials 20-22; central 1; fls. pinkish. Tex. to N. Mex.

hidalgénsis: M polythele.

Hildemanniana: listed name.

Hoffmanniana. G, M: globose to subcylindrical, to 12 in. tall and 5 in. diam.; tubercles short and symmetrical, axils woolly; radial spines usually 18, white, bristly; centrals 4-6, to % in. long: fls. pale rose-pink. Mex.

Hookeri: unidentified name.

horrípila: Neolloydia horripila.

jaliscâna. A: cespitose, globose, to 2 in. diam.; tubercles in 13 rows, nearly $\frac{1}{4}$ in. high; radial spines 30–50; centrals 4–6, reddish-brown, one hooked: fls. pink to purphsh-pink, about $\frac{1}{2}$ in. neross, fragrant. Mex.

Jóhnstonii. G. M.: globose, to 8 m. tall, apex flattened; tubercles elongated, acutish, at least at apex, axils bare; radials 10-14, white to tan, somewhat unequal in length; centrals 2, larger and stouter than others: fls. white. Mex.

Karwinskiana. G. Pe: globose or cylindric; tubercles milky, axils woolly and with long white bristles; spines 4-6 and all radial: fls. cream-colored, reddish outside, 3/4 in. long. Mex.

Kelleriana: listed name.

kewénsis. H. He: globose or cylindric, to 1½ m. diam.; tubercles woolly in axils; spines 5-6 and all radial and short: fls. reddish-purple, ½ in. long. Probably Mex.

Klissingiàna. G. Leu: globose, to 6 in. high and 3½ in. diam., densely covered with white spines; tubercles whitewoolly in axils; radial spines 30–35, interlaced and completely hiding the st; centrals 2–4, about ½ in. long: fis. rose, ½ in. long. Mex.

Knebeliana. H. S: usually cespitose, short-cylindrical, to 2½ in. tall and 1½ in. diam, axils of tubercles setose; radial spines 20-25, about ½ in. long; centrals 4-7, reddishbrown, the lower ones to ¾ in. long, hooked: fls. yellow inside, rose-pink outside. Mex.—Not to be confused with M. Knippeliana, which is not known to be now in cult.

Kunthii: M. elegans

Kunzeana. H. S: globose or cylindric, cespitose, tubercles with bristly axils; radial spines 25, white and bristle-like; central spines 3-4, brownish, one hooked: fls. white or yellowish-white, rose outside, 3/4 in. long, stigma-lobes 4, cream-colored. Mex.

lanata. G. E: short-cylindric; spines 12-14 and all radial, wide-spreading, white fis. red. 1/4 in. long, when young surrounded by long white hairs. Mex.

lasiacántha. H, C: globose, to 1 in. high; tubercles small and axils naked; spines 40-60 and puberulent: fla. whitish or pink, about ½ in. long. W. Tex.

lénta. II, C: cespitose, globose or short-cylindric, to 2½ in. dnam, nearly hidden by white fragile spines, axils woolly; spines about 40, all radial: fis. whitish, ¼ in. long. Mex.

ledna: M. Pottsii.

Lesaunièri. H. He: plant simple, globose or a little elongated; tubercles conic with naked axils; radials 11-13, white; central 1 and short: fis. reddish, 1 in. long, stigmalobes 4, red. Mex.

Llóydii. G, M: usually solitary, depressed-globose to subcylindric; tubercles short and symmetrical, areoles not silky; spines 4, all radial, equal in length, laterals whitish, upper one resembling a central and brown: fls. white with pink stripe inside, reddish outside, stigma red. Mex.

long from a. H. S. somewhat cespitose, globose, to 2 in. diam.; tubercles with long white hairs in axils; radial spines 25 or more and hair-like; central spines 4 and ½ in. long, brown: fls. white, strongly suffused rose to clear rose. Mex.

longiflora. H. A. globose, to 1½ in. diam., often clustered, axils woolly and bristly; radial spines about 30 and yellow; central spines 4, ½ in. long, reddish-brown: fls. pinkish, 1½ in. long, with distinct tube, stigma-lobes yellowish. Mex.

longimamma: Dolichothele longimamma.

longisèta: probably M. compressa.

Louisem: listed name.

Macdongalii. G, M: globular or flattened, to 6 in. diam.; tubercles with woolly axils; radial spines 10-12; centrals 1-2: fls. cream-colored, 1½ in. long. Ariz.

macrántha (M. centricirrha var. macrantha). G, M: depressed-globose, about 1 in high; tubercles elongated, angular at apex and the axils becoming naked; spines 1 or 2, alke, recurved: fis dark pink. Mex.

macrocárpa: listed name.

macromeris: Coryphantha macromeris.

macrothèle: Coruphantha octacantha.

magnimamma (M. centricirrha, M. pachythele, M. pentacantha). G, M: globose, to 4 in. diam., commonly oespitose, milky; tubercles elongated, conical and angular at apex, axils woolly when young; spines 3-5, alike, the lower curved: fis. cream-colored Cent. Mex.

Mainise. H. A: globose or depressed, to 3 in. diam.; radial spines 10 and yellowish or white with brown tips; central spine strongly hooked at tip: fls. white with reddish central stripe, 34 in long, stigma-lobes purple. Mex.

mammillaris (M. simplex). G, M: globose or short-cylindric, to about 2½ in. high; tubercles conic and axils slightly woolly; radials 10-12; centrals 3 or 4: fls. cream-color, about ½ in. long. Venezuela and adjacent isls.

Marshalliana. G. M: occasionally cespitose, depressed-globose, to 5 in. diam.; tubercles elongate, acute at apex; radials 8-13, to ½ in. long, unequal, white; central 1, white: fis. greenish-yellow, stigma 8-lobed. Mex.

Martinèzii: listed name.

mazatlanénsis. H. A: cespitose, sts. somewhat cylindrical, to 4 in. tall and 1½ in. diam., axis woolly and bristly; radial spines 12-15, bristly, white; centrals 3-6, reddish, stouter than radials: fis. rose-carmine. Mex.

meiacántha. G. M: somewhat depressed, to 5 in. diam.; tubercles angled and milky with naked axils; spines 5-9: fls. white with pink stripes. Tex., New Mex.

melaleuca: Dolichothele longimamma.

melanocentra (M. valida). G, M: short-cylindric and glaucous-green; tubercles elongate, angled at apex; radial spines 6, unequal, grayish-black; central 1, black: fls. pinkish-red, segms. linear. Mex.

Mendeliàna. G. Per solitary, globular, to 3½ in. diam., dark olive-green, axils woolly and bristly; tubercles roundish to somewhat angular; spines 4, alıke, pubescent, reddish to black becoming gray-white: fis. rose-pink: fr. club-shaped, purple, to ¾ in. long. Mex.

microcárpa (M. Grahami). H, A: globose to cylindric, sometimes clustered, to 3 in. high; tubercles small and axils naked; radial spines 15-30; centrals 1-3, to 1½ in. long, hooked: fls. purplish and perhaps with whitish margins, to 1 in. long. Tex, Ariz. (perhaps Utah and Calif.), Mex.

microhèlia. H. Lep: cylindric, to 6 in. long and 1½ in. diam., white-woolly at top; radial spines about 50 and radiating horizontally; central spines 1-4: fls. white, ½ in. long. Mex.

microheliópsis. H. Lep: short-cylindric, to 2½ in. high and 2 in. diam., densely woolly at top; radial spines 30-65, to ½ in. long; centrals 6-8: fls. purple, ½ in. long. Mex.

micromeris: Epithelantha micromeris.

microthèle. G. E.: allied to M. elegans: cespitose, the joints small and globose, axils usually woolly; radials 22-24, about $\frac{1}{8}$ in long; centrals 2: fis. about $\frac{1}{8}$ in long, flesh-colored outside and white inside. Mex.

Miehiàna. H: cespitose, cylindrical, to 6 in. high and 2 in. diam., dark green, areoles white-woolly; radial spines 18-20, to $\frac{5}{6}$ in. long, needle-like, bright yellow; centrals 3-6, equal, brownish-yellow; fls. yellow, to $\frac{5}{6}$ in. long. Mex.

Müleri. H, A: globose or cylindric, to 8 in. high and 3 in. diam.; radial spines 20, white tipped brown; centrals 2-4, hooked at tip: fls. purple or pink, 1 in. across. Ariz.

mínima: probably M. elongata.

missouriénsis: Neobesseya missouriensis.

Moelleriana. H. A: globose, to 2½ m. diam., hidden by spines; radial spines 30-40 and white; central spines 8-10, wide-spreading to ¾ m., yellow or red-brown; fls. rose or brownish, ½ m. long. Mex.

montana: probably Coruphantha vivipara.

Muchlbaueriana: see Coryphantha Muchlbaueriana.

Múlleri: listed name, perhaps for M. Milleri.

málticeps (M. pusulla). H. S.: globose, ¾ in diam, cesiptose; tubercles hairy in axils; radial spines white and hair-like; centrals several, straight: fls. yellowish-salmon, ½ in. long. Mex.—By some authors said to be synonymous with M. prolifera.

multiformis. H. I.: clumps of 25 or more globose to subcylindrical plants; tubercles to ½ in. long, white-woolly; radial spines 30-40, to ½ in. long, ascending; centrals 4, to ½ in. long, one strongly hooked: fis deep purplish-red, to ½ in. long and ½ in. across, filaments red Mex.

multihamata. H, S: globose, to 2 in. diam. dark green, axils bristly, not woolly; radials 25, about 1/4 in. long, bristly, slender, straight; centrals 7-9, to 1/2 in. long, stout, brownish: fls. pale rose inside with purplish stripe, to 1/4 in. long. Mex.

Múndtii. H. He: depressed-globose, to 3 in diam, woolly on top; tubercles not compact, conical; radials 10-12, tan when young, becoming white, to ¾ in long; centrals 2, brown, to ¾ in. long, straight: fis. red, stigma 6-7-lobed, green. Mex.

mutábilis: M. mystax.

mýstax (M. mutabilis). G, Pe: globose to short-cylindric, flat-topped, to 6 in. high; radials 8-10 and white; centrals 4, flexuous, about ½ in. long, red becoming gray, one of them elongated: fls. dark red, about ¾ in. long. S. Cent. Mex.

napina. II, He: depressed-globose, to 2½ in. diam., axils slightly woolly; spines all radial, 10-12, stiff, pectinate, white with yellowish base: fis. pink. Tex.

neo-mexicana: Coryphantha neo-mexicana.

Nickelsiæ: Coryphantha Nickelsiæ.

nìgra, nigrispìna: names of doubtful standing but perhaps vars. of M. elegans.

nívea: M. geminispina.

nivôsa. G, M: globose or cylindric, 7 in. diam., cespitose, very spiny; tubercles milky and white-woolly in axils; spines 14, ½ in. long, bright yellow: fis. cream-colored, ½ in. long. W. Indies.

Nunezii. II, He: globose to cylindrical, to 6 in. long and 314 m. dnam.; tubercles short with bristly axils; radial spines 25-35, bristly, white; centrals 2-4, stout, about ½ in. long, brown with blackish tip: fis. not known: fr. white, tinged red, club-shaped, to 1 in. long. Mex.

Núttallii: Neobesseya missouriensis.

occidentalis. II, A: cespitose, cylindrical, to 4 in. tall, axils naked; radials about 12, pale yellow; centrals 3-6, reddish-brown: fls. rose-pink, about ½ in. long: fr. red. Mex.

Ochoterènæ. H. He: solitary, depressed-globose, to 3½ in. diam., top spiny, axils naked; rudial spines about 17, bristly, white, about ½ in. long; centrals 5, to ¾ in. long, straight, brown with black tip becoming paler: fls. pale rose-pink. Mex.

octacántha: Coryphantha octacantha.

Olivies. H, C: solitary becoming respitose with age, st. globose to subcylindric, to 4 in. tall and 2½ in. diam., axils naked; radials 25-35, to ½ in. long, covering the entire surface, white to tan; centrals 1-3, white, tipped brown: fls. purplish-red, to 1¼ in. across. Ariz.

Orcuttii. G. M.: solitary, globose to somewhat clubshaped, dark blue-green; tubercles short, round, axils and areoles woolly; spines all alike, usually 4-5, black to gray: fls. pale carmine, segms. with darker stripe. Mex.

Ortiz-Rubiòna. H. C: cespitose, depressed-globose, to 3½ in. diam., axils silky, areoles white-woolly; radial spines numerous. ½ in. long, white; centrals 4-6, about ½ in. long: fls. yellowish-red, ¾ in. long. Mex.

Ottonis: Coryphantha Ottonis.

pachythèle: M. magnimamma.

pacifica. G, M: cespitose, sts. depressed-globose, to 6 in. diam.; tubercles elongated, angular basally but rounded at apex; radials 7-12, white; central 1, about ½ in. long, tipped brown: fls. yellowish-green, outer segms. entire, about ½ in. long. Lower Calif.

Painteri. H, S: solitary, globose, to ¾ in. diam., axils naked; radials 20, minutely puberulent, white; centrals 3-5, puberulent, dark brown, one or more hooked: fis. white to ¾ in. long. Mex.

pállida: see Coryphantha vallida.

Pálmeri. H, He: cespitose, sts. small, axils woolly and bristly; radials 25-30, about ½ in. long, white; centrals 3-5, to ¾ in. long, brownish with black tips: fls. cream-colored: fr. club-shaped, scarlet. Mex.

Párkinsonii. G, Leu: cespitose, parts depressed to cylindric, to 6 in. high, glaucous; tubercles short, axils woolly and bristly, the latter not numerous; radials 25-30, bristly, white, pectinate; centrals 2 or 4 or 5: fls. yellowish and small. Cent. Mex.

pectinàta: Coruphantha pectinata.

peninsularis. G. M: solitary becoming cespitose, depressed-globose; tubercles elongated, acutely angular at apex, axils woolly becoming naked with age; spines 4-8, all radial, with one occasionally more central, yellowish-brown, darker tipped: fls. yellowish-green. Mex.

pentacántha: M. magnimamma.

perbélla. G. E: depressed-globose, glaucous-green, solitary or more or less cespitose; tubercles conic and axils woolly; radials 14-18; centrals none: fls. reddish, nearly ½ in. long. Mex. Vars. lanata and minor are listed.

petrophila. G, M: solitary becoming cespitose, sts. globose, to 6 in. diam.; tubercles short, rounded, axils woolly when young; radials 10, about ½ in. long, pale chestnutbrown; central 1, to ¾ in. long; fis. greenish-yellow, to ¾ in. long. Mex.

Pétterssonii (M. Heeseana). G, Pe: cylindric, to 8 in. or more and very spiny; tubercles terete and axis bristly; radials 10-12, white with black tips; centrals 4: fls. not described. Mex.

Pfeifferi: form of M. rhodantha with lemon-yellow central spines.

phæacantha. Probably H, He: depressed-globose; tubercles conical, somewhat angled, axils woolly; radials 16-20, bristly, white; centrals 4, awl-shaped, black: fis. dark red. Mex.

Phellospérma: Phellosperma tetrancistra.

phitauiana. H. A: solitary, occasionally cespitose, sts. cylindrical, to 6 in. tall and 1¾ in. diam.; tubercles to ¼ in. long, conical, axils woolly; radials about 24, to ½ in. long, bristly, white; centruls 4, about ½ in. long, white tipped brown. fls. white, to ¾ in. long. Mex.

pilispina: Neolloydia pilispina.

plumòsa. H. C: clusters to 6 in. across, covered with white spines; tubercles very small and axils somewhat woolly; spines all radial and about 40, plumose: fis. white, nearly ½ in long. N. Mex.

polyédra. G. Pe: solitary, cylindric or somewhat club-shaped; tubercles flattened and angled and axis bristly; spines 4-6, all alike, short, grayish-white tipped reddish: fls. reddish and inconspicuous. S. Mex.

poigona. G, Pe: solitary, somewhat club-shaped, about 4 in. tall; tubercles large, more or less angular, axils woolly and setose; radials 8, the 2 upper ones very small; centrals 2: fls pale rose-pink. Mex.

polythèle (M. hudalgensis). G, M: cylindric, to 8 in. high and 4 in. diam.; tubercles short, symmetrical, usually rounded and when young densely woolly in axils; spines all radial, 2-4, unequal, to 1 in. long, reddish; fls. reddish, 1/3 in long. Mex.

Posélgeri: Cochemica Poselgeri.

potosina. In the lists the name represents a plant allied to *M. geminispina*: resembles *M. Celsiana* in the spines but st. is elongated and tubercles milky. The true *M. potosina* is probably *Neolloydia clavata*. Mex.

Pôttsii (M. leona). H, He: somewhat cespitose, individuals cylindric to about 5 in long; tubercles nearly hidden by spines; radials white and about 30; centrals 6-12 and stouter: fls. light purple, less than ½ in. long. Tex., Mex.

Praelii. G, Pe: globose; tubercles woolly and bristly in axils; radial spines 4 and forming a cross: fis. pale yellow, to 1½ in. long. Guatemala.

Pringlei. H, He: globose or depressed, to 6 in. high and 3 in. diam.; tubercles with woolly and bristly axils; radial spines 18-20 and yellow; centrals 5-7, to 1 in. long and curved: fls. deep red, 1/4 in. long. Mex.

prolifera (M. pusilla). H, S: in low colonies, individuals globose or cylindric and 2 in. or more diam.; tubercles conic and axils bristly; radials many and hair-like; centrals 5-12 and stouter: fls. yellowish-white, small. Cuba, Hispaniola.

pseudocrucigera: listed name.

pseudechinus: probably Coryphantha pseudechinus. pseudoperbélla. G, Leu: globose or short-cylindric, very

spiny, axils woolly, not bristly; radial spines 20-30, white and bristle-like; central spines 2, one of them recurved: fis. purple. Mex.

publishma. H. S.: solitary, globose, to 134 in. diam.; tubercles to ½ in. long, cylindrical; radial spines about 15 almost hair-like, spreading with recurved hairs mixed among them; centrals 3-4, white to dark brown, minutely pubescent, lower ones hooked: fis. white, segms. with pink midvein. Mex.

Purpusii: Pediocactus Simpsonii.

pusilla: plants so listed may be M. prolifera or M. multicers.

pygmæa. H, S: globose or cylindric, 1 in. diam.; radial spines about 15 and white; central spines 4 and golden-yellow, glabrous, the upper ones about 1/2 in. long, the lower hooked: fis. cream-colored tinged red outside, 1/2 in. long. Mex.

radians: Coruphantha radians.

radiòsa: Coryphantha mupara.
recurvàta: Coryphantha recurvata.

recurvispina: Coryphantha recurvata.

Rettigiana. H. A.: globose or depressed, to 1½ in. diam.; radial spines 18-20, white and spreading; centrals 3-4, ½ in. long: fls. rose, ½ in. across. Mex. Var. flavispina has yellow spines becoming grayish-white.

retùsa: Coryphantha retusa.

rhapidacántha: Neolloydia clavata.

rhodántha. H, He: sts. cylindric and erect, to 1 ft. long; tubercles terete and axils sometimes bristle-bearing; radials 15-20 and white; centrals 4-6: fls. rose-colored, about ½ in. across. Mex.—Grown under many names; among the vars. offered are campacántha, chrysacántha, férro-rübra, gigantèa, rübra and sulphirea.

robustispina: Coryphantha robustispina.

Roseana: Cochemiea Poselgeri.

roseofiba. G. M.: depressed-globose, to 2½ in. high and 3 in. diam.; tubercles 4-angled and white-woolly in axis; spines 4-5, white tinged rose at base: fis. white, 1½ in. long. Mex.

rubrispina: listed name.

Rúestii. H. He: globose to subcylindrical, to 4 in. tall and 3 in. diam., pale green, white-woolly and crimson-spined on top, axils woolly and bristly; radials 16-24, white; centrals 4, awl-shaped, about ½ in long: fls. pale pink with darker midrib. Honduras, Guatemala.

Rúnyonii. G. M: solitary, depressed-globose; tubercles elongate, angular at apex, axils woolly becoming naked with age; radials 6-8, brown to white; central 1, about ½ in. long, erect, dark brown: fls. purple, to ¾ in. long, segms. oblong: fr. red, club-shaped. Mex.

settgera. G. Leu: solitary, subglobose, apex white-woolly; tubercles conical, angular with truncate apex, axils woolly and setose; radials 15-20, about ½ in. long, spreading, white; centrals 2, to $\frac{3}{2}$, in. long, white brown tipped: fls white, segms. striped rose-pink, to $\frac{3}{4}$ in. long. Mex.

Saffordii. H. S.: globose or short-cylindric, to 2 in. high, nearly hidden by spines, axils naked; radial spines 12-14; central 1, brown, to ½ in. long and hooked; fis. rose, 1 in. long. Mex.

Sálm-Dyckiana: Coryphantha Salm-Dyckiana.

sanguinea: M. spinosissima.

Sártori. G. M: globose or short-cylindric, to 5 in. diam., cespitose; tubercles 4-angled, axils woolly becoming naked; radial spines 4-6, to 1/4 in. long, brownish; central 1 or sometimes absent: fls. carmine, to 3/4 in. long. Mex.

Scheeri: Coryphantha Muchlenpfordtri.

Scheidweileriana. H, He; cespitose, globose to subcylindrical, bright green, axils bristly; tubercles in 8-13 rows; radials 9-11, about ½ in. long, bristly, white; centrals 1-4, brownish, 1-2-hooked: fis. rose-pink, to ½ in. long. Mex.

Schelhäsei. H, S: forming large mound, individuals globose to short-cylindric; tubercles cylindric, angular, axils somewhat woolly but not bristly; radials 14-16, bristle-like and white; centrals 3, brown, one of them hooked: fls. salmon or rose-color, 1 in. long. Mex.

Schiedeana. II, C: densely cespitose, globose, to 2½ in. diam.; tubercles white-bristly in axils; radial spines 30, white and bristle-like; centrals 6-10, pubescent: fis. white, ½ in. long. Mox.

Schmöllii. H, Pa: solitary, depressed-globose, to 3 in. diam, olive-green; tubercles conical, axils naked; radials 23-25, nearly ¼ in. long, white; centrals 11-15, slightly longer: fls. yellow. Mex.

Schumannii: Bartschella Schumannii.

scolymoides: Coryphantha cornifera var.

Seideliàna. H, S: solitary to cespitose, sts. globose to

subcylindrical, about 3 in tall and 2 in. diam., axils naked, areoles somewhat woolly; radials 18-25, stout, white; centrals 3-4, yellow, pubescent, one of them hooked: fis. pale yellow. Mex.

Seitziàna. G. M: solitary or proliferous, cylindric, 4 in. or more high; tubercles conical, somewhat elongate, remotely angular at apex, axils woolly; spines 4: fis. rose-color, about 1 in. long. Mex.

sempervivi (M. Caput-Medusæ). G, M: solitary or more or less cespitose, flattened above and narrowed below; tubercles short, symmetrical, axils very woolly; radials 3-7 and shedding; centrals 2, about 1/8 in. long, brown: fis. dull white with reddish lines. Cent. Mex.

senilis: Mamillopsis senilis.

setisping. Cochemiea setranina

Sheldonii. H, A: cylindric, 3 in. high; radial spines 12-15 and reddish; central 1, hooked at end: fls. light purple. Mex.

Shurliana: listed name.

simplex: M. mammillaris.

Simpsonii: Pediocactus Simpsonii.

sinistrohamata. II. A: solitary, globose, about 3 in. diam., apex woolly and spiny; tubercles short-cylindrical, axils naked; radials 20, to \(\frac{1}{2} \) in. long, needle-like, covering the sts; centrals 4, to \(\frac{1}{2} \) in. long, amber-yellow; fls. very pale greenish-yellow, to about \(\frac{1}{2} \) in. long. Mex.

Sneèdii: see Escobaria Sneedii.

Solisii. H. A: solitary, globose, about 2½ in. diam., green, tinged red; tubercles ovoid, axils silky-woolly; raduals 10-20, about ¼ in. long, bristly-white; centrals 3-4, stouter than radials, one or more hooked: fis. rose-pink. Mex.

sphacelata. H. S: cespitose, forming clusters to 1½ ft. diam., sts. cylindrical, to 8 in tall and 1½ in diam.; tubercles hemispherical, axils with woolly and silky hairs, bristly; radials 14-20, about ¾ in. long, reddish-brown; centrals 1-4, grayish-white: fls. rose-purple, to ¼ in. long. Mer

sphérica: Dolicothele sphærica.

spinosissima. II, Pn: cylindric, to 12 in. long and 4 in. diam., densely covered with spines; tubercles very short and axis bristly; radials about 20; centrals 7 or 8; fis. purplish, about ½ in. long. Cent. Mex.—Known under many names. Var. sanguinea does not differ from the type.

Standleyi. G. Pe: usually solitary, globose, to 4 in. diam., axils bristly and woolly; radials about 16, whitish; centrals 4, stout, reddish-brown: fls. dark rose-purple, to ½ in. long. Mex.

stélla-aurata: M. elongata.

strobiliformis: a name of various applications; see Neolloydia conoulea, Coryphantha sulcuta and Escobaria tuberculosa.

sulcata: Coryphantha sulcata.

sulcolanata: Coryphantha sulcolanata.

tarajaénsis: listed name.

ténuis: M. elongata.

tetracántha (M. dolichocentra). II, He: nearly globular, to 3 in. diam.; tubercles obscurely angled and axis woolly; spines 4 and all central. fls. pink to rose-color, small. Mex.

tetrancistra: Phellosperma tetrancistra.

trichacántha. H. A.: globose or short-cylindric, axils woolly and bristly; radial spines 15-18 and white; centrals 2, ½ in. long, one hooked: fis. red or yellow, ½ in. long, lobes white. Mex.

Trohartii. G, M: solitary becoming cespitose, sts. globose, somewhat flattened on top, glaucous, to 2½ in diam.; tubercles short, axils naked; radials 4-6, about ¼ in. long, usually white; centrals 1, rarely to 3, brown, hooked: fis. pale pink, to ¾ in. long. Mex.

tuberculosa: Escobaria tuberculosa.

uberiformis: Dolicothele uberiformis.

umbrina. H. He: solitary or occasionally cespitose, sts. cylindrical, to 5 in. tall and 2½ in diam; tubercles conical, axis naked; radials 18-25, radiating, about ½ in. long; centrals 2-4, tō ¾ in. long, brownish-red: fls. rose-purple, stigma green, 5-lobed. Mex.

uncinata. G, M: globose or somewhat depressed and partly buried in soil, to 4 in. diam.; tubercles short and milky and finally naked; radials 4-6; central mostly 1, brown, uncinate: fis. reddish-white, nearly 1 in. long. Cent. Mex.

válida: M. melanocentra or Coryphantha Poselgeriana.

Vaupeliana: Coryphantha Vaupeliana.

Vieréckii. H. S. globose, 1½ in. diam.; spines 9-11 and ½ in. long, areoles with 6-7 whitish spines below: fis. cream-colored with greenish central stripe, ½ in. long.

villifera. G, Pe: cespitose, depressed-globose; tubercles angular, axils woolly and bristly; spines 4, alike, dark red: fls. pale rose, stigma-lobes 4-5. Mex.

viperina. H, S: cylindric, to ¾ in. diam., decumbent and cespitose; spines numerous and very short; fis. carmine-red. Mex.

viridiflora. Probably H, A: solitary, globose to subcylindrical, to 4 in. tall and 3 in. diam.; tubercles terete, axils naked; radials 20-30, to ½ in. long, white tipped brown; centrals several, to ¾ in. long, one hooked: fls. greenish-yellow with light-green indrib, to 1½ in. long, stigma pale green, 7-lobed. Ariz.

vivipara: Coryphantha vivipara.

Wagneriàna. G. M: soltary, depressed-globose, to 2 in. tall and 4 in. dam., woolly on top; tubercles short, conical, angular, axils woolly; radials 9-10, awl-shaped, brown tipped darker; centrals 2-4, to 2 in. long, unequal, the longer ones twisted: fls. white, striped rose, about 3/8 in. long, stigma pale green, 5-6-lobed. Mex.

Wáltheri. H, S: globose, to 3 in. diam.; radial spines 12-14 and horizontally spreading; centrals usually 2: fis. white, $\frac{1}{2}$ in long. Mex.

Wérdermannii: see Coryphantha Werdermannii.

Wilcoxii: M. Wrightin.

Wildii. H. S. somewhat respitose, cylindric to globose; tubercles slender with rose-colored hairs and bristles in axils; spines pubescent, the radials 8-10 and centrals 4: fis. white, $\frac{1}{2}$ in across. Mex.

Winteriæ. G, M: solitary, depressed-globose, to 4 in. diam., dark green; tubercles to 34 in. long, 4-angled, axils white-woolly; spines all radial, 4, to 12 in. long, whitish, dark tipped, straight: fls. pale sulfur-yellow, stigma pale green, 8-10-lobed. Mex.

woburnénsis. G. cespitose, globose to cylindrical, dull green; tubercles angular, axils woolly and setose; radials 5-9, yellowish-white; centrals 1-8, reddish to yellow: fis. yellow, about 3% in. long. Guatemala.

Woodsii: listed name.

Wrightii (M. Wilcorn). H, A: simple and depressed-globose; tubercles terete with axils naked; radials 8-15, white; centrals 1-3 and stouter: fis purple, 1 in. long New Mex.

Zachariniana: catalogue name for M. Zuccariniana.

Zahniana. G, M: solitary, globose, to 2½ in. diam.; tubercles to ¾ in. long, conical, angular; spines 4, all radial, the lower ones stouter and longer, to ¾ in long; fls. white with rose-pink stripe, stigma green, 6-10-lobed Mex.

Zeilmanniana. H, S: usually solitary, globose to sub-cylindrical, covered with spines; tubercles cylindrical, in 13-21 compact rows; radials 15-18, stiff, straight, white; centrals 4, lower one hooked, red: fls. violet-purple, stigma yellow, 4-lobed. Mex.

zephyrantholdes. H. A: depressed-globose to short-cylindric, to 3 in. high; tubercles nearly 1 in. long; radials 14-18 and white; centrals 1 or 2: fis. white with red stripes, to 1½ in. across. S. Mex.

Zeyeriàna. G, M: globose or short-cylindric, to 4 in. high, glaucous; radial spines 10, white; central spines 4, ½ in. long: fls. unknown. Mex.

Zucariniana. G. M: usually solitary, globose to cylindrical, to 8 in. tall, glaucous blue-green, axils and areoles white-woolly when young; radials lacking or only stout bristles present; centrals 2-4, black; fls. magenta-red, stigma purple, 3-4-lobed Mex.

MAMONCILLO: Melicocca bijuga.

MANDEVÍLLA. A pocynacex. More or less woody vines from trop. Amer., one grown in the greenhouse, or out-of-doors in the S., with opposite lvs., funnelform fls. in racemes, and fr. of 2 follicles; the genus differs from Dipladenia only in technical features.

The mandevillas are grown in soil consisting of equal parts of peat and loam, with sand; they should not be planted in pots. Propagated by cuttings over bottom heat.

suaveolens. CHILEAN-JASMINE. Lvs. oblong-cordate, to 3 in. long, glaucous beneath: fls. white or pinkish, fragrant, 2 in. across. Argentina.

MANDRAGORA. MANDRAKE. Solanaceæ. Herbaceous perennials with thick or tuberous roots often having a human-like form of branching, lvs. undivided, and rather large bell-shaped fls. solitary or clustered among the foliage, whitish, blue-violet or purple; native Medit. and Himalayan region. Seldom cult. but interest-

ing for the medicinal qualities and for the old superstitions connected with it. The name mandrake is incorrectly applied also to Podophyllum peltatum. Propagated by seeds and

autumnalis. Similar to M. officinarum, but with smaller roots and lvs. and violet fls. S. Eu., N. Afr.

officinarum. To 1 ft., with spindle-shaped often branching root: lvs. ovate, sinuate-toothed, to 1 ft. long: fis. greenish-yellow, to 1 in. long. S. Eu.

MANDRAKE: Mandragora.

MANÉTTIA (Lygistum). Rubiaceæ. green herbs or shrubs of twining habit with mostly opposite lvs. and white, yellow or red attractive fls. with tubular corolla and 4-5lobed limb; native in trop. Amer.

Manettins are grown as trellis and rafter vines in the greenhouse, or planted out in the summer and in southern United States. They need a night temperature of 55° and above. Propagated by cuttings of young growth over heat, and by seeds when available.

bicolor. Lvs. lanceolate, glabrous: fis. red with upper part yellow, ¾ in. long, solitary, calyx-lobes erect or spreading, style exserted. Brazil.

cordifòlia: M. glabra.

glàbra ($M.\ cordsfolia$). Lvs. cordate-ovate, glabrous: fis. crimson, $1\frac{1}{2}$ in. long, lobes revolute, solitary, stamens exserted. S. S. Amer.

inflata. Lvs. lanceolate, pubescent on veins beneath: fls. red tipped yellow, ¾ in. long, solitary, calyx-lobes leafy and reflexed, style included. Paraguay, Uruguay.—Sometimes mistaken for M. birolor.

MANFRÈDA. Amaryllidaceæ. Segregate from Agave; fleshy bulbous herbs with basal lvs. and large nocturnal fls. in terminal spikes or racemes, the perianth-segms. united into a tube below. For cult. see Agave.

brachýstachys (Agave brachystachys). To 6 ft.: lvs. to 14 in. long and 1½ in. wide: fls. green, 2 in. long, stamens long-exserted. Mex. to Guatemala.

maculòsa (Agave maculosa). To 3 ft.: lvs. to 1 ft. long and ¾ in. wide, mottled: fls. fragrant, greenish or whitish, 2 in. long. S. Tex.

variegāta (Agave variegātā). To 4 ft.: lvs. to 1½ ft. long and 1½ in. wide, mottled: fls. brownish-green, to 1½ in. long, stamens long-exserted. S. Tex., N. Mex. Var. gigantēa is listed.

virginica (Agave virginica). To 6 ft.: lvs. to 2 ft. long and 2½ in. wide: fls. fragrant, greenish-yellow, about 2 in. long. Md. to Fla. and Tex.

MANGEL: Beta vulgaris.

MANGIFERA. Anacardiacex. Asian trees with leathery simple lvs., small polygamous fls. in terminal panicles, 1-5 stamens but often only 1 fertile, large fleshy drupaceous fr. with a compressed fibrous stone, edible and widely grown in the tropics.

The genus is known mostly for the mango, planted in southern Florida, warmest parts of California, and tropics for the large edible fruit; well marked pomological varieties are now prized. Trees should be planted 35 by 35 feet, in well-drained soil in regions free from frost, and in which there is dependable supply of mosture. Propagated by seeds, but budding, grafting and inarching are employed for named varieties. for named varieties

indica. Mango. Evergreen tree to 90 ft. and sometimes with a spread of 125 ft.: lvs. stiffish, lanceolate, to 16 m. long: fis. pinkish-white, in Fla. blooming from Dec. to Apr.: fr. variable in size, shape and color, mostly ovoid-pointed or heart-shaped, commonly 3-5 in. long but may be shorter or longer, smooth, mostly yellow and reddish when ripe, containing I very large flat adhering stone or seed. N. India. Burma, Malaya.

MANGO: Mangifera indica.

MANGOSTEEN: Garcinia Mangostana.

MANGROVE: Rhizophora.

MÁNIHOT. Euphorbiacex. Several trop. American herbs, shrubs or trees with alternate mostly lobed lys., monœcious fls. without petals borne in racemes, and capsular fr.: M. csculenta is extensively grown in trop. regions for the starchy roots which yield tapioca, cassava, and other food products, obtained by manufacturing processes; other species are a source of rubber.

Cassava thrives on rich sandy land. Propagated by cuttings of the stem into 4-6-inch pieces and planted 4 feet apart each way. In the United States the canes should be buried until spring and then cut into lengths. Some early-maturing races may be grown from seed. Roots should not be dug until ready for use, as they decay readily.

carthaginensis. Tree or tree-like, to 20 ft., with fleshy roots: lvs. to 5 in. long, 5-7-lobed, some of the lobes fiddle-shaped, lyrate or pinnatifid. Tex., Lower Calif. to N. S.

dúlcis. Differs from M. esculenta in lvs. sometimes as much as 13-lobed, fr. cylindrical and not winged. S. Amer. -Has tuberous edible roots.

esculénta (M. utilissima. Jatropha Manihat). Cassava. Manioc. Tapioca-Plant. Shrub to 9 ft., with long tuberous edible roots: lvs. usually digitately parted into 3-7 lobes: ft. ½ in. across, 6-angled and narrowly winged. Blazil.—Of great importance in many countries as a food plant.

Glaziòvii. Tree to 40 ft.: lvs. peltate, deeply 3-5-lobed into entire lobes to 4 in. long: caps. not wing-angled. S.

utilissima; M. esculenta.

MANIOC: Manihot esculenta.

MAN-ROOT: Echinocystis oregana.

MANULÈA. Scrophulariacex. S. African or trop. African ann. or per. herbs or subshrubs with mostly opposite entire or dentate lys. or sometimes all radical, tubular fls. with 5-lobed limb borne in spikes, racemes or panicles, and capsular frs. Confusion exists between the genera Chænostoma, Manulea and Sutera and their interpretation.

violacea. Ann. to 1 ft.: lvs. ovate to oblong, to 1 in. long, toothed: fls. violet, ½ in. long. S. Afr.—The proper name of this plant may be M. antirrhinoides.

MANZANITA: Arctostaphylos.

MAPLE: Acer. Flowering: Abutilon.

MAPLEWORT: Aceranthus diphytlus.

MARAH: Echinocustis.

MARÁNTA. Marantacex.Attractive per. herbs native in trop. Amer. having basal and st.-lvs. sheathing at base and fls. in panicles or branched racemes; grown for the ornamental foliage and one species for the roots which furnish arrowroot and tapioca. Cult. as for Calathea, from which the genus differs in technical not obvious characters. Most of the plants grown as marantas are calatheas.

arundinacea. Arrowroot. To 6 ft., having starchy roots: lvs. to 1 ft. long and 4 in. across: fls. white. Trop. Amer. Var. variegata has lvs. variegated with yellow, and var. aurea may not be different.

hélla: Calathea bella

bicolor (Calathea bicolor). To 15 in., tuber-bearing: lvs. to 6 in. long and 4 in. broad, wavy-margined, glaucous above spotted with brown and with light central stripe, light purple beneath: fls. white spotted and striped with vallet. Brazil Chicago violet. Brazil, Guiana.

Rindtii: Calathea zebrina var.

Chantrièri: Calathea Chantrieri.

Closonii. Lvs. dark green variegated with pale yellow. Brazil.—Botanical position uncertain.

conspicua: Calathea Lietzei.

eximia: Calathea eximia.

fasciata: Calathea fasciata.

Goùletii: Calathea Vandenheckei.

Goveniana. Lvs. light green with dark markings. Botanical position uncertain.

illústris: Calathea illustris. insignis: Calathea insignis.

Kegeliana: Calathea Bachemiana.

Kerchoveana: M. leuconeura var. Kummeriana: Ctenanthe Kummeriana. Legrelliana: Calathea Legrelliana. leonardina: Calathea Legnardina.

leuconeùra. To 1 ft.: lvs. to 7 in. long and 3½ in. wide, light green above with white along midrib and veins and spotted toward margins, purple or glaucous beneath: fts. white striped purple. Brazil. Var. Kerchoveàna has larger lvs. glaucous or spotted with red beneath. Var. Massangeàna has smaller lvs. purple beneath.

Liètzei: Calathea Lnetzei.
Lindenii: Calathea Lindeniana.
Louisæ: Calathea Louisæ.
Lúbbersi: Ctenanthe Lubbersiana.
Luciàna: Calathea Luciana.
Makoyàna: Calathea Makoyana.
Massangeàna: M. leuconeura var.

micans: Calathea micans.

Móssellii: hort. name.

musàica: Calathea musaica.

Oppenheimiana: Ctenanthe Oppenheimiana.

Porteàna: Stromanthe Porteana. princeps: Calathea princeps. pulchélla: Calathea pulchella.

regalis: a hort, variant of Calathea ornata.

roseo-lineata: probably a cult. form of Calathea ornata.

rdseo-picta: Calathea roseo-picta.

spléndida: Calathea splendida.

Sanderiana: probably a variant of Calathea ornata.

smarágdina: Monotagma smaragdinum.

tubispatha: Calathea Pavonri. undulata: Calathea undulata. Vandenhéckii: Calathea Vandenheckei. Veitchiana: Calathea Veitchiana.

vittàta: Calathea vittata. Wállisii: Calathea Wallisii.

Warscewiczii: Calathea Warscewiczii.

zebrina: Calathea zebrina.

MARANTÀCEÆ. MARANTA FAMILY. Permonocotyledonous herbs having tubers or rootstocks, forming clumps or colonies, mostly large sheathing lvs. and bisexual irregular fls. in clusters surrounded by spathe-like bracts, composed of 3 free sepals, 3 united petals, 1 fertile stamen and 5 petal-like sterile stamens or staminodia, inferior 1—3-celled ovary, and fr. a caps. or berry. A few genera are grown for the ornamental foliage, and tapioca is obtained from the root of one species of Maranta. The cult. genera are Calathea, Ctenanthe, Maranta, Monotagma, Stromanthe, Thalia. They are well-known greenhouse subjects.

MARÁTTIA. Marattiaceæ. Trop. ferns with thick rootstocks and large 2-3-pinnate fronds; sori near margins of segms. Sometimes seen in greenhouse collections. For cult. see Ferns.

attenuata. Fronds to 4 ft. long, on stipes to 4 ft. long, 3-pinnate, segms. to 6 in. long. New Caledonia.

Douglasii. Fronds dark green, glossy, to 8 ft. long, on stipes to 5 ft long, 3-pinnate, segms. ovate or oblong, to 1 in. long, toothed. Hawaiian Isls.

erécta: probably Angiopteris evecta.

fraxínea. Fronds dark green and glossy, to 15 ft. long, on stipes to 2 ft. long, 2-pinnate, the thick fine-toothed lfts. to 6 in. long. S. Afr., Malaya, New Zeal.

pruindsa: probably Angiopteris pruinosa.

MARATTIACEÆ. MARATTIA FAMILY. Seven genera of trop. ferns with large mostly pinnate fronds and sori separated or united on under side of lvs. Angiopteris and Marattia are grown in greenhouse collections.

MARCGRAVIA PARADOXA: Monstera dubia.

MARCHÁNTIA. Marchantiaceæ. A liverwort (cryptogam), M. polymórpha, offered for colonizing in rock-gardens. The leaf-like flat thallus is 4-5 in. long and 1 in. wide. A frequent plant in moist places, of wide distribution.

MARGOSA: Melia Azadırachta.

MARGUERITE: Chrysanthemum frutescens. Blue: Felicia amelloides. Golden: Anthemis functoria.

MARGYRICÁRPUS. Rosacex. Evergreen shrubs native in the Andes and suitable for the rock-garden but not hardy in northern states: lvs. alternate, pinnate, the rachis spiny: fls. inconspicuous, without petals: fr. a berry or achene.

setbsus. Pearl-Fruit. Prostrate, branches to 1 ft. high: lvs. 1 in. or less long, the lfts., linear and revolute at margins: fr. a white berry about ½ in. across. Ecuador to Patagonia.

MARIA: Calophyllum antillarum.

MARICA: Cimura and Neomarica.

MARIGOLD: Tagetes. Bur-: Bidens. Cape-: Dimorphotheca. Corn-: Chrysanthemum segetum. Fig-: Mesembryanthemum. Marsh-: Caltha palustris. Pot-: Calendula officinalis.

MARIJUANA: see Cannabis.

MARJORAM: Origanum, Majorana.

MARKET-GARDENING, as now prevailingly understood, is the raising of vegetables and perhaps small-fruits and other garden products for a market within driving distance. Truck-gardening or trucking is now defined to be the growing of a few products, as sweet potatoes, kale, spinach, in larger areas and on cheaper land so far from market as to require shipping facilities by rail or boat; yet the term truck-gardening was at first the same as market-gardening, denoting the raising of products that were hauled to market on trucks or wagons. There is no sharp line of demarcation between market-gardening and truck-gardening; but they are well set off from home-gardening, in which the garden is a scene of personal satisfactions and the products are intended for the family table.

MARKHAMIA. Bignoniaceæ. Trop. African and Asiatic trees and shrubs with large persistent pinnately compound lvs. and tubular-funnel-form fls. in large terminal or axillary panicles, usually yellow with red or purple stripes within and a spathe-like calyx splitting down one side: fr. a linear loculicidally dehiscent caps.

intea. Shrub or tree to 20 ft.: lvs. to 20 in. long, lfts. 7-11, ovate to elliptic-obovate, to 7½ in. long, stalked: fls. yellow, to 2½ in. long, stamens 4, included: caps. curved, to 22 in. long, seeds winged at the ends, to 1¼ in. long. Upper Guiana, Afr.—Planted in S. Fla.

MARLBERRY: Ardisia paniculata.

MARMALADE-BOX: Genipa americana. -Plum: Achras Zapota.

MARRAM: Ammophila arenaria.

MARRŪBIUM. HOARHOUND. HOREHOUND. Labiatæ. Ann. and per. herbs, mostly silky or woolly, the lvs. wrinkled and toothed or cut; fls. small, 2-lipped, purplish or white, in manyfld. axillary whorls; one species is extensively used in confections and medicines, and a few others occasionally planted.

Propagated by division or by seeds sown in early spring; the latter method should give good plants for cutting the following year.

candidíssimum. Differs from M. vulgare chiefly in the stiff spreading rather than recurved calyx-teeth. S. Eu.

catariæfðlium. Ann. to 1 ft., pubescent: lvs. oblong, to $\frac{3}{4}$ in. long: fls. rose. Caucasus.

libanóticum. Much branched per. to 1 ft., yellow-tomentose: lvs. oval or orbicular, to ½ in. long: fis. pale pink. Asia Minor.

vulgare. Common H. Aromatic per. to 3 ft., white-woolly: lvs. ovate, to 2 in. long: fis. whitish, in summer. Eu., Asia; nat. in N. Amer.—An old-time sweet herb.

MARSDÈNIA. Asclepiadaceæ. Shrubs, upright or twining, of warm and trop. regions in Old and New Worlds, one of which is sometimes planted for ornament and hardy N.: lvs. opposite: fls. mostly small, paniculate or umbellate; corolla bell-, urn- or salver-shaped, with 5 scaly crown-lobes: follicles thick, often fleshy.

erécta (Cynanchum erectum). Erect more or less twining deciduous shrub, or the branches sometimes lopping: lvs. broad-ovate, 2-3 in. long, short-acuminate, base truncate or cordate; fis. white, fragrant, about ½ in. across, mostly in axillary clusters. S. E. Eu. and W. Asia.

MARSHÁLLIA. Compositæ. Per. tufted herbs of N. Amer., with entire lvs. and solitary long-stalked heads of purple, pink or white disk-fls.; pappus of scales; no close relatives in general cult.

cæspitòsa. To 15 in.: lvs. mostly basal, linear, to 4 in. long: heads 1 in. across, pink or white, bracts of involucre acute. Mo. to Tex.

grandiflora. To 2 ft., rarely to 3 ft.: lvs. elliptic-spatulate, soute, to 7 in. long, the upper ones linear-elliptic: heads to 1 in. across, the florets to 34 in. long, involucial bracts obovate. Pa. to N. C.

trinérvia. To 2½ ft., usually less: lvs. mostly basal, spatulate-elliptic, obtuse, to 5 in. long: heads about ¾ in. across or less, florets to ¼ in. long, involucral bracts ovate-lanceolate, strongly ribbed. Va. to Ala.

MARSILEA. PEPPERWORT. WATER-CLOVER. Marsileaceæ. Aquatic or paludose herbs with 4-parted clover-like floating lvs.; widely distributed.

Propagated by pieces of the runners. M. Drummondii requires moderate greenhouse temperature if grown in the North.

Drümmondii. Lits. covered with whitish hairs, wavy-margined. W. Australia.

quadrifòlia. Lits. glabrous, entire. Eu., Asia, and nat. in U. S.; likely to become a pest in ponds.

MARSILEACEÆ. MARSILEA FAMILY. Three genera of per. herbs rooting in mud of ponds and ditches, having 2-4-parted or thread-like long-petioled lvs. and spores borne in bodies known as sporocarps. Marsilea is grown in ponds and tanks. The family is classified with the ferns.

MARTINEZIA: Aiphanes.

MARTÝNIA. Martyniaceæ. A monotypic genus allied to Proboscidea, differing in sepals fused marginally into a spathe-like calyx and fertile anthers 2, not 4. M. annua, of wide distribution throughout Mex., Cent. Amer. W. Indies, India to Malasia. Herbaceous ann. to 10 ft. high, becoming woody at maturity, clammy and sticky-hairy especially when young: lvs. opposite, broadly ovate to deltoid, blade to 15 in. long, with petiole about 1 ft. long, palmately veined, coarsely dentate: fls. cream-white to reddish-purple, usually yellow spotted and blotched purplish, campanulate, to 1¾ in. long, in racemes of 10-20: fr. to 1½ in. long, ovoid, 8-ribbed, horns shorter than body.—For cult. and other names see Proboscidea.

MARTYNIACEÆ. MARTYNIA FAMILY.
American sticky-hairy more or less succulent nerbs of 5 genera in the latest monographic

treatment, with opposite or alternate lvs., irregular gamopetalous fls. having 5-lobed corolla-limb, usually 4 stamens, superior 1-celled ovary, and fr. a curved long-beaked caps. Ibicella, Martynia and Proboscidea are grown in N. Amer. for ornament and curiosity, and the frs. for food.

MARVEL-OF-PERU: Mirabilis Jalana.

MASCARENHÀSIA. A pocynaceæ. Shrubs or small trees of Afr. and Madagascar, one planted experimentally as a source of rubber: lvs. opposite: fls. pink or purple, salverform, solitary or clustered: fr. of 2 linear follicles.

elástica. Tall tree: lvs. oblong, to 10 in. long: fls. 1/2 in. long, in few-fld. cymes: fr. purplish-black, to 3/2 in. long. Trop. Afr.

MASDEVÁLLIA. Orchidaceæ. Epiphytic or terrestrial orchids native in trop. Amer., without pseudobulbs but with very short sts.; fls. mostly solitary but sometimes 8 in a raceme, the sepals united and the lobes often prolonged into long tails, the petals small, lip small and attached to base of column. They require coolhouse treatment, with frequent watering; see Orchids.

bélla. Lvs. to 9 in. long: infl. 1-fld., shorter than the lf.; fls. large, pale yellow spotted with brownish-crimson, with tails to 4 in. long. May-July, Nov. Colombia.

Chimèra. Lvs. to 9 in. long: infl. 1-5-fid.; fls. large, successive, brownish-yellow spotted with brownish-purple, the tails to about 7 in. long. Jan.-Sept. Colombia.

coccinea (M. Harryana). Lvs. to 10 in. long: fis. solitary, violet-red, the dorsal sepal prolonged into a tail; petals and lip white. Apr.—June. Colombia.

coriàcea. Lvs. very leathery, to 8 in. long: fls. solitary, greenish-white spotted along nerves with crimson, all sepals with short tails. Dec., July. Colombia.

Harryana: M. coccinea.

Houtteana. Lvs. to 10 in. long: scapes to 5 in. long; fls. solitary, cream-white spotted with purple, with long reddish-purple tails. Colombia.

ignea: M. militaris.

macrura. Lvs. to 1 ft. long: fls. solitary, on stalks to 1 ft. high, brownish-yellow spotted with purple, with yellow tails to 434 in. long. Dec.-June. Colombia.

militàris (M. iynea). Lf. to 10½ in. long: scape 1-fld; fis. orange to scarlet, dorsal sepal extended into a long tail. Feb.—June. Colombia.

Reichenbachiana. Lvs. to 6 in. long: scapes to 7 in. high, 1-4-fid.; fis. dark red outside, pale yellow or whitish striped with reddish nerves inside, with recurved tails about 1½ in. long. Apr.-July, Dec. Costa Rica.

Schifmii. Lvs. to 1 ft. long: scapes longer than lvs., 3-8-fid.; fls. yellow densely spotted with reddish-brown, with yellow tails to 2½ in. long. Jan.-Mar., Aug. Venezuela, Colombia.

tovarénsis. Lvs. to 6 in long: scapes equalling or surpassing lvs., 2-5-fid.; fis. white, with tails to $1\frac{3}{4}$ in long. Nov.-Dec. Venezuela.

Veitchiana. Lvs. to 10 in. long: scapes to 1½ ft. tall, 1-2-fid.; fls. large and showy, orange-red, closely studded with purple hairs, with short tails. May-July. Peru.

MASK-FLOWER: Alonsoa.

MASTERWORT: Astrantia.

MASTIC-TREE, PERUVIAN: Schinus Molle.

MATAI: Podocarpus spicata.

MATCHWEED: Gutierrezia Sarothræ.

MATHIOLA. Cruciferæ. Ann. and per., or subshrubs, grayish-pubescent, two in cult. for ornament under the name of stocks, native mostly in Medit. region: lvs. long, entire or sinuate or pinnatifid: fls. lilac, purple, to white, in terminal racemes: fr. long narrow pods or siliques.

bicórnis. Evening Stock. Perfume-Plant. Ann., low and much branched: lvs. lanceolate or narrower, to 3½ in. long, entire or only small toothed: fls. scattered, lilac or

purple, very fragrant at evening and closed by day, about ¾ in long. S. E. Eu., Asia.

incana. Stock. Brampton Stock. Gilliflower. Bien. or per., stiffly erect, to 2½ ft.: Ivs. oblong to oblanceolate, to 4 in. long: fis. in terminal racemes, about 1 in. long, purple or reddish varying to white, blush and yellowish, fragrant, often full double. S. Eu., nat. in S. Calif. Var. annua, Ten Weeks Stock, is ann. or so grown, blooming earlier. See Stock.

MATRICÀRIA (incl. Chamomilla). MATRICARY. Compositæ. Herbs with finely dissected foliage, ann., bien., per., often strongly scented, disk-fls. yellow, ray-fls. white or sometimes wanting, the center or receptacle very high or conical; pappus none; native in S. Afr., Medit. region and Orient, a few cult. as ornamentals. The distinctions between Matricaria and Chrysanthemum are technical and are not clear. Matricarias require only the usual treatment for annuals and perennials, indicated under Chrysanthemum.

álba: Chrysanthemum Parthenium.

aîrea (Coula aurea). Ann., crect, to 12 in.: lvs. finely pinnatisect: heads globular, about ¾ in. across, dull yellow, on long peduncles. Spain, N. Afr., Caucasus.—Sometimes raised in flower-garden.

capénsis: Chrysanthemum Parthenium.

Chamomilla. Sweet False Chamomile. Ann. to 2 ft., glabrous, much branched: lvs. 2-3-pinnate into linear segms. heads 1 in. across, with 10-20 white rays. Eu., N. Asia; escaped in E. U. S.

discoidea; M. matricarioides.

eximia: Chrysanthemum Parthenium.

grandiflora of hort.: M. inodora var. plenissima.

inodora (Chrysanthemum and Pyrethrum inodorum). Scentless False Chamomile. Ann. to 2 ft., diffusely branching, glabrous, scarcely scented: lvs. 2-3-pinnate nto linear segms.: heads 1½ in. across, with 20-30 white rays. Eu. Var. plenissima (M. grandifora) has very double heads, sometimes known as "Bridal-Rose."

matricarioides (M. discordea). Ann. to $1\frac{1}{2}$ ft.: lvs. 2-3-punnate into linear segms.: heads $\frac{1}{2}$ in. across, without ray-fls. N. Amer.

nàna hort name

oreades. Per., pubescent, sts. ascending: lvs. oblong, bipinnatisect, segms. linear, acute: heads to 1½ in. across, ray-fls white. Syria.

parthenoides: Chrysanthemum Parthenium.

Tchihátchewii (Chrysanthemum and Chamæmelum Tchihatchewu). Turring Daisy. Mat-forming per., sending up sts. 6-12 in. high terminated by white-rayed attractive daisy-like heads 1 in. or less across: lvs. finely cut. Asia Minor.

MATRIMONY-VINE: Lycium.

MATTEUCCIA: Pteretis.

MATUCANA. Cactaceæ. One species, from Peru, M. Hâynei. St. globose to cylindrical, to 6 in. tall and 4 in. diam., covered with spines; ribs 25-30, low, tubercled; spines 30-50, radial, to 1% in. long, stiff, needle-like, spreading irregularly, white to gray: fls. orange-red with violet margin, to 2½ in. across, stamens pink, stigma 4-lobed, yellow.

MAURÁNDIA. Scrophulariaceæ. Bright-flowered per. herbs mostly climbing by means of coiling petioles, with axillary showy irregular trumpet-shaped fls. in white, rose, purple and blue, and triangular or halberd-shaped lvs.; Mex. and adjacent U. S.

Maurandias flower freely in winter in a cool greenhouse, but if the seed is sown early they bloom the first summer and may then be used in baskets or vases in the open. For seed sowing, a soil of 4 parts new loam, 2 parts leaf-mold, 1 part sand may be employed; cover with glass and keep at a temperature of 60° . Under glass maurandias may also be propagated from cuttings taken any time after the middle of January.

álba: probably a color form of M. Barclaiana.

antirrhinisidra (Antirrhinum antirrinistorum and

A. maurandioides). Plant glabrous: lvs. arrow- or halberd-shaped, to 1¾ in. long: fls. purple or white, to 1 in. long, the sepals lanceolate. Tex., Calif., Mex.; now widely spread.

Barclaiana. Lvs. glabrous, halberd-shaped, entire, about 1 in. long, the petioles long and twining: fis. 1½ in. long, purple-down outside, the sepals glandular-hairy and long-attenuate. Mex.

erubéscens. Plant glandular-hairy: lvs. triangular, toothed, 3 in. and more long: fis. rose-red, 3 in. long, the sepals broad and leafy, to 1 in. long, corolla-lobes obtuse or notched. Mex.—Commonly grown under the name M. scandens.

Lophospérmum (Lophospermum scandens). Often confused with M. erubescens but the corolla-tube straight rather than ventricose and glabrous outside, the lobes more acute, the sepals oblong and attenuated. Mox.—Inf equent. Most of the material cult. as M. scandens is M. erubescens.

purpùrea grandiflòra: probably a color form of M. Barclaiana.

Párpusii. To 2 ft., lopping but not climbing, slightly pubescent, the rootstock tuberous: Ivs. arrow-shaped, to 2 in. long, slightly toothed or entire: fls. violet, 2 in. long; sepals broad-ovate, purplish, ½ in. long. Mex.

scandens. Plant glabrous: lvs. arrow-shaped, to 1½ in. long: fis. purple, 1 in. long; sepals lanceolate, about half length of corolla-tube. Mex.—The plant commonly cult. as M. scandens is M. erubescens.

MAXILLÀRIA. Orchidaceæ. Epiphytes native in trop. Amer., usually with pseudobulbs clustered or on elongate sts., and small or large mostly dull colored sometimes fragrant solitary fls., the lateral sepals united to foot of column forming a chin, the lip mostly 3-lobed. Grown after the manner of Lycaste; see Orchids.

Cólleyi: Xylo ıum Colleyi.

dénsa: Ornithidium densum.

grandiflora. Pseudobulbs 1-lvd., to 3 in. high: fls. 4-6 in. across, among the largest of the genus; sepals and petals milk-white; lip buff-yellow, side lobes streaked with wine-purple. Pe u, Ecuador.

Houtteana. Rhizome creeping: pseudobulbs to 3 in. long, 1-lvd.: If. to about 10 in. long and ½ in. wide: fls. nearly 2 in. across; sepals and petals red-purple or cnnamon with narrow yellow margins within; lip goldenyellow spotted with red-brown or purple. Dec.-May. Mex., Guatemala.

hyacinthina: Xylobium hyacinthinum.

lùteo-álba. Pseudobulbs clustered, 1-lvd.: If. to 20 in. long: fis. large, frag ant; sepals and petals brownish-yellow, whitish at base; lip white with purple-streaked side lobes and yellow in center of mid-lobe Feb.-June. Venezuela.

pcta. Pseudobulbs clustered, with 2 lvs to 15 in, long: fis. to 2¾ in. ac oss; sepals and petals orange- or brown-yellow spotted with purple within, whitish spotted with purple without; lip white or cream-color spotted with purple. Oct.—Aug. Brazil.

porphyrostèle. Pseudobulbs clustered, to about 1½ in. high, with 2 lvs. to 8 in long and ½ in. wide: fls. about 1½ in. across, yellow with purple median stripe on petals and purple streaks on side lobes of lip. Feb. Brazil.

ruféscens. Pseudobulbs clustered, up to 2 in. high, with 1 lf. to 13¾ in long and 1½ in wide: fls. small, fragrant; sepals brownish-yellow or reddish-brown; petals yellow; lp yellow with red spots. Sept.-June. Cent. Amer., W. Indies, S. Amer.

Sanderiana. Pseudobulbs clustered, to 2 in. long, with 1 lf. to 23½ in. long and 2½ in. wide: fls. large, nodding, to about 6 in across; sepals and petals white blotched with purple at base; lip dark purple near base, cream-color to yellow above. May-July, Oct.-Dec. Ecuador, Peru.

sanguinea. Rhizome more or less elongate: pseudobulbs ellipsoid-oblong, to 1 in. long, often subcompressed, 1-lvd.: If. narrowly linear, to 15 in. long and scarcely ½ in. wide, acute: sepals dull eddish-brown, oblong, to ¾ in. long; petals pale yellow with reddish-brown spots and blotches; lip carmine to purple-crimson with darker crest. Cent. Amer.

setigera. Pseudobulbs clustered, up to 2 in. high, with 1 lf. nearly 1 ft. long: fis. large, fragrant; sepals and petals milk-white with light yellow upper part; lip white with purple streaked side lobes and large yellow patch on midlobe. July. Colombia, Venezuela.

tenuifolia. Rhizome creeping: pseudobulbs to 2 in. long, with 1 linear lf. to about 2 ft. long and $\frac{1}{4}$ in. wide: fis. small, to 2 in. across; sepals and petals dark red speckled with

yellow; lip red in lower half, yellow with red spots above. Feb.-June, Dec. Cent. Amer.

variabilis. Rhizome creeping: pseudobulbs to 1½ in. long, with 1 lf. to 9½ in. long and ½ in. wide: fis. small; sepals and petals dull- or bronzy-yellow; lip purple at base, yellow above. Blooming all year. Cent. Amer.

venústa. Pseudobulbs clustered, to 3 in. long, with 1 lf. to 15 in. long: fis. 5-61/2 in. across, white; lip short, yellow bordered with red. Colombia, Venezuela.

MAXIMILIANEA: Cochlospermum. MAYBERRY: Rubus palmatus. MAYENIA: Thunbergia erecta.

MAYFLOWER: Epigæa repens. MAYPOP: Passiflora incarnata.

MAYTÈNUS. Celastraceæ. Evergreen trees and shrubs bearing alternate simple leathery lvs., small polygamous fls., and leathery capsular fr.; grown for ornament in warm climates. Propagated by seeds or suckers.

Boaria. MAYTEN. Tree to 25 ft. and more: lvs. lanceolate, to 2 in long, finely toothed; fls. greenish, in axillary clusters: seeds with scarlet and. Chile.

MÀZUS. Scrophulariaceæ. Mat-forming herbs grown as ground-cover or in rock-gardens: lvs. toothed or cut: fls. blue or white, short-tubular, 2-lipped, in terminal more or less one-sided racemes; native in Asia, Australia and Malaya. Increased by division or seeds, and of simple requirements.

japónicus (M. rugosus). Trailing per., fl.-sts. to 1 ft. high: lvs. obovate, to 2½ in. long, coarsely toothed: fls. to ¾ in. long, blue, the ridges of the lower lip biown-spotted and bearded with club-shaped hairs. E. Asia

Pumilio. Per. with creeping underground sts.: lvs. obovate, to 3 in. long, entire or coarsely toothed: fls. white or bluish with yellow center, to ½ in. long. New Zeal.,

radicans. Creeping per. to 3 in., sts. stout, rooting at nodes: lvs. obovate, often narrowly so, to 2 in. long, obtuse, usually pilose, petioled, mostly entire: fls. white with yellow center, to ¾ in. long, 1-3 on terminal peduncles. New Zeal.

rèpens: M. reptans.

reptans. Tufted per. to 2 in., the sts. rooting at nodes: lvs. lanceolate to elliptic, to 1 in. long, coarsely toothed: fls. purplish-blue, lower lp spotted white, yellow and purple, to ¾ in. long. Probably Himalayas.—Material in the trade as M. rugosus probably belongs to this species.

rugdsus: M japonicus.

stolonifera. Spreading per. to 3 in., sts. prostrate and said to root at nodes: lvs spatulate, tapering into somewhat winged petiole, to 1½ in. long, margins with 3-5 coarse sharp serrations: fig. to ½ in. long, lower lobes rounded, upper ones acute. Japan.

MEADOW-BEAUTY: Rhexia. -Foam: Limnanthes Douglasir. -Rue: Thalictrum.

MEADOWSWEET: Filipendula, Spiræa alba.

MECONELLA. Papaveracex. Ann. herbs with opposite or basal entire lvs. and solitary fls. with deciduous petals; allied to Platystemon.

linearis. To 8 in.: lvs. basal, linear, to 2½ in. long: fls. light yellow, to ¾ in. long. Calif., Ore. Var. pulchéllum has outer petals yellow and inner white.

MECONÓPSIS. Papaveraceæ. Per. and bien. poppy-like herbs with yellow juice, entire, lobed or dissected lvs. and yellow, reddish or blue fls. solitary or in racemes or panicles; grown in the flower- and rock-garden.

The plants are hardy or semi-hardy, but different species require special treatment. In general they require a soil sufficiently well drained to be dry during the winter and yet moist during the growing season. A mixture of equal parts of leaf-mold, granulated peat and sharp coarse sand to a depth of one foot or more is sometimes recommended. They should be planted in a somewhat shaded situation where they are protected from excessive summer heat and strong winds. The plants are deep-rooted and long-lived and are best not disturbed after becoming established. They are best grown from seed. They are best grown from seed.

Bailevi: M. betonicifolia var.

bélia. Stemless per.: lvs. pinnately cut, to 4 in. long: fis. pale blue, to 2 in. across, solitary on scapes to 3 in. high.

betonicifòlia (Cathcartia betonicifolia. M. betonicifolia var. Franchetti). To 6 ft.: lvs. ovate to oblong, to 6 in. long, cut-toothed or nearly lobed, glaucous beneath; fis. blueviolet or purple, about 2 in. across, in cymes. China. Var. Baileyi (M. Bailey) differs only in having ovary covered with yellowish bristles rather than glabrous.

cámbrica. Welch-Poppy. Per. to 1½ ft.: lvs. pinnate, to 6 in. long, glaucous beneath: fls. pale yellow, to 3 in. aeross, solitary. W. Eu. Var. flore-plêno has double fls. Var. aurantiàca, fls. orange.

Dhwòjii. To 2 ft.: lvs. pinnatifid, to 1 ft. long, bristly on both surfaces: fls. yellow, on axillary branches, to 3 in. across. Nepal.—A woodland plant requiring well-drained soil, especially at surface, and full shade.

grándis. Per, to 3 ft.: lvs. entire or coarsely toothed, to 7 in. long: fls. brown-purple, to 5 in. across, in 3-fid. cymes. Himalavas.

heterophýlla: Stylomecon heterophylla,

horrídula (M. Prattii. M. rigidiuscula. M. rudis). Bien. to 5 ft.: lvs. elliptic to linear-oblong, to 10 in. long, entire or irregularly lobed, covered with yellow or purple spines: fls. light blue or claret-colored, rarely white, solitary in axils of lvs. Cent. Asia.

integrifòlia. Yellow Chinese-Poppy. Bien. to 3 ft.: lvs. linear-lanceolate, entire, to 8 in. long: fls. yellow, to 6 in. across, in 3-7-fld. cymes. Cent. Asia. Var. máxima is listed as a large form.

latifòlia. To 3½ ft.: lvs. entire, oblong to broadly lanceolate, to 8 in. long, margin pinnate to crenulate, covered on both surfaces with spines: fls. pale blue to white, to nearly 3 in. across. Kashmir.—Adapted to rock-garden, in gritty soil and partial shade.

napaulénsis (M. Wallichii). Satin-Poppy. Per. to 6 ft.: lvs. pinnately cut: fls. pale blue, satiny, to 2 in. across, in panicled cymes. Cent. Asia.

paniculata. Per. to 5 ft.: lvs. lobed or toothed, rarely pinnately cut, to 1½ ft. long: fls. yellow, 2 in. across, in racemes to 2 ft. long. Cent. Asia.

Práttii: M. horridula.

quintuplinérvia. HAREBELL-POPPY. To 1 ft.: lvs. obovate to lanceolate, to 10 in. long, in basal rosettes, usually 3-5 longitudinal nerves, both surfaces bristly: fls. lavender-blue to purplish, to 3½ in. across. N. E. Tibet.—Adapted to stony ledges of rock-garden in stony scree.

règia. Bien. to 2 ft. lvs. to 16 in. long and 3½ in. wide, toothed, hairy: fls. yellow, to 3 in. across. Himalayas.

rigidiúscula: M. horridula.

rùdis: M. horridula.

simplicifòlia. Per. to 2 ft.: lvs. usually entire, to 8 in. long: fls. purple or blue, nodding, to 3 in. across, solitary Cent. Asia.

sinuâta. Ann. or bien. to 2 ft.: lvs. irregularly lobed, to 7 in. long: fls. pale bluish-purple, to 3 in. across, in racemelike cymes. Cent. Asia. Var. latifòlia is M. latifòlia.

supérba. To 3½ ft.: lvs. oblanceolate to ovate, to 16 inlong, basal lvs. with petiole to 2 in. long, upper cauline lvs. sessile, basal lvs. persistent in rosette: fls. white, to 5½ in. across, single in axils of upper lvs. on pedicels to nearly 5 in. long Tibet.—Suited to woodland planting with good drainage especially at crown; shade.

villòsa (Cathcartia villosa). To 2 ft., tomentose: basal lvs. cordate-ovate, 3-5-lobed and the lobes cut, long-stalked: fls. yellow, 2 in. across, in cymes: caps. to 2½ in. long. Himalayas.

violacea. To 6 ft.: lvs. to nearly 10 in. long, pinnatifid with lanceolate segms., basal lvs. with petiole to 3 in. long, in dense rosette, upper cauline lvs. smaller and sessile: fts. bluish-violet to purple, to 3½ in. across, on 2½ in. pedicels, single on If. axils, anthers orange. Burma and Tibet.—Moist shaded woodland.

Wállichii: M. napaulensis.

MEDÈOLA. Liliaceæ. One per. herb with tuberous root which is sometimes eaten, native in E. N. Amer. M. virginiàna. Indian Cucumber-Root. To 2 ft. or more: lvs. in two whorls, to 5 in. long and 2 in. wide: fls. small, greenish-yellow, in a terminal umbel, the perianth-segms. distinct: berries dark purple. M. asparagoides and M. myrtifolia are Asparagus asparagoides.

MEDICAGO. MEDICK. Leguminosæ. Ann. and per. herbs or rarely shrubs with lvs. of 3 small lfts., small papilionaceous fls. in short axillary racemes or heads, and curved or spirally twisted pods; one species (M. sativa) is extensively grown for hay, and others are sometimes planted for forage or ornament.

Alfalfa should be grown on deep well-drained non-acid soil. Propagated by seeds sown in drills or broadcasted. The annual species grown for ornament and interest require no special handling.

arábica. Spotted Bur Clover. Ann.: fls. yellow: pods compactly coiled, spiny. Eu.; nat. in N. Amer.

arbòrea. TREE ALFALFA. To 8 ft.: fis. orange-yellow: pods spiral, not spiny. S. Eu.

aurea: listed name, perhaps M. arborea.

denticulata: M. hispida.

Echinus. Calvary Clover. Ann.: fis. yellow: pods spiny. S. France.

hispida (M. denticulata). TOOTHED BUR CLOVER, Ann.: fls. yellow: pods loosely coiled, spiny. Eu., Asia; nat. in N. Amer.

intertexta. Ann.: fis. yellow: pods coiled, spiny. Medit.

lupulina. Hop Clover, Yellow Trefoil or Black M. Ann.: fls. yellow: pods curved, nearly glabrous. Eu., Asia.; nat. in N. Amer.

orbicularis. Ann.: ffs. yellow: pods spirally coiled, not spiny, glabrous. S. Eu. to W. Asia.

rigidula. Tiffon Bur Clover. Ann., procumbent: fis. yellow: pods coiled, spiny, pubescent. Eu.

sativa. Alfalfa. Lucerne. Per.: fls. purplish: pods loosely spiral, pubescent, not spiny. Eu.; nat. in N. Amer. scutellata. Snail M. Ann.: fls. yellow: pods resembling a snail shell, not spiny. Eu.

MEDICK: Medicago.

MEDINÍLLA. Melastomaceæ. Trop. Old World shrubs with simple entire lvs., white or rose fls. in panicles or cymes, and fr. a berry crowned by the calyx-lobes; grown in hothouses

The plants should be given plenty of light but shaded from the direct rays of the sun. Propagated by cuttings potted singly in a mixture of finely sifted peat and sand, kept close and fairly moist.

amábilis: M. Teysmannii.

magnifica. Striking evergreen when in bloom, with angled or winged sts.: lvs. ovate or ovate-oblong, sessile, to 1 ft. long: fls. coral-red, 1 in. across, in pendulous panicles to 1 ft. long and with great showy pinkish bracts. Philippines.—A striking plant, once frequent in greenhouses.

Téysmannii (M. amabulis). Sts. 4-winged: lvs. oblong, sessile, to 1 ft. long: fls. rose, to 2 in. across, in erect panicles without bracts. Celebes, New Guinea.

MEDIOCÁCTUS. Cactaceæ. Mostly or often epiphytic, with long procumbent usually 3-winged branches that bear aerial roots: fls. nocturnal, large, funnelform, the tube scaly: 2 species, S. Amer. See Cacti.

coccineus (Cereus coccineus. C. setaceus. C. Hassleri), Usually climbing on trees or clambering over rocks, joints to 3 in. broad; spines commonly 2 or 3 or only 1, pinkish then brown or yellowish: fis. white, outer segms. green, to 1 ft. long. Brazil, Argentina.

MEDIOLOBÍVIA. Cactaceæ. A small genus of cespitose Argentinian cacti intermediate between Lobivia and Rebutia, resembling the former genus in shape and size of fls. which are yellow and self-sterile and the latter in the shape and coloration of the seeds.

aureiflora (Rebutia aureiflora). Sts. dark green tinged reddish; tubercles in about 12-16 rows; radial spines 15-20, to ¼ in. long, white to tan; centrals 3-4, to ½ in. long; fls. golden-yellow with white throat, to 1½ in. across. Var. longisèta has spines bristly, golden-brown, to 1½ in. long, 3s. tinged orange. Vars albispina, brunispina, leucolitea and lilacinostoma are listed.

Boedekeriana. Depressed-globose, gray-green; ribs about 14, tubercled; radial spines 11-12, short, bristly,

white; central 1, shorter than radials: fis. pale orange with white throat, to 2 in. across.

Duursmaiana (Rebutia Duursmaiana). Globose to suboylindrical, about 1½ in. diam., dark green tinged reddish; tubercles in about 15-17 rows, spiralled, the lower ones stout and tinged violet-black; radial spines about 10, to ½ in. long, bristly, white; central 1, slightly longer: fis. orange-yellow with white throat, about 1½ in. diam.

élegans (Rebutia elegans). Globose, pale green; ribs many, in spirals; radial spines about 14, to ½ in. long, bristly, whitish-yellow; centrals 3-4, to nearly ¼ in. long, darker: fis. bright yellow. Var. grácilis is listed.

MEDLAR: Mespilus germanica.

MEDUSAS HEAD: Euphorbia Caput-Meduse.
MEGACLINIUM: Bulbophyllum falcatum.

MEGAPTERIUM: Enothera.

MEGASEA: Bergenia,

MEGOTIGEA: Helicodiceros.

MEIBOMIA: Desmodium.

MELALEÙCA. BOTTLE-BRUSH. Myrtaceæ. Shrubs and trees native in Australia, freely planted in Calif., and somewhat in Fla., with mostly alternate simple lvs., red, white or yellow fls. in spikes or heads, the long-exserted stamens making the infl. resemble a bottle-brush, and capsular frs. For cult. see Callistemon, from which Melaleuca differs in having the stamens united in bundles opposite the petals.

acuminata. Lvs. mostly opposite, lanceolate, to $\frac{1}{2}$ inlong, often pungent-pointed: fis. whitish, in lateral clusters. alba; M. armillaris.

armillaris $(M.\ alba)$. To 30 ft.: lvs. to 34 in. long and $\frac{1}{16}$ in. or less wide: fis. white, the spikes to 2 in. long.

decussata. To 20 ft.: lvs. opposite, to ½ in. long and ½ in. wide: fls. lilac, the spikes to 1 in. long.

elliptica. Lvs. opposite, oval, to 14 in. long, somewhat glaucous: fls. red, in spikes to 3 in. long.

ericifolia. Shrub or tree: lvs. narrowly linear, ½ in. or less long; fls. yellowish-white, the spikes to 1 in. long.

genistifòlia. To 40 ft.: lvs. linear-lanceolate or lanceolate, flat, to $\frac{1}{2}$ in. long, stiff: fls. white.

Huegèlii. To 6 ft.: lvs. ovate or ovate-lanceolate, to 1/4 in. long, spirally overlapping: fis. white, the spikes to 5 in. long.

hypericifolia. Tall shrub: lvs. mostly opposite, to 11/4 in. long and 1/4 in. wide: fls. rich red, the dense spikes 2-3 in.

imbricata. Tall shrub or tree: lvs. linear, obtuse, punctate-dotted beneath, to 4 in. long and 1 in. across: fis. white, small. Australia.

incana. Tall shrub: lvs. linear or lanceolate, to ½ in. long, crowded and spreading, usually hoary: fis. yellowish-white.

laterítia. Tall shrub: lvs. linear, to ¾ in. long: fis. scarlet, in spikes to 3 in. long.

Leucadéndra. CAJEPUT-TREE. PUNK-TREE. Tree, bark shredding in broad strips: lvs. to 4 in. long and ¾ in. wide: fls. creamy-white, the spikes to 6 in. long. Name commonly but not originally spelled Leucadendron. A conspicuous tree.

linariifòlia. Tall tree: lvs. mostly opposite, to $1\frac{1}{16}$ in. long and $\frac{1}{16}$ in. wide: fls. white, the spikes to $1\frac{1}{16}$ in. long.

longicoma. Tall shrub: lvs. oblong-lanceolate, to 2 in. long: fls. rich red, in spikes to 2 in. long.

micromèria. Tall shrub: lvs. scale-like and overlapping, ½4 in. long: fis. small, diœcious, in globular heads.

microphýlla. Shrub: lvs. linear, to ¼ in. long: fis. white. nesóphila. To 8 ft.: lvs. to 1 in. long and ¼ in. wide: fis. pink or rose, in dense heads.

nodòsa. Shrub or small tree: lvs. linear, to 1 in. long, stiff and spiny-pointed: fls. pale yellow, in small heads.

parviflora (M. Preissiana). Tall shrub or tree: lvs. lanceolate, to $\frac{1}{2}$ in. long: fis. white or yellowish, the spikes to 2 in. long.

Preissiana: M. parviflora.

rádula. Tall shrub: lvs. opposite, linear, to 2 in. long, the margins rolled in: fls. pink or white, in distant pairs.

rhaphiophýlla. To 50 ft.: lvs. narrow-linear, to 1 in. long, mostly cylindrical: fis. yellowish-white.

styphelioides. To 80 ft.: lvs. ovate, to ¾ in. long and

1/2 in, wide, sometimes twisted; fis, creamy-white, the spikes to 2 in. long.

tenélla. To 4 ft.: lvs. narrow-linear, to 1/4 in. long, scattered or in 3's: fis. white, small.

teretifòlia. Tall shrub: lvs. linear, to 2 in. long, cylindrical: fis. white, in sessile heads.

thymifòlia. To 2 ft.: lvs. mostly opposite, lanceolate to linear, to ½ in. long, stiff: fls. red.

Wilsonii. Tall shrub: lvs. opposite, linear, to ½ in. long: fis. red.

MELAMPÒDIUM. Compositæ. small herbs or shrubs with opposite lys. and heads of ray- and disk-fls.; pappus none; sometimes transplanted to the rock-garden.

cinèreum. Per. to 1 ft., gray- or silvery-pubescent: lvs. linear or lanceolate, entire or undulate, sometimes pinnatifid: rays white, to ½ in. long. Tex., N. Mex.

leucánthum. Per. to 1 ft., hairy: lvs. linear to spatulate, to 2 in. long, mostly entire: heads to ¾ in. across, rays white. Kans. to Colo. and Tex.

MELANDRIUM: Lychnis, Silene.

MELÁNTHIUM. BUNCH-FLOWER. Liliaceæ. Per. herbs with stout rootstocks, mostly basal lvs. and monœcious or polygamous, greenish or white fls. borne in large terminal panicles, the perianth-segms. distinct; sometimes transplanted to the wild- or bog-garden.

latifòlium. Lvs. oblanceolate. Conn. to D. C.

virginicum. Stout plant to 5 ft. lvs. linear, to 1 ft. long: ffs. greensh-yellow, ½ in. across, in long panicles to 1½ ft. long. June-Aug. R. I. to Fla. and Tex.

MELASPHÈRULA. Iridaceæ. A S. African cormous herb, grown like ixias. M. gramínea. To 2 ft.: lvs. in basal rosette, to 1 ft. long and ½ in. wide: fls. yellowish-green veined with purplish-black, ½ in. long, in loose panicles, the perianth-tube very short.

MELÁSTOMA. Melastomaceæ. Old World and Pacific trop, shrubs with opposite entire lvs., purple, rose or white fls. solitary or clustered at ends of branches, and fr. a berry. Grown in the greenhouse or out-of-doors in warm regions. Propagated by cuttings in spring over bottom-beat

malabáricum; probably a catalogue error for M. malabathricum

malabáthricum. To 8 ft.: lvs. to 2½ in. long and 1½ in. wide, hairy: fls. mauve-purple, 2 in. across. India.

Mólkenboeri. To 20 ft.: lvs. about 4 in. long and 1½ in. wide, pubescent: fls. mauve, about 2 in. across. Java. Var. álbum has white fls.

MELASTOMÀCEÆ. MELASTOMA FAMILY. Mostly trop. herbs, shrubs and trees in both hemispheres, of about 175 genera, with simple opposite or whorled lvs., commonly with 3-9 strong longitudinally parallel nerves, bisexual regular polypetalous fls. having 4-5-lobed calyx, 4-5 petals, as many or twice as many stamens that are prevailingly unequal and declined or bent, inferior 2-many-celled ovary, and fr. a berry or caps. The following genera are grown for ornament, mostly in greenhouses: Bertolonia, Centradenia, Heterocentron, Medinilla, Melastoma, Miconia, Phyllagathis, Rhexia, Schizocentron, Sonerila, Tibouchina, Tococa.

MÈLIA. BEAD-TREE. Meliaceæ. Trees or shrubs with pinnate lvs., white or purple fls. in axillary panicles, and fr. a small somewhat fleshy drupe; native in trop. Asia and Australia; one species widely cult. in warm regions and withstands several degrees of frost. Propagated by seeds sown as soon as ripe, and by cuttings under glass.

Azadiráchta. Margosa. Evergreen tree to 50 ft. with 1-pinnate lvs. near ends of branches, small white fis., and oblong frs. to 3/4 in. long, from India, may occur far southward in test plantations.—It is better retained in a separate genus, as Azadirachta indica.

genus, as Azadirachia indica.

Azédarach (M. sempervirens. M. japonica). China-Berry. China-Tree. Pride-of-India. Indian Lilac. Spreading mostly deciduous tree to 50 ft: lys. 2-pinnate, the ifts. toothed or lobed: fis. purplish, fragrant: frs. globose, yellow, to ¾ in. across, hanging after lys. fall. Asia; nat, in trop. Amer. and planted in warm-temp and trop. regions around the world; sometimes run wild. Var. umbraculifórmis, Texas Umbrella-Tree, has drooping foliage and radiating branches which give an umbrella-like effect. Var. floribúnda is a bushy very floriferous form; M. semperforens is probably the same.

japónica: M. Azedarach.

sempérvirens: M. Azederach.

MELIACEÆ. MAHOGANY FAMILY. Trees and shrubs, or seldom woody herbs, of about 40 genera largely in trop. regions, with usually alternate pinnate or digitate lvs., commonly bisexual polypetalous fls. in panicles, the sepals and petals 4 or 5, mostly 8-10 stamens. 2-5-celled ovary, and fr. a caps. or drupe or berry. The genera known to hort, are Cedrela, Dysoxylum, Melia, Swietenia, Trichilia, Turrea. With the exception of Melia, the species are little grown within the U.S., but the mahoganies (Swietenia) are always of interest.

MELIANTHACEÆ. MELIANTHUS FAMILY. Three genera of African trees or shrubs with alternate often large and showy lvs., bisexual mostly striking polypetalous fls. in racemes having 4–5 sepals and petals, 4, 5 or 10 stamens, superior 4-5-celled ovary, the essential organs often prominently protruded, and capsular not prominent fr. Greyia and Melianthus are grown for ornament.

MELIÁNTHUS. Honey-Bush. Melianthaceæ. Evergreen shrubs, often with herb-like sts., bearing alternate pinnate lvs. and large stipules, very irregular showy nectar-bearing fls. in racemes, 4 exserted stamens, and fr. an inflated caps.; planted in warm regions for decorative purposes; native in S. Afr.

The plants are very strong-scented and in Africa are valued for medicine. They do well in southern California. Propagated by seeds and cuttings in heat.

comòsus. Lvs. to 6 in. long, the lfts. lanceolate and toothed, white-tomentose beneath, with winged petiole and 2 stipules about ½ in. long: fls. orange spotted with red, green at base, in nodding racenes to 3 in. long.

major. To 10 ft.: lvs. 1 ft. or more long, of 9-11 toothed lfts., with winged petiole and stipules united into one piece 2 in. long: fls. red-brown, about 1 in. long, in racemes 1 ft. long.

minor. Lvs. to 6 in. long, the lfts. lanceolate, with 2 free stipules: fls. dull red, in erect racemes to 1 ft. long.

Melic-Grass. Graminex. Per. grasses with flat lvs. and spikelets borne in narrow or open panicles; native in temp. regions and sometimes cult. for ornament. See Grasses.

altíssima. To 4 ft., with creeping rhizomes: lvs. flat, to 1 in. broad: panieles to 8 in. long, narrow, loose and interrupted. S. Eu. Var. atropurpurea is listed as having panieles of a purple hue.

ciliàta. Tufted, to 3 ft., with creeping rhizomes: lvs. mostly narrow and involute: panicles to 8 in. long, spikelike, the spikelets silky. Eu.

MELICÓCCA (Melicoccus). Sapindacex. Two trop. American trees, one of which is grown in warm regions for its edible frs. M. bijuga. Mamoncyllo. Spanish-Lime. Genip. To 60 ft.: lys. of 4 elliptic-lanceolate lfts. to 4 in. long: fls. small, greenish-white, fragrant, polygamous or diœcious, in racemes to 4 in. long borne in terminal panieles: fr. round, 1 in. or more across, the large stone surrounded by yellowish juicy edible pulp.—When well established will stand several degrees of frost. Propagated by seeds.

MELICÒPE. Rutacex. A few species of trees and shrubs, mostly from southern hemisphere, having alternate or opposite lvs. which are usually trifoliolate but when simple have winged petioles, fls. 4-merous, small, often unisexual, in few- to many-fld. cymes or panicles: fr. a 1-seeded 2-valved schizocarp. Propagated by seeds or cuttings. Name in four syllables.

ternata. Tree to 20 ft.: lvs. opposite, trifoliolate, lfts. linear-oboyate to elliptue-ovate, to 4 in. long, entire, finely covered with pellucid dots: fls. greenish, to ½ in. across, in axillary trichotomous panicles: seeds black and glossy. New Zeal. Var. Mantéllii, not known to be in cult. here, is smaller and often has entire lvs. which are rounder and somewhat crenate and panicles only 3-6-ftd.

MELICYTUS. Violaceæ. Diceious trees and shrubs native from New Zeal. to Fiji Isls.: lvs. alternate: fls. small, in clusters: fr. a berry. One species is sometimes planted in Calif.

ramiflorus. To 30 ft., bark white: lvs. oblong-lanceolate, to 5 in. long, toothed: fis. greenish, ½ in. across: berries blue, ½ in. across.

MELILÒTUS. MELILOT. SWEET CLOVER. Leguminosæ. Sweet-smelling ann. and bien. herbs with trifoliolate lvs., small papilionaceous fls. in slender axillary and terminal racemes, and short straight very small pods; grown as bee-plants, forage and green-manure crops, and also nat. Propagated by seeds.

álba. White S. Bokhara Clover. Bien. to 10 ft.: fls. white. Eu., Asia; nat. in N. Amer. Var. ánnua, Hubam Clover, matures in one year.

altíssima. Yellow S. To 8 ft.: fls. yellow, on long peduncles, calyx about 1/4 as long as fl.: pod smooth or nearly so. Eu., Asia; nat. in N. Amer.—Forage crop.

cærulea: Traonella carulea.

grácilis. Ann. to 4 ft.: fls. yellow, calyx less than ½ as long as fl., peduncles not greatly exceeding lvs.: pod reticulate. S. Eu.

indica. To 3 ft.: fts. yellow, on long peduncles, calyx about ½ as long as ft.: pod smooth or nearly so. Eu., Asia; nat. in N. Amer.—Cover-crop in Calif.

officinalis. Yellow M. To 8 ft.: fls. yellow, on long peduncles, calyx about ¼ as long as fl.: pod with strong transverse ridges. Eu., Asia; nat. in N. Amer.

MELINIS. Graminex. One African grass widely intro. in western hemisphere and cult. for forage far S. M. minutiflora. Per. to 3 ft. from a branching base, herbage with sweetish odor: lvs. viscid-pubescent, flat, 6 in. long and ¼ in. or more broad: panicle 4-8 in. long, loosely bearing many awned spikelets.

MELIÓSMA. Sabiacex. Trop. Asian trees or shrubs, evergreen or deciduous, bearing alternate simple or pinnate lvs., small not showy fls. in panicles, and fr. a small drupe; grown in Calif. Propagated by seeds, layers, and cuttings of young wood under glass.

cuneifolia. To 20 ft.: lvs. obovate, to 7 in. long, wavy-toothed: fls. yellowish-white, fragrant, in panicles to 10 in. long, in July: fr. black, about 1/4 in. diam. China.

myriantha. Tree to 30 ft.: lvs. obovate-elliptic to oblongobovate, to 8 in. long, toothed, acute: fls. greenish-yellow, in erect panicles to 8 in. long: fr. red, about 1/2 in. diam. Japan.

Stèwardii. Tree to 18 ft., twigs glabrous: lvs. oblongelliptic, to 5 in. long, olive-brown above, paler beneath with midrib ciliate to pilose, margins with incurved mucronate teeth: fls. scattered in erect terminal panicles to 4 in. long. Kuling, China.

MELÍSSA. BALM. Labiatæ. Erect herbaceous perennials, with broad toothed lvs.

and white or yellowish 2-lipped fls. in axillary clusters; only one cult. for the lemon-flavored lvs. used in seasoning, especially in liqueurs, and also as a medicine; one of the sweet herbs. Propagated by seeds sown in a hotbed or cold-frame, also by division.

officinalis. Lemon B. Bee B. Aromatic, to 2 ft.: lvs. ovate, to 3 in. long: fis. white, 1/2 in. long, in late summer. Eu., Asia; nat. in N. Amer. Var. aurea is listed. Var. variegata is sometimes used in borders.

MELÍTTIS. Labiatæ. One per. herb to 1½ ft., native in Cent. and S. Eu. and W. Asia, and sometimes planted in the open. M. Melissophýllum. Lvs. cordate-ovate, toothed: fts. pink and variegated, 2-lipped, to 2 in. long, in axillary whorls.

MELOCÁCTUS (Cactus). Cactacex. As now defined (particularly under the genus Cactus, a name rejected by the International Rules), a group of some 18 small species: plant-body solitary or clustered, globular to short-cylindric or even depressed; ribs 9–20 and bearing clusters of spines: fls. small, pinkish, opening in midafternoon, close together in a terminal hairy and bristly mass or cephalium. See Cacti.

amœnus. To 8 in., with 10-15 ribs; radial spines 9; central 1 and 1 in. long: fis. red, the cephalium to 3 in. across. Colombia.

Antonii. Similar to M. intertus but has longer more slender spines and paler pink fls.; fr. white at base and not uniformly pink. W. Indies.

bahiénsis. Depressed-globose, to 4 in. tall and 6 in. diam., dull green; ribs 10-12, narrowing toward edge, areoles 6-7 on each rib; spines brown, radials usually 10, to 1 in. long, subulate, slender, stiff, centrals 4, to 1½ in. long, straight: fis. pink, about 1 in. long or less. Brazil.

Bésleri: Discocactus placentiformis.

Broadwayi. To 8 in., with 14-18 ribs; radial spines 8-10 and ½ in. long; central usually 1: fls. purplish, the cephalum to 3 m. across and with brown brustles and white wool. W. Indies.

cæsius (M. humilis). Globose and depressed, to 8 in., with 10-15 ribs; radial spines 8; centrals 1/4 in. long: cephalium of brown bristles and white wool. Venezuela, Colombia, Trinidad.

communis (Cactus Melocactus). Turks-Head or Turks-Cap Cactus. Body short-cylindric, to 12 in. and more, with 10 or 11 ribs and awl-like spreading radial spines: fis. to 1½ in. long, red. Jamaica.

depréssus: M. melocactoides.

hùmilis: M. cæsius.

intortus. Body globose to cylindric and 3 ft. or more tall with a long woolly head; ribs 14-20; spines 10-15, yellow or brown, stout, to nearly 3 in. long; fis. about ¾ in. long, pinkish. W. Indies.—Known under many names

Lemàirei (Echinocactus Lemaurei). Conical, to 12 in. tall; ribs 9-12, wavy, obtuse, areoles about 1½ in. apart; spines wine-red to brown to white, radials 11-14, to 1½ in. long, stout, somewhat angular, centrals 3-4, to 1½ in. long: fis. pink, to ¾ in. long. Haiti.

macrocánthus. Globular or perhaps broader than high, sometimes 1 ft. diam., the cephalium becoming 8 or 9 in. high; radial or outer spines needle-like, appressed, unlike the stouter awl-like central ones: fls. about ¾ in. long. Curacao and adjacent isls. of the southern Caribbean Sea.—Known under a great number of names.

matanzànus. Solitary or cespitose, depressed-globose, to 3½ in. high and slightly wider; ribs 8–9, to ½ in. high, arcoles about ½ in. apart; spines yellowish when mature, radials 7–8, to ½ in. long, curved, reddish when young, central 1, to ¾ in. long: fls. rose-pink, to ¾ in. long. Cuba.

Máxonii. Depressed-globose, to 6 in., with 11-15 ribs; radial spines 7-11, ½ in. long, pale red; central usually 1: fls. rose. Guatemala.

melocactoides (M. depressus, M. violaceus). Conical, to 3½ in. tall and 6 in. diam. at base, light green; ribs 10, obtuse, areoles ¾-1 in. apart, white-woolly; spines all radial, about 5-8, to ¾ in. long, white to gray; fis. pink, segms. dentate: fr. white to pale pink, to 1 in. long. Brazil.

Miquélii. Ovoid, to 10 in tall and 8 in diam., dark green; ribs 14, obtuse, crenate, areoles about 1½ in apart, woolly becoming naked; spines dark brown, radials 8, to ½ in.

long, somewhat curved, centrals 1-3, to ¾ in. long, straight: fls. white. St. Croix Isl.

missouriénsis: Neobesseya missouriensis.

Néryi. Depressed-globose, to 4½ in. tall, dark green; ribs 10, acute; radials 7-9, about 1 in. long; centrals 1-2 or absent: fls. pale pink, to ¾ in. long; fr. carmine-red. Brazil.

obtusipétalus. Globose to conical, to 9 in. tall and 6 in. diam., gray-green; ribs 10, acute, straight, to 1½ in. high; spines white to brownish, radials 9-11, ringed, stiff, centrals usually 2: fls. pink, segms. oblong, obtuse. Colombia.

oreas. Globose, to 134 in. diam., white-woolly on top; ribs 10-12, to 34 in. high, acute; radals 10-14, brown, subulate; centrals 4-6, to 14 in. long: fls. pink. Brazil.

peruviànus. Globose, to 6 in. diam.; ribs 12-13, areoles to $\frac{9}{2}$ in. apart; spines brown, radials 7-8, central 1 when present, to $\frac{1}{2}$ in. long: fls. pink, to 1 in. long: fr. red. Peru.

Townséndii. Globular, ½ in. diam., often clustered, with 12-13 ribs; spines 8-9 and brown: fls. pinkish, 1 in. long, the cephalium to 3 in, high and with brown bristles and white wool. Peru.

unguispinus is reported as a new species from N. Peru. violaceus: M. melocactoides.

Zuccarinii. Conical, to 9 in. tall, dark green; ribs 16, obtuse, to 1½ in. high, tubercled; radials 18-20, lowermost to 1¾ in. long, all yellowish-gray; centrals 4-6, to 2¾ in. long, base bulbous; fis. pale pink, to ¾ in. long. Curacao Isl.

MELON, MUSKMELON (Cucumis Melo and varieties); not including the watermelon (which

see), which is a very different fruit.

The melons commonly known in this country are of two types or groups,—the netted or nutmeg melons, and the cassaba or winter melon. The culture of the two is similar except that the cassaba requires a longer season and is not grown to any extent in the northern and central melon regions. The cantaloupe is a form of melon seldom grown in North America and practically unknown among the people, although the name is commonly but inaccurately applied to varieties of the netted melon class.

All the melons are alike in requiring open fertile soil and sunny location, continuous rapid growth, and all are frost-tender. They are grown to some extent in the home garden in nearly all regions of the United States, except where the growing season is too short. The commercial supply is produced in special regions such as the Imperial Valley of California, and other warm and relatively dry areas. Most of the commercial crop is started directly in the field in drills 4 to 6 feet apart or in hills 5 or 6 feet apart each way. When the drill method is followed, the plants are thinned to about 3 feet apart, while in the hill method several seeds are planted in each hill and all but two or three plants are removed after the danger of loss from the cucumber beetle is past. In some regions, plants are started in greenhouses or hotbeds four or five weeks before it is safe to set in the open, by planting the seed in small flower pots. plant bands, or other containers. Many growers apply a liberal quantity of manure in each hill and, in addition, use some chemical fertilizer, but a large portion of the commercial crop is grown without manure. Shallow clean tillage should be practised until the plants begin to run. Three or four good fruits is a good yield to the

The striped cucumber beetle is likely to be troublesome: plant liberally to allow for losses, cover young plants with mosquito-netting in the home garden, or apply various repellents now on the market.

The melon is an interesting crop to grow regularly under glass, but if ripened to full quality in midwinter much heat and constant care are required. There are special forcing or winter melons of the English type that yield fruits of particular excellence and beauty. Whether grown for late autumn crop or for spring or for midwinter, the plants are raised preferably on benches to insure sufficient bottom heat. The plants may be set about 2½ feet apart (having been started in pots) on 4-foot benches, and trained high so that the fruits hang; but the fruits must be suspended in netting, raffia slings or other support. Pollination is performed by hand. The air should be kept on the dry side at ripening time. About four months is required from seed-sowing to midwinter fruit in northern climates, depending much on soil, season, adaptability of the house, skill of the grower, and variety of melon. For early November crop, seeds may be started by the middle of July for the regular forcing melons.

MELON, PRESERVING: Benincasa hispida, Citrullus vulgaris var. citronis.

MELÒTHRIA. Cucurbilaceæ. Diffuse slender climbing or prostrate monœcious or diœcious herbaceous vines in the warm parts of both hemispheres, about 70 species, a few native in the U. S.: lvs. entire or lobed: fls. small and not conspicuous, pistillate solitary or clustered, staminate racemose or corymbose: fr. small, berrylike, smooth or warty. Two species are somewhat grown for ornament.

punctata (Pilogyne suavis). Per. from a thick root: lvs. cordate-ovate, angled or lightly 3-5-lobed: fr. about ¼ in. diam., slightly pitted, brown. Afr.—Raised from seeds: the roots may be brought in for the winter, the tops cut back and grown in window-gardens, or they may be stored till spring or carried over by means of green cuttings.

scabra. Ann. or grown as such: lvs. triangular-ovate and lobed: fr. to 1 in. long, glabrous and more or less spotted with green. Mex.—Blooms in latter part of summer from seeds sown in Apr.

MENISPERMÀCEÆ. Moonseed Family. Woody or herbaceous plants, largely twining vines, of 63 genera mostly in the tropics, having alternate simple but sometimes lobed lvs., small inconspicuous diœcious polypetalous fls. with usually 6 sepals and 6 petals, 6 or more stamens, 3 or more separate carpels, and fr. a drupe. A few genera are grown for ornament over arbors or walls, as Cocculus, Menispermum, Sinomenium, the foliage being the chief consideration, although the berries may be attractive.

MENISPÉRMUM. Moonseed. Menispermaceæ. Two woody twining vines with peltate lvs. and white or yellowish fls. in racemes or panicles, suitable for outdoor cult. in the N. for trellises and arbors; the foliage is attractive. Propagated by seeds or cuttings of ripe wood.

canadénse. Lvs. broad-ovate, to 8 in. long, entire or shallowly lobed, pubescent beneath when young: fr. black. Que. to Ga. and Ark.

daûricum. Resembles the above, but the lvs. are smaller, more distinctly peltate, and glaucous and glabrous beneath. E. Asia.

MENODÒRA. Oleaceæ. Substrubs with opposite simple or pinnate lvs. and yellow or white fls. in terminal racemes or cymes or solitary; native in N. and S. Amer. and S. Afr. and one species intro. to cult. in Calif.

integrifòlia. To 2 ft.: lvs. lanceolate or linear-lanceolate, to 1 in. long, entire, margins recurved: fls. ½ in. long, bell-shaped, in terminal cymes. Brazil, Argentina.

MÉNTHA. MINT. Labiatæ. Odorous herbs mostly cult. for the aromatic oil obtained from

all parts of the plant, a few in the garden for ornament and fragrance; well-known sweet herbs: sts. square: lvs. simple: fls. small, purplish, pink or white, crowded in axillary clusters in terminal spikes or heads.

Mints are easily propagated by cuttings and division, in some cases by stolons or runners; also by seeds when available. They tend to become established and to run wild. anisata: listed name

aquática. WATER M. Per. to 2½ ft., hairy: lvs. ovate, to 3 in. long, toothed: fis in dense terminal spikes to 1 in. long, and in the upper axils. Eu.; nat. in E. U. S.

arvénsis. Per. of wide dustribution over the world, in several forms or subspecies, producing runners: to 2 ft.: lvs. oblong to ovate, 1-2 in. long, more or less pubescent or hairy, rounded at base Eurasa, N. Amer. Var. canadénsis (M. canadensis) Lvs. narrower, tapering at base. Me. to Calif. Var. globôsa is listed. Var. piperáscens. Japanesse M. Plant larger, to 3 ft, lvs. larger; an oil-producing plant.

austriaca: M. sylvestris. canadénsis: M. arvensis var.

Cardiaca. Per. to 2 ft. and more, with ascending upper

branches, more or less pubescent: lvs. lanceolate to oblong, sharp-serrate: infl. interrupted or in detached leafy whorls and thus differing from M. spicata, with which it has been confused in cult. Eu; nat. in N. Amer.

Catària: see Neveta Cataria

citriodòra: hort. name; possibly Monarda pectinata.

citrata. Bergamot M. Per. by leafy stolons, st. decumbent, to 2 ft. long, glabrous: lvs. ovate, to 2 in. long, toothed: fls. in the uppermost axils and in dense terminal spikes to 1 in. long. Eu.; nat. in N. Amer.

crispa. Per, with weak hairy sts. to 3 ft. long: lvs. ovate, crisped and sharp-toothed: fis. in terminal spikes to 1½ in. long. Eu.; nat. Conn. to Pa.

géntilis. Tall, branched at base: lvs. ovate, narrowly ovate, to somewhat obovate, short-stalked, serrate: fis. in small dense axillary heads. Eu., sometimes nat.—Forms of M. spicata have been grown under this name.

gibraltárica: M. Pulegium var.

lanata. To 2 ft., villous-pubescent: lvs. lanceolate to ovate, to 3 in. long, short-petioled: fls pink to white, in axillary whorls. Ida. to B. C. and Calif.

lanugindsa: listed name, perhaps M. lanata.

piperita. Peppermint. Per. by runners and rootstocks. having strong pungent or pepper-like oil, to 3 ft. lvs. lanceolate, to 3 in. long, toothed: fis. in thick terminal spikes to 3 in. long, purple seldom white. Eu. Var. Cúrtisii is listed. Var. vulgăris, Black M., has purple sts. and dark foliage.

Pulègium. Pennyroyal. Prostrate: lvs. oval, ½ in. long, entire: fis, in dense axillary whorls, bluish-lilac. Eu., W. Asia. Var. gibraltárica has deep green sometimes variegated lvs.

Requiènii (Menthella Requienii). Small creeping herb, used for ground-cover; lvs. round, very small; fis. mauve or pale purple, in loose few-fid. whorls. Corsica.

rotundifòlia. Apple M. Per. by leafy stolons, to 30 in., pubescent: lvs. sessile, oval, to 2 in. long, toothed: fls. purple, in dense or interrupted spikes to 4 in. long. Eu.; nat. in N Amer Var. variegata has variegated lvs.

spicata (M. viridis of trade lists). Spearmint. Per. by leafy stolons, to 2 ft., glabrous: lvs. sessile, lanceolate, to 2½ in. long, toothed: fl.-whorls in narrow not leafy spikes to 4 in. long. Eu.; nat. in N. Amer.

sylvéstris $(M.\,austriaca)$. Lvs. sessile, lanceolate, toothed, white-tomentose beneath: fls. purplish, pubescent, in dense spikes or interrupted at base. Eu , Asia.

tomentosa: a confused name, plants so listed are usually referable to M. Pulegium or M. sylvestris.

viridis of hort.: M. spicata.

MENTHELLA: M. Requienii.

MENTOCALYX: see Gibbæum velutinum.

MENTZÈLIA. Loasacex.American herbs or shrubs armed with barbed hairs, often with shredding bark, having mostly alternate lvs., white or yellow often very showy fls., and capsular frs.; cult. in the flower-garden. Propagated by seeds sown where the plants are to grow

albéscens (Bartonia albescens. Nuttallia albescens). Ann. or bien. to 3 ft., sts. white-hairy: lvs. pinnately lobed, ovate-lanceolate to linear-lanceolate: fls. pale yellow, to 1/2

in. across, in corymbose cymes; stamens 20-40. Okla., Mex. to Argentina.

aurea: M. Lindlevi.

decapétala (M. ornata. Nuttallia decapetala). Bien. to 4 ft.: lvs. pinnately lobed: fis. white or yellowish, to 5 in. across, opening in evening, fragrant; petals 10. S. D. to Tex.

gronoviæfòlia: Eucnide bartonioides. involucrata. Ann. or bien. to 1½ ft., sts. very white: lvs. coarsely toothed: fis. cream-color, to 2½ in. long, subtended by large white bracts with deeply toothed green margins. Calif.

lævicaulis. Blazing Star. Bien. to 3½ ft., sts. shining white: lvs. wavy-toothed: fis. light yellow, to 4 in. across. Wyo. to Calif.

Lindleyi (Bartonia aurea). Ann. to 4 ft.: lvs. pinnately cut or toothed. fls. golden-yellow, to 2½ in. across, opening in evening, fragrant; petals 5. Calif.

multiflora (Bartonia multiflora, B. pumila, Nuttalia multiflora). Per, to 2½ ft.; lvs. pinnately-lobed, narrowly lanceolate: fls. yellow, to 1 in. across, usually 3-4 in corymbose cluster. Wyo. to Calif., and Mex.

nuda. Bien. or per, to 5 ft.: lvs. toothed or pinnatifid: fls. creamy-white, to 2½ in. across, usually without bracts, opening toward evening; petals 10. Mont. to Tex.

ornata: M. decapetala.

stricta (Nultallia stricta). Per. to 3½ ft., st. not much branched at base: lvs. linear-lanceolate, to 4 in. long, sinuate: fls. yellow, subtended by toothed bracts. Neb. to Wyo. south to Colo. and Tex.

MENYÁNTHES. Gentianacex; by some authors separated in the family Menyanthacex. A per. herb with creeping rootstocks, native around the world in the cooler parts of the northern hemisphere in wet places and shallow water, sometimes planted in bog-gardens. M. trifoliàta. Bogbean. Buckbean. Lvs. of 3 oblong or obovate entire lfts. with petioles to 10 in. long sheathing at base: fls. white or purplish bearded inside with white hairs, ½ in. long, in 10-20-fld. racemes borne at the end of long scapes.

MENZIÈSIA. Ericacex.Low deciduous shrubs with alternate entire lys., bell-shaped or urn-shaped fls. in terminal clusters, and capsular frs.; suitable for rock-gardens. For cult, see Andromeda.

álba: probably a form of Daboecia cantabrica.

cilifcalyx. Lvs. ciliate, elliptic: fls. yellowish-green tipped with purple, ½ in. long; stamens pubescent. Japan. Var. multiflora (M. multiflora) has 6-10-fld. clusters.

ferruginea. To 8 ft., often straggling: lvs. glandular-ciliate, with rusty hairs above, to 2½ in. long: fls. greenish-purple, ½ in. long; stamens pubescent. Alaska to Calif.

globulàris: M. pilosa.

multifldra: M. cilicalyx var.

pentándra. Lvs. ciliate, to 134 in. long: fls. whitish, 14 in. long; stamens glabrous. Japan.

pilòsa (M. globularis) To 6 ft.: lvs. ciliate, hairy, to 2 in. long: fls. yellowish-white or pinkish, ¼ in. long; stamens glabrous. Pa. to Ga. and Ala.

polifòlia: Daboëcia cantabrica.

purpurea. Lvs. elliptic to obovate, to 11/2 in. long, pubescent beneath on midrib: fis. bright red, 1/2 in. long, campanulate. Japan.

MERATIA: Chimonanthus.

MERCURIÀLIS. Euphorbiaceæ. Herbs or subshrubs native in Medit. region, one of which is sometimes grown for medicinal purposes, having opposite simple lvs., diœcious fls. without petals, and capsular frs.

fanua. HERB-MERCURY. Ann. to 2 ft.: lvs. ovate to lanceolate, toothed: male fis. in spikes, female clustered in axils. Eu., Afr.; nat. in N. Amer.

MERCURY ("Markery"): Chenopodium Bonus-Henricus. Herb: Mercurialis annua.

MERIANA: Watsonia.

MERIDIANA: Gazania.

MERIOLIX: Enothera.

MERTÉNSIA. BLUEBELLS. Boraginaceæ. Attractive per. herbs, smooth or pubescent. often glaucous, with alternate entire often punctate lys. and blue, purplish or white erect or drooping fls. in racemes or panicles; corolla funnelform, sometimes crested in the throat; a few species are planted in wild- or rockgardens; native in northern hemisphere, largely in woods and thickets. Propagated by seeds sown as soon as ripe and with difficulty by divi-

alpina. To 8 in., glabrous: lvs. spatulate to lanceolate, 2 in. long: fls. dark blue, 1/2 in. long. Rocky Mts.

Bakeri. To 1 ft.: lvs. spatulate to lanceolate, grayish-pubescent: fls. 1/2 in. long. Mts. of Colo.

ciliata. To 2 ft., pale and glaucescent: lvs. oval to lanceolate: fls. bright blue, 1/2 in. or more long. Rocky Mts. coriàcea: M. lanceolata.

echioides. To 1 ft., soft-hairy: lvs. oblong: fls. deep blue, in, long. Himalayas.

elongata. To 8 in., sts. pubescent: lvs. oblong-spatulate, to 2 in. long: fls. blue, calyx nearly as long as corolla-tube, lobes spreading. Kashmir.

foliosa. Cespitose to 16 in., glabrous, roots not tuberous: lvs. oblong-spatulate to lanceolate or ovate, to 3 in. long, rather thick: fls. bluish-purple, corolla-tube twice as long as lmb and throat. Wyo., Utah.

Hörneri. To 5 in., glaucous, with small black tuberous root: lvs. oblong: fls. turquoise-blue, drooping. Mts., Ida.

humilis. To 8 in., sts. glabrous, ascending or decumbent: lvs. elliptic to ovate, to 12% in. long, somewhat fleshy and pustulate above: fls. blue, to 3% in. long. Wyo.

lævigåta. To 3 ft., glabrous and somewhat glaucous: lvs. ovate, 5 in. long: fls. blue, ½ in. long. Wash.

lanceolata (M. corracea). To 1 ft., glabrous: lvs. oblong or lanceolate: fls. blue, 14-14 in. long. Sask. to Colo.

longiflora. Per. to 10 in., rootstock tuberous-thickened: lvs. elliptic-spatulate to obovate or ovate, to 2½ in. long, all but basal ones sessile: fls. about 1 in. long, tube twice as long as limb, Mts. of Mont. to B. C. south to Ida. and Wash.

macedónica variegata: catalogue name of unknown botanical standing.

moltkioldes. Differs from M. elongata in lvs. more softly hairy, racemes shorter peduncled, calyx larger and corollatube 1/3 and not 1/4 in. long. Kashmir.

nûtans. To 8 in., glabrous: lvs. oblanceolate, to 3 in. long; fls. ½ in. long, in drooping panicles. Wash, and Mont. to Nev.

oblongifòlia. To 8 in., glabrous, with thick root: lvs. spatulate to linear, to 2 in. long: fls. with purple tube and blue bell, to ¾ in. long. B. C. to Nev.

paniculata (M. pubescens). To 3 ft., rough-pubescent: lvs. ovate: fis. purple-blue, ½ in long. N. N. Amer. Var. alba is listed with white fis. Var. subcordata (M. subcordata) has lvs. glabrous above.

platénsis. To 16 in.: lvs. ovate to lanceolate, 2½ in. long, glabrous except ciliate margins, pale beneath. Colo.

platyphýlla. Per. to $2\frac{1}{2}$ ft, sts. weak and slender: lvs. broadly ovate-acuminate, to 10 in. long and 4 in. wide at cordate base: fls. bright blue fading to rose, to $\frac{3}{8}$ in. across. Wash.

praténsis. To 3 ft.: lvs. oval-lanceolate, hairy above: fls. blue varying to white, ¾ in. long. Colo. to Ariz. primuloides. To 3 in., rough-hairy: lvs. oval, to ¼ in. long: fls. deep blue varying to white and yellow, ¼ in. across. Himalayas.

pubéscens: M. paniculata.

pulchélla. To 8 in., glabrous, with thick root: lvs. obovate or ovate, to 2½ in. long: fls. ¾ in. long. Ida.

pulmonarioides: M. virginica.

sibírica (Luthospermum sibiricum). To 5 ft., glabrous: lvs. ovate: fls. purplish-blue varying to white, 1/2-1/2 in. long. Siberia.

speciosa: listed name.

subcordàta: M. paniculata var.

virginica (M. pulmonarioides). VIRGINIA-BLUEBELLS OF COWSLIP. To 2 ft., glabrous: lvs. elliptic to oblong: fis. with purple tube and blue bell, 1 in. long, the clusters somewhat nodding. N. Y. to Tenn. Var. ribra has pink fis.

MÉRYTA. Araliaceæ. Small diœcious trees, one of which may be grown in Calif.: lvs. alternate or crowded at ends of branches, leathery: fls. in panicles or heads: fr. a drupe: native in Pacific Isls., New Zeal., Australia.

Sinclairi. Puka. To 25 ft., evergreen, making a dense head: lvs. oblong, to 2 ft. long, on stalks to 1 ft. or more long, entire, shining: fls. greenish-white, in panicles to 1½ ft. long; fr. black and shining, ½ in. long. New Zeal.

MESEMBRYÁNTHEMUM. FIG-MARI-GOLD. Aizoacex. A re-defined group: more than 1,000 species have been described under this genus, mostly from S. Afr. In recent years the group has been re-studied and special attention has been given to fruit characters, which were mostly overlooked or unavailable in former descriptions. Such marked differences exist that the plants can be best defined and understood by making separate genera, placing closely related kinds together. The systematic studies of the group are still in progress and further changes in nomenclature are likely to occur.

The plant-forms in the general group are of great variety and absorbing interest to the naturalist. Some are branching plants with leaves of more or less usual form, but other species have a very condensed structure, some of but other species have a very condensed structure, some of them so closely simulating stones as to be overlooked at their native places, as in Pleiospilos. As a whole, the Mesembryanthemum relatives have the grotesqueness of xerophytic vegetation. The herbage of many of them is provided with glistening points, pimples or vesceles that give them the name of "ice-plants." In botanical collec-tions under glass the odd forms are sometimes grown as curiosities, but these kinds are little known to the general cultivator; they are likely to be grown by fanciers of cacti and similar plants. and similar plants.

and similar plants.

The cultivation of all the genera is conditioned on the fact that the plants are native in hot or semi-arid regions. Some of them grow in barren rocky places and others on sandy plains. A few of them frequent sea-coasts. They are succulent plants, and are therefore able to withstand heat and dryness. If grown in pots, care should be taken to have them properly drained, and the plants should be given full sun when well established. None of them can be carried over winter in the open in the North, but may be placed in a cool dry greenhouse with good ventilation. The stemless condensed species should be watered on top with caution, the better plan being to stand the pots in water or moist ground until the soil is moistened. In climates like Florida and southern California, many of them do well as open-air subjects, particularly in the latter state where the dryness suits them The perennial species are propagated by cuttings as well as by seeds. The common ice-plant, Cryophytum crystallanum, which is an annual, comes quickly from seeds, as does also the showy Dorotheanthus gramineus (formerly known as M. lineare, M. pyropzum and M. tricolor), and Carpanthea pomeruliana. In window-gardens the commonest species are the ice-plant and Aptenia or a relatively small number of South African species is The cultivation of all the genera is conditioned on the

A relatively small number of South African species is A relatively small number of South African species is now retained in the genus Mesembryanthemum, and few of them are grown in North America. This genus is now defined to include mostly branching plants with 2 or more pairs of distinct leaves and prominent internodes, calyx lobed down to the ovary, petals nearly or quite free to the base, stamens collected into a column or cone, stigmas and cells of ovary normally 5 or 6; these marks distinguish the genus as characterized by Linnæus in combination with the species named by him.

aberdeenénse: Delosperma aberdeenense. abyssinicum: Delosperma abyssinicum. acinaciforme: Carpobrotus acinaciformis.

acutum: Cephalophyllum subulatoides.

æquilaterale, æquilaterus: see Carpobrotus chilensis:

agninum: Agnirictus agninus.

Aitonis: Cryophytum Aitonis.

albatum. To 1 ft.: lvs. densely imbricated, about 2 in. long and ½ in thick, united, grayish: fls. solitary, white, 1 in. across, short-stalked.

albidum: Machairophyllum albidum.

albindtum: Rabiea albinota.

albipunctum: Rabiea albipuncta.

alboròseum. To 5 in., shrubby: lvs. dense, keeled, to 1 in. long and ½ in. wide and ½ in. thick, glaucous: fis. solitary, white turning rose, 1 in. across.

album. To 8 in.: lvs. to ¾ in long, ¼ in. wide and ¼ in. thick, glaucous: fis in cymes, white.

aloides: Nananthus aloides.

Alstonii: Cephalophyllum Alstonii.

anemoniflorum: Cephalophullum anemoniflorum.

angulàtum: Cryophytum Attonis.
Astridiæ: Titanopsis Huyo Schlechteri.
aurantlacum: Lampranthus aurantiacus.

sureum: Lammanthus aureus.

austrāle: Disphyma australe.
Axthelmiānum: Ruschia Axthelmiana.
barbātum: Trichodiadema barbatum.
bellidiflorum: Acrodon bellidiflorums.
hellidif forme: Doratheanthus bellidiformis.

béllum: Lathons bella.

bidentatum: Glottiphullum semiculindricum.

bifoliàtum. Sts. branching underground: lvs. 2, united, $1\frac{1}{2}$ in. long: fls. solitary, rose purple, 1 in. across, short-stalked.

bigibberatum: Glottiphyllum semicylindricum.

bilobum: Conophy!um bilobum.
blándum: Lampranthus blandus.
Bòlusii: Pletospilos Bolusii.
Bosscheanum: Faucaria Bosscheana.
brévipes: Argyroderma brevipes.
Brownii: Lampranthus Brownii.
Brunntháleri: Delosperma Brunnthaleri.
bulbòsum: Trichodiadema bulbòsum.
calamiforme: Cylindrophyllum calamiforme

calcareum: Titanopsis calcarea.
Calculus: Conophytum Calculus.
candens: Drosanthemum candens.

candidissimum: Cherridopsis candidissima.

caninum: Carruanthus caninus.

canum: Birlia cana.

Càroli-Schmidtii: Cheiridopsis Caroli-Schmidtii.

cauléscens. Oscularia caulescens.
chilénse: Carpobrotus chilensis.
chrysoledicum: Mondaria chrysoleuca,
cigarettiferum: Cheiridopsis cigarettifera,
coccíneum: Lampranthus coccineus.
compáctum: Pleiospilos nobilis.
compréssum: Erepsia compressa.
Cómptonii: Lampranthus Comptonii.
confdaum: Cephalophyllum confusum,
conspícuum Lampranthus conspicuus.
cordifolium: Aptenia cordifolia.
crassifolium: Disphyma crassifolium,

crássum: Ruschia crassa.

criniflòrum: Dorotheanthus bellidiformis, cròceum: Hymenocyclus croceus, crystállinum: Cryophytum crystallinum, curviflòrum: Lampranthus curviforus,

cymòsum: Ruschia cumosa.

decípiens: Cephalophyllum decipiens. Dekenàhii: see Pleiospilos Dekenahii. deltoides: Oscularia deltoides

deinsum: Truchodiadema densum.
depréssum: Glottiphyllum depressum.
Derenbergianum: Ebracteola Derenbergiana.

dichroum: Ruschia dichroa, digitàtum: Dactylopsis digitata.

dolabriforme: Rhombophyllum dolabriforme.

Éberlanzii: Lithops Eberlanzii.
echinatum: Delosperma echinatum.
Ecklonis: Delosperma Ecklonis.
edentulum: Echinus edentulus.
edile: Carpobrous edule.
elongatum: Convosia elongata.

emarginàtum: Lampranthus emarginatus. falciforme: Lampranthus falciformis.

felinum: Faucaria felina.

filamentòsum: Ruschia filamentosa. filicaule: Lampranthus filicaulis.

filipes: listed name.

fissum: Argyroderma fissum.

floribundum: Drosanthemum floribundum.

formosiànum: catalogue name.

Franciscii: Luthops Franciscii.

Friedrichiæ: Ophthalmophyllum Friedrichiæ.

Fülleri: see Luthops Fulleri.

gibbòsum: Gibbæum gibbosum; see also Ruschia.

gigantèum aureum: listed name, glaucéscens: Carpobrotus glaucescens. glaucoides: Lampranthus glaucoides, glaucum: Lampranthus glaucus, glomeràtum: Lampranthus glomeratus, gracile: Erepsus graculus, granulatum: Hereroa granulata, granulicaile: Psilocaulon granulicaule.

Hadgei: Faucaria Haagei.
hamdtum: Ruschia hamala.
Hawfithii: Erepsia Haworthii.
Hedthii: Gibbaum Heathii.
hesperanthum: Hereroa hesperantha.
heteropétalum: Erepsia heteropetala.
hexamèrum: Ruschia hezamera.

hispidum: Drosanthemum hispidum.

Hùgo-Schlechteri: Titanopsis Hugo-Schlechteri.

inclaudens: Erepsia inclaudens. inspérsum: Cheiridopsis inspersa, intônsum: Trichodiadema intonsum.

Johannis-Winkleri: Conophytum Johannis-Winkleri.

karasmontanum: Lithops karasmontana.

karrodicum: Ruschia karooica.

Klinghardtianum: Delosperma Klinghardtianum.

lacerum: Semmanthe lacera.
laeve: Hymenocyclus Thunbergii.
lanceolatum: Cryophytum Autonis.
lapidifórme: Dudymaotus lapudiformis.

latum: Glottiphyllum latum.

Lèhmannii: Corpuscularia Lehmannii. Lericheanum: Lithops Lericheana.

Lésliei: Lathops Leslier.

lineare: Dorotheanthus gramineus. linguiforme: Glottiphyllum linguiforme.

linguinum: catalogue name.

longispinulum: Sphalmanthus longispinulus.

longum: Glottiphyllum longum.

lùcidum: Glottiphyllum latum var. cultratum. Luederítzii: Drosanthemum Luederitzii.

lupinum: Faucaria lupina. Iutèolum: Hymenocyclus luteolus.

macradènium: Rhinephyllum macradenium. magnipunctatum: Plerosprilos magnipunctatus.

Márgaretiæ: Lapidaria Margaretiæ.

Mărlothii: Odontophorus Marlothii; see also Cheiridopsis Marlothii.

marmoratum: Lithops marmorata. Maximilianii: Echinus Maximilianii.

máximum: Astridia maxima.

microspérmum: Dinteranthus microspermus, minutiflòrum: Conophytum minutiflorum, minùtum: Conophylum minutum.

mirábile: Trichodiadema mirabile. mitratum: Mitrophyllum mitratum. monilifórme: Monilaria moniliformis. móntis-móltkei: Ebracteola montis-moltkei.

múlticeps: Bergeranthus multiceps. multiflòrum: Ruschia multiflora.

multiradiatum: Lampranthus multiradiatus.
muricatum: Oscularia deltordes var. muricata.

murinum: Stomatium murinum.

musculinum: Chasmatophyllum musculinum. mustellinum: Stomatium mustellinum.

mutábile: Erepsia mutabilis.
nànum: Oophytum nanum.

Nellii: listed name, possibly Glottiphyllum Neilii.

Névillei: Conophytum Nevillei. nóbile: Pleiospilos nobilis. nodiflorum: Cryophytum nodiflorum. obcordéllum: Conophytum obcordellum. octophýllum: Argyroderma octophyllum. odorátum: Conophytum odoratum.

optatum: Pleiospilos optatus. ópticum: Lithops optica. ovalinguis: listed name.

paardebergénse. Branches decumbent or ascending to 8 in.: lvs. compressed laterally, 1 in. long and 1/4 in. wide: fis. rose, 1 in. across, in dense cymes.

pachyphyllum. Branches crowded, densely 4-6-lvd.: lvs. usually erect, pairs unequal, to 2 in. long and 1 in. thick, margins slightly cartilaginous: fls. solitary, rosepurple, to 134 in. across.

pachypodium: Gibbæum pachypodium.

papaveránthum: listed name.

parvifòlium: Drosanthemum parvifolium. Pátersoniæ: Delosperma Patersoniæ.

pervíride: Gibbæum perviride. píctum: Conophytum pictum. pilósulum: Gibbæum pilosulum. piscodòrum: Ruschia piscodora.

piscodòrum: Ruschia piscodora.
Pòle-Évansii: Dinteranthus Pole-Evansii.
pomeridiànum: Carpanthea pomeridiana.
prodúctum: Lampranthus productus.
propinquum: Ruschia propinqua.

pseudotruncatéllum: Lithops pseudotruncatella.

pubéscens: Gibbæum pubescens.
pugionifórme: Conicosia pugioniformis.
purpuráscens: Cheiridopsis purpurascens.

purpureo-croceum: Hymenocyclus purpureo-croceus.

Pürpusii: Conophytum Purpusii. pustulatum: Glottiphyllum longum.

Pútterillii. Shrubby, with ascending or decumbent branches to 9 in. long: lvs. ascending, 3-angled, to ½ in. long and ½ in. wide and thick, punctate: fls. solitary, rosepurple, ½ in. across.

Puttkammerianum: Hereroa Puttkammeriana.

pygmæum: Ruschia pygmæa. pyropæum: Dorotheanthus gramineus. rèpens: probably Lampranthus reptans.

réptans: Lampranthus reptans.
retrovérsum: Diplosoma retroversum.

rhèolens: Dracophilus rheolens. rhomboideum: Rhombophyllum rhomboideum.

rhopalophýllum: Fenestraria rhopalophylla.
rígidum: Ruschia rígida.

Roddiæ: Plenospilos prismaticus.
roseum: Lampranthus roseus.
rosulatum: Aistocaulon rosulatum.
rubrolineatum: Nananthus rubrolineatus.

rubropurpureum: listed name.
Ruschidrum: Luthops Ruschidrum,
scapigerum: Bergeranthus scapiger.

Schickii. Said to be a hybrid between Delosperma echinatum and Glottiphyllum linguiforme.

Schoenlandianum: Drosanthemum Schoenlandianum.

Schwantesii: Tilanopsis Schwantesii. serulatum: Ruschia serrulala. setuliferum: Trichodiadema setuliferum. Simpsonii: Jultadinteria Simpsonii. simulans: Pleiospilos simulans. Sladenianum: Prenia Sladeniana.

sólidum: Ruschia solida.

speciòsum: Drosanthemum speciosum, spectábile: Lampranthus spectabilis, spinòsum: Eberlanzia spinosa, spléndens: Aridaria splendens.

spongidsum: Cephalophyllum spongiosum.

Stánleyi. To 4 in., shrubby: lvs. keeled, ½ in. long and ½ in. wide and thick, glaucous: fis. solitary, fragrant, yellow, 1 in. across.

Steingrdeveri: Ruschia Steingroeveri.

stellaris: listed name.

stellåtum: Trichodiadema stellatum. stelligerum: Trichodiadema stelligerum.

stenum: Lampranthus stenus.

suaveolens: Stomatium suaveolens.

subcompréssum: Drosanthemum subcompressum.

supérbum: listed name.

tenuifòlium: Lampranthus tenusfolius. testàceum: Delosperma testaceum. testiculàre: Argyroderma testiculare. Ihúnbergii: Hymenocyclus Thunbergii.

tigrinum: Faucaria tyrina.
tortudsum: Sceletum tortuosum.
tricolor: Dorotheanthus grammeus.
tricoldrum: Cephalophyllum tricolorum.
trigdnum: probably Cerochlamys tryona.
truncatéllum: Conophytum truncatellum.
tuberculatum: Cheiridopsis tuberculata.
tuberculosum: Faucaria tuberculosa.
tumidulum: Ruschia tumidula.
turbinifórme: Lithops turbiniformis.
uncinatum: Ruschia uncinata.
uncinéllum: Ruschia uncinella,
vaginatum: Ruschia vaginata,
velùtinum: Gibbaum velutinum,

verruculatum. Per, to 1 ft, or more, branches twisted or crooked: Ivs. fascicled, cylindric, mealy, to 1½ in, long: fis yellow, the petals scarcely longer than calyx.

vespertinum: Bergeranthus vespertinus, violaceum: Lampranthus emarginatus, vittatum: Nanapthus vittatus.

vulpinum: a form of Carruanthus caninus, Wâtermeyeri: Lampranthus Watermeyeri. Wêttsteinii: Conophytum Wettsteinii.

Zèvheri: Lampranthus Zeuheri.

MÉSPILUS. Rosaceæ. One deciduous small tree from Eu. and Asia Minor, grown for the edible fr. M. germánica (Pyrus germanica). MEDIAR. To 20 ft., sometimes thorny: lvs. oblong, to 5 in. long, finely toothed: flx. white, to 2 in. across, solitary on shoots of the season: fr. an apple-shaped open-topped pome 1-2 in. across, eaten out of hand when fully ripe or bletted, or made into preserves.—It is hardy N. Propagated by seeds which are slow in germinating and by grafting or budding on seedling stock or on the pear, quince or hawthorn.

MESOUITE: Prosopis glandulosa.

METROSIDÈROS. Myrtaceæ. Odd trees or shrubs native in New Zeal., Australia and Pacific Isls., having mostly opposite simple lvs., showy white or red fls. in cymes or racemes, the stamens long-exserted, and fr. a leathery caps.; planted for ornament in warm regions, as in Calif. Propagated by cuttings. Sometimes listed as "Iron-tree." The following are from New Zeal. except M. tremuloides.

citrìna: Callistemon lanceolatus.

Colensol. Climbing shrub: lvs. to 34 in. long, ovate or ovate-lanceolate, densely pubescent when young: fis. pink or whitish, in cymes to 1½ in. long.

diffusa. Climbing shrub: lvs. to $1\frac{1}{2}$ in. long, oblong or ovate, leathery: fis. crimson, in terminal branched cymes.

floribunda: Callistemon lanceolatus.

flórida. Climbing shrub: lvs. to 3 in. long, elliptic-oblong, leathery: fls. orange-red, in terminal cymes. Var. aurâta has yellow or yellowish-orange fls.

licida. Tree to 60 ft.: lvs. to 3 in. long, lanceolate, leathery: fls. bright red, in short terminal cymes.

Párkinsonii. Shrub with prostrate branches or tree to 30 ft.: lvs. to 3 in. long, ovate-lanceolate, leathery: fls. red, in dense cymes usually on old wood.

perforata: M. scandens.

robústa. Rata. Tree to 100 ft.: lvs. to 1½ in. long, ovate-oblong or elliptic-lanceolate, leathery: fis. dark red, in dense terminal cymes.—Commonly starts as an epiphyte.

scándens (M. perforata). Climbing shrub: lvs. to ½ in. long, ovate to orbicular, leathery and shining: fis. white, in terminal leafy panicles.

semperflorens: Callistemon lanceolatus.

tomentòsa. Tree to 70 ft.: lvs. to 4 in. long, lanceolate to oblong, leathery, usually white-tomentose beneath; fis. dark red. in dense terminal cymes.

tremuloides. Small tree: lvs. to 2 in. long, narrow-lanceolate, leathery, shining above: fls. bright red. Hawaii. villosa. Tree to 60 ft.: lvs. to 2 in. long, ovate or oblong, very leathery, white-tomentose beneath: fls. scarlet, in small terminal cymes.

MÈUM. Umbelliferæ Per. tufted aromatic herb to 2 ft. high, native in the mts. of Eu. and planted for ornament. M. athamanticum. Lvs. mostly basal, pinnately divided into fine segms.: fts. white to pink, in compound terminal umbels: fr. ribbed.—Propagated by seeds and division.

MEYEROPHYTUM. Aizoacex. One succulent shrub of S. Afr. M. Meyeri (Mitrophyllum Meyeri). To 2 in., the branches short, thickly covered with sheaths of dead lvs., the internodes very short: lvs. united into a heart-shaped body ¼ in. long, ½ in. wide and ½ in. thick: fls. red.

MICHAÙXIA. Campanulaceæ. Several species of bien. or per. herbs of S. W. Asia, one sometimes planted in the border: lvs. toothed or lobed: fls. white or pink, 8-10-parted and not bell-shaped: caps. opening laterally. Propagated by seeds.

campanuloides. Erect, 5-8 ft.: lvs. lanceolate, irregularly toothed, bristly-hairy: fls. white tinged purple, to 2 in. long, drooping, the segms. becoming reflexed.—Blooms second or third year from seed.

MICHÈLIA. Magnoliaceæ. Trees and shrubs of Asia resembling Magnolia but with axillary fls. and with a long gynophore or stipe to the ovary; planted in S. U. S. Propagated by seeds and cuttings of ripe wood under glass.

Champaca. Tall evergreen tree: lvs. lanceolate-ovate, to 10 in. long: fis. yellow or orange, very fragrant, to 2½ in. across. Himalayas.

compressa (Magnolia compressa). Evergreen tree to 40 ft.: lvs. oblong, to 4 in. long: fls. yellow, fragrant, 1 in. across. Japan.

fuscata (Magnolia fuscata). Banana-Shrub. Evergreen shrub to 15 ft., the branchlets brown-tomentose: Ivs. elliptic to oblong, to 3 in. long: fls. brownish-yellow edged with red, with banana fragrance, to 1½ in. across. China.

MICONIA. Melastomaceæ. Shrubs and trees of trop. Amer. grown in greenhouses for the large attractive lvs., having rather small white, rose, purple or yellow fls., and berry-like frs.

Miconias should be grown in fibrous soil, given abundant moisture, and screened from the direct rays of the sun. Propagated by cuttings of firm wood over heat.

magnifica (Cyanophyllum magnificum). Lvs. broadly ovate, to 2½ it. long, wavy-margined, reddish-bronze beneath with white or light green veins. Mex.

MICRAMPELIS: Echinocystis lobata.

MICRANTHES: Saxifraga.

MICROCÍTRUS. Rutaceæ. Four Australian very spiny shrubs or small trees, as now known, introduced into this country as interesting citrus allies and as possible material for hybridization and for stocks. They differ from Citrus in the small fls., stamens not united, few-celled ovary and fr., and in foliage characters. M. australàsica, Finger-Lime, probably best known here, grows to 30 or 40 ft.: juvenile lvs. very small; mature lvs. obovate or rhomboidal, to 1½ in. long: fr. elongated, to 4 in. long by 1 in. thick, the juice acid.—Hardier than lemon and lime, and promising for experiment; it has been crossed with Citrus mitis.

MICROCYCAS. Cycadaceæ. A single species in W. Cuba, much like Zamia except in scales of staminate cone. M. calocoma, Corcho, which is sometimes planted in collections, reaches tree dimensions (to 30 ft.), sometimes with a few short branches: lvs. to 3 ft. long, pubescent; lfts. to about 80 pairs, long-linear and acuminate, margins somewhat revolute, the veins parallel but no midrib: staminate cone very large.

MICROGLÓSSA. Compositæ. Shrubs of Asia and Afr., sometimes climbing, with alternate commonly entire lvs. and heads in panicles or corymbs, the ray-fls. white or bluish; pappus of hairs. Grown for ornament.

albéscens (Aster cabulicus). To 3 ft.: lvs. lanceolate, to 5 in. long, gray-tomentose beneath: heads 1/4 in. across, borne in corymbs to 6 in. across, ray-fls. lılac, disk yellow. Himalayas, China.

MICROLÈPIA. Polypodiacex. Trop. and subtrop. ferns similar to Davalla but differing in the character of the indusia. Graceful plants requiring the usual greenhouse treatment. See Ferns.

platyphýlla. Fronds to 4 ft. long, 3-pinnatifid, segms. broad and toothed, glabrous and shining when old, on stipes to 3 ft. long. India to Japan.

MICROMÈRIA. Labiatæ. Per. usually trailing herbs with small lvs. and small 2-lipped fis. in axillary whorls or terminal spikes; adapted to the rock-garden. Propagated by seeds, cuttings and division.

Chamissonis (M. Douglasii). Yerba Buena. Sts. to 2 ft. long, rooting at tips: lvs. round, to 1 in long, wavy, pubescent: fls. white, 1/4 in. long, usually solitary. B. C. to Calif.

corsica: hort. name for woody or suffrutescent form having ovate lvs. to $\frac{1}{2}$ in. long, with acute apex, silvery appressed pubescence beneath and rose-pink fis.—The plant is probably Satureja corsica.

croatica (Satureja croatica). Sts. low and tufted: lvs. ovate or orbicular, pubescent: fis. violet, in 1-3-fid. peduncled clusters. Balkans.

dalmática. Sts. ascending to 1½ ft., branched: lvs. ovate, pubescent: fis. white, in many-fid. peduncled clusters forming long loose racemes. Rocks, S. E. Eu.

Douglasii: M. Chamissonis.

grèca. To 1½ ft., much branched: lvs. linear or lanceolate, rough-pubescent: fis. rose, in peduncled 2-10-fid. loose clusters. Medit. region.

Juliàna. To 1 ft., much branched: lvs. linear or lanceolate, pubescent: fls. purplish, in many-fld. nearly sessile clusters. Medit. region.

libanótica. To 10 in., sts. usually erect, simple, slender: less, orbicular to ovate, to 4 in. long, sessile, white-woolly: fls. pink, in short eymes. Syria.

Piperélla. To 6 in.: lvs. ovate, glabrous: fis. reddishpurple, in few-fld. clusters. S. Eu.

rupéstris. Sts. prostrate, ascending at tips: lvs. ovate or oblong: fis. white spotted lavender, in many-fid. short-peduncled clusters. S. Eu.

MICROSERIS: Uropappus linearifolius.

MICROSPERMIA: Parodia.

MICROSTYLIS: Malaxis.

MIDRIB: the main rib of a leaf or leaf-like part: a continuation of the petiole or petiolule.

MIGNONETTE: Reseda. -Tree: Lawsonia inermis. -Vine: Boussingaultia baselloides.

MIKANIA. Compositæ. American twining herbs or shrubs with opposite lvs. and 4-fld. heads of white or pink disk-fls. borne in panicled cymes; pappus of bristles. Allied to Eupatorium and requiring similar treatment.

scandens. CLIMBING HEMPWEED. Twining to 15 ft., glabrous: lvs. ovate or hastate, to 4 in. long, deeply cordate at base, long-acuminate. Me. to Fls. and Tex. and S. Amer.—Adaptable for colonizing in wild places.

MILA. Cactacex. Small cylindrical cacti growing in clumps; ribs low, the closely placed areoles bearing spines: fls. at top of plant, small, yellow.

Kubeana. To 6 in.; ribs about 11; radial spines 9-12, 14 in. long, white; centrals 4, yellow tipped brown, to 34 in. long. Peru.

Nealeana. To 6 in. tall and nearly 2 in. diam.; ribs 11, low and flat; radial spines 11-13, to ½ in. long, white; centrals 3-4, to ½ in. long, flexible: fls. to 1 in. across. Peru.

MILFOIL: Achillea Millefolium. Water: Myriophyllum.

MILK-BUSH: Euphorbia Tirucalli. African: Sunadenium Grantii.

MILK-MAIDS: Dentaria integrifolia.

MILKWEED: Asclepias. MILKWORT: Polygala.

MILLA. Liliacex. One bulbous herb native in Ariz., New Mex. and Mex. M. biflòra. MEXICAN STAR. Lvs. basal and grass-like: fls. fragrant, waxy-white, to $2\frac{1}{2}$ in. across, 1-5 together terminating a scape to 1½ ft. high.— Sometimes erroneously cult. under the name Bessera elegans. Several bulbs may be planted in one pot and grown in the greenhouse for late winter and early spring bloom; or the bulbs may be planted out-of-doors and the bulbs lifted and stored over winter. M. uniflora is Brodiza uniflora.

MILLET: Panicum miliaceum, Setaria italica. African: Eleusine coracana, Penniselum glaucum. Indian: Pennise-tem glaucum. Japanese Barnyard: Echinochloa Crus-galli var. frumenlacea. Pearl: Penniselum glaucum. Texas: Panicum texanum.

MILLÉTTIA. Leguminosæ. Old World trees, shrubs or climbing vines allied to Wisteria and differing in the pod which is rather flat, much thicker and not splitting open readily.

japónica: Wisteria japonica.

megaspérma: Wisteria megasperma.

megasperma: wisteria megasperma. Teticulata (Wisteria reticulata). Twining woody vine: lvs. persistent, pinnate, lfts. elliptic-lanceolate to lanceolate, to 3 in. long, acute, glabrous, somewhat leathery: fls. pinkishblue, to ½ in. long, in dense stout racemes to 8 in. long, sometimes compounded into large panicles: pods to 6 in. long. China; planted in the S., and hardy to neighborhood of Philadelphia.

MILTÒNIA. Orchidacex. American epiphytes allied to Odontoglossum and requiring similar treatment, with 1- or 2-lvd. pseudobulbs having sheathing lvs. at base and fls. solitary or in loose racemes, the sepals and petals nearly equal, the lip expanded and showy. For cult. see Orchids.

Bleuana. Hybrid between M. vexillaria and M. Roezlii. Bluntii. Supposed to be a natural hybrid between M. Clowesii and M. spectabilis.

cándida. Pseudobulbs with 2 lvs. to 1½ ft. long: infl. to 20 in. long. 2-8-fld.; fls. about 3-3½ in. across; sepals and petals chestnut-brown tipped and spotted with yellow; lip white with 2 purple-brown spots at barn. July-Oct.

Chárlesworthii. Hybrid between M. Hyeana and M. pexillaria.

Clówesii. Pseudobulbs with 2 lvs. to 1½ ft. long: infl. about twice as long as lvs., loosely 7-10-fid.; fls. 2-3 in. across, chocolate-brown barred with yellow; lip with violet basal half and white anterior half. Aug.—Oct. Brazil.

cuneata. Pseudobulbs with 2 lvs. to 15 in. long: infl. to about 28 in. high, 5-8-fld.; sepals and petals chestnut-brown with yellow at apex and base; lip white. Jan.-Mar. Brazil.

flavéscens. Pseudobulbs with 2 lvs. to 14 in. long and ½ in. broad: infl. loosely 4-16-fld., commonly longer than lvs.; sepals and petals straw-yellow; lip white marked with red-purple. Oct., Nov., May, June. Brazil, Paraguay.

Hyeana. Hybrid between M. Bleuana and M. vezillaria. lavis (Odontoglossum lave). Pseudobulbs with 2 lvs. to 12 in, long and about 1½ in, wide: infl. to 3 ft. high, race-mose or paniculate, loosely many-fld.; sepals and petals cinnamon-brown barred with yellow or yellow-green; lip violet near base, white above. Mar.—July. Cent. Amer.—This species, together with M. Reichenheimi, though lately referred to Miltonia, may be found to belong to Odontoglossum in its broadest sense.

Lyceana. Hybrid between M. Lord Lambourne and M. Princess Margaret.

Phalsenopsis. Pseudobulbs with 1-2 lvs. to 9 in. long: infl. shorter than lvs., loosely 2-5-fid.; fis. 1½-2½ in. aeross, white with streaks and blotches of purple on lip. Apr.-Aug. Colombia.

pulchra. Hybrid between M. Luceana and M. Wm. Pitt. Régnellii. Pseudobulbs with 2 lvs. to about 1½ ft. long: infl. to 20 in. long, loosely 3-5-fld.; fls. to 2¾ in. across; sepals and petals white; lip rose veined with rose-purple. Jan.-May, Aug.-Oct. Brazil.

Reichenheimii (Odontoglossum Reichenheimii). Similar to M. Levis, but with larger fis. and flatter lip with less distinct claw.

Roézlii. Pseudobulbs with 1 lf. to 1 ft. long: infl. loosely 2-5-fld.; fls. to about 4 in. across, white with purple blotch at base of each petal and yellow at base of lip. Sept.-Oct., Mar.-July. Colombia.

Russelliana. Pseudobulbs 2-lvd.: If. to 9 in. long: infl. to 2 ft. long, 5-9-fld.; sepals and petals reddish-brown; lip with basal part lilac and apical third pale yellow or white. Brazil.

spectábilis. Pseudobulbs with 2 lvs. to 6 in, long: fls. solitary, about 4 in. across; sepals and petals white or cream-color; lip rose-purple with darker center and nerves. Feb., Sept. Brazil. Var. Moreliàna has larger fls. with plum-purple sepals and petals and violet-rose lip.

vexillaria. Pseudobulbs 1-2-lvd., surrounded at base by 6-8 two-ranked lvs.: If, to about 1 ft, long: infl. to 20 in, long, 4-7-fid.; fis. 2-4 in. across, pale rose or white or rose-carmine; hip rose with yellow and white at base and white on edges. May-July. Colombia.

Warscewiczii (Oncidium fuscatum). Pseudobulbs bearing 1 lf. to 9½ in. long: 1nfl. simple or paniculate, manyfid., to 14 in. long; sepals and petals red-brown with yellow or white at tips; lip rose-purple with white margins and brown blotch above middle. Feb., Mar. Colombia, Peru.

MIMÒSA. Leguminos x.Plants of various habit, herbs, shrubs and trees with feathery bipinnate foliage, in some species sensitive, small fls. in heads or spikes, and fr. a flat pod made up of 1-seeded joints; native mostly in trop. Amer. Some of the acacias and other plants are sold under the name Mimosa. A few of the shrub and tree species are planted for ornament in warm countries, and the sensitiveplant in conservatories. Cult. as for Acacia.

acanthocárpa: M. aculeaticarpa.

aculeaticárpa (M. acanthocarpa). Sp tree: fls. white or pink, in heads. Mex. Spiny shrub or small

álbida. Spiny shrub to 10 ft., gray-pubescent: fls. pinkish, in heads. Mex. to Peru.

argentea. Climbing: lvs. pinkish below and partially silvery-gray. Brazil.

illinoénsis: Desmanthus illinoensis.

Nèmu: Albizzia Julibrissin.

pùdica. Sensitive-Plant. Humble-Plant. Spiny per. but cult. as an ann.: lvs. sensitive: fis. lavender, in heads. Brazil; nat. in warm countries, running wild in Gulf states.

sepiària. Shrub or tree-like, with short hooked spines or prickles: lvs. twice compound, the pinne 6-8 pairs and 2 in. or less long and with many secondary linear lfts.: fls. white, in peduncled small globular heads: pod about 2 in. long, very narrow. Brazil.—Planted in S. Fla.

Speggazzínii. Spiny shrub: lvs. sensitive: fls. rose-purple, in heads. Argentina. Var. gladca, fls. white.—A good greenhouse species, intro. into Calif.

MIMOSACEÆ: Leguminosæ.

MÍMULUS (incl. Diplacus). MONKEY-FLOWER. Scrophulariaceæ. Ann. and per. herbs or sometimes subshrubs with usually showy tubular 2-lipped fls. often spotted, giving more or less the effect of a face (personate), either solitary and axillary or in terminal racemes: lvs. opposite, entire or toothed; decumbent or erect.

Monkey-flowers are grown in the greenhouse and in the border and some of the large kinds in the general garden in California. In the open, glasshouse kinds of mimulus profit

by a shady or semi-shady situation and plenty of water, but some of the semi-shrubby kinds of the Pacific Coast may not require such protection. The greenhouse and florists' kinds are propagated by seed sown from January to April, in a mixture of equal parts of loam, leaf-mold and sand, and kept in a temperature of 60° until germination; cuttings and division are also used. M. luteus is the chief source of flower-garden and conservatory kinds, with large of the spotted flowers. often spotted flowers.

alàtus. Per. to 2 ft., stoloniferous: lvs. ovate or ovate-lanceolate, to 6 in. long: fis. blue or violet, 1 in. long. Mass. to S. C. and Tex.—Similar to M. ringens, differing in its stalked lvs. and shorter fl. pedicels.

alpinus: M. luteus var.

áridus. Shrub to 10 in., sticky: lvs. oblanceolate to oblong, to 134 in. long and ½ in. wide, crowded: fls. pale buff to yellow, to 2 in. long, on stout pedicels to ½ in. long. S. Calif.

aurantiacus (M. glutinosus. Diplacus glutinosus). Bush M. Shrub to 4 ft.: lvs. oblong, to 2 in. long, densely pubescent beneath: fls. deep yellow, to 1½ in. long, the spreading lobes toothed or notched. Ore., Calif.

Bartonianus. Hybrid between M. cardinalis and M. Lewisii with fis. rose-red, throat yellow spotted brownish-

brévipes. Ann., sticky-pubescent, to 2 ft.: st.-lvs. lanceolate to linear, to 3 in. long: fis. yellow, bell-shaped, 2-lipped, to 2 in. long. Calif.

Brèweri. Ann. to 6 in., pubescent: lvs. oblong or linear, to ¾ in. long: fls. pink or red, funnel-shaped, ¼ in. long. B. C. to Ida. and Cahf.

cæspitdsus: M. Tılıngıi var.

cardinalis. Per. with erect or weak sts. to 1 ft., sticky-pubescent: lvs. obovate, to 4½ in. long: fls. scarlet, seldom yellow, to 2 in. long, 2-lipped, stamens exserted. Utah to Ore and Lower Calif.

cùpreus. Chilean M. Ann. to 8 in.: lvs. ovate, to 1¼ in. long, 3-5-nerved from base: fls yellow becoming brilliant copper-color, to 1¼ in. long, lobes spreading. Chile.

Frèmontii. Ann. to 8 in., sticky-pubescent: lvs. oblong, to 1 in. long: fis. crimson, 1 in. long, broadly funnel-shaped. Calif.

glauca: catalogue name, perhaps for M. glaucescens.

glaucescens. Ann. to 15 in, glabrous and glaucous: lower lvs. rounded-ovate to subcordate, to 4 in. long, coarsely toothed, long-petioled, upper lvs. orbicular and sessile: fis. yellowish, spotted red, to 1½ in. long. Calif.

glutindsus: M. aurantiacus.

guttatus (M. Langsdorfi). Ann. or per. to 1½ ft.: lvs. ovate to oblong-lanceolate, to 6 in. long: fls. yellow, usually with red-spotted thront, to 1½ in. long, 2-lipped, calyx much inflated in fr. Alaska to Mex.

imperialis: listed as a low per. with orange fis. spotted red. impléxus: M. Tiliginii.

Lángsdorfii: M. guttatus.

leptánthus (Diplacus leptanthus and grandiflorus). Shrub to 3 ft., pubescent: lvs. oblong, to 2 in. long: fis. yellow, to 2½ in. long, the lobes notched. Calif.

Lèwisii. Per. to 214 ft., sticky-pubescent: lvs. oblong, to 3 in. long: fls. rose-red or pink, to 2 in. long. B. C. to Calif. and Utah Var. álbus, fls. white.

longiflorus (Diplacus longiflorus and speciosus. M. glutinosus var. brachypus). Shrub to 3 ft.: lvs. lanceolate, to 3 in. long, pubescent beneath: fls. cream-color to salmonycllow, to 3 in. long, lobes cut or wavy. S. Calif. Var. rùtilans is glandular-pubescent with dark red fls.

lùteus. Per., sts. to 1 ft. long, prostrate: lvs. broad-ovate, in long, 5-7-nerved from base: fls. yellow spotted with red or purple, to 1½ in. long. Chile. Var alpinus, to 6 in., erect; rivulàris, middle lobes of lower lip with large red spot; variegàtus, throat pale yellow, lobes margined with pinkish-purple; Youngeàna, each lobe spotted.

moschatus. Musk-Plant. Per. with spreading and creeping stolons to 1 ft. long, sticky-hairy, with a musky odor: lvs. ovate, to 1½ in. long; fls. pale yellow, lightly dotted with brown, to ¾ in. long. Mont. to Calif. Var. compactus is listed as a denser plant.

nanus. Ann. to 6 in., sticky-pubescent: lvs. obovate or oblong, to 1½ in. long: fls. reddish-purple with yellowish tube, ½ in. long. W. N. Amer.

nasùtus. Ann. to 2 ft.: lvs. ovate or oblong, to 4 in. long, toothed or lobed: fls spotted with red-brown, to 1 in. long, 2-lipped. B. C. to N. Mex. and Rocky Mts.

parviflorus (Diplacus parviflorus). Shrub to 2 ft.: lvs. obovate, to 1 ¾ in. long, pale green below and often shining; fis. brick-red tinged with yellow, to 1¾ in. long. Santa

primuloides. Per. to 4 in., stoloniferous: lvs. obovate or

oblong, to 1 in. long: fls. yellow often spotted with reddishbrown, to 3/4 in. long, funnel-shaped, usually solitary. W. N. Amer.

puniceus (M. glutinosus var. puniceus. Diplacus puniceus). Shrub to 6 ft., sticky: lvs. linear, to 2½ in. long: fls. red, to 1½ in. long. S. Calif.

quinquevúlnerus: hort, name for M. luteus.

ringens. Allegheny M. Per. to 4 ft., sts. 4-angled: lvs. oblong, to 4 in. long: fls. blue varying to pink or white, to 1/2 in. long, 2-lipped, throat very narrow. N. S. to Man., Va., Tex.

speciosus: M. longiflorus.

tigrinus. Hybrids (or other cultigens) between M. luteus and M. guttatus, with large fis.

and M. guttatus, with large fls.

Tflingii (M. implexus). Per., sts. creeping, to 8 in. long: lbs. broad-ovate, 3-5-nerved from base: fls. yellow spotted red, to 1½ in. long, calyx inflated in fr. Mont. to Calif. Var. cæspitôsus (M. cæspitosus) is a smaller mat-forming plant with sts stoloniferous, shorter than type: fls. to 1 in. long, terminal and solitary. Wet rocks near the snow-line, Calif.

tricolor. Ann. to 6 in., glandular-pubescent: lvs. oblanceolate or oblong, to 1 in. long: fis. yellow, lobes usually with reddish-purple spot, to 13/4 in. long. Ore., Calif.

variegatus: M. luteus var.

MÍMUSOPS. Sapotacex. Large number of milky-juiced thick-lvd. evergreen trees in the tropics of both hemispheres, some planted in warm countries for ornament and interest as well perhaps as for the frs. and for the production of rubber: lvs. simple and entire, mostly glossy, without prominent side nerves: fls. bisexual, white or whitish, not showy, single or clustered in axils, the corolla of 6 or more lobes: fr. an ovoid or globose large-seeded berry. Propagated by seeds; they have been employed as stock for sapodilla.

Balata. To 100 ft. and more: lvs. oblong-obovate, to 8 in. long: fls. 10 or more, outside corolla-lobes lobed: fabout 1 m. long Farther W. Indies, Venezuela, Guiana.—A source of balata rubber.

Eléngi. Spanish-Cherry. Tree to 30 ft. and more, with spreading top: Ivs elliptic or oval, obtuse or bluntly acute, to 4 in. long: fls. white, about 1/2 in. across, the parts acute: fr. ovoid, yellow, nearly 1 in. long, edible. E. Indies.

MINA: Quamocht lobata

MINT: Mentha. Horse-: Monarda. Lemon-: Monarda ctinata. Mountain-: Pycnanthemum. Stone-: Cunila nectinata. origanoides.

MINUARTIA: Arenaria octandra.

MIRÁBILIS. Nyctaginaceæ. Per. or ann. herbs with colored tubular calyx resembling a corolla and spreading 5-lobed limb; roots often tuberous; about a dozen species in the warmer parts of Amer., a few grown in flower-gardens.

Mirabilis species are grown as tender annuals from seed sown where plants are to stand; roots may be taken up and stored over winter.

califórnica. To 3 ft., sticky-pubescent: lvs. ovate, to 1½ long, somewhat fleshy: fls. rose-purple, ½ in. long. Calif.

dichôtoma. Ann. to 30 in.: fls. pink suffused with white, stamens purple. Mex.

divaricata. Differs from M. Jalapa in the longer-stalked lvs. which are not cordate at base, and the tube of the purple or rose fls. being narrower. Madeira Isls.

Froèbelii. Per. with tuberous root, sts. decumbent, to 2 ft. long, much branched, sticky-pubescent: lvs. ovate, to 3 in. long: fls. purplish-red, to nearly 2 in. long, usually 3-10 in involucre. Dry stony regions in Colo., Nev. and S. Calif.

Jalapa. Four-o'Clock. Marvel-of-Peru. To 3 ft., glabrous or nearly so: fls. in shades of red, yellow and white, often striped and mottled, the tube 1-2 in. long, opening in late afternoon. Trop. Amer.—Known as an ann., but the roots are deep and tuberous, weighing more than 40 lbs. when grown as per. in warmer regions.

longiflòra. To 3 ft., glandular-pubescent: fls. white, rose or violet, the tube 4-6 in. long. Mex.

multiflora (Quamoclidion multiflorum). To 3 ft.; fis. rose or purple, the tube to 2 in. long. Colo. to Tex.

viscosa. To 3 ft., sticky-pubescent, sts. to 2 in. thick: lvs. ovate, to 4 in. long, fleshy, petiolate, usually cordate at base: fls. purple, red, pink or white, to ¾ in. long or less, usually solitary. Colombia, Ecuador, Mex.

MIRASOLIA: Tithonia diversifolia.

MIRLITON: see Chauote.

MIRO: Podocarpus ferruginea.

MISCÁNTHUS (Eulalia). Gramineæ. bold broad-lvd. per. grasses with awned spikelets in large terminal silky panicles; native in Old World and one species grown for striking effects. See Grasses.

gracıllimus: M. sinensis var.

gracillimus: M. sinensis var.

sinénsis (Eulalia japonica). Eulalia. Common landscape grasses: to 10 ft., forming leafy clumps: lvs. to 3 ft.
long and 1 in. wide, with prominent whitish midrib: panicles
to 2 ft. long, branches spreading or drooping, silky. China,
Japan; somewhat escaped in N. Amer.; hardy N. Var.
gracillimus has channelled lvs. to ½ in. wide. Var. variegâtus has lvs. striped white or yellowish and in var. zebrinus, ZEBRA-GRASS, they are banded. Plants listed as
M. sinensis univitatus, E. gracillimu univitata and E.
japonica folius-nitatis belong to M. sinensis var. gracillimus. zebrinus: M. sinensis var.

MIST-FLOWER: Eupatorium calestinum.

MISTLETOE: see Loranthacex.

MITCHÉLLA. Rubiacex. A single N. American evergreen herb, barely woody, with trailing rooting sts. to 1 ft. long, useful in the rockgarden or as a ground-cover beneath trees. M. rèpens. PARTRIDGE-BERRY, TWIN-BERRY. SQUAW-BERRY. Lvs. orbicular-ovate, to 34 in. long, dark green and shining above and often with white lines: fls. twin, white, $\frac{1}{2}$ in. long, with 4 spreading lobes bearded inside: fr. scarlet, 1/3 in. across, white in var. leucocarpa.

MITÉLLA. BISHOPS-CAP. Saxifragacex. Per. small delicate woods herbs with heart-shaped mostly basal lvs. and small white or greenish fls. in racemes, the petals pinnately cut; native in N. Amer. and E. Asia. Sometimes transferred to the wild-garden.

Brèweri (Pectiantia Brewert). Slender scapes to 8 in. fls. greenish-yellow, usually 4-20 in raceine, on short spreading pedicels. B. C. to Calif. on high mts.

cauléscens (Mitellastra caulescens). Scapes to 1 ft., with 1-3 lvs.: fls. yellowish-green, in loose racemes. May-July. B. C. to Mont. and N. Calif.

diphylla. Scapes to 1½ ft., with one pair of opposite nearly or quite sessile lvs.: fls. white, in racemes to 8 in, long. Apr., May. Que. to N. C. and Mo.

nuda. Scapes to 8 in., usually leafless: fls. yellowish-green, in few-fld. racemes. Apr.-June. N. N. Amer., Asia. oppositifòlia. St.-lvs. long-petioled: divisions of petals filiform. Cent. N. Y.

pentándra (Pectiantia pentandra). Scapes to 1 ft. high, naked: fls. greenish, in loose racemes. June-Aug. Alaska to Calif.

stauropétala (Ozomelis stauropetala). To 20 in., glandular-puberulent or hirsute: lvs. remform-orbicular and 5-9-obtusely lobed, somewhat hirsute on each side: fls. white, in elongate racemes, petals 3-parted to the middle. Mont. to Colo., Wash. and Ore.

MITELLASTRA: Mitella caulescens.

MITRÀRIA. Gesneriacex. A climbing evergreen shrub from Chile, grown under glass or out-of-doors in mild climates and of easy cult. M. coccinea. Lvs. opposite, ovate, to 1 in. long, with few coarse teeth: fls. scarlet, to 1½ in. long, tubular, drooping on long stalks; stamens exserted.

MITREWORT, FALSE: Tiarella.

MITROPHYLLUM. Small S. A izoaceæ. African shrubs: first pair of lvs. united only at base, second pair united one-third to entirely into a conical body: fls. solitary and terminal. with numerous linear petals and 5-7 stigmas.

grande. To 1 ft. when in flower: cones to 4 in. long and 1 in, thick: fls. white, 2 in, across.

Meyeri: Meyerophytum Meyeri.

mitratum (Mesembryanthemum mitratum). To 2 ft.: plant at rest a cone to 2½ in. long and 1 in. thick: fis. pale pink with white base, ¾ in. across.

MITSUMATA: Edgeworthia papurifera. MOCCASIN-FLOWER: Cypripedium,

MOCKERNUT: Carya tomentosa.

MOEHRINGIA: Arenaria muscosa.

Scrophulariaceæ. MOHÀVEA. Ann. herbs of Calif. and Ariz., botanically allied to Antirrhinum: fls. solitary in the axils, forming a leafy spike, cream-color, with very short tube and limb of 2 fan-shaped lips, the upper 2-lobed, lower 3-lobed

confertiflora. To 1 ft., sticky-pubescent; lys. lanceolate. to 2½ in. long, entire: fls. about 1 in. long, with fine dots arranged in lines. Colorado and Mohave deserts.

MOHRODENDRON: Halesia MOLDAVICA: Dracocephalum

MOLE-PLANT: Euphorbia Lathyrus.

MOLÍNIA. Graminex. Tufted per grasses with narrow lvs. and spikelets in interrupted panicles; native in Eu. and Asia and one of some ornamental value. See Grasses.

cærùlea (Aira cærulea). To 5 ft.: lvs. to 1 ft. long and 1/4 in. wide, rather stiff: panicles to 11/4 ft. long, green or purplish. Eu.; nat. in E. U. S.

MOLOPOSPÉRMUM. Umbelliferx.per. herb to 5 ft. high, native in mts. of Eu., sometimes planted for ornament. M. cicutarium. Lvs. ternately decompound, the ultimate segms. pinnatifid: fls. yellowish-white, small, in terminal umbels standing above the foliage.—Propagated by division or seed.

MÓLTKIA. Boraginaccæ. Per. hairy herbs of S. Eu. and Asia, with alternate simple lvs. and blue or yellow fls. in terminal cymes or racemes; corolla funnel-shaped, the throat naked or hairy; stamens protruding. Allied Lithospermum. Sometimes cult. in the rock-garden.

graminifòlia: M. suffruticosa.

petræa (Luthospermum petræum). Hoary somewhat woody per. to 1 ft.: lvs. linear-oblong: fls. deep violet-blue, to ½ in. long. S. E. Eu. Hoary somewhat

suffruticosa (M. graminifolia. Lithospermum graminifolium). Subshrub to 1½ ft.: lvs. linear, white-tomentose beneath: fls. purple-blue, ½ in. long. Italy.

MOLUCÉLLA. Labiatæ. Old-fashioned herbaceous annuals, with toothed or cut lvs. and white or pink-tipped tubular 2-lipped fls. in axillary whorls subtended by spiny subulate bracts, the limb of calyx inflated and surpassing the corolla.

Molucellas are grown from seeds sown early in spring indoors, or M. lævis in the open where the season is long.

lævis. Shell-Flower. Molucca-Balm. To 3 ft.: lvs. round, to 1½ in. long toothed, long-stalked: fls. fragrant, white, the limb of greatly enlarged calyx with 5 slightly prickly angles. W. Asia.—Grown as a curiosity.

spinosa. To 8 ft, sometimes bien., sts. brownish-red: lvs. ovate, deeply cut: fls. white, the limb of calvx with 1 long spine above and 7 others below. S. Eu., Syria.

MOMBIN: Spondias Mombin and purpurea.

MOMÓRDICA. Cucurbitacex. Two ann. slender herbaceous tendril-bearing vines, out of 35-40 in the genus, are cult. for ornament and screens: monœcious or diœcious: lvs. in ours compound or deeply lobed: fls. yellow or white, rather showy (to 1 in. or more across), solitary in ours and the staminate peduncle bearing a broad bract: fr. nearly spherical to oblong, often splitting at maturity. Native in Old World tropics, one extensively nat. elsewhere. Quickly grown from seeds.

Balsamina. Balsam-Apple. Lvs. thin, 1-4 in. across, with very sharp lobes and teeth, lobed ½ or less of the width; bract of stammate pedundle on its upper part: fr. ovoid or ellipsoid, orange, to 3 m. long, narrowed both ends, with points or nearly smooth, bursting.

Charantia. Balsam-Pear. Lvs. deeply lobed and mostly less pointed: bract at middle of peduncle or lower: fr. oblong or ovoid, orange-yellow, 1-8 in. long, warty, bursting and showing red arils. Nat. Fla. south.—The commoner species.

Elatèrium: Ecballium Elaterium.

MONÁNTHES. Crassulaceæ. Small herbaceous or subshrubby succulents, mostly per., of the Canary Isls., with very thick mostly alternate lvs. and fls. greenish, purplish, or yellowish, in racemes or cymes.

atlántica: Sedum atlanticum.

brachycaùlon (Sempervivum Lowei). Minute per. with a much thickened bulb-like or cylindrical rootstock and usually a single rosette: lvs. loosely rosulate, oblong-spathulate, papillose, green mottled with purple, to ¾ in. long: fis. in a raceme with the calyx glandular-hairy and the petals greenish-purple. Canary Isls

laxiflora. Per. with fibrous roots and fat egg-shaped lvs. to $\frac{9}{8}$ in, long; flowering shoots to 3 m high, terminating in a slightly hairy raceme; fis. purplish or yellowish, with the callyx glabrous or slightly hairy. Canary Isls.

MONÁRDA. Horse-Mint. Labiatæ. Ann. and per. aromatic N. American herbs, with opposite toothed lvs. and rather large strongly 2-lipped fls. in dense terminal and axillary bracted showy clusters.

Horse-mints are rather coarse plants but striking in masses in the wild-garden. Of easy cultivation. Propagated by division of plants in the spring.

Bradburiàna. Per. to 2 ft.: lvs. ovate or ovate-lanceolate, to 31% in. long, sessile: fls. pink to white spotted with purple, 1 in long, in terminal clusters, the bracts green or purplish. Ind. to Ala. and Ark.

citriodò a: M. pectinata. coccinea: M. didyma.

didyma (M. coccnea. M. Kalmiana). Oswego-Tea. Bee- or Fragrant-Balm. Per. to 3 ft.: lvs. ovate or ovate-lanceolate, to 6 in. long, petioled: fis. scarlet, to 2 in. long, in terminal clusters, bracts tinged red. Que. to Ga. and Tenn.—Lasted hort. names include álba, coccinea, magnifica, purpurea, ròsea, rubra, salmònea, spléndens, supérba, violàcea.

fistulosa. WILD BERGAMOT. Per. to 3 ft: lvs. lanceolate to ovate, to 4 in. long, petioled; fls. like to purple, 1½ in. long, in termina clusters, the bracts whitish or purplish. Me. to Fla. and La. Var. 4lba has white fls. Var. mollis (M. mollis) differs from the typical form only in its much shorter pubescence.

florariénsis: hort. name.

hybrida: hort, name of no botanical standing.

Kalmiana: M. didyma.

lasiodonta. Per. to 11½ ft.: lvs. linear-lanceolate, to 2 in. long: fls. yellowish, ½ in. long, in axillary and terminal clusters, the bracts white. Okla. to Ariz.

mèdia (M. fistulosa var. media). Per. to 3½ ft.: lvs. ovate or ovate-lanceolate, to 5 in. long, petioled: fis. purple or purple-red. 1½ in. long, in terminal clusters, the bracts purple. Me. to Va.

menthæfòlia. Similar to *M. fistulosa* var. mollis from which it differs chiefly in its almost ressile or short-petioled lvs. Sask. to Alta., south to Ill. and Tex.

móllis: M. fistulosa var.

pectinata (M. citriolora). Lemon-Mint. Ann. or short-lived per. to 15 in.: lvs. lanceolate to oblanceolate, to 1½ in. long, distantly serrulate, punctate; fis. yellowish-white, in axillary and terminal clusters, slightly longer than the purplish-green lanceolate bracts, calyx-lobes awl-shaped. Neb. to Utah south to Tex. and Ariz.

punctata. Per. to 3 ft.: lvs. lanceolate, to 3 in. long, petioled: fls. yellowish spotted with purple, 1 in. long, in

axillary and terminal clusters, the bracts white or purplish, calvx-lobes lanceolate. S. N. Y. to Fla. and Tex.

Ramâleyi. Per. to 2 ft., sts. white-pubescent above: lvs. lanceolate or ovate-lanceolate, short-petroled: fls. lilac, 1 m. long, in terminal clusters, the bracts tinged purple. Colo.

Russelliàna. Per. to 2 ft.: lvs. lanceolate to ovatelanceolate, nearly sessile: fls. lilac veined with purple, 1 in. long, in terminal clusters, the bracts purplish. Ark.

salmonea: M. didyma var.

stricta. To 2 ft., minutely pubescent: lvs. ovate to broadly lanceolate, to 2½ in. long, acuminate, sharply toothed, base rounded or truncate: fls. bright purple. Wyo. to Ariz. and New Mex.

violacea: M. diduma var.

MONARDÉLLA. Labiatæ. W. American fragrant herbs with purple, rose or white 2-lipped fls. in terminal heads subtended by an involucre. Sometimes grown in the rockgarden. Propagated by division in spring.

lanceolata. Ann. to $2\frac{1}{2}$ ft., somewhat pubescent: lvs. oblong-lanceolate to lanceolate, to 2 in. long, entire: fls. rose-purple. Calif.

macrántha. Tufted per. to 1 ft., pubescent: lvs. ovate, to 1 in. long, mostly with entire revolute margins: fis. orange-red, 1½ in. long. Calif.

odoratissima (Madronella odoratissima). Per. to 10 in., sts. decumbent at base, grayish-hairy: lvs. oblong, about ½ in. long, obtuse, sessile or nearly so, somewhat hairy beneath; fis. rose-pink to white, in compact terminal heads to ½ in. across. Ore., Wash. and Ida.

parvifòlia (Madronella parvifolia). Per. to 1 ft., woody at base and sts. decumbent: lvs. ovate- or oblong- lanceolate, ½ in. long, entire: fls. lılac-purple, ½ in. long. Colo.

purpurea: a form of M. odoratissima occurring in N. W. U. S., having the leafy bracts subtending the head puberulent and not pubescent.

villòsa. Per. to 1½ ft., pubescent: lvs. ovate, to 1 in. long, slightly toothed: fls. purple, pink or white, about ½ in. long. Calif.

MONDIA: Chlorocodon. MONDO: Ophiopogon.

MONÈSES. Pyrolacex. One evergreen perherb to 6 in. high, native in woods of N. N. Amer., Eu. and Asia and sometimes planted in the wildgarden. M. uniflora (Pyrola uniflora). One-flowered Shinleaf. Lvs. near base of st., orbicular or ovate, to 1 in. long, wavy-toothed: fls. white or pink, fragrant, to 34 in. across, solitary and nodding: caps. 14 in. across.

MONEYWORT: Lysimachia Nummularia.

MONILÀRIA. Aizoaceæ. Dwarf succulents of S. Afr.: first pair of lvs. a globular body pushed apart by second pair of cylindrical lvs.: fls. solitary, terminal, long-stalked; petals numerous, linear; stigmas 5–7.

chrysoleùca (Mesembryanthemum and Conophyllum chrysoleucum). To 4 in.: second lvs. to 3 in. long and 1 in. thick, papillose: fls. white with yellow stamens, 1½ in. across, on pedicels to 3 in. long.

moniliformis (Mesembryanthemum moniliforme). To 4 in., branched: second lvs. to 3 in. long and ½ in. thick, papillose: fis. white with yellow center, 2 in. across, on pedicels 2 in. long.

MONIMIACEÆ. Monimia Family. About 30 genera in the tropics, trees and shrubs with opposite simple lvs., mostly bisexual polypetalous fls. having inconspicuous perianth, numerous stamens, many 1-celled carpels, and fr. an achene or drupe borne on the receptacle. Hedycarya, Laurelia and Peumus may be cult. in warm climates.

MONIMIA FAMILY: Monimiaceæ.

MONKEY-BREAD TREE: Adansonia digitata. -Flower: Mimulus. -Pod: Samanea Saman. -Pot: see Lecythidacex. -Puzzle: Araucaria araucana.

MONKSHOOD: Aconitum.

MONOCOTYLEDON: a plant bearing only one cotyledon or seed-leaf, in distinction from those that have two (dicotyledon) or more seed-leaves in the embryo; the cotyledons become apparent in germination. Monocotyledonous: adjective, pertaining to monocotyledons. The monocotyledons (in speech sometimes shortened to "monocots") are those of endogenous internal structure, lacking true separable bark or cortex; they were formerly known as endogens. Mostly these plants have parallel-veined leaves and floral parts in threes or multiples of three. Few of them are tall trees, many of the palms being exceptions. Monocotyledonous plants comprise all the grasses, cereal grains, sedges, banana, lilies, aroids, bromeliads, irids, cannas, orchids, palms.

MONŒCIOUS: staminate and pistillate flowers on the same plant.

MONOLÒPIA. Compositæ. California white-woolly annuals with alternate sessile lvs. and large solitary heads of golden-yellow ray- and disk-fls.; pappus none; somewhat allied to Baeria.

major. To 1½ ft.: lvs. oblong-lanceolate, to 4 in. long, entire or slightly toothed: heads 1-2 in. across.

MONÓPSIS. Lobeliaceæ. Small genus of ann. herbs native in S. Afr., allied to Lobelia and differing in the 5-lobed rotate corolla: fr. a caps.

campanulata (Lobelia campanulata). To 1 ft., much branched, glabrous, sts. very slender: lower lvs. ovatelanceolate, to ¾ in. long and ¾ in. wide, entire or fewtoothed: fls. deep blue with yellow anthers, to nearly ¾ in. long: caps. about ¼ in. long, base rounded.

MONOTÁGMA. Marantaceæ. Per. herbs from S. Amer., with creeping rootstocks, long-petioled basal lvs. and fls. borne in bracted spikes; sometimes grown for the ornamental foliage. Cult. as for Calathea.

smarágdinum (Calathea and Maranta smaragdina). To 1½ ft.: lvs. lanceolate or oblong-lanceolate, emerald-green above with dark green central stripe, pale green beneath. Ecuador.

MONÓTROPA. Monotropaceæ (see Pyrolaceæ). White saprophytic herbs with leafless bracted scapes bearing a solitary nodding fl. with 2-4 deciduous sepals and 5-6 petals; 2 species in N. and S. Amer. and Asia, one of them sometimes transferred for curiosity under proper woods conditions.

Bríttonii. Per. 4-15 in. high: lvs. ovate to oblanceolate: fls. ochroleucous or salmon-colored, petals densely ciliate and hairy within. N. C. to Fla.

uniflora. Indian Pipe. To 10 in., the scapes whitebracted and lacking chlorophyll: fls. white, to 1 in. long: caps. erect, 1/2 in. long. N. Amer., Mex., Japan, Himalayas.

MONSTERA. Araceæ. Trop. American woody-stemmed large strong climbers with large thick lvs. which are entire, pinnately cut and sometimes perforated, long sheathing petioles, and bisexual fls. on densely-fld. spadices surrounded by boat-shaped spathes; grown under glass as a curiosity.

Monsteras are not particular as to soil and thrive in pots, tubs and beds in the greenhouse or in the open far South. Propagated by cuttings of the growing stems placed in pots and kept in a humid hot atmosphere.

acuminata. Lvs. ovate-cordate, to 14 in. long, entire: spathe to 3 in. long, spadix to 2 in. long and 1½ in. diam. Cent. Amer.

deliciòsa (Philodendron pertusum). Ceriman. Straggling climber, having long hanging cord-like aerial roots: lvs. to 3 ft. long and wide, pinnately cut and perforated with large holes: spathes white, about 1 ft. long; spadix to 10 in. long, becoming a solid cone-like edible fr. Mex., Cent. Amer.

dùbia (Marcgravia paradoxa). Lf.-blade oblong, to 2½ ft. long, pinnatisect, segms. linear, to 1½ in. wide, acute: spadix to 1 ft. long and 2 in. thick. Mex., Cent. Amer.

MONTANÒA. Compositæ. Large shrubs or small trees native Mex. to N. S. Amer., with opposite lvs. and white or rose heads of rayand disk-fls. borne in panicled cymes; pappus none.

Propagated by seeds under glass and by cuttings; grown under glass and out-of-doors in warm climates for the large leaves and bold habit as well as for the showy heads.

bipinnatifida (Polymnia grandis). To S ft., shrubby: lvs. pinnately cut, hairy: heads to 3 in. across, with white rays. Mex.

hibiscifòlia. Shrub to 20 ft.: lvs. palmately lobed to about middle, pubescent beneath, to 1 ft. across: heads to 1½ in. across, with white rays and yellow disk. Guatemala to Costa Rica.

MONTBRETIA: Tritonia.

MONTEZÙMA (Maga). Malvaceæ. Two heavily foliaged trees, one Puerto Rican and one Cuban, distinguished from Thespesia by the large calyx breaking apart (circumscissile) and deciduous, with very large showy fls.: fr. an indehiscent leathery or fleshy pod.

speciosissima (Thespesia grandsflora). Tree to 40 or 50 ft.: lvs. thick, broadly cordate-ovate, acuminate, entire, 5-8 in. long: fts. long-peduncled, 5-6 in. across, glossy red and very veiny. Puerto Rico, once thought to be Mexican.—Planted in S. Fla.

MÓNTIA. Portulacacex. Small soft herbs with rather fleshy lvs., small white or pinkish fls., and capsular frs.; one sometimes grown as a salad and pot-herb and others for interest in moist places. Seed may be sown where plants are to stand, any time in spring or summer.

Chamissol (Crunocallis Chamissonis). Aquatic-floating or creeping per, rooting at nodes: st.-lvs. of several opposite pairs, spatulate to oblanceolate, to nearly 2 in. long: fls. pale rose, to ½ in. long, 1-9 in raceme. Alaska to Calif. and New Mex.—Occurs in wet places and springs, adapted to bog garden or shallow pools and ponds.

depréssa (Limnia depressa). Ann. to 4 in.: lvs. broadly ovate to orbicular, to $\frac{5}{6}$ in. across, connate, usually only a single pair: fls. pink, in short racemes. S. D. to B. C., south to Ariz. and Calif.

parviflora (Claytonia and Limnia parviflora). Ann. to 8 in.: Ivs. spatulate to filiform, to 6 in. long: fls. pink or white, in racemes subtended by involucral Ivs. united into a disk. B. C. to Utah.

perfoliata (Claytonia and Limnia perfoliata). WINTER PURSLANE. Ann. 4-12 in. or more: lvs. basal, rhombic-ovate and long-stalked: fls. white, in racemes subtended by 2 lvs. which are united into a round disk, on scapes to 1 ft. high. B. C. to Mex.

Sweetseri. Procumbent, sts. to 4 in long: basal lvs. ovate, 1½ in. long: fls. pink, petals ½ in. long. Ore.

MONVILLEA. Cactaceæ. S. American nightblooming cacti with half-erect long slender sts.: fls. toward top of st., naked outside, the perianth persisting even after withering and in that respect differing from Cereus as well as in the absence of columnar sts. or trunks. See Cacti.

Cávendishii (Cereus Cavendishii. C. splendens). To 10 ft., more or less branched at base, sts. to 1 in. or somewhat more diam., ribs 9 or 10 and low; spines needle-like and 8-12: fts. white, pinkish outside, to nearly 5 in. long. Brazil, Paraguay, Argentina.

Damazidi: Arthrocereus microsphæricus.

marmorata: probably not distinct from M. Spegazzinii. phæacantha: Cephalocereus phæacanthus.

phatnospérma (Cereus phatnospermus). Sts. decumbent, to 6 ft. long and 1 in. diam.; ribs 4-5; radial spines 5-6 and brown; centrals to 1 in. long: fls. white, 5 in. long. Paraguay.

Spegazzinii (Cereus Spegazzinii). Sts. erect, 3-angled, spotted white; spines 3-6 and small: fls. white, purplish outside, 5 in. long. Paraguay, Argentina.

MOONFLOWER: Calonyction.

MOONSEED: Menispermum. Carolina: Cocculus carolinus.

MOONWORT: Botrychrum, Lunaria.
MOOSEWOOD: Acer pensylvanicum.

MORÀCEÆ. MULBERRY FAMILY. Trees, shrubs or herbs of wide distribution, some of them climbing, often having milky juice and mostly alternate simple lvs.: fls. small, unisexual, in spikes or heads, or in Fieus on the inside of a hollow receptacle and constituting a fig; perianth usually of 4 parts and stamens 4; ovary superior, 1-celled: fr. an achene or drupe. The family furnishes many economic products, as edible frs., hemp, rubber, dyes, medicines, and food for silkworms. Genera known to hort are Antiaris, Artocarpus, Brosimum, Broussonetia, Cannabis, Castilla, Cecropia, Chlorophora, Cudrania, Dorstenia, Ficus, Humulus, Maclura, Morus.

The plants are of diverse utility. Fig, mulberries and breadfruit are known for the edible fruit, hemp (Cannabis) for its fiber, Castilla and some species of Ficus for rubber, Dorstenia for its curious open receptacle and sometimes grown under glass for botanical demonstration, hop (Humulus) for its cones used in brewing and grown also for ornament, osage-orange (Maclura) for hedges, and others in general planting for

ornament and interest.

MORÆA (Morea). Iridaceæ. Herbs, mostly African, having corms or short rootstocks, narrow basal lvs. and iris-like fls. in clusters, the perianth without tube. Tender in the N.; otherwise cult. as for Iris which these plants much resemble. They thrive in Fla. and Calif. The spelling Moræa is now conserved.

bicolor. To 2 ft.: fls. lemon-yellow spotted with brown at base, 2 in. across. S. Afr.

Carsonii. To 1½ it.: If. 1, narrowly linear, to 1 ft. long, stiffly erect, strongly ribbed: fis purple, less than 1 in. long, in clusters of 3-4. caps. to ½ in. long. E. trop. Afr.

catenulata (Dietes catenulata). To 15 in.: lvs. glaucous: fis. white tinged with blue, outer segms with large yellow spot and 2 rows of small yellow warts, stigmas blue. Described from a cult. plant from Mauritius.

edulis. To 18 in, sts slender, terete: If. solitary, 8-15 in. long, wiry: fls. lilae with yellow basal patches, usually 2-4, about 2 in. across, remaining open for four to six hours only, fragrant, Aug. S. Afr.—Pure yellow and white-fld. forms are known.

flagelloides: listed name of unknown botanical standing. glaucópis. To 2 ft: fls. white with blue-black circular spot at base of outer segms., to 1¼ in. long. S. Afr.

iridioldes (Dietes iridioides). To 2 ft.: fls. white with yellow bands, 1½ in. long, the crests of the style marked with blue. S. Afr. Var. Jöhnsonii has longer lvs. and larger fls. Var. Macleai (M. Macleai) is an improved hort. form.

isopétala: listed name of form said to be similar to M. polystachya but with lilac fls.

Macleai: M. iridioides var.

papilionàcea. To $6~\mathrm{in.}$: lvs. to $6~\mathrm{in.}$ long, hairy: fis. lilac to red with yellow on claws. S. Afr.

pavonia (Iris pavonia). To 1 or 2 ft.: lvs. pilose: fls. about 1 in. long, bright red with blue-black or green-black spot at base, or in var. lutea glabrous lvs. and unspotted yellow fls.; var. villosa bright purple with blue-black; another kind is white with blue spots. S. Afr.

polystachya. To 3 ft.: fis. lilac with large yellow spot at base of outer segms., to 1½ in. long. S. Afr.

ramosa. To 3 ft.: lvs. linear, to 1½ ft. long: fls. bright yellow, to 1¼ in. long, infl. a corymb of 20-30 clusters. S. Afr.

ramosissima. To 30 in.: lvs. basal, linear, about 6, to 18 in. long, canaliculate, ribbed: fls. bright yellow, in corymbs, blossoming over several weeks, sts. branched with axillary bulbels. S. Afr.—Corms of this species are sometimes labelled *M. ramosa*.

Robinsoniàna. To 8 ft.: fls. white spotted near base with red and yellow. Lord Howe Isls., Australia.

Sisyrinchium: Iris Sisyrinchium.

spathacea. To 4 ft.: fls. bright yellow, to 2 in. long. S. Afr.

tricúspis (*Iris tricuspis*). To 1 or 2 ft.: fls. whitish or lilac, to 1 in. long. S. Afr. Var. lûtea is listed.

tripétala. To 2 ft.: fis. lilac, rarely blue or reddish, to 11/4 in. long. S. Afr.

tristis. To 1½ ft.: lvs. 2-3, linear, mostly basal, grass-like, to 2 ft. long: fi.-st. unbranched; fis. lilac or pink, short-lived, in lax corymbs. S. Afr.

undulata. Lf. solitary, basal, linear, margin somewhat wavy: fis. lilac, in few erect cymes on short peduncles. S. Afr.

villòsa: M. pavonia var.

MORAWETZIA: Oreocereus Doelzianus.

MORICÁNDA. Cruciferæ. Erect herbs or small shrubs from Medit. region, having glaucous and usually entire lvs., large rose-violet to purple fls., and a linear silique with a short beak on straight, erect pedicels. Propagated by seed.

arvensis. Ann or bien to 1½ ft.: lvs. entire, basal ones cordate and sessile, lower st.-lvs. spatulate and briefly petioled: fls. violet with darker veins, to 1½ in. across or more: pod much compressed, to 2 in. long and ½ in. wide, beak about ½ in. long.

hesperidifiòra: Diplotaxis acris.

nesperiamora: Diplocars acris.
sonchitòlia. Ann. or bien. to 2 ft., branched, glabrous:
basal lvs. lyrate, segms. ovate, st.-lvs. obovate-oblong, to
4 in. long, acute, serrate, sessile, acutely auricled at base:
fls. pale violet-blue, to 1½ in. across, in lax terminal
racemea, anthers yellow: pod to 4 m. long, nearly straight.
Siberia.

MORÎNA. Dipsacex. Thistle-like per. Asian herbs with opposite or whorled spiny-toothed lvs. and 5-lobed fls. in interrupted spikes, the whorls subtended by leaf-like spiny-toothed bracts; sometimes planted for ornament. Propagated by division.

longifòlia. Whorl-Flower. To 4 ft.: lvs. oblong to linear, to 6 in. long: fls. white changing to crimson, 1½ in. long, tubular and conspicuously protruding. Himalayas.

MORÍNDA. Rubiacex. Trees and shrubs in warm and trop. regions of both hemispheres, sometimes climbing, with opposite lvs. or sometimes in 3's, and small white or crimson fls. often in close clusters: fr. a glomerate head of berry-like carpels.

citrifòlia. Indian-Mulberry. Small glabrous tree: lvs. narrow-oblong to broad-oval, entire, to 10 in. long, with prominent curving side veins, the stipules large and soon falling: fls. white, ½ in or more long: fr. an aggregate yellowish fleshy head to 2 in. long. S. E. Asia, Australia.—Yields red and yellow dye in fls. and roots.

Royoc. Royoc. Vine-like shrub or sometimes erect to 4 ft.: lvs. narrow-oblong, acute, to 3 in. or more: fls. mostly white, in a head which becomes a yellow fr. to ¾ in. and more across. Fla., W. Indies, and seen about cult. grounds.

MORÍNGA (Hyperanthera). Moringaceæ. Deciduous trees with alternate pinnate lvs. and white or red fls. in axillary panicles; one grown for ornament in the tropics, also for the edible root and the seeds from which ben oil is extracted. Propagated by seeds or cuttings.

olesfera (M. perygosperma). Horse-Radish-Tree. To 30 ft.: Ifts. small, less than 1 in. long: fls. white, 1 in. across, fragrant: fr. linear, 3-angled, to 1½ ft. long. E. Indies; nat. in trop. Amer.

pterygospérma: M. oleifera.

MORINGACEÆ. MORINGA FAMILY. Only one genus, Moringa, characterized by bisexual irregular fls. having 5 sepals and petals, 5 fertile and 5 sterile stamens, superior 1-celled ovary, and fr. an elongated caps.

MORÍSIA. Cruciferæ. One very small per. herb native in Corsica and Sardinia, adapted to the alpine-garden. M. monántha (M. hypogæa). Sts. none or very short: lvs. linear, pinnately cut, to 3 in. long: fls. golden-yellow, ¾ in. across, solitary, spring and early summer.

MORMÒDES. Orchidaceæ. American epiphytic orchids with more or less elongate several-lvd. pseudobulbs, plicate lvs. and lateral loosely-fld. racemes; allied to Catasetum from which it differs in its perfect fls. and twisted column

bădium. Pseudobulbs to 8 in. tall: lvs. linear-oblong, to 15 in. long: scapes many-fld., arching; fls. deep purplish-crimson. Dec.-Jan. Peru. Var. lûteum has bright yellow

Lawrenceanum. Pseudobulbs oblong-conic: lvs. to 16 in. long: fls. to about 3 in. across, abundant on long scapes; sepals and petals pale greenish-yellow with 5 brown-purple lines; lip yellow spotted with purplish-brown. Colombia.

MORNING-GLORY: Ipomæa, also Argyreia, Convol-ทนในส

MORONGIA: Schrankia.

MORPHIXIA: Ixia paniculata.

MORRÈNIA. Asclepiadacex. Twining more or less woody vines from Brazil and Argentina bearing grayish foliage and small not conspicuous fls. in lf. axils; follicles smooth, thick and leathery. One species is planted in Fla. and S. Calif., M. odorata, prized for its fragrant greenish white-centered fls. which are about 5% in. long, solitary or few together in axils on slender pedicels nearly or quite the length of the corolla: lvs. opposite, halberdshaped, with 2 spreading blunt lobes at base and a long central lobe or part acute at apex, closely pubescent underneath: corolla-lobes pointed.

MÒRUS. MULBERRY. Moracex. Deciduous trees of the northern hemisphere with alternate lvs., unisexual fls. in drooping catkins, and fr. a juicy syncarp resembling a blackberry in appearance; grown for the edible frs. and the foliage which is used to feed silkworms. For cult. see Mulberry.

acidòsa: M. australis.

acidosa: M. australis.

álba. White M. To 80 ft.: lvs. ovate, to 4 in. and more long, coarsely toothed or often lobed, shining above: ft. white, pinkish or purple-black, to 2 in. long, sweet. China; nat. in Eu. and N. Amer. Var. globosa, said to be of more compact habit. Var. macrophylla (M. Morettiana) has undivided lvs. to 9 in. long and red fr. Var. pēndula, branches drooping. Var. pyramidālis, of narrow pyramidal habit. Var. skeletoniāna (var. lacinata), lvs. with deep narrow lobes. Var. tatárica (M. tatarica), Russian M., is a small very hardy form.—Other names referred here are M. cedrona, M. hispanica and M. Tokwa.

austràlis (M. acidosa. M. japonica). To 25 ft., usually shrubby: lvs. ovate, to 6 in. long, toothed, often deeply lobed: fr. dark red, ½ in. long, sweet. China, Korea, Japan.

cedròna: M. alba. hispánica: M. alba. iapónica: M. australis.

Morettiana: M. alba var. macrophylla.

multicaùlis (M. alba var. multicaùlis). Resembling M. alba and sometimes considered a var., but with much larger coarsely toothed lvs. which are dull green and rough above, and sweet black fr. China.—Famous for its part in the historic attempts at silk-raising in N. Amer.

nigra. Black M. To 30 ft.: lvs. broad-ovate, to 8 in. long, coarsely toothed, usually not lobed, heart-shaped at base, dull green and rough above, pubescent beneath: fr. purple to black, to 1 in. long. W. Asia.

pérsica: listed name of unknown botanical standing.

rubra. Red or American M. To 60 ft.: Ivs. ovate, to 5 in. or more long, sharply toothed, sometimes lobed, soft-pubescent beneath: fr. dark purple, about 1 in. long. Mass. to Fla. and Tex.

tatárica: M. alba var. Tókwa: M. alba.

MOSCHARIA. Compositæ. One musky-scented ann. herb from Chile, sometimes planted for ornament. M. pinnatífida. To 2 ft., diffuse: lvs. clasping, pinnate or pinnatifid, the upper ones lobed only at base: heads of white or light rose ray- and disk-fls., borne in terminal panicles; pappus of scales.

MOSCHATEL FAMILY: Adorgoes

MOSCHOSMA: Iboza riparia

MOSOUITO-TRAP: Cynanchum acuminatifolium.

MOSS, CLUB-: Lycopodium. Ditch-: Anacharis canadensis. Flowering-: Pyzidanthera barbulata. Pink: Phlox subulata. Rose-: Portulaca grandiflora. Spanish-: Tillandera venacidae

MOTHER-OF-THYME: Thumus Sermillum.

MOTHERWORT: Leanurus

MOUNTAIN FLEECE: Polygonum amplexicaule. Fringe: Adlumia fungosa.

MOURNING BRIDE: Scabiosa.

MUCRONATE: tipped with a short sharp point or

MUCÙNA. Leguminosæ. Woody 'per. vines with lvs. of 3 lfts., papilionaceous fls. in axillary clusters, and thick leathery pods; distinguished from Stizolobium chiefly by characters of seed.

Deeringiana: Stizolobium Deeringianum.

urens. Climbing to 30 ft.: lfts. to 7 in. long: fls. purple with yellowish keel: pods to 8 in. long, covered with stinging hairs. Trop. Amer.

MUEHLENBÉCKIA (Calacinum). WIRE-PLANTS. Polygonacex. Prostrate, viny climbing more or less polygonum-like woody plants with wire-like sts. and alternate lvs., small unisexual fls. in axillary clusters or short spikes or racemes, and berry-like frs.; grown in greenhouses and hanging-baskets and outof-doors in warm climates. Propagated by cuttings, when seeds are not available. Calacinum is an older name than Muehlenbeckia but the latter has been officially conserved.

axillaris. Much branched prostrate or sprawling small bush forming matted clumps 1 ft. or less through or at other times straggling: lvs. 1/4 in. or less long, oblong to nearly orbicular, rounded at base: fls. solitary or in 2's. New Zeal.—Cult. as M. nana.

chilénsis. Twining: lvs ovate to oblong, triangular at base, about 1/2 in. long: fls. in axillary and terminal racemes. Chile, Peru.

compléxa. Wire-Vine. Maidenhair-Vine. Twining, covering bushes, rocks and chimneys with interlaced sts.: lys. orbicular or fiddle-shaped, 1/2-1/2 in. across fls. in axillary or terminal spikes. New Zeal.—Much grown in

nàna: see M. arillaria.

platyclados: Homalocladium platycladum.

rivulàris: see Polygonum rivulare.

MUGWORT: Artemisia.

MUILLA. Liliacex. Small group of California cormous plants with very narrow lvs. and small greenish-white fls. in umbels, allied to the alliums.

maritima (Allium maritimum). To 1 ft.: lvs. nearly cylindrical: fis. on long pedicels in loose umbels, anthers purple.

MULBERRY. Trees from many regions in the northern hemisphere, being species of Morus (which see). Both for fruit and ornament the mulberry is planted. The tree is naturally open-centered and round-headed, and is an interesting subject; some of the varieties have finely cut leaves. The fruits are in great demand by the birds.

In orchard plantations mulberries may be placed 25-30 feet apart. About the borders of a place they may go closer. The Russian varieties are often planted for windbreaks, for they are very hardy and thrive under the greatest neglect; and for this purpose they may be

planted 8-20 feet apart; they make excellent screens and stand clipping well. New American, Trowbridge and Thorburn are leading kinds of fruit-bearing mulberries for the North. The true Downing is not hardy in the northern states; but New American has been sold under this name. Pomological mulberries for planting in the North are forms of Morus alba. The more tender M. nigra, black mulberry, is grown in the Middle South and beyond. Certain named fruit varieties of the native M. rubra are also known. In silk-producing countries mulberries are grown as forage for silkworms. Mulberries thrive in any good soil, and need no special treatment. A weeping mulberry is frequent as an ornamental oddity, being grafted 4 or 5 feet high on a straight tree form; it is *Morus alba*.

Mulberries grow readily from seeds. Named kinds may be cion-budded on seedlings or on stocks grown from ripe hardwood cuttings.

MULBERRY, FRENCH-: Callicarpa americana, Indian -: Morinda citrifolia. Paper -: Broussonetia.

MULGA: Acacia aneura.

MULGEDIUM: Lactuca.

MILLEIN: Verbascum Cretan: Celsia cretica.

MULTIFID: cut or cleft into many narrow lobes or parts.

MUNDI-ROOT: Chlorocodon Whiteii.

MUNTÍNGIA. Elæocarpaceæ. One species, a tree to 30 ft., native in W. Indies, Mex. to N. S. Amer. and somewhat naturalized in the eastern tropics. M. Calabura. Lvs. alternate. oblong-lanceolate, to 5 in. long, toothed, tomentose beneath: fls. white, 1 in. across, solitary or clustered in the axils: fr. a globose berry about 1/2 in. across.

MURRÀA (Murraya. Chalcas). Rutacex. A few Indo-Malayan spineless small trees or shrubs, one of which, M. exótica, the Orange-JESSAMINE, is a handsome evergreen grown for ornament in S. Fla. and S. Calif. and the tropics; the plant known as *M. paniculata* is probably a form of it. The orange-jessamine makes a tree-like specimen 10-12 ft. high with glossy foliage and white very fragrant fls. succeeded by clusters of red ovoid frs. 1/2 in. or less in diam.: lvs. pinnate, of 7-9 ovate or rhomboidal lfts. and marginless petioles; blooms several times a year.

MUSA. Banana. Musaccæ. Tree-like but hardly woody plants, the large spirally arranged lvs. (which become frayed by the wind) forming a trunk by their sheathing bases, the irregular fls. borne in clusters under colored bracts on long drooping or erect spikes, each st. or trunk blooming only once, and fr. long and fleshy; grown for the edible frs. and a few for fiber and ornament. See Banana.

Bananas are suited only to warm climates, although they often withstand a few degrees of frost. For ornament they are grown in mild climates and are often planted out for subtropical effects. The plant is renewed by the suckers that spring up at the base, as the top dies after fruiting or becomes weak and unsightly. Propagation is also effected by root-cuttings planted in warm beds and transplanted as soon as one or two leaves have matured. The ornamental kinds often produce seeds and these should be sown in beds with bottom heat. Bananas may be grown for decoration in greenhouses with a night temperature of about 65°. in greenhouses with a night temperature of about 65°.

Arnoldiana. To 15 ft: lvs. to 7 ft. long: spikes short and drooping: fr. to 4 in. long, with seeds ½ in. long. Trop. Afr.

Cávendishii: M. nana. chinénsis: M. nana.

Ensète. Abyssinian B. To 40 ft., the trunk swollen at base: lvs. to 20 ft. long and 3 ft. wide: spike erect, the reddish-brown bracts to 1 ft. long: fr. to 3 in. long, having large black seeds, inedible. Abyssinia,

Martinii. To 30 ft.. lvs. to 8 ft. long, oblong, long-petioled, green above, red-vened beneath: fls. rose-red, followed by small yellow fr. Intro. from Canary Isls.—Plant similar in habit to M. paradisiaca.

nana (M. Cavendishii. M. chinensis). DWARF B. To 6 ft., stoloniferous. Ivs. to 4 ft. long and 2 ft. wide: spike short and drooping, the reddish-brown bracts to 6 in. long: fr. yellow, to 5 in. long, seedless. S. China.

oranocénsis: probably a hort, form of banana.

paradislaca. PLANTAIN. To 30 ft., stoloniferous; lvs. to 9 ft. long and 2 ft. wide: spike drooping, to 5 ft. long, the red or violet bracts to 1 ft. long: fr. greenish-yellow, to 14 in. long, seedless, edible when cooked. Probably India. Var. sapientum, Common B., has yellow fr which is edible without cooking. Races are rubra with red frs. and Chámpa with thun-skinned "lady-finger" frs.

religiòsa. To 8 ft.: lvs. to 5 ft. long, somewhat elliptical, mucronate tipped and thick: fr. filled with seeds to 1/3 in. diam., not edible. French Congo.

rosacea. To 6 ft., stoloniferous: lvs. to 3 ft. long and 1 ft. wide, purplish beneath: spike drooping, to 1 ft. long, the pale blue bracts to 8 in. long: fr. yellowish-green, to 3 in. long, inedible. India.

sapiéntum: M. paradisiaca var.

sumatrana. To 8 ft., usually stoloniferous: lvs. to 6 ft. long and $1\frac{1}{2}$ ft. wide, glaucous beneath: spikes drooping: fr. to 3 in. long, medible. Sumatra.

supérba. To 12 ft., st. short: lvs. oblong, to 10 ft. long, sessile, base narrow: fis dull red, many in drooping spike: fr. to 3 in. long. Tropics of Old World.

téxtilis. Abacá. Manha Hemp. To 20 ft, stoloniferous: lvs oblong with petiole 1 ft. or more long: spike drooping and short: fr. to 3 in. long, with numerous black seeds, inedible. Philippines.—Grown for the fiber in the lf.-bases.

zebrina; botanical identity uncertain; lvs. striped with

MUSACEÆ. BANANA FAMILY. Trop. per. monocotyledonous herbs of about 6 genera, often of very large size and becoming woody and somewhat tree-like. The family is characterized by the bisexual or monocious fls. borne in the axils of large bracts in a spicate or paniculate infl. which is subtended by spathes, with 3 sepals and 3 petals, 6 stamens, 5 of which are fertile, inferior 3-celled ovary, and fr. a berry or caps. Several genera are cult. for orna-ment and other kinds for fiber and the edible fr., as Heliconia, Musa, Ravenala, and Strelitzia.

MUSCADINIA: Vitis rotundifolia, V. Munsoniana and V. Popenoei.

MUSCÀRI. GRAPE - HYACINTH. Liliaceæ. Spring-blooming bulbous herbs native in Medit. region, having a few narrow basal lvs. and small blue or white urn-shaped nodding fls. in racemes or spikes at top of scape, the perianth-segms. united and having 6 small recurved teeth. Of easy cult., as for hyacinths, and useful for colonizing. Propagated by offsets or seeds.

album: plants under this name may be forms of M. botryoides or M. conicum.

amethýstinum: an unidentified trade name.

amphibilis: listed name for a form with light blue fls.

Argèi: hort. name of uncertain standing.

armeniacum. Lvs. to 1 ft. long and 1/4 in. across: fls. deep violet, the teeth white, scape to 6 in. high. Armenia. azureum: Hyacinthus ciliatus.

botryoides. To 1 ft.: lvs. ½ in. across: fls. blue, about ½ in. long. S. Eu. Var. álbum has white fls., cárneum flesh-colored, and cærûleum bright blue.

cærùleum: M. botyroides var.

ciliatum: Hyacinthus ciliatus.

commutatum. To 10 in.: lvs. 1/4 in. across: fls. dark blue. Sicily.

comòsum. To 1 ft.: lvs. to 1 in. across: upper fls. sterile, blue or violet. lower fertile fls. olive. S. Eu., Asia. Var. monstròsum (M. plumosum and tenuifolium) has all the fls. sterile and cut into fine shreds.

cónicum. To 6 in.: lvs. $\frac{1}{4}$ in. across: fis. violet-blue. S. Eu.

élegans: listed name, fls. bright blue bordered with white.

Heldreichii. To 8 in.: lvs. 1/3 in. wide: fls. amethyst-blue, the teeth white. Greece.

latifolium. To 1 ft.: lvs. solitary, to 1 in. across: fls. blue, the sterile fls. paler. Phrygia.

Masseyanum: listed name; plant with rose-colored fls. micránthum. Scape to 5 in.: lvs. longer, to 1/4 in. across: fls. bright violet, sterile ones pale blue, fragrant. Habitat

monstrosum: M. comosum var.

moschatum. To 10 in. or less: lvs. to 34 in. across: fls. musk-scented, purplish becoming vellowish or brownish. Asia Minor. Var. flavum, fls. yellowish. Vars. majus and minus are hort, forms.

minus are hort, forms.

negléctum. To 9 in.: lvs. 1/6 in. wide: fis. dark blue, fraurant. Medit. region.

paradóxum. To 9 in.: lvs. few, to ¾ in. broad: fls. blue-black, in dense racemes. Caucasus.

plumòsum; M. comosum var. monstrosum.

polyánthum. To 1 ft.: lvs. 1/4 in. across: fls. deep blue. Asia Minor. Var. álbum is listed.

racemòsum. To 8 in.: lvs. 1/3 in. wide: fis. dark blue, fragrant. Eu, Asia. Var. carneum is in the trade.

Szovitsianum. To 7 in.: lvs. lnear, to 9 in. long, canaliculate, light green: fls. bright to purplish-blue, on short curved pedicels, nodding in dense conical racemes. Caucasus and S. Russia.

tenuifòlium; M. comosum var. monstrosum.

MUSCARIA: Saxifraga.

MUSHROOMS are higher fungi, of which Agaricus campestris, the common mushroom, is the only species usually cultivated in the United States. The life cycle of mushrooms begins with the germination of a spore, which in the cultivated mushroom gives rise to a thread-like growth called mycelium. The mycelium develops an extensive underground system by which it concentrates food in a central point. Here the threads enlarge, eventually forming a group of buttons or small mushrooms.

Mushrooms are produced from an especially prepared material, called spawn, filled with living mushroom mycelium with which the prepared beds are inoculated. The spawn originally had a manure base, but since 1930 there has been a gradual change to a base of whole kernels of wheat or rye. This new type is economical to produce and will inoculate approximately three times as much bed area as an equal volume of the manure spawn.

Mushrooms are grown where the temperature can be kept between 45 and 65° F., providing the relative humidity is high and the ventilation controlled. Sunlight is not harmful to mushrooms, but they are usually grown in the dark because it is easier and cheaper to control the temperature and humidity in structures without windows. Cellars, caves, old barns, and specially constructed mushroom houses are employed.

Horse manure with straw bedding has been used almost exclusively in the past as the raw material for mushroom compost. However, experiments in Pennsylvania have shown that a compost of wheat straw, urea and wheat produced nearly as many mushrooms to a ton as did horse manure. Manure from grain-fed horses bedded with wheat straw seems to be best. It is usually composted as soon as a pile is assembled sufficient to fill the mushroom house or a definite unit of bed space; less than 1 ton of manure is difficult to compost. Aeration, moisture, and temperature are the most important factors affecting the composting process. These are largely dependent on the size, shape and compactness of the pile, the quantity of water added and the number of days between turnings. Manure containing a moderate amount of straw is usually piled 4 to 6 feet high when first assembled. The piles are allowed to stand undisturbed for ten days before the first turning. Repeated turnings are made at intervals of about a week. Usually three or four turnings are sufficient. The compost should be kept moist at all times, neither wet nor dry. The practical test is to squeeze a ball of it tightly in the hand. If the hand is not moistened, the compost is too dry; if water oozes out freely between the fingers, it is too wet.

Manure should be placed in the beds at about the rate of 1 bushel to 2 square feet of bed space. As soon as the beds are filled, the house, or that section of the structure containing the beds, is sealed tightly for a few days to allow the manure to go through a final period of fermentation. High temperatures are generated in the beds and in the air surrounding them. The manure in the beds should reach a temperature of 130-145° and the surrounding air temperature should reach 120–130°. This eradicates most of the harmful insects and fungi and seems to bring about a condition which later encourages a healthier and more rapid run of spawn. A still more complete control of the insects and diseases may be obtained by burning flowers of sulfur, 2 pounds to 1,000 cubic feet of air space, at the time the house reaches its peak heat. All cracks and openings should be tightly sealed for twenty-four hours.

After heating, the temperature is gradually lowered to 75° for spawning. Mycelium develops most rapidly from the spawn inoculations if this temperature is maintained for a week or ten days after spawning. The beds are then allowed to cool slowly until a cropping temperature of 45–65° is reached. Spawn pieces about one-half as large as hen's eggs should be spaced 8 inches to 1 foot apart in the bed and about 1–1½ inches deep. An imperial quart bottle of manure spawn will inoculate 30 to 40 square fect of bed area. The new type grain spawn will inoculate about twice this area.

Casing is the term applied to spreading soil about an inch thick over the entire bed. This is performed two to four weeks after spawning. Silt leams to light clay leams, containing a fair amount of organic matter and with a reaction approximately neutral, are best. Acid soils should be avoided or limed.

Watering the beds usually begins as soon as they have been cased. Light waterings may be necessary before this if the compost becomes too dry. Care should be taken to avoid excess watering.

After easing, mushrooms should appear in six or seven weeks, and the crop should continue, under proper conditions, for two or three months.

MUSINEON. Umbelliferæ. W. American caulescent or cespitose perennials with pinnate to tripinnate lvs., cream-colored to yellow fls. in dense bractless umbels, and ovate to oblong fr. flattened laterally.

tenuifolium (Daucophyllum tenuifolium). Plant cespitose, to 10 in. high: lvs. 2-3-pinnate, segms, filiform: fr. cream-white. Neb. to S. D. and Wyo.

MUSKMELON: see Melon.

MUSK-PLANT: Mimulus moschatus. -Root: Adoxa Moschatellina.

MUSQUASH-ROOT: Cicuta maoulata.

MUSTARD. Several species of Brassica (Sinapis), mostly annuals, grown for the cluster of basal leaves used as greens, and also for the seeds employed in the manufacture of table mustard and in other countries for oil (colza). They are half-hardy, coming quickly from seeds. For greens the plants are usually in rows far enough apart to admit of tool-tillage; in the row they may stand 5 or 6 inches apart and be thinned as used. They may be sown at intervals, in early spring for early summer use up to August or even later for autumn use; in warm countries they are sown in autumn for early spring crop. They are usually little attacked by fungi. If allowed to seed, they may become weedy.

The commonest vegetable-garden species is Brassica juncea, particularly var. crispifolia in the kinds known as Ostrich Plume and Southern Curled. Another race is represented by B. chinensis, B. parachinensis and B. pekinensis, the latter discussed under the entry PeTsai. Probably all these mustards are east-

Asian in nativity.

MUTÍSIA. Compositæ. Herbs and shrubs of S. Amer., with alternate lvs. and solitary terminal heads of disk-fls. and a few purple, rose or yellow ray-fls.; pappus plumose. One species grown out-of-doors in Calif. or in a cool greenhouse. Propagated by cuttings.

Clématis. Pubescent climbing herb: lvs. pinnate, with 4-5 pairs of oblong-lanceolate entire lfts., the midrib extended into a tendril: heads 2 in, across, with 9-10 bright red recuived rays. Trop. Andes.

MYALL, WEEPING: Acacia pendula.

MYCONÉLLA. Compositæ. A small Cent. and S. European genus, probably of a single species, differing from Chrysanthemum in the marginal achenes sterile, flattened and those of the disk with a stiff pappus. M. Myconis (Chrysanthemum and Myconia Myconis). Ann. or per. to 2½ ft., sts. glandular-hairy to glabrescent: lvs. obovate to spatulate, sharply serrulate, obtuse: heads yellow, to 1½ in. across, solitary on long narrow-lvd. peduncles; rays oblong, apex usually bidentate.—Plants cult. under this name may be Chrysanthemum segetum.

MYCONIA: Myconella Myconis.

MYOPORÀCEÆ. MYOPORUM FAMILY. Trees and shrubs of 5 genera native from Australia, E. Asia to Hawaii and W. Indies: lvs. mostly alternate, simple and entire: fls. bisexual, with 5-parted calyx, gamopetalous 5-6-lobed corolla, 4 stamens and 1 staminode, and superior usually 2-celled ovary: fr. a drupe. Bontia and Myoporum are occasionally grown for ornament in warm regions or greenhouses.

MYÓPORUM. Myoporaceæ. Shrubs and trees with alternate glandular long and narrow lvs. and usually white bell-shaped fls., regular or essentially so, in axillary clusters among the foliage, and small drupaceous frs.; native from Japan to Australia and grown in the open in warm regions and under glass N. Propagated by cuttings.

acuminatum. Shrub: Ivs. oval-oblong to linear, to 3 in. long: fls. white, 1/3 in. long. Australia.

insulare. Tall shrub or tree to 30 ft.: lvs. lanceolate to obovate, to 3 in. long, remotely serrate to entire, thick: fls. white with purple spots, to ¼ in. across, usually 2-4 in axils: fr. purplish-blue, globular, to ¼ in. across. Australia.

lætum. Shrub or tree to 15 ft.: lvs. lanceolate, to 4 in.

long, shining: fis. white spotted purple, $\frac{3}{3}$ in. across: fr. reddish-purple. New Zeal.

sandwicense. Bastard Sandalwood. Naio. Tree to 60 ft. with wood odor of sandalwood: lvs. oval-lanceolate, to 6 in. long: fls. white or pink, 1/2 in. across: fr. white. Hawaiian Isls.

MYOSOTÍDIUM. Boraginaceæ. A single per. herb native in the Chatham Isls. (New Zeal.), sometimes cult. in mild climates; it has been referred to Cynoglossum. Propagated by seeds. M. Horténsia (M. nobile). To 3 ft.: basal lvs. ovate, heart-shaped at base, to 1 ft. long, st.-lvs. smaller: fls. dark blue, paler at outside, ½ in. across, in dense cymes to 6 in. across.

MYOSÒTIS. FORGET-ME-NOT. Boraginaceæ. Small ann., bien. and per. herbs with alternate entire lvs. and small but abundant blue, rose or white fls. in terminal racemes, largely in Amer. and Eu. in moist or cool places; corolla salverform, throat-usually crested; stamens included.

Forget-me-nots are cultivated mostly out-of-doors and thrive in partially shady positions in moist soil. Winter protection is desirable. Propagated by seeds which will give bloom in autumn or the second year; also by division of the clumps.

alpéstris (M. rupicola). Similar to M. sylvatıca, from which it differs in its lower habit, shorter-stalked fls. and larger nutlets. Eu.—Not known to be in cult., the plant grown under this name is a form of M. sylvatica, which see for listed vars.

alpina: M. sylvatica.

arvénsis. Ann. or bien. to 1½ ft.: lvs. oblong or oblong-lanceolate, 1 in. long: fis. white or blue, to ½ in. across. Eu., Asia, E. N. Amer.

australis. Per. to 1½ ft., densely hispid: basal lvs. oblong- to linear-spatulate, obtuse, to 2 in. long, st.-lvs. smaller: fls. yellow or white, to ½ in. long, many in elongated racemes. New Zeal. Var. conspicua has fls. to ½ in. long and may not be cult.

azórica. Per. to 1½ ft.: lvs. broadly oblong-lanceolate, to 4 in. long: fls. blue with whitish center, ¼ in. across. Azores, Canaries, Algeria.

cespitòsa (M. Rehsteineri). Similar to M. laxa but more pubescent and fls. longer pedicelled. Eu.

decora. Per., white-hoary, sts. prostrate or decumbent, to 2 in. long: basal lvs. linear-oblong, to 1 in. long, leathery, st.-lvs. to ½ in. long, sessile: fls. white, solitary in lf. axils, to ½ in. long, on short stalks, anthers long and conspicuous. New Zeal.

dissitifiora. Similar to M. sylvatica, but differing in lower habit and nutlets stalked, not sessile. Switzerland.—The plant known to hort, under this name is a form of M. sylvatica.

explanata. Per. to 12 in., sts. white-hairy, ascending: basal lvs. linear to spatulate, to 4 in. long, st.-lvs. narrowly oblong-lanceolate: fls. white, to $\frac{2}{3}$ in. across, in many-fld. short racemes. New Zeal.

grandiflòra álba: M. sylvatica var. robusta grandiflora.

láxa. Per. with decumbent sts. to 1½ ft. long: lvs. oblong or spatulate: fls. blue with yellow center, ¼ in. across. Newf. to Va. and Tenn., Eu.

lithospermifòlia: a form of M, sylvatica with numerous large lvs.

oblongàta: M. sylvatica.

palústris: M. scorpioides.

pyrenâica. Per. to 5 in. tall, sts. ascending: basal lvs. spatulate, long-petioled, st.-lvs. lanceolate: fls. bright blue, to 14 in. across, in groups of 2-3, stalks shorter than calyx. Corsica to Asia Minor.

Rehsteineri: M. cespitosa.

robústa grandifiòra: a form of M. sylvatica.

ròsea: a variant of M. sylvatica.

rupicola: M. al pestris.

scorpioldes (M. palustris). Sts. decumbent, to 1½ ft. long: lvs. oblong-lanceolate: fls. bright blue with yellow, pink or white center, ½ in. across. Eu., Asia. Var. rosea is listed as a color form. Var. semperflorens is a dwarf form to 8 in. high which flowers all summer.

sylvática (M. alpina. M. oblongata). Ann. or bien. to 2 ft.: lvs. oblong-linear: fis. blue with yellow center, varying to pink or white, to $\frac{1}{2}$ in. across, fl.-stalks nearly twice as long as calyx: nutlets sessile. Eu. and Asia.—A variable

plant in cult. and hort. variants are often confused and listed under M. alpestris; some of these are: álba, fls. white; compácta, a dense-growing form, lower than type; Físcheri, dwarf with fls. bluish-pink; robústa grandiflòra, vigorousgrowing with large fls.; ròsea, fls. rose; strícta, branches erect and strict.

Traversii. Much branched per. to 6 in., white-hairy: lvs. linear-spatulate, to 1½ in. long, leathery, rough: fis. lemon-yellow, ½ in. long, fragrant, in head-like hairy racemes. New Zeal.

unifibra. Tufted per, forming clumps 2-6 in. across, covered with appressed white hairs: lvs. linear-lanceolate or oblong, to ½ in. long: fls. yellowish-white, to ¾ in. across, solitary, terminal, almost sessile. New Zeal.

Welwitschii. Ann. or bien. to 4 in.: lvs. ovate-lanceolate: fls. bright blue with yellowish-white center. Spain.

MYRCIARIA: Eugenia.

MYRICA (Cerothamnus). Myricaceæ. Shrubs or tree-like, with alternate simple lvs., unisexual fls. in catkins, and grayish or purple drupaceous frs.; native in the northern hemisphere. Cult. for ornament or M. rubra for the edible frs. Propagated by seeds, layers and suckers.

asplenifòlia: Comptonia peregrina.

califórnica. California Bayberry. To 35 ft.: lvs. evergreen, lanceolate, to 4 in long: fr. purple, to ¼ in. long. Wash. to Calif.; not hardy N.—Will grow on sterile sandy soils.

caroliniénsis: M. pensulvanica and M. cerifera.

cerifera (M. caroliniensis). Wax-Myrtle. To 35 ft.: lvs. evergreen, lanceolate, to 3 in. long, acute: fr. grayish-white. N J. to Fla. and Tex.; fairly hardy N.—Prefers most peaty soil.

Gale. Sweet Gale. To 5 ft.: lvs. deciduous, oblanceolate, to 2½ in long: fr. inclosed by 2 wing-like bracts, yellowish, in dense catkins ¼ in. or more long. N. Amer., Eu., Asia; hardy N.—Does best on most peaty soil. Specific name pronounced in two syllables.

pensylvánica (M. caroliniensis of cult.). BAYBERRY. To 9 ft.: lvs. deciduous or sometimes evergreen, obovate, to 4 in. long, acutish or obtuse: fr. grayish-white. N. S. to Fla. and Ala.; hardy N.—Will do well on poor soil. The name M. caroliniensis was originally used by Philip Miller for the plant correctly known as M. cerufera and is not available for the Bayberry.

pumila. To 2 ft., spreading by horizontal rootstocks: lvs. obovate to linear-spatulate, often toothed at apex, glandular, hairy beneath, sessile: fr. grayish-white, to 1/6 in. diam. Ga. and Fla.

rubra. To 15 ft.: lvs. oblong-lanceolate, to 5 in. long: fr. deep red-purple. China, Japan; hardy only in warm regions.

—The frs. are edible and also used for making a drink.

MYRICACEÆ. SWEET GALE FAMILY. Two genera of small trees or shrubs native in the northern hemisphere, Comptonia and Myrica, with alternate simple or pinnatifid lvs., unisexual fls. without perianth, having 2-16 stamens, 1-celled ovary, and fr. a small drupe or nut.

MYRICÀRIA. FALSE TAMARISK. Tamaricaceæ. Deciduous woody plants, Eu. to China, with heath-like or scale-like closely placed alternate lvs., distinguished from Tamarix on technical characters of fls. and seeds: fls. small, in dense racemes, pink or white.

germánica (Tamarix germanica). To 6 ft., with many close ascending branches: fls. in terminal bracted racemes to 2 m. long. S. Eu., W. Asia; hardy N.

MYRIOCÉPHALUS. Compositæ. Herbs of Australia, usually white-woolly, with alternate entire lvs. and tubular fls. in dense compound heads surrounded by a general involucre, the bracts often with conspicuous appendage; pappus none or of awns or bristles. One species sometimes grown as an everlasting.

Stuartii (Polycalymma Stuartii). Ann. to 2 ft.: lvs. linear or lanceolate, to 2 in. long: fls. yellow, the bracts tipped white and resembling rays, in clusters 1 in. or more across.

MYRIOPHÝLLUM. WATER-MILFOIL. Haloragidaceæ. Aquatic herbs, the lvs. often of two kinds, those above the water entire or toothed and the submerged lvs. pinnatifid into hair-like segms., and the fls. in axillary clusters or spikes; grown in aquaria and ponds. Propagated by long cuttings planted in mud. Several species are native in the U.S., and they may occasionally be transferred to aquaria or pools.

proserpinacoldes. Parrots-Feather. Water-Feather. Rising about 6 in. out of water: lvs. feathery, all of one kind, the herbage in long bright green strands: fis. dicecious. Chile, Uruguay.—Now commonly grown in fountain basins and similar places.

verticillatum. Lvs. of two kinds; submerged lvs. in whorls of 3 or 4 and very finely divided; floral lvs. pinnatifid. N. N. Amer., Eu., Asia.

MYRISTICA: see Nutmea.

MYRISTICACEÆ. NUTMEG FAMILY. Trop. evergreen dioccious trees of 8 genera, having alternate entire lvs., small fls. without corolla, with 2-30 stamens, superior 1-celled ovary, and fleshy fr. containing 1 seed surrounded by an aril. The genus Myristica furnishes the nutmeg and mace of commerce.

MYROBALAN: Phyllanthus Emblica, Terminalia Catappa: also Prunus cerasifera.

MYROSPÉRMUM. Leguminosæ. A single tree to 60 ft., native in S. Amer. and escaped in W. Indies. M. frutéscens. Lvs. of 11-17 oblong or oval lfts. to 1 in. long: fls. papilionaccous, white, ½ in. long, in racemes to 4 in. long: pod flat, to 3 in. long, winged.

MYRÓXYLON (Toluifera). Leguminosæ. Large trees with pinnate lvs., whitish papilonaceous fls. in racemes, and flattened 2-winged pods bearing 1 seed in the end; native of trop. Amer. where they are grown for the balsam which they yield.

Pereiræ. Balsam-of-Peru. To 50 ft.: lfts. 7-11, oblong. Mex. to N. S. Amer.

peruiferum. Peru Balsam-Tree. Large tree: lfts. 9-13, ovate. N. S. Amer.

senticòsum: Xylosma senticosa.

toluifera (T. Balsamum). TOLU BALSAM-TREE. To 100 ft.: lits. 7-11, oblong. N. S. Amer.

MYRRHÍNIUM. Myrtaceæ. Shrubs and trees of S. Amer. with opposite simple lvs. and fls. in corymbs, having 4-8 long-exserted stamens; one species intro. in S. Calif.

salicinum. Medium-sized glabrous tree: lvs. narrow oblong-lanceolate, gradually contracted at base. Uruguay.

MÝRRHIS. MYRRH. Umbelliferæ. European per. herb., sometimes grown for the sweet-scented herbage. M. odorata. Sweet Cicely of Eu. To 3 ft.: lvs. 2-3-pinnately compound into lanceolate, toothed or cut segms.: fls. small, whitish, in compound umbels: fr. shining, nearly 1 in. long and strongly ribbed.—Propagated by seeds sown as soon as ripe, or by division.

MYRSINACEÆ. MYRSINE FAMILY. Trees and shrubs of about 30 genera in the tropics and subtropics on both sides of the world, with alternate simple lvs., regular bisexual or rarely diœcious fls. having 4-5 sepals, 4-5-lobed corolla, 5 stamens, mostly superior 1-celled ovary, and fr. a berry or drupe. Ardisia, Mæsa, Myrsine and Suttonia are grown for ornament.

MÝRSINE. Myrsinaceæ. Shrubs and trees in Asia and Afr., having entire or toothed lvs., small fls. with petals united at base or to middle, and fr. a 1-seeded berry; grown out-of-doors in warm climates. Name in three syllables.

africana. Shrub to 4 ft. or sometimes small tree: lvs. elliptic, variable but usually about ½ in. long, finely toothed beyond middle: fls. ½4 in. across, in 3-8-fld. clusters. Afr., Arabia to Cent. China.

salicina: Suttonia salicina.

semiserràta. Small tree; lvs. lanceolate, to 4 in. long, toothed or nearly entire: fis. white, about $\frac{1}{12}$ in. long, in 5-12-fid. clusters. Hımalayas to China.

Urvillei: Suttonia australis.

variábilis. Tree to 40 ft.: lvs. obovate-ohlong, to 2½ in. and more long, entire or slightly toothed: fis. about 12 in. long. Australia.

MYRSIPHYLLUM: Asparagus asparagoides.

MYRTACEÆ. MYRTLE FAMILY. An important family with aromatic qualities, in the tropics and semi-tropics of both hemispheres, particularly strong in Australia, of about 75 genera, largely evergreen, yielding valuable timber, economic products such as oils, gums, cloves, allspice, and many edible frs., as well as numerous ornamental subjects. shrubs with simple mostly opposite lvs., regular bisexual polypetalous fls. having usually 4-5 sepals and petals or petals lacking, numerous stamens and inferior 1- to many-celled ovary. Genera known to hort. are: Agonis, Angophora, Astartea, Backhousia, Baeckea, Balaustion, Beaufortia, Britoa, Callistemon, Calothamnus, Calytrix, Chamælaucium, Darwinia, Eremæa, Eucalyptus, Eugenia, Feijoa, Hypocalymma, Kunzea, Leptospermum, Melaleuca, Metrosideros, Myrrhinium, Myrtus, Pimenta, Psidium, Regelia, Rhodomyrtus, Syncarpia, Tristania, Verticordia.

MYRTILLOCÁCTUS. Cactaceæ. Short-trunked tree-like heavy spiny cacti of Mex. and Guatemala, making thick-branched erect tops, with few stout ribs: fls. diurnal, very small, often several at an areole; ovary bearing a few very small scales with wool in the axils. See Cacti.

Côchal (Cereus Cochal). To 10 ft. with short woody trunk and many branches; ribs 6-8; radial spines 5; centrals 34 in long: fis. light green tinged with purple, 1 in. long: fr. red, ½ in. across, edible. Lower Calif.

geométrizans (Cereus geometrizans). Top large and much

branched, to 15 ft., branches bluish-green and commonly 5- or 6-ribbed and to 4 in. thick; radials mostly 5; central 1 and dagger-shaped: fis. mostly 1 in. or more broad: fr. (garrambulla) size of olive, bluish or purplish, edible. Tablelands, Cent. and S. Mex.

Schénckii. To 4 in. diam., dark green; ribs 7-8, acute, smooth, areoles glabrous; radial spines 5-7, to 1 in. long or less; central 1, to 2 in. long: fis. cream to pale lemon-yellow within, brownish outside, small. Mex.

MYRTLE: Myrtus. Crape:: Lagerstræmia. Downy: Rhodomyrtus tomentosa. Gum:: Angophora. Running:: Vinca minor. Sand:: Leiophyllum. Wax:: Myrica cerifera.

MYRTUS. MYRTLE. Myrtacex. Shrubs and trees in both hemispheres, with opposite entire lvs., white or rosy fis. solitary or in cymes, and fr. a berry.

Myrtle is grown out-of-doors in the South, in greenhouses or in pots for lawn specimens in the North. Propagated by cuttings of partially ripened wood under glass; also by seed

bullàta. To 25 ft.: lvs. broad-ovate, to 2 in. long, leathery, blistered between veins: fis. ½ in. across: fr. dark red, ½ in. long. New Zeal.

communis. The classic MYRTLE. To 10 ft., evergreen, strongly scented: lvs. ovate to lanceolate, to 2 in. long: fls. to 34 in. across: fr. bluish-black, ½ in. long. Medit. region. Var. albocárpa, fr. white. Var. buxifòlia, lvs. elliptical. Var. compácta is more dwarf and dense. Var. itálica, lvs. small, sharp-pointed. Var. latifòlia, lvs. very broad. Var. microphýlla has small overlapping lvs. Vars. mínima and nàna are small-lvd. dwarf forms. Var. romàna, lvs. broad-ovate. Var. tarentina, lvs. in 4 rows, short. Var. variegàta, lvs. variegated.

Lùma: Eugenia apiculata.

obcordata. To 15 ft., much branched: lvs. obcordate, to ½ in. long, leathery: fls. ¼ in. across: fr. dark red or violet ¼ in. long. New Zeal.

pedunculata. Similar to M. obcordata but differing in the obovate lvs rounded at the tip and 5- rather than 4-lobed calyx. New Zeal.

Poeppigeri: listed name.

Rálphii. To 15 ft.: lvs. ovate, to 1 in. long: fls. ½ in or less across: fr. dark red, to ½ in. long. New Zeal.

romana: M. communis var.

Ugni (Eugenia Ugni) CHILEAN GUAVA. Shrub or tree, pubescent when young: lvs. ovate, leathery, shining above, whitish beneath: fls. tinted rose, with 2 persistent basal bracts, calyx-lobes reflexed: fr. purple or reddish, about ⅓ in. diam. Chile.

MYSTACÍDIUM. Orchidaceæ. African epiphytic orchids resembling Angræcum; sepals and petals similar, lip entire or 3-lobed, spurred at base. See Orchids.

distichum (Angræcum distichum). Sts. tufted, more or less curved, to about 9 in. long, densely covered with small equitant two-ranked fleshy lvs. about ½ in. long: fls. white, solitary, about ½ in. long; spur as long as the furrowed ovary. July-Oct. Trop. Afr.

N

NABALUS: Prenanthes.
NÆGELIA: Smithiantha.

NAIBEL: Hesperethusa crenulata.

NAIL-WORT: Paronychia.

NAIO: Myoporum sandwicense.

NAMA: Eriodictyon Parrui.

NANÁNTHUS. Aizoaceæ. Segregates from the old genus Mesembryanthemum: stemless very dwarf per. plants with thick rootstock and warted lvs. in tufts of 3-6 pairs together not separated by internodes: fls. sessile or nearly so; stamens erect and conspicuous, in a cone. S. Afr.

albinòtus: Rabiea albinota.

aloides (M. aloides). Tufted: lvs. 6-8, partially terete, 2 in. long and 1/4 in. broad at base, white-warted: fis. yellow, 1 in. across, the petals in a single series.

Jamesii (Aloinopsis Jamesii). Lvs. 2, recurved, about 1 in. long, the upper ones ovate or orbicular, 1/2 in. long, brownish-green, punctate: fls. yellow with red lines, in two series.—See also Rabiea Jamesii.

Peèrsii: Cherridopsis Peersii.

Pole-Evansii. Lvs. 6-10, spatulate-lanceolate, 11/4 in, long and 1/4 in. broad, gray-green with pale warts: fls. light yellow with red line down middle of petals, 3/4 in. across, the petals in two series.

rosulatus: Austocaulon rosulatum.

rubrolineatus (M. rubrolineatum, Aloinopsis Dyeri). Lvs. 6-8, oblong--patulate, to 2 in. long and ½ in. broad, covered with whitish warts fis. yellow with red line down middle of petals, 1¼ in. across, the petals in two series.

vitatus (Aloinopsis vittata. M. vitatum). Closely cespitose: lvs. 6-8, obtusely triangular, to 1 in. long and ½ in. broad, with many warts: fls. bright yellow with red line down center of petals, 1 in. across.

NANDÎNA. Berberidaceæ. An attractive evergreen shrub native in China and Japan, and grown out-of-doors in S. U. S. N. doméstica. To 8 ft.: lvs. 2-3-pinnate, lfts. narrow, to 2 in. long, turning red in fall: fls. white, small, in panicles to 1 ft. long: berries bright red, ½ in. across. Var. álba is listed. The plant offered in the trade as N. aurea is probably only a hort. form of N. domestica. In China the plant is called "heavenly bamboo."—It thrives in shady or sunny positions but should be well watered; adaptable for full growth to southern parts of the country but root-hardy N. in protected places. Propagated by seeds.

NÁNNORRHOPS. Palmaceæ. Three species in N. India and 1 of them also in the Afghanistan region, small cespitose polygamous fan-palms with prostrate branching sts. and infl. among the foliage, unarmed but with serrulate petiole: lvs. rigid, plicate, with short petiole and curved bifid segms.: spadix much branched; stamens about 9 in the staminate fls. and 6 in the hermaphrodite ones: fr. a small globose or oblong 1-seeded drupe.

Ritchieana (Chamærops Ritchieana). Mazari Palm. Lvs. grayish or whitish, commonly tufted from slender underground sts. or rhizomes but sometimes from erect branching st. to 10 or 20 ft. high; segms. 8-15 and a ft. or more long, long-pointed, extending to middle of blade or lower: fr. \$4 in. or less diam, surface somewhat wrinkled. Punjab, Afghanistan, Baluchistan, in arid and cold regions; has been planted in S. Calif. and in Fla., but little known amongst us.

NANNY-BERRY: Viburnum Lentago.

NARCÍSSUS. Amaryllidacex. Spring-flowering bulbous plants with basal lvs. and yellow or white fls. solitary or several at top of scape,

the perianth salverform and having a crown or corona which may be long and tubular or short and ring-like.

Narcissi are hardy out-of-doors and also forced in the greenhouse for winter and spring bloom; favorites for colonizing. Bulbs should be planted in September or October in good loamy soil, and they will bloom the following spring if of flowering size. They do better if lifted every few years and separated, the poor bulbs discarded. A few kinds, as N. Tzzetla, may be grown in the house without soil, merely putting the bulbs in a bowl of water and propping them up with stones. There are many choice variants and hybrids, prized by fanciers. See Bulbs.

Ajax: a garden group belonging to N. Pseudo-Narcissus:

Bárri: a hort. group intermediate between N. incomparabilis and N. poeticus, the solitary yellow fis. having a crenulate crown about 1/4 as long as segms. Var. conspicuus is said to have a broad short crown edged red.

bicolor: plants so listed may be forms of N. Pseudo-Narcissus or N. Tazetla, having white segms, and yellow corona.

biflorus. Primrose Peerless N. Lvs. to 2 ft. long and ½ in. broad: fis. usually 2, white, the tube 1 in. long, the pale yellow wavy-edged crown several times shorter than segms. France to Tyrol.

Broussonètii. To 1 ft.: lvs. linear, as long as scape: fls. white, to 1 1/4 in. across, crown very low or seemingly absent, segms. oblong-lanceolate, acutish. Motocco.—Perhaps not hardy N.

Bulbocòdium (N. cantabricus). Petticoat Daffodil.
Lvs. to 15 in. long, very slender, exceeding the fls.: fls. solitary, bright yellow, the crown to 1 in. long and surpassing the very narrow segms. S. France to Morocco. Var. citrinus has lemon-yellow fls. to 2 in. long. Var. conspicuus is a large form. Var. Graélisii has whitish or primrose-yellow fls. Var. monophilus (N. Clusn) has sessile white fls. and is said to be hardier.

Búrbidgei. Probably hybrid between N. incomparabilis and N. poeticus: fis. solitary, drooping, white, with very short yellow crown with red rim.

Campernéllii. N. odorus.

canaliculatus: N. Tazetta.

cantábricus: N. Bulbocodium.

cérnuus: N. triandrus var.

Clùsii: N. Bulbocodium var. monophyllus.

cyclamineus. Fls. solitary, drooping or inclined, with very short tube and lemon-yellow reflexed segms., the orange-yellow wavy-edged narrow crown as long as segms. Portugal.—Small slender plant.

gigantèus: a large-fld. form of N. incomparabilis.

grácilis. To 1 ft.: lvs. grass-like. A in. wide or less: fls. light lemon-yellow, corona usually deeper colored, segms, oblong acute and imbricated. S. France. Var. tenúior is more slender with paler fls.

incomparabilis. Lvs. 1 ft. long and 1/4 in. wide: fls. solitary, yellow, with tube 3/4 in. long and wavy-edged crown about half as long as segms. Spain to Tyrol. In var. albus the segms. are white. There are double-fld. forms.

Johnstonii: N. Pseudo-Narcissus var.

Jonquilla. Jonquill. Lvs. to 1½ ft. long, narrow and rush-like: fis. 2-6 together, yellow, fragrant, with tube 1 in. long and wavy-edged crown much less than half as long as segms. S. Eu., Algeria. Var. simplex is listed.

juncifolius. Lvs. to 6 in. long, narrow and rush-like: fls. 1-4 together, bright yellow, with tube ½ in. long and darker yellow wavy-edged crown about half length of segms. S. France, Spain, Portugal. Var. rupicolus, pedicels absent or greatly reduced, perianth-tube about ¾ in. long.

Leèdsii: a hort. group intermediate between N. Pseudo-Narcissus and N. poeticus with solitary whitish fis. having a yellow wavy-edged crown nearly as long as segms.

máximus: garden form of N. Pseudo-Narcissus with very large golden-yellow fls.

minimus: very small garden form of N. Pseudo-Narcissus, 3-6 in. high, early.

minor: name applied to small forms of many species.

monophýllus: N. Bulbocodium var.

monspeliénsis: listed name of plant believed to be dwarf form of N. Tazetta.

moschatus. By some authors considered a variant of N. Pseudo-Narcissus but differs in lvs. to 1 ft. long and ½ in. wide: fls. pale yellow becoming white, the segms. lanceolate and somewhat twisted, pedicel shorter and stouter. Mts. of Spain and Portugal.

nanus: hort, name applied to small garden forms of N. Pseudo-Narcissus.

Nélsonii. Robust: fls. solitary, white with short tube and lemon-yellow crown more than half as long as segms. Probably hybrid.

odòrus (N. Campernellis). Campernelle Jonquil. Lvs. about 1 ft. long and very narrow: fls. 2-4 together, bright yellow, fragrant, with tube ¾ in. long and crenate-lobed crown about half length of segms. France and Spain eastward. Var. rugulòsus has shorter imbricated segms.

orientalis: N. Tazetta var.

ornatus: N. poeticus var.

pdetaz. Poetaz N. Hybrid between N. Tazetta and N. poeticus var. ornatus, having 2-6 fls. larger and more pleasantly fragrant than Tazetta.

poeticus. Poetrs N. Lvs. to 1½ ft. long and ½ in. wide: fls. mostly solitary, white, very fragrant, with tube 1 in. long and shallow crown with wavy red edges much shorter than segms. France to Greece. Var. ornātus is an early-flowering form. Var. radiiflðrus has narrower lvs. and segms. and a more erect crown. Var. recúrvus, lvs. and segms. recurved.

polyánthos: N. Tazetta var.

princeps: a form of N. Pseudo-Narcissus with sulfuryellow fis, and yellow crown,

yellow is, and yellow crown.

Pseudo-Narcissus. Daffodil. Trumpet N. Lvs. to
15 in. long and ¾ in. wide: fis. solitary, yellow, with tube
½ in. long and frilled crown about length of segms. or 2 in.,
sometimes double. Eu.—Here belong the Ajax narcissi.
Among the Latin-named forms are: bicolor, corona yellow
with white imbricated segms.; Johnstonii, corona pale
yellow and truncate segms. reflexed. Portugal.

recurvus: N. poeticus var.

ruguldsus: N. odorus var.

scabérulus. To 4 in.: lvs. 2, linear, arching to prostrate, canaliculate: fls. deep orange-yellow, tube narrowly cylindrical, to 1 in. long, segms. obovate, acute, somewhat reflexed. Portugal.—Requires much moisture at blossoming time, but little or none for remainder of season.

serotinus. To 10 in.: lvs. narrowly linear, appearing after flowering: fis. with greenish-white tube to ½ in. long and small white segms. Spain to Palestine.—Perhaps not hardy N.

Tazétta (N. canaliculatus). Polyanthus N. Lvs. to 1½ ft. long and ¾ in. wide fis. usually 4-8 together, white, fragrant, with tube to 1 in. long and light yellow crown much shorter than the obovate segms. Canary Isls. to Japan.—A pure white-fid. kind is the Paper White narcissus, favorite with florists for winter bloom, capable of being brought into flower before Christmas. Var. orientalis, Chinese Sacred-Lily, has sulfur-yellow segms. and dark yellow crown about ½ their length; much grown in water as a house plant. Var. polyánthos has fis. in umbels of 12-20, segms. ovate, shorter than tube. S. France.

segms. ovace, shorter than tube. S. France.

triandrus. Lvs. about 1 ft. long, narrow and rush-like:
fls. 1-6 together, pure white, with tube to ¾ in. long and
entire cup-like crown half the length of segms. Spain,
Portugal. Var. calathinus has pale yellow fls. with crown
nearly as long as segms. Var. albus, an old name for triandrus. Var. cérnuus (N. cernus) has larger fls. with pale
yellow segms. and golden-yellow crown. Var. cóncolor,
pale yellow. Var. pulchéllus, yellow with white crown.

viridiflorus. To 1½ ft.: lvs. slender and cylindrical, to 1 ft. long: fls. green, drooping, to 1 in. long, segms. linear-lanceolate, reflexed, usually 2-4 on slender erect scape. Morocco.

Watièri. To 6 in.: lvs. narrowly linear, obtuse: fis. solitary, segms. pure white or occasionally flushed pink, to 1 in. across, tube to ½ in. long, greenish-white. Mts., Turkey.—Does best in sun in not too dry a soil.

NARTHÈCIUM. Bog-Asphodel. Liliaceæ. Rhizomatous herbs with grass-like lvs. and small greenish-yellow fls. in terminal racemes; sometimes transplanted.

americanum (Abama americana). To 11/2 ft.: lvs. to 8 in. long: fls. 1/2 in, long, in dense racemes 2 in. long. Swamps, N. J. and Del.

californicum. To 2 ft.: basal lvs. sword-shaped and folded as in iris, narrowly lanceolate, to 10 in. long, st.-lvs. to 4 in. long: fls. yellowish-green, to ½ in. long, in loose terminal racemes to 7 in. long, anthers red: caps. salmon-pink. Marshes, Calif. to S. W. Ore.

NASTÜRTIUM. Cruciferæ. Name of confused application because of the indefinite and varying practices of early authors. The horticultural plant involved is the water-cress, N. officinale (N. Nasturtium-aquaticum). An

aquatic or marsh inhabiting bien., sts. much branched, floating or creeping, glabrous: lvs. pinnately divided, of 3–9 segms. with terminal one largest, all ovate to orbicular: fls. white, to ½ in. across, in racemes: caps. to 1½ in. long, on pedicels as long. Eu., N. Asia; nat. in temp. or subtrop. regions of New World. See Cress. As a vernacular name, Nasturtium is applied to Tropæolum. See also Armo. acia.

NAVARRETIA: Gulia.

NAVELSEED: Omphalodes.

NAVELWORT: Omphalodes, Umbilicus pendulinus.

NEANTHE BELLA: Collinia elegans probably.

NECKLACE-TREE: Ormosia.

NECTARINE, smooth-fruited peach, named as a botanical variety (var. Nectarina) of Prunus Persica. Usually nectarines are of smaller size than peaches and of richer quality, but there are no essential differences. The trees are the same. One may originate from the other, reciprocally, by seed and by bud-variation. Cultural requirements and propagation are the same. Nectarines are infrequently planted in E. U. S., being known mostly as oddities or rarities.

NEGUNDO: Acer.

NEÍLLIA. Rosacex. Simple-leaved deciduous Asian spirea-like shrubs with alternate toothed often lobed lys. and white or pink fls.in terminal racemes or panicles. Attractive bushes, hardy N. or in the north central states. Propagated by greenwood cuttings under glass and by seeds.

affinis. To 6 ft.: fls. pink, campanulate, in dense racemes to 3 in. long, calyx pubescent. May-June. China.

longiracemòsa. To 10 ft.: fls. pink, tubular, in dense racemes 3 in. and more long, calyx pubescent. June-July.

sinénsis. To 6 ft.: fls. pinkish, tubular, in nodding racemes to 2 in. long, calyx glabrous May-June China.

racemes to 2 in. long, calyx glabrous May-June China. thibética. To 6 ft.: fls. pink, tubular, in dense racemes to 3 in. long, calyx pubescent. China.—Closely allied to N. longiracemosa but lvs. and ovary more pubescent.

thyrsiflora. To 4 ft.: fls. white, campanulate, in panicled racemes, calyx pubescent. Aug.-Sept. Himalayas.

NELÚMBIUM (Nelumbo). Lotus. Nymphæaceæ (or Nelumbonaceæ). Large aquatic plants with shield-like lvs. usually standing above the water, single large fls. mostly overtopping the lvs., and large flat-topped frreceptacles containing many carpels, each opening on top by a large hole; suitable for large ponds and for masses, sometimes colonized.

The roots of nelumbiums should not be allowed to freeze. Increased by seed, sown in shallow pans in the garden or if sown in ponds they are rolled in a ball of clay and dropped in the water; the hard seeds of some species germinate better if they are bored or filed. Propagated also by sections of the rhizomes, covered with a foot or two of water, if outdoors; N. Nelumbo may be increased by division. The tubers or roots should not be transplanted until good growth has begun.

flavéscens: a hort. form, probably of N. pentapetalum. liteum: N. pentapetalum.

lùteum: N. pentapetalum.

Nelambo (N. speciosum. Nelumbo nucifera and indica).

EAST ÎNDIAN L. Rootstock with small scale-like lvs., many
ft. long, used as food in some countries: lvs. mostly 3-6 ft.
above the water, 1-3 ft. across: fis. 4-10 in. across, fragrant,
pink or rose. S. Asia to Australia, sometimes nat. Many
vars. are in cult. as álbum grandiflòrum; álbum plènum
(Shroman); Grossherzog Ernst Ludwig (N. flavescens ×
N. Ostris), salmon-rose; kermesinum, light rose; Kinshiren,
white shaded pink; Ostris, deep rose; pülchrum, dark rosyred; pekinénse rūbrum, rosy-carmine and plènum large and
double; pygmæun, dwarf; röseum, rosy-pink.—This plant
is sometimes called Egyptian lotus, but that name belongs
rather with Nymphæa Lotus.

pekinénse: hort, form of N. Nelumbo.

pentagetaium (N. luleum). American L. Water Chinkapin. Lvs. usually 1-2 ft. above the surface in shallow water, cup-shaped, 1-2 ft. across: fis. pale yellow, to 10 in. across. S. Ont. to Fla. and La.

speciòsum: N. Nelumbo.

NELHMBO. Nelumbium

NEMÁSTYLIS. Iridacex. American bulbous herbs with long narrow lys, and blue or purple fls. lasting only a day: tender in the N.

acuta. To 2 ft., the sts. simple or forked: lvs. to 1 ft. long; fis. to 2 in, across, 2-3 from a spathe. Apr.-June. Tenn. to Tex.

cœléstina: Salpingostylis cœlestina.

floridana. Recently discovered species in the north-eastern coastal region of Fla.: 1½-4 ft. and more: lvs. plicate: fls. several, erect, violet, to 2 in. across, opening 4-6 o'clock afternoon in autumn.

purpurea: Eustylis purpurea.

NEMATÁNTHUS. Gesneriacex. Trop. American shrubs or vines similar to Columnea, differing in its calyx-tube turbinate, corolla-throat swollen the entire length becoming somewhat funnelform, and fr. a caps.

lóngipes (Columnea splendens). Shrub to 2 ft. with drooping branches; lvs oblong to ovate-lanceolate, to 3 in. long, fleshy, ciliate when young; fls. bright red, to 2½ in long, lobes reflexed, pedicel to 3 in. long, slender and hirsute. Brazil.—Sometimes grown as a house plant; propagated by seeds and cuttings.

NEMÈSIA. Scrophulariaceæ. African herbs and subshrubs with attractive tubular fls. in various colors, usually in terminal racemes, the corolla-tube 2-lipped, short, with a sac or spur in front, blooming from June-Sept.: lvs. opposite. Much like short-tubed linarias.

Nemesias are easily grown as annuals; they should stand about 6 inches apart in the garden; seeds are commonly started in the house.

chamædrifðlia. Ann. to 2 ft.: lvs. ovate, to 1½ in. long: fls. pale pink, spurred, solitary in the axils. S. Afr.

compácta: N. versicolor var.

floribúnda. Ann. to 15 in.: lvs. ovate or oval, to 1½ in. long: fls. whitish, spurred, in many-fld. racemes to 5 in. long. S. Afr.

fôtens. Per. to 2 ft., somewhat shrubby: lvs. linear, to 1½ in. long: fls. blue, lavender, pink or white with yellow crest, spur and throat, to ½ in. long. S. Afr. Var. latifòlia has lvs. lanceolate, toothed, and fls. white to pink.

grandiflora tigrina: N. strumosa var.

hýbrida: hort. name.

lilácina. To 15 in.: lvs. narrow-lanceolate, to 1½ in. long: fls. small, lilac, spurred, in racemes to 1 ft. long. S. Afr.

nana compácta: N. strumosa var.

strumosa. Ann to 2 ft.: lvs. lanceolate, to 3 in. long: fls. white or in shades of yellow and purple, often purple marked on the outside, the bearded throat spotted on a yellow ground, with pouch at base, in racemes to 4 in. long. S. Afr. Var. grandiflora is an improved form with larger fls. Var. nana compacta is dwarf. Var. Súttonii comprises improved forms in white, yellow, rose-pink, orange, crimson and scale for the superconduction.

versicolor. Ann. to 1 ft. or more: lvs. ovate to lanceolate, to 2 in. long: fls. in various colors, the spur nearly straight or incurved, in racemes to 3 in. long. Var. compacta (N. compacta) is a compact form, very free flowering.

NEMOPÁNTHUS. MOUNTAIN-HOLLY. Aquifoliacex. Neat deciduous bush distinguished from Ilex by the narrow separate petals and very small not persistent sepals. N. mucrovery small not persistent sepals. N. mucronata (N. canadensis. N. fascicularis). To 10 ft., glabrous, with purplish young growths, nearly or quite entire elliptic or oblong or somewhat obovate mucronate-tipped lvs. to $1\frac{1}{2}$ in. long: fis. axillary, on slender pedicels: drupe about ¼ in. diam., red. Mostly in bogs and swamps, Newf. to Wis. and Va.—Handsome in fr. and in autumn foliage.

NEMÓPHILA. Hydrophyllaceæ. Small soft fragile ann. herbs, mostly Californian, glabrous, pubescent or prickly-hairy, with usually pinnatifid lvs., blue or white solitary peduncled fls. or rarely in racemes, the calvx having 5 spreading or reflexed appendages in each sinus, stamens not exserted; grown in the garden for the continuous spring and summer bloom.

Seeds may be sown where the plants are to grow in early spring for summer bloom; the flowers are small but usually profuse and bight. Recent studies have modified the conception of the cultivated species.

atomària: N. Menziesii var.

surits: Pholistoma aurutum.

crambeoldes: N. Menziesii var.

discoidàlis: N. Menziesii var. insígnis: N. Menziesii.

integrifòlia: N. rotata var.

liniflora: N. Menziesii var.

maculàta. Five-Spor. Ascending or decumbent: fls. white with deep purple spot at tip of each lobe. Calif. Var. grandiflòra has larger fls. and var. purpùrea purple fls.

Var. grandinora has larger is, and var. purpures purple is.

Ménziesii (N. insignis). Baby Blue-Fyes. Sts. prostrate or ascending, to 20 in. long: lvs. to 4 in. long, pinatifid into 5-9 lobed divisions: fls. blue, rotate, to 1½ in. across. Calif. Var. álba, fls. white. Var. atomària (N. atomaria), fls. paler, dotted with purple or black. Var. crambeoldes, fls. light blue veined purple. Var. discoidàlis, fls. brownish-purple in center and white on edges. Var. grandiflora, fls. large. Var. liniflora (N. liniflora), fls. white or pale blue with black center. Var. marginàta, fls. blue marginad white

placelioides. To 2 ft.: lvs. alternate, segms. ciliate, notched at tip: fls. blue with white center, bell-shaped. W. N. Amer.

purpurea: trade name, possibly for N. maculata var.

rotata. Differs from N. Menziesti in lvs. pinnatifid into 3-5 entire divisions and smaller fls. Calif. Var. integrifòlia (N. integrifolia), fis. pale blue, about 1/2 in. across.

NEOBENTHÀMIA. Orchidacex. A single African terrestrial orchid, N. grácilis. Tall more or less branching plant to 4 ft. high: lvs. numerous, two-ranked, linear or linear-lanceo-late, to 8 in. long: infl. terminal, simple or branched, densely-fld. at the end of a long naked peduncle; fls. white having a lip with vellow middle line bordered on each side by a row of rosy spots. Jan.-Apr., Sept. See Orchids.

NEOBÉSSEYA. Cactacex. Small simple or tufted globose or depressed cacti, on the Great Plains of the U. S. to Mex.: plant-body bearing spiralled or irregular tubercles mostly grooved on the upper side and which are spine-bearing at the apex: fls. near top of plant, relatively large, yellow or pink. See Cacti.

asperispina. Usually solitary, globose, blue-green, to 2½ in. diam.; tubercles conical, to ¾ in. long; spines grayish, radials 9-10, to ½ in. long, stiff, radiating, central usually absent: fis. greenish-yellow, to 1½ in. long. Mex.

missouriensis (Cactus, Mammillaria and Coryphantha missouriensis. Mammillaria Nuttallii). St. usually solitary, globose, 1-2 ft. high; tubercles ½ in. or more long; spines 10-20 together: fls. about 1 in. long and broad, yellow or reddish, stamens yellow. N. D. to Tex. and west.

Notesteinii. Similar to N. missouriensis from which it differs in its pubescent spines, pink stamens, and perianth-segms, with red midrib. Mont.

similis (Coryphantha similis). Growing in clumps to 6 in high and 1 ft. diam.; tubercles cylindrical and to 34 in. long; radial spines 12-15, white tipped brown; central 1 or none: fis. light yellow, 2 in. long. E. Tex.

Wissmannii. Solitary or growing in clumps to 4 in. high and 1 ft. diam., areoles white-woolly; spines 7-14, ½ in. long: fls. deep yellow, 2 in. long. Cent. Tex.

NEOLLÓYDIA. Cactaceæ. Small cylindric and densely spiny tubercled cacti of Tex. and Mex., formerly named in Mammillaria and NEOLLÓYDIA. Echinocactus: central spines 1-several and much longer than the numerous radials: fls. large, pink or purple. See Cacti.

Beguinii (Echinocactus Beguinii). Cylindric, to 6 in. high; tubercles in geometric figures and covered with spines; radials 20 or more and white. fis. bright pink, to 1½ in. long. Mex. Var. senilis is listed.

ceratites (Mammillaria ceratites). Ovoid, to 4 in. tall and 2 in. diam., gray-green; tubercles about % in. across, rhomboid, axils woolly; spines grayish, radials 15, to % in. long, base bulbous, centrals 5-6, to 1½ in. long, stout: fis. purple, to 1½ in., long. Mex.

clavata (Mammillaria clavata, M. rhapidacantha). Simple, cylindric, to 6 in. high, bluish-green; tubercles conic and axils woolly when young; radials 6-12; central 1: fls. about ¾ in. long, creamy-white. Mex.

conoidea (Mammillaria conoidea. Echinocactus conoideus). Mostly cespitose, parts short-cylindric; tubercles obtuse and axils very woolly; spines very many and covering the plant, the radials white: fis. purple. N. Mex.

grandiflora (Mammillaria and Corpphantha grandiflora). Cylindrical, to 4 in. tall and nearly 3 in. diam.; tubercles subrhombic, compact, woolly in groove and axils; radial spines usually 20-25, white with black tip; centrals 1-2, or absent, black, stiff: fis. dark violet-pink, to 2½ in. across or more. Mex.

hortfpila (Mammillaria horripila). Globular or short-cylindric, 5 in. high; tubercles glaucous; radial spines 8-10 and ½ in. long; central 1. fls. deep purple, 1½ in. long. Mex.

pllispina (Manmillaria pilispina). Cespitose, 1½ in. diam., young areoles with long white wool; radial spines 5-7 and white tipped black; central spine 1 or none: fls. purplish, ½ in. long. Mex.

Roseana: probably Cochemica Poselgeri.

texensis. Globose or short-oblong, 2 in. long; radial spines 10-15 and white; central spines 1-3, 1 in. long, black. Tex.

NEOMAMMILLARIA: Mammillaria.

NEOMÁRICA (Marica of hort.). Iridaceæ. Trop. per. herbs with short rootstocks, narrow basal lvs. and blue, yellow or white iris-like fls. of brief duration, in clusters near the end of flat, winged, leaf-like scapes. The generic name Marica, long associated with the following plants, is now known to be a synonym of the closely related genus Cipura.

Maricas are hardy in mild regions with winter protection, and thrive in Florida and similar climates. Propagated by division.

cærùlea. To 2½ ft.: lvs. to 3 ft. long and 1½ in. across, ensiform: fls. bright blue or lilac, to 4 in. across, outer segms. with transverse bars of brown, yellow or white. Brazil.

grácilis. Lvs. to 1½ ft. long and 1 in. across: fls. 2 in. across, the outer segms, white with yellow and brown markings, inner segms. small, blue. Mex. to Brazil.

longifòlia. To 2 ft.: lvs. 1 in. across: fls. 2 in. across, yellow barred with brown. Brazil.

magnifica: listed name of unknown botanical standing.

Northians. To 3 ft.: lvs. to 2 ft. long and 2 in. across: fls. very fragrant, to 4 in. across, outer segms. white variegated at base, inner segms. violet variegated at base. Brazil.

tristis: listed name.

NEOPIERIS: Lyonia.

NEOPORTÈRIA. Cactaceæ. Chilean cacti of globose or cylindrical form with usually straight tubercled ribs: fls. from center of plant, pinkish or reddish, short-funnelform.

acutissima: Chilenia acutissima.

chilénsis: Chilenia chilensis.

fúsca (Echinocactus fuscus and ebenacanthus). To 4 in. diam., globular or short-cylindric; ribs 12-13; radial spines 5-7 and brownish; central spines 4 and 1 in. long: fls. yellowish-white, 1 in. long.

napina. Globose to obconical, to nearly 4 in. tall and 2 in. diam., reddish-gray to brownish-green; ribs 14, spiral, conspicuously tubercled; spines all radial, about 3-9, to 3/6 in. long, dark brown: fis. yellow, to 13/2 in. long.

Nidus (Echinocactus Nidus and senilus. N. senilus). Solitary, globose to subcylindrical, to nearly 4 in. diam., covered with long recurved spines; ribs 16-18, deeply notched; spines in two series, the outer 20-24 slender, white and about ¾ in. long, the inner 6-8 stouter, tortuous and to 1¼ in. long: fls. reddish, to 1½ in. long.

nigricans (Echnocactus nigricans). Short-cylindric; ribs 15, strongly tubercled; radial spines 8-9, black; central spines 1-2, 14 in. long: fls. white or yellowish-green, 2 in.

occilta (Echinocactus occultus). To 3 in. high, globular or short-cylindric; ribs about 14, strongly tubercled; spines 1-10 or wanting, blackish, to 1½ in. long: fis. reddish outside, 2 in. across.

Reichii (Notocatus Reichii). Cespitose and free-sprouting, globose, to 3 in. diam., gray-green; ribs 30-40, low, tubercled, spines 7-9, to ½ in. long, white, curved: fis. yellow, style red.

senilis: N. Nudus.

Stumeriana: listed name, perhaps Parodia Stuemeri.

subgibbòsa: Chilenia subgibbosa.

NEORAIMÓNDIA. Cactacex. Stout columnar cactus branching near base, native in W. Peru. N. macrostibas. To 12 ft., areoles very large and sometimes elongated to 4 in.; ribs few; spines 12 or more, very unequal, the central often to 10 in. long: fls. to 1½ in. long, funnel-form. Var. roseiflòra, fls. rose-pink. Var. gigantèa, a large form to 20 ft., much branched from about 1½ ft. above ground, with spines to 6 in. long.

NEOWASHINGTONIA: Washingtonia.

NEOWERDERMÁNNIA. Cactaceæ. One species native in the high mts. of S. Amer. N. Vorwérkii. Plant of 16 spirally arranged protuberant 3-angled ribs, areoles in depressions and white-woolly when young; spines 10, bent, ½ in. long, and one to 1½ in. long and black.

NEPENTHÀCEÆ. NEPENTHES FAMILY. One genus of semi-woody more or less climbing insectivorous plants native from E. Indies to Madagascar, sometimes grown under glass as curiosities and once assembled as much-prized fanciers' plants in many forms and hybrids. The family is characterized by alternate lvs. with midrib prolonged into tendril bearing at end a hollow pitcher with thickened rim and large or small lid, small dioccious fls. in racemes, having 3-4 sepals, no petals, 4-24 united stamens, superior 4-celled ovary, and fr. a caps. The family appears in the sequence associated with Sarraceniaceæ, Droseraceæ, Resedaceæ.

NEPÉNTHES. PITCHER-PLANT. Nepenthaceæ. Characters as for the family (above); many of the named kinds are artificial hybrids.

Pitcher-plants are suitable for pots or baskets suspended from roof of greenhouse, with temperature of not less than 65°. The best potting material is fibrous peat, moss and sand. They should be shaded from bright sunshme. Propagated by cuttings of ripened shoots and by seeds in a close propagating frame.

atrosanguinea. Hybrid probably of N. distillatoria and N. Sedenii: pitchers reddish-purple mottled with pale green, wings fringed.

Chélsonii. Hybrid between N. Hookeriana and N. Domini: pitchers yellowish-green spotted with purple, wings fringed.

Courtii. Hybrid, with N. Dominii as one of the parents: pitchers green mottled with purple, wings fringed.

Dickinsoniana. Hybrid between N. Rafflesiana and N. Veitchii: pitchers green marked with purple, wings fringed. distillatoria. Pitchers pale green to dull red, to 5 in. long and 1½ in. across, wings fringed. Ceylon.

Dôminii. Hybrid with N. Rafflesiana as one of parents: pitchers mottled green and purple, wings fringed.

edinensis. Hybrid between N. Rafflesiana and N. Chelsonii: pitchers yellow-green spotted with dark purple, wings fringed

Henryana. Hybrid with N. Hookeriana and N. Sedenii pitchers red or greenish-red and mottled, wings fringed.

Hookeriana. Pitchers pale green marked with purple, to 6 in. long and 3 in. across, the wings broad and doubly fringed or unfringed on upper pitchers. Borneo.

intermedia. Hybrid with N. Rafflesiana as one parent: pitchers green spotted with purple, the wings fringed.

khasiana. Pitchers green or reddish-green, to 7 in. long and 1½ in. across, wings narrow and fringed. India.

Lawrencians. Hybrid between N. polymorpha and N. Hookerians: pitchers pale green with dark purple markings, wings fringed, expanded: lvs. lanceolate, margins usually dentate-ciliate.

Mastersiana. Hybrid between N. sanguinea and N. khasiana: pitchers deep crimson or crimson-green with purple spots, the wings fringed or small.

māxima. Pitchers pale green, heavily blotched with purple, lower ones with wings expanded and fringed, middle narrow-cylindric and unfringed, upper ones funnel-shaped; peristome expanded and wavy, greenish to dark purple within. Celebes, Borneo, New Guinea.—Highly colored, free-flowering; parent of many hybrids.

Mórganiæ: probably not distinguishable from N. Law-renciana, both of which are reputed to have same parentage.

paradism. Hybrid with N. Phyllamphora as one parent: pitchers purple-red below, yellow-spotted above.

Pátersonii. Hybrid of uncertain parentage: pitchers yellowish-green mottled with red, the wings narrow and fringed.

Phyllamphora. Pitchers pale to reddish-green or red, to 6 in. long and 1½ in. across, the wings narrow and cord-like. S. China, E. Indies.

Rafflesiāna. Pitchers pale green spotted with purple, to 7 in. long and 4 in. across, the lower urn-shaped and upper funnelform. Malacca to Borneo and Sumatra.

sanguínea. Pitchers red or reddish-green, to 10 in. long and 3 in. across, wings fringed or plain. Malaya.

Sèdenii. Hybrid of uncertain parentage: pitchers slightly contracted in middle, the wings fringed.

spléndida. Hybrid between N. Hookeriana and N. Phyllamyhora.

Veitchii. Pitchers yellowish-green to reddish, hairy, to 8 in. long and 3 in. across, wings fringed, with wide rim. Rorneo.

Williamsii. Hybrid between N. Sedenii and N. Hookeriana: pitchers yellow-red with many bright red blotches and spots: lvs. petiolate.

NÉPETA. Labiatæ. Mostly aromatic herbs, ann. and per., with toothed or cut lvs., blue or white fls. in whorls in clusters or spikes; grown for medicinal purposes and the creeping kinds for ground-cover in shady places. Catnip is one of the sweet herbs. Propagated by seeds and by division; easily grown.

amethýstina. Per. to 2 ft., soft-tomentose: lvs. cordate-lanceolate, to 1½ in. long: fls. blue, ½ in. long, in clusters forming a long raceme. Spain.

barbata. To 1½ ft.: lvs. ovate, to 1½ in. long and ½ in. wide, rounded or hastate at base. fls. in few-fld. loose racemes, the spreading lower lip barbed. Turkestan.

Cataria. Catnip or Catner. Catmint. Per. to 3 ft., pubescent and pale: lvs. ovate, to 2½ in. long. fis. whitish or pale purple, ¼ in. long, in dense spikes to 5 in. long. Eu., Asia; widely nat. in N. Amer.—An old sweet herb.

cyànea. To 6 in., sts. ascending, soft-tomentose: lvs. ovate or oblong, small, wrinkled: fis. pale purple, small, in numerous racemes 1 in. long. Caucasus.

distans. Per. to 1½ ft., soft-tomentose: lvs. ovate-cordate, to 2 in. long: fls. rose, in spikes to 8 in. long. Himalayas.

Glechoma: N. hederaceu.

grandiflora. Per. to 2 ft.: lvs. ovate-cordate, to 2½ in. long: fls. blue, ¾ in. long, in clusters forming loose racemes. Caucasus

hederâcea (N. Glechoma. Glecoma hederacea). GROUND IV. GILL-OVER-THE-GROUND. FIELD-BALM. Creeping performing a mat, useful as ground-cover in both exposed and shady places: lvs. round or kidney-shaped, deeply cordate, to 1½ in. across: fls. light blue, to 1 in. long, in few-fld. clusters. Eu., Asia; widely nat. in N Amer. Var. variegāta has variegāted lvs.

itálica. Per. to 3½ ft.: lvs. ovate, to ¾ in. long, obtuse, cordate, petiolate, glabrous above and shortly villous-pubescent beneath, margins crenate: fls. purple to white, in condensed verticillate cymes subtended by narrowly lanceolate bracts. N. W. Medit. region.

lanceolàta: N. Nepetella.

macrantha. Per. to 3 ft.: lvs. ovate-lanceolate, to 4 in. long: fls. blue, to 1½ in. long, in few-fld. clusters. Siberia.

Mussinii. Per. to 2 ft., much branched, white-pubescent: lvs. oblong-ovate, to 1/2 in. long: fls. blue with dark spots, to 1/2 in. long, in clusters forming long racemes. Caucasus, Persia. Vars. grandis and superba are listed.

Nepetélla (N. lanceolata). Per. to 4 ft.: lvs. lanceolate, 1 in. long, gray-pubescent: fis. white or pink spotted with purple, ½ in. long, in spikes. S. Eu.

nervosa. Per. to 2 ft.: lvs. linear-lanceolate, to 4 in. long, toothed: fls. pale blue, in spikes to 3 in. long. Himalayas. nuda (N. pannonica). Per. to 4 ft.: lvs. oblong, to 2 in. long, nearly glabrous: fls. violet to white spotted with purple, ½ in. long, in many-fld. racemes. S. Eu.

purple, ½ in. long, in many-nd. racemes. S. Eu. pannônica: N. nuda. ucránica. Per. to 2 ft., pubescent or nearly glabrous: lvs. oblong-ovate to oblong: fls. blue, small, in loose bracted cymes. E. Eu., W. Asia.—Not showy; the material planted under this name is usually N. grandiflora.

Wilsonii: Dracocephalum Wilsonii.

NEPHELIUM: Litchi and Euphoria.

NEPHRODIUM: Druonteris.

NEPHRÓLEPIS. SWORD-FERN. Polypodiacca. Trop. and subtrop. ferns of both hemispheres, some of them favorite house and conservatory plants: fronds usually long and narrow, pinnately compound or divided; sori on upper forks of veins.

The sword-ferns are greenhouse or porch subjects, sometimes grown in vases and baskets; they are commonly propagated by rooting runners, as good spores may not be produced by the horticultural varieties. The plants thrive under common or even untoward conditions and produce dense crowns of long often drooping fronds. See Ferns.

acuminata (M. davallioides). Fronds drooping, to 3 ft. long and 1 ft. wide, pinne linear-lanceolate, coarsely toothed, the fertile ones much contracted. Malaya.

acuta: N. biserrata.

biserrata (N. acuta). Fronds drooping or arching, to 41/2 ft. long and 1 ft. wide, pinnæ distant, to 6 in. long, toothed. Tropics. Var. fúrcans has forked segms.

bostoniénsis: N. exaltata var.

bulbifera: perhaps a form of Polystichum aculeatum.

cordata: N. cordifolia.

corditolia (N. cordata. N. tuberosa). Rhizome bearing tubers: fronds to 2 ft. long and 2½ in. wide, erect or nearly so, bright green, pinnæ close together, to 1½ in. long, sharp-toothed. Tropies and subtropies. Hort. vars. are compácta, gigantèa, plumòsa, tessellàta, variegàta.

davallioides: N. acuminata.

Dúfii (N. cordifolia var. Dufii). Tufted, graceful: fronds to 2 ft. long and 1/2 in. wide, usually forked or crested at tips, pinnæ nearly orbicular, 1/2 in. across, wavy-toothed. New Zeal. or S. Sea Isla.—Probably a mutant of N. cordifolia.

exaltàta. Stiff, erect: fronds to 5 ft. long and 6 in. wide, pinnse close together, to 3 in. long, entire or slightly toothed. Fla. to Brazil and in Afr. and E. Asia.—This species has given rise to numerous sports or mutants with much divided and even crested fronds and that have received Latinized names, some of which are entered here. Var. bostoniénsis, Boston-Fern, is more graceful and drooping, a famous window-garden and table fern. From to rits derivatives have arisen many forms as: Amersohlit, Childen, Dreyen, edmontoniensis, elegantissima and its vars. compacta and compacta cristata, Elmsfordu, falcata, Forsteriana, Galvestonii, Giarrasii, Goodii, Greinai, Harrisu, Hillsu, lycopodioides, Macawin, magnifica, Milleri, Millsu, iycopodioides, Macawin, magnifica, Milleri, Millsu, muscosa, Norwoodii, philippinensis. Piersonii, Randolphii, robusta, Rooseveltii, Scholzetii, Schubertii, Scottii. Smithii, splendida, superba, superbissima, tripartita, todecides, viridissima, Wanamakeri, Whitmanii, Wicheri, Wilsonii, Wiltboldii, Wredei.

pectinata (N. cordifolia var. pectinata). BASKET-FERN. Small, compact, grayish-green: fronds to 1½ ft. long and 1 in. wide, pinnæ close together, ½ in. long, toothed. Trop. Amer.

tuberòsa: N. cordifolia.

NEPHROPHYLLÍDIUM. Gentianaceæ. A monotypic genus occurring in arctic and subarctic regions from N. Wash. to Alaska and Japan: allied to Menyanthes, differing in having simple lvs. and entire corolla-lobes. N. Crístagálli. Per. with creeping rootstocks: basal lvs. kidney-shaped, to 5 in. wide, coarsely crenate, long-petioled: fls. white, shortly funnelform and 5-lobed, in cymes on scapes to 2 ft. high. In bogs and marshes.—Adaptable to the bog garden or in moist mucky soil along pools or ponds.

NEPHTHYTIS. Araceæ. Herbs with thick rhizomes, in W. Afr., long-petioled arrow-shaped lvs., and fls. borne on a stalked cylindrical spadix, the spathe decurrent on peduncle; no close relatives in general cult.

Atzèlii (N. liberica). Rhizome horizontal and creeping: lvs. to 1 ft. long, on petioles to 1½ ft. or more long: spathes green, to 3 in. long. Var. variegata is listed as a variegated foliage form.

libérica: N. Afzelii.

picturata: Rhektophyllum mirabile.

triphýlla: hort, name unidentifiable botanically, probably not a Nephthytis.

NEPTUNIA. Leguminosæ. Per. herbs or shrubs of warm parts of the western hemisphere: sts. spineless, diffusely branched or prostrate: lvs. bipinnate, lfts. small: fls. regular, in globose or cylindrical spikes on solitary axillary peduncles: pods \(\frac{1}{3}\)-\(\frac{1}{2}\) as broad as long, flattened. Grown for ornament in the border; propagated by seeds.

lùtea. Low per., branched at base, pubescent: Ifts. 18-34, oblong, ½ in. long or less, ciliate, apiculate: fis. yellow, in dense heads to ¾ in. long. Okla., Tex.

NERINE. Amaryllidaceæ. Bulbous herbs from S. Afr. with strap-shaped basal lvs. not appearing with the bloom, and funnelform fls. in shades of red to white borne in umbels at top of solid scape, the perianth-tube very short, blooming in autumn (Mar. to May in S. Afr.)

Nernes are tender and grown mostly in pots in the greenhouse, and out-of-doors in mild climates. They should be given plenty of water until after flowering, and from May to August the bulbs should be rested. Propagated by offsets.

Bowdenii. To 15 in.: lvs. strap-shaped, obtuse: fls. bright rose-pink, in umbels of 8-12, segms. to 3 in. long, spreading, margin wavy and crisp, reflexed at tip, stamens and style longer than segms.

corúscans: hort. name, perhaps for N. sarniensis var.

curvifòlia. To 1½ ft.: lvs. 1 ft. long, curved, glaucous, after fls.: fls. scarlet, stamens not exserted. Var. Föthergillii (N. Fothergillii) is stronger with numerous fls.

filifòlia. Suberect grass-like lvs. to 8 in. long: fis. bright red, to 1 in. long, segms. narrow, oblanceolate; infl. a centripetal umbel.

flexuòsa. To 3 ft.: lvs. linear-lorate, to ¾ in. wide: fls. pale pink, to 1½ in. long, in umbels of 10-20, segms. with crisped margins, stamens and style shorter than segms. A var. 4lba with white fls. is advertised.

Fothergillii: N. curvifolia var.

Mánsellii. Said to hybrid between N. flexuosa and N. curnfolia var. Fothergillii.

ròsea: N. sarniensis var.

sarniensis (Amaryllis sarniensis). GUERNSEY-LILY. To 1½ ft.: lvs. to 1 ft. long and ¾ in. wide, after fis.: fis. crimson, 1½ in. long, the segms. slightly crisped and the bright red stamens exserted. Var. corúsca, lvs. broader with cross-bars between veins, fis. bright scarlet, large; its form major has crimson-red fis. Var. rôsea (N. rosea) has darker lvs. and rose-pink fis.

NÈRIUM. A pocynaceæ. Stout evergreen shrubs with lvs. opposite or in 3's or 4's, showy funnel-form fls. in terminal cymes, and fr. of 2 long follicles; native from Medit. region to Japan.

Oleanders are grown out-of-doors in the South and as pot- or tub-plants North. They require little attention in the South; in the North plants should be cut back and rested after flowering, then potted in loam and rotted manure. Propagated easily by cuttings of mature firm wood, sometimes in water.

indicum (N. odorum). Sweet-scented Oleander. To 8 ft.: lvs. linear-lanceolate, to 10 in. long: fls. rosy-pink to white, often double, fragrant, 2 in. across. Persia to Japan.

oddrum: N. indicum.

Oleander. Oleander. To 20 ft.: lvs. oblong-lanceolate, to 8 in. long: fls. to 3 in. across, white, yellowish to red and purple, as indicated by the trade names álbum, atropur-

pùreum, cardinàlis, cárneum, lutéscens, ròseum, spléndens. Var. variegàtum, lvs. variegated with white or yellow. Medit. region. — Popular as a tub-plant; slips are sometimes rooted in bottles of water.

NERTÈRA. Rubiaceæ. Creeping per. herbs with small opposite lvs., solitary tubular 4-5-lobed fls., and fr. a fleshy drupe; native in the southern hemisphere.

One species is cultivated as a ground-cover in California and under glass in the North. It should be grown in a shady place in sandy or light soil. Propagated by seeds and division.

depréssa. BEAD-PLANT. Sts. to 10 in. long, matted: lvs. broad-ovate, 1/2 in. long: fls. greenish, minute and inconspicuous: fr. orange, about 1/2 in. across. S. Amer., New Zeal., Tasmania.

NESÆA: Decodon.

NETTLE: Urtica. Dead: Lamium.

NEVIÙSIA. Rosaceæ. One deciduous shrub native in Ala., grown out-of-doors for ornament and sometimes forced under glass. N. alabaménsis. Snow-Wreath. To 6 ft.: lvs. alternate, ovate, to 3 in. long, toothed: fls. white, without petals, 1 in. across, in clusters, of feathery appearance due to the many stamens.—Propagated by seeds and cuttings of young wood in the greenhouse. It is hardy to New England and Cent. N. Y. in somewhat protected places.

NEYRAÙDIA. Gramineæ. One large leafy per. grass native in trop. Asia, trop. Afr. and Madagascar, planted somewhat for ornament in S. Fla. and S. Calif. N. madagascariénsis. To 8 ft. or more: lvs. to 2 ft. long and 1 in. wide: spikelets awned, in compound nodding plume-like panieles to 3 ft. long. See Grasses.

NICÁNDRA (Physalodes). Solanaceæ. Stout ann. herbs from Peru differing from Physalis in the 3-5-celled ovary and dry rather than fleshy fr.; fls. larger and more showy. Sometimes grown from seed sown in the open in the S., under glass in the N., as an ornamental subject; escaped as a weed in some places.

Physalòdes. APPLE-OF-PERU. SHOO-FLY PLANT. Strong spreading old-fashioned garden plant, to 4 ft.: lvs. oval, sinuate-toothed: fis. blue, 1 in. or more across, wheelshaped, solitary: berry inclosed in an enlarged strongly 5-winged calyx. Escaped in U. S. and tropics.

violàcea. Sts. dark violet: lvs. to 10 in. long, with colored hairs on upper surface: fls. solitary, bell-shaped, violet-blue on upper half and white on lower.

NICKER-NUT: Cæsalpinia Bonduc.

NICOTIÀNA. Solanaceæ. Large herbaceous annuals and perennials, rarely shrubby or tree-like, usually sticky-hairy, with long tubular strongly fragrant fis., white, greenish, yellow or purple, mostly opening at night, in terminal panieles or racemes: lvs. alternate and simple, possessing narcotic-poisonous properties; grown for ornament and N. Tabacum yielding tobacco.

Nicotianas are easily grown but are sensitive to frost. Some of them make good pot-plants and border subjects. Propagated by seed, the ornamental forms also by cuttings; N. alaia var. grandiflora by root-cuttings.

acuminata. Per. but grown as ann.: lvs. ovate-lanceolate, long-acuminate, short-petioled, undulate: fis. white, 3 in. long, salverform, the tube 5 times as long as calyx, lobes obtuse. Chile.

affinis: N. alata var. grandiflora.

alita. Tender per. to 5 ft.: lvs. lanceolate or oblong, to 4 in. long, acute or obtuse, the petiole with narrow wings, undulate: fls. fragrant at night, closing in cloudy weather, salverform, corolla-limb white within, pale violet beneath, 2 in. across, lobes acute or notched, tube 4-5 times longer than calyx. Brazil, Uruguay, Paraguay. Var. grandiflora (N. afinis), Jasmine Tobacco, has very large fls. with much dilated tube.

angustifòlia: N. Tabacum var.

arbòrea: N. alauca.

attenuata. Ann. to 4 ft.: lvs. broad-ovate to lanceolate, to 4 in. long, petioled: fis. white or greenish, salverform, to 1 in. long, opening at night. B. C. to Mont. and Mex.

auriculata. Ann.: lvs. oblong-lanceolate, acuminate, clasping and ear-shaped at base: fis. funnel-shaped, red, lobes acuminate. Sardinia.

Bigelovii. Indian Tobacco. Ann. to 2 ft.: lvs. oblong-ovate to lanceolate, to 7 in. long, acute, short-petioled or sessile: fls. white, salverform, 2 in. long, limb 1 in. across. Calif. to Nev. and Ariz.

cerinthoides: a listed name of uncertain botanical ap-

chinénsis: N. Tabacum var. angustifolia.

colossèa: N. tomentosa.

Forgetians. Ann. to 3 ft.: lvs. papery, oblong-lanceolate, about 1 ft. long, obtuse, with short winged petiole: fis. rose, funnelform, to 1½ in. long and 1 m. across, the lobes obtuse.

fragrans: N. suaveolens var. macrantha.

fruticòsa: a listed name of uncertain botanical application

gigantèa: N. Tabacum.

glatea (N. arborea). TREE TOBACCO. Tree-like, to 20 ft., glaucous-blue and glabrous: lvs. ovate, acute, long-petioled: fls. yellow, salverform, 1½ in. long, lobes acute. S. Amer.; nat. in Tex., Calif. and elsewhere.

glutinosa. Ann.: lvs cordate-ovate, abruptly acuminate, petioled: fis. reddish-yellow, drooping, salverform, twice as long as calyx, lobes acute. Peru, Bolivia.

grandiflòra purpùrea: a form of N. Tabacum var. macro-phylla; see also N. aluta var.

lancifòlia: an unidentified name in lists; perhaps a form of N. Tabacum.

Lángsdorffi. Ann. to 3 ft.: lvs. ovate to lanceolate, obtuse, short-petioled or sessile: fls. greenish-yellow, drooping, salverform, 3 times longer than calyx, lobes obtuse. Brazil, Chile.

longifièra. Ann. or per. to 3 ft.: lvs. ovate-lanceolate, to 9 in. long, obtuse or acute, sessile or short-petioled: fls. salverform, fragrant, night-opening, yellowish-violet without, white within, to 6 in long, 6-7 times longer than calyx, the lobes obtuse or notched. Tex. to Chile and Argentina.

macrophýlla: N. Tabacum var.

noctiflora. Per. to 3 ft.: lvs. oblong to linear-lanceolate, obtuse or acute, short-petioled or sessile: fis. salverform, opening at night, fragrant, white within, purplish without, 3 times as long as calyx, lobes notched. Argentina, Chile.

paniculàta. Ann. to 3 ft: lvs. ovate, acute or obtuse, petioled: fls. yellowish-green, salverform, 6 times longer than calyx, lobes acute. Peru.

petiolaris. Ann.: lvs. cordate-ovate, to 1 ft. long, acuminate, with short reddish petioles: fls red, funnelform, the lobes acuminate or acute. Habitat unknown.

plumbaginifòlia. Lvs. oblong, sessile or clasping, undulate: fls. salverform, greenish-white, to 2 in. long, opening in evening Mex., W. Indies.

quadriválvis. Ann. to 2 ft.: lvs. ovate-lanceolate or oblong, petroled, upper sessile: fls. funnelform, white inside, purplish outside, to 1 in. long. Wash., Ore., Mont.

rústica. Ann, bien. or trien. to 3 ft.: lvs. ovate or oblong, to 1 ft. long, obtuse, petioled, thick: fls. day-opening, yellowish or greenish, 1 in. long, salverform, 2-3 times longer than calyx, lobes obtuse. Mex., Tex. Var. humilis is listed.

Sánderæ. Hybrid between N. alata and N. Forgetiana: ann. to 3 ft.: lvs. spatulate, to 1 ft. long, acuminate, petioled, undulate: fls. salverform, tube greenish-yellow tinted with rose, to 3 in. long, the limb carmine-rose, 3 times longer than calyx, lobes acute, obtuse or notched.

sanguinea: listed name of uncertain botanical standing.

suaveolens. Ann. or bien. to 2 ft.: lvs. spatulate to ovate-lanceolate, obtuse or acute, short-petioled: fls. nodding, greenish-purple, night-opening, fragrant, to 2 in. long and 1 in. wide, the limb somewhat 2-lipped, lobes obtuse. Australia. Var. macrántha (N. fragrans) has white fls.

sylvéstris. Per. to 5 ft. or more: lvs. wrinkled, oblong, obtuse, sessile or clasping: fis. drooping, not closing in the morning when cloudy, white, fragrant, salverform, 3½ in. long, 7 times longer than calyx, lobes acute. Argentina.

Tabácum (N. gigantea). Tobacco. Ann. to 6 ft.: lvs. oblong or oblong-lanceolate, 1 ft. or more long, acuminate, sessile: fls. diurnal, to 2 in. long, woolly, funnelform, rose-colored or red, lobes acute. Probably trop. Amer. Var. angustifòlia (N. chinensis) has narrow lvs. Var. macrophylla (N. macrophylla) has larger lvs. and fls.

texana: listed name without botanical standing.

tomentòsa (N. colossea). Giant N. Per., often woody, to 20 ft.: lvs. obovate-oblong, to 1½ ft. long, acuminata with winged petiole: fls. 1½ in. long, salverform, pale green without, yellowish tinged with red within, lobes obtuse. Brazil. Var. variegàta has mottled and margined foliage.

trigonophylla. Ann. to 3 ft.: lvs. obovate-oblong, to 6 in. long, sessile, lower with winged petioles: fls. salverform, creamy-white, to 1 in. long. Colo. to Calif. and Mex.

virginica: a name of uncertain application.

viscosa. Ann.: lvs. oblong, to 3 in. long, obtuse, sessile or clasping: fis. funnelform, twice as long as calyx, lobes obtuse. Argentina.

wigandioides. Per. to 9 ft.: lvs. ovate, undulate, petioled: fls. salverform, yellowish-white, drooping. Colombia.

NIDULÀRIUM. Bromeliacex. Epiphytic Brazilian herbs with prickly-margined lvs. in dense basal rosettes and red, purplish or white fls. sessile among the lvs. and subtended by modified or bract-lvs.; grown as a glasshouse subject. Cult. as for Bromeliacex.

amazónicum: Canistrum amazonicum.

fülgens (N. pictum). Lvs. to 1 ft. long and 2 in. broad, spotted with dark green: fls. white with violet limb, in dense clusters, the bract-lvs. bright scarlet.

Innocentii. Lvs. to 1 ft. long, strap-shaped, tinted with brown or red: fls. white, in dense heads, the bract-lys. bright

Lindenii: Canistrum Lindenii.

pictum: N. fulgens.

striatum. To 1 ft.: lvs. lorate, serrulate, deep green, longitudinally striped with narrow white bands which become cream-colored as they approach the margin: fts. white. Brazil.

NIEREMBÉRGIA. CUP-FLOWER. Solanacex. Herbaceous annuals, perennials and substrubs grown in the open border, rock-garden or as pot-plants for the showy pale violet or white tubular fls. which often have a purple center, and are borne singly at or near the tip of the branches: lvs. small, alternate, simple and entire.

The perennial species described (except N. Veitchii) are hardy as far north as New York. Propagated by seeds or in the fall from cuttings of firm shoots; N. rivulurus most easily by division of the creeping stems where they have rooted.

atroviolacea: color form of N. frutescens.

cardina.—Ber. to 1 ft.: Ivs. linear, to ½ in. long: fls. pale lavender-blue with bright yellow eye, to 1½ in. across. Argentina.—Best treated as an annual propagated by seeds, or desirable color forms may be maintained by cuttings. This plant is often erroneously listed in the trade as N.

calcina. Per., sts. decumbent, much branched: lvs. broadly obovate, to ½ in. long, glandular-pubescent: fis. white, yellowish at base, to 3 in. long; corolla-tube very slender, 4-6 times as long as lobes; calyx large, lobes triangular. N. Argentina.—This plant may not be in general cult., and much of the material so listed is N. graculis.

filicaulis; N. gracilis.

frutéscens (N. fruticosa). TALL C. To 3 ft., shrubby, much branched: lvs. linear, to 1 in. or more long: fls. 1 in. across, the saucer-shaped limb white tinted with lilac or blue, the throat yellow. Chile. Var. albiflora has white fls., atroviolàcea dark violet with bright yellow throat, and grandiflora larger fls.—This is the prevailing species in cult.

fruticosa: N. frutescens.

grácilis (N. filicaulis). Prostrate or creeping, sts. ascending to 8 in.: lvs. linear, to ½ in. long: fls. with convex limb, white tinged and veined with purple toward the center, throat yellow, to 1¾ in. long; calyx-lobes linear. Argentina. Var. Crozyana has more abundant violet-tinted fls.—N. frutescens is likely to be cult. under this name, and plants listed as N. calycina usually belong here.

hippománica. Per. to 6 in. or less, pubescent: lvs. linear, to ½ in. long: fls. white tinged rose, to ¾ in. across or less. Argentina.—Not known to be in cult., the plants so listed are probably N. cærulea.

rivularis. White-Cup. Sts. creeping and rooting, matted, to 6 in. high: lvs. oblong or oblong-spatulate, to 1 in. long, long-petioled: fls. 2 in. across, creamy-white sometimes tinged rose or blue, limb broadly bell-shaped, throat golden. Argentina.

Veltchii. Tender per. to 1 ft., sts. prostrate, glabrous or nearly so: lvs. spatulate to linear, to 1 in. long: fis. pale lilac

with white tube to ¾ in. long; calyx-lobes linear and recurved. Trop. Amer.

NIGÉLLA. FENNEL-FLOWER. Ranunculaceæ. Ann. ornamental herbs with lvs. pinnately cut into linear or thread-like segms., often showy white, blue or yellow fls., and fr. a caps.; native in Medit. region and W. Asia.

Nigellas are planted in the flower-garden and of easy culture. Propagated by seeds, that may be sown directly where the plants are to stand; open sunny situation.

atistata: N. arvensis.

arvénsis (N. aristata). To 1½ ft.: lfts. filiform: fls. bluish-white, 1 in. or more across, solitary, without involucre: fr. of 3-5 strongly ribbed carpels joined about 3½ their length, with long beak-like styles. N. Afr., Eu., Asia.

damascèna. Love-in-a-Mist. To 1½ ft. or more, much branched: lfts. filiform: fls. white or light blue, to 1½ in. across, solitary and surrounded by a large finely divided attractive involuere: fr. globular, inflated, carpels united to top, with long erect styles. S. Eu.

diversifòlia. Lower lvs. oblong-linear, entire, st.-lvs. sessile, palmately parted into linear lfts.: fls. pale blush, in cymes: fr. of 3 carpels united about to middle, shortly beaked. Turkestan.

hispánica. To 1½ ft., branching: lfts. linear but not filiform: fis. blue with red stamens, to 2½ in. across, solitary or in 2's, without involucre: fr. ribbed, the carpels united nearly to top, the styles spreading. Spain, N. Afr. Var. 4lba has white fis. and atropurpurea purple.

sativa. To 1 ft. or more, branching: lfts. linear but not filiform: fls. blue, to 1½ in. across, solitary, without involucre: fr. of 3-7 carpels united to top, inflated, styles spreading. Medit. region.—Seeds are used for seasoning.

NIGHTSHADE: Solanum. Enchanters-: Circæa lutetiana. Malabar-: Basella.

NINEBARK: Physocarpus.

NINTOOA: a section of the genus Lonicera.

NIORE: Hosta

NIPA. Palmacex. One gregarious mon ∞ cious unarmed feather-palm with branched rootstocks and no upstanding trunk: spadices erect from the rootstock; staminate fls. in catkin-like short lateral branches among the many bracts; stamens 3; pistillate fls. in dense terminal heads: fr. a large globose aggregation of obovoid fibrous carpels. A plant of estuaries and brackish swamps, India, Malaya, Philippines, Australia; stands in S. Fla. in suitable locations; a handsome plant when properly placed. The herbage is employed in domestic manufacture.

fruticans. Lvs from crowns of rootstocks, 10-30 ft. long, gracefully arching; pinna very many, well separated, rigid, long-acuminate, 2-3 ft. long, ridged, glaucous underneath; head of fr. 10-12 in. diam., the angular hard carpels 4-5 in. long.

NIPHOBOLUS: Cyclophorus Lingua.

NIPPON-BELLS: Shortia uniflora.

NODE: a joint where a leaf is borne or may be borne; also incorrectly the space between two joints, which is properly an internode.

NOLANA. Nolanacex. Reclining and prostrate herbaceous per. but grown as ann., with showy tubular blue fls., and entire usually fleshy lvs.; native in Chile and Peru.

Nolanas are grown as basket-plants and also useful in the border or on rocky hillsides. They require the usual treatment for annuals, with a sunny exposure.

atriplicifòlia (N. grandıflora. N. paradoxa). Sts. spotted and streaked with purple above, to 1 ft. or more long, usually erect: lvs. spatulate, basal with petioles 3 in. long; fls. blue with white throat, yellow inside, to 2 in. across. Var. álba, fls. white. Var. violacea, fls. violet.

grandiflòra: N. atriplicifolia.

lanceolata. Whole plant hoary-pubescent; lys. lanceolate to 6 in. long: fls. deep blue with yellowish-white spotted throat, to 2 in. across.—Stock grown under this name is likely to be N. atriplicifolia.

paradóxa: N. atriplicifolia.

prostrata. Sts. reclining, to 10 in. long: lvs. spatulate, to 3 in. long: fls. blue with white throat, latter with purpleviolet veins, to 3/4 in. across.

NOLANÀCEÆ. NOLANA FAMILY. genera of herbs or subshrubs native in Chile, Peru and Bolivia, with lvs. alternate or paired, bisexual solitary fls. having 5-parted calyx, gamopetalous 5-lobed corolla, 5 stamens, superior ovary and fr. of 5-30 nutlets or follicles. Only the genus Nolana is known to hort. The family is sometimes included in Convolvulaceæ and in Solanaceæ.

NOLÌNA. Sometimes producing Liliacex.tree-like trunks or often without apparent sts.. having linear stiff lvs. and very small whitish fls. in panicles; occasionally planted in warm climates; rigid dry-country and desert plants. For cult, see Yucca.

Béldingii. To 25 ft., branched near top: lvs. to ¾ in. broad and 3 ft. long, glaucescent: panicle compound, primary divisions about 1½ ft. long: fr. emarginate. Lower Calif.

longifòlia (Dasylirion longifolium). To 10 ft., swollen at base and with few branches toward top: lvs. 3 ft. or more long and 11/4 in. wide, rough on edge. Mex.

microcárpa. Stemless per. with coarse linear lvs. 1/2 in. wide, scabrous on margins: fis. pale yellow to whitish, in erect racemes. S. W. New Mex. to Ariz. and south.—Lvs. may be used in basketry and cordage.

Pálmeri. Stemless: lvs. about 1/2 in. wide, rough on edge. Lower Calif.—Roots said to be used as a substitute for soan.

Parryi. To 6 ft., unbranched: lvs. in dense crown, to 3 ft. long and ¾ in. broad; flowering stalk to 2 ft. long, branches stout. S. Calif.

tuberculata: Beaucarnea recurvata.

NOLTEA. Rhamnaceæ. One S. African evergreen shrub, sometimes grown in Calif. N. africana (Willemetia africana). To 12 ft.: lvs. alternate, oblong-lanceloate, to $2\frac{1}{2}$ in. long, toothed, pale beneath: fis. white, small, in panicles about 1 in. long: caps. $\frac{1}{3}$ in. across. Var. adrea is listed.—Propagated by seeds and cuttings of green or mature wood.

NOMÓCHARIS. Liliaceæ. Bulbous herbs with scattered or whorled lanceolate lvs. and showy somewhat drooping fls. 1-4 in the axils, perianth-segms. spreading and deciduous; allied to Fritillaria.

Mairei. To 2 ft.: distinguished from N. pardanthina by the subverticillate and broader lvs. and the perianth-segms. abruptly acuminate, anthers purple, basifixed. Yunnan.

—Forms with satin-white and unspotted fis. also occur.

nana (Fritillaria Stracheyi). To 16 in.: st.-lvs. linear, acute, the upper one exceeding the fl.: fls. purple to pale lilac, about 1 in. long, solitary, nodding, segms. ovate-lanceolate, acute, anthers purple and versatile. Himalayas.

pardanthina. To 1 ft.: fis. to 3 in. across; sepals pale rose, oval, entire; petals reddish spotted with violet, oval, cut-toothed on edge, anthers yellow. Yunnan.

NOPALEA. Cactacex. Cacti of Mex. and Guatemala, differing from Opuntia in erect petals and elongated filaments and style: much branched plants with cylindrical trunks and flattened often narrow branches, producing small nearly terete lvs. which are soon deciduous; spines present in most of the species: fr. a juicy red edible berry. Cult. as for Opuntia. See Cacti.

Auberi (Opuntia Auberi). To 30 ft., with jointed trunk not very spiny; joints narrow to 1 ft. long, bluish or glaucous, areoles bearing wool and glochids and spines 1 or 2 or wanting: fls. rose-pink, about 3½ in. long. Cent. and S. Mex.

Brittonii. Differs from N. cochenillifera in the sprawling habit, flattened trunk, joints 2-3 ft. long, areoles much further apart, and longer ovary. Mex. Var. variegata is listed.

cochenillifers (Opuntia cochenillifera). Cochineal Plant. To 16 ft., trunk sometimes 8 in. diam.; joints oblong and often 20 in. long and mostly spineless, the many glochids caducous: fls. on tops of joints, upwards of 2 in. long, pink or rose. Long cult. but original habitat unknown.—The cochineal of commerce is the insect that feeds on the plant, collected in bulk, once extensively used as a dye. This is one of the cacti on which the insect subsists.

dejecta (Opuntia dejecta). To 6 ft. with definite trunk, very spiny; joints narrow and 4-6 in. long; fls. 2 in. long, dark red. Probably Panama; cult. in trop. Amer. Var. variegata is listed.

inaptera. To 20 ft. with very spiny trunk and many branches; joints to 7 in. long and strongly tubercled; spines 4-12 and to 3/4 in. long and yellowish: fls. pink, 11/4 in. long. Mex.

Cactaceæ. Two Mexican NOPALXÒCHIA. cacti with irregularly branching habit, fls. funnelform with tube shorter than limb, segms. or sepals and petals many, outer segms, acute or acuminate. See Cacti.

Ackermannii (Epiphyllum and Zygocactus Ackermannii). Sts. several, to 3 ft., flat, thin and crenate: fls. very large, to 8 in. long, scarlet outside and carmine within. Believed to be of hybrid origin.

phyllanthoides (Epiphyllum phyllanthoides). Somewhat woody, branches at length hanging and thin and flattened above and often 2 in. broad: fls. diurnal, rose or red, tube about 1 in. long.

NORMÁNBYA. Palmacex. Trop. Australian palm that has been planted in Fla.: monœcious, unarmed, feather-lvd.: the genus is particularly distinguished from Drymophleus and Ptychosperma by the non-sulcate seed, and the peculiarly arranged pinnæ which are in groups resulting apparently from the splitting of one pinna or lft. into several that remain united at their bases, and each pinna narrow with no marginal nerves and truncate irregular apex.

Mérrillii: Adonidia Merrillii.

Müelleri: N. Normanbyi.

MUCHET: N. Normanbys.

Normánbyi (N. Muelleri. Areca, Cocos, Drymophlæus and Ptychosperma Normanbyi). BLACK PALM. Stout tree to 60 ft., outer wood hard and black: lvs 6-8 ft. long, the petiole short or none; pinne, or groups of about 9 narrow lobes, 1½ ft. long and 1 in. broad, whitish underneath: fls. spiral, the pistillate on lower part of branches: fr. about 1½ in. long, more or less pear-shaped.

NOTAPHŒBE: Persea Borbonia.

NOTHOCALAIS: Agoseris cuspidata.

NOTHOFAGUS. Fagacex. Beech-like trees or shrubs but with small alternate lvs., sexual fls. solitary or in 3's, and usually 3 3-angled nuts in a 2-4-lobed scaly involucre; native in S. S. Amer., Australia and New Zeal., the southern hemisphere representative of Fagus. Hardy only in warm regions, as Calif. Propagated by seeds and layers.

antarctica. To 100 ft.: lvs. deciduous, to 1 in. long, toothed or slightly lobed, glabrous except on midrib. Chile. cliffortioides. To 40 ft.: lvs. persistent, to 34 in. long, acute, entire, grayish-pubescent beneath. New Zeal.

Cunninghamii. To 200 ft.: lvs. persistent, to 1/2 in. long, glabrous. Australia.

fúsca. To 100 ft.: lvs. persistent, to 1½ in. long, coarsely toothed, glabrous except on margin. New Zeal.

Ménziesii. To 80 or 100 ft.: lvs. persistent, ovaterhomboid, to ½ in. long, doubly toothed, glabrous except petiole. New Zeal.

obliqua. To 100 ft.: lvs. deciduous, to 3 in. long, toothed. Chile.

procèra. Tree: lvs. deciduous, to $\bf 4$ in. long, finely toothed, pubescent beneath. Chile.

Solandri. To 80 ft.: lvs. persistent, to ¾ in. long, obtuse, entire, grayish-pubescent beneath. New Zeal.

NOTHOLÆNA. Polypodiaceæ. Small rock-loving ferns with farinose densely chaffy or hairy fronds, 1-4-pinnate: sori usually sub-

marginal, borne at or near the tips of the unmodified veins: margins of segms. unmodified, flattish or revolute and partially covering the sporangia. About 60 species in S. E. U. S. and trop. Amer., also 1 in Eu.

Féndleri. Fronds to 9 in long, broadly deltoid-ovate, 4-5-pinnate, whitish-farinose below, with rachises and their branches flexuous and zigzag. Colo. to Ariz. and Tex.

NOTHOLCUS: Holcus.

Four NOTHOLIRION. Liliaceæ. species now considered distinct from Lilium. differing in the bulb being tunicated (not composed of scales), in the production of small bulbils at the base of the bulb, long basal lvs., stigma deeply 3-cleft (not merely 3-lobed) and seeds much smaller and wingless.

macrophyllum (*Lilium macrophyllum*). To 1 ft., with flexuose sts.; fls. rose, 1½ in. long, funnel-shape, usually in clusters of 4-6. Himalayas.

Thomsonianum (Lulum Thomsonianum). To 3 ft., with long racemes and lvs. scattered: fls. pink, fragrant, spreading, broad-funnelform, the narrow segms. to about 2 in. long. Afghanistan to N. W. Himalayas.

NOTHÓPANAX. Araliaceæ. Evergreen trees and shrubs from Malaya to New Zeal. with simple or compound lvs., small fls. in umbels, and drupaceous frs.; a few species are grown in Calif. for ornament.

anómaium (Panax anomaium). Shrub to 12 ft., much branched: lvs. orbicular, to 34 in. long, in young plants of 3 lfts.: fls. minute, in simple umbels: fr. mottled. New Zeal. arbòreum. Tree to 25 ft, much branched lvs. digitately 5-7-parted into oblong toothed lfts. to 7 m. long: fis. 1/2 in. across, in compound umbels: fr. purplish-black. New Zeal.

Colensoi. Shrub or tree to 15 ft.: lvs. of 3-5 obovate toothed lfts. to 6 in. long; fls. in compound umbels. New Zeal.

simplex. Tree to 25 ft.: lvs. lanceolate, to 5 in. long, in young plants lobed or pinnately parted: fis. small, in compound umbels. New Zeal.

NOTHOSCÓRDUM. FALSE GARLIC. Liliaceæ. Bulbous allium-like herbs with linear basal lvs. and small yellow or white fls. in umbels, the perianth-segms. distinct; rarely cult., the following species tender N.

bivalve (Allium striatum). Lvs. to 16 in. long and 1/4 in. wide: fls. yellowish, 1/2 in. long, on scapes to 16 in. high. Va. to Fla. and Mex.

fragrans. Lvs. to 1 ft. long and ¾ in. wide: fls. white lined with pinkish, fragrant, to ½ in. long, on scapes to 2 ft. high. Habitat doubtful; nat. in Bermuda and S. U. S.

NOTOBASIS: Carsium suriacum.

NOTOCÁCTUS. Cactaceæ. A S. American genus of cacti combined by some authors with Malacocarpus from which it differs in its bristly, scaly and hairy perianth-tube and fr., the latter being dry and dehiscing at maturity; further distinguished by highly colored bristle-like spines and larger fls. Treatment as for Echinocactus. See Cacti.

ápricus (Echinocactus apricus). Cespitose, globose, to 2 in. diam.; ribs 15-20, low, somewhat tubercled; spines reddish-yellow, radials 18-20, to % in. long, bristly, centrals 4, to 1½ in. long; fls. yellow, to 1½ in. long, inner segms. dentate, stigma 13-lobed. Uruguay.

concinnus (Echinocactus and Malacocarpus concinnus). Usually solitary, depressed-globose, to 2½ in. tall and 4 in. diam.; ribs about 18, low, tubercled along upper third; radials 10-12, to ½ in. long, yellow; centrals 4, to ½ in. long, yellow to reddish-brown: fls. pale yellow within, red outside, to 3 in. long, stigma red, 10-lobed. Uruguay,

S. Brazil.
floricomus (Echinocactus and Malacocarpus floricomus).
Solitary, depressed-globose to subcylindrical, to 7 in. tall and 5 in. diam.; ribs 20, tubercled; spines white to gray with red base, radials 15-20, radiating, centrals 4-5, to 1 in. long, sreet: fls. yellow, to 2½ in. long, inner segms. dentate, stigma dark red, 8-lobed Uruguay, Argentina. Var. flavispinus is said to have bright yellow spines.

Graessneri (Echinocactus and Malacocarpus Graessneri). To 2 in. high and 4 in. across; ribs more than 60 and usually in spirals; spines numerous, ¾ in. long, bright yellow: fis.

Gróssei (Echinocactus and Malacocarpus Grossei). Clobose or depressed, to 4 ft.; ribs usually 16; spines 3-7, white, to 1½ in. long: fls. citron-yellow, 1½ in. long. Paraguay.

Håselbergii (Echinocactus and Malacocarpus Haselbergii). Globose or slightly depressed, to 3 in. across; ribs 30 or more; radial spines about 20 and white; central spines 3-5, pale yellow: fls. red outside, variegated inside, 1 in. across. Brazil.

Léninghausii (Echinocactus and Malacocarpus Leninghausii). St. slender and cylindric, to 3 ft. long and 4 in. diam.; ribs about 30 and obtuse; radials about 15; centrals 3 or 4 and longer: fls. 2 in. across, yellow. S. Brazil.

mammulosus (Echinocactus and Malacocarpus mammulosus). Plant simple and nearly globose, to 3 in. high, shining green; ribs 18-25; radials 20-30; centrals 2-4, to % in. long; fis. about 1½ in. long, yellow. Brazil to Argentina. Var. rüber is listed.

Mueller-Mélchersii. A little-known species; st. de-pressed-globose, areoles usually with 1 erect spine to ½ in. long. Uruguay.

nuricatus (Echinocactus muricatus). Globose to sub-globose, to 6 in. tall and 4 in. diam.; ribs usually 16-20, low, rounded, light green, notched; spines brown, radials usually 12-15, to ¼ in. long, somewhat curved, centrals 3-4, to ¾ in. long, darker: fis. pale yellow, to 1½ in. long, stigma 9-11-lobed. Uruguay, S. Brazil.

nigrispinus: listed name.

Ottonis (Echinocactus and Malacocarpus Ottonis). Simple or cespitoses, globular or perhaps depressed, 2 in. or so diam.; ribs 10 and broad; spines needle-like and short: fls. 2 in. or so long, yellow. S. Brazil to Argentina. Var. uruguayénsis has 11 ribs with areoles more distant.

pampeanus (Malacocarpus and Echinocactus pampeanus). Globose to subcylindrical, to 4 in. tall and 2½ in. diam.; ribs 21, straight; radials 7-10, to ½ in. long, sharp, spreading; centrals 1-2, stout: fls. yellow, inner segms. dentate. Uruguay, Argentina.

Reichii: Neoporteria Reichii.

Schumannianus (Echinocactus and Malacocarpus Schumannianus). To 1 ft. long and across; ribs about 30 and low; spines 4-7, brownish or yellow: fis. citron-yellow, 1 in. long. Paraguay, Argentina.

Scopa (Behinocatus Scopa and var. Malacocarpus Scopa).
Globular or cylindrical, to 1½ ft, high; ribs 30-40 and nearly hidden by spines; radial spines 40 and white; central spines 4, brown or purple; fls. lemon-yellow, 2½ in across. Brazil, Paraguay. Var. rubérrimus has crimson-red central spines.

submammuldsus (Echinocactus and Malacocarpus subsuomammuosus (Ecannocactus and Maucocarpus suo-mammulosus). Differs from N. mammulosus in having only 6 radial spines and a single central, the latter to ¾ in. long. Uruguay and Argentina.

tabularis (Echinocacius and Malacocarpus tabularis). Simple and globose or short-columnar; ribs 16-18 and glaucous; radials 16-18; central spines 4: fls. 2 in. or more long, yellow. Brazil or Uruguay.

Velenóvskii. Similar to N. floricomus, to 4 in. thick and as high; ribs 18-20, to ½ in. wide, acute; radial spines about 25, to ½ in. long, radiating, bristly; centrals 7. Uruguay.

NOTONIA. Compositæ. Fleshy herbs or subshrubs with rudimentary or succulent lys., allied to Senecio but with heads of disk-fls. only: heads red or yellow, solitary or in cymes: native trop. Afr. and Asia.

Grántii. To 8 in., root tuberous: radical lvs. elliptic, sessile, to ¾ in. long: heads orange-scarlet, ¾ in. long, on scape-like sts. bearing a few scale-like lvs. Trop. Afr.

péndula (Kleinia pendula). Sts. prostrate and rooting, to 1 ft. long and ¾ in. thick, covered with remains of dried lvs.: lvs. nearly cylindrical, ¾ in. long: fis. orange- or blood-

NOTOSPÁRTIUM. PINK OF SOUTHERN BROOM. Leguminosæ. Leafless shrubs, endemic to New Zeal, having flattened pendulous branchlets, small papilionaceous fls. in lateral racemes, and legume linear, straight or curved, compressed, 3-10-jointed and indehiscent. N. Carmichaeliæ. To 12 ft., sts. slender, much branched, greenish: lvs. present only on young plants, obcordate or orbicular, small: fls. magenta-pink, to 1/4 in. long, 8-20 crowded into simple racemes to 2 in. long crowded on the branchlets for a considerable

distance: pods to 1 in. long, 1 seed in each joint.—Does best on sandy loam in sunny locations. Propagated by seeds and cuttings. Not hardy N.

NOTOTHLÁSPI. Cruciferæ. A small genus of fleshy alpine herbs from New Zeal., having spatulate lvs., large white fls. in terminal racemes or corymbs, and rather large much com-pressed and winged pods containing numerous kidney-shaped seeds attached by long radicle.

rosulatum. Per. to 9 in., sts. unbranched and very short or wanting: lvs. fleshy, spatulate, densely crowded and imbricated in rosette, becoming glabrous with age: fls. fragrant, in dense conical racemes: pods to 1 in. long, obovate, stigma very short.

NOTOTRÍCHIUM. Amaranthaceæ. or trees, one sometimes planted in Calif.: lvs. opposite: fls. small, pubescent, in spikes: fr. a utricle.

sandwicense. Kului. To 20 ft. or often a shrub: lvs. ovate, to 3 in. long, silvery-tomentose beneath: fis. crowded in 3-5 spikes to 1 in. long at ends of branches. Hawaiian

NÙPHAR (Nymphozanthus).
PATTERDOCK. YELLOW POND-I Cow-Lily. SPATTERDOCK. POND-LILY. phæaceæ. Aquatic plants with stout rootstocks creeping in the mud: lvs. large, some submerged, others floating or standing erect above the water: fls. not very attractive, yellow or purplish, usually standing above the water, the 5 or more sepals the showy part of the fl.

The spatterdocks grow on the margins of slow-running mud-bottom streams or lakes or in stagmant pools Their cultivation and propagation is the same as for the hardy nympheas and nelumbos.

Advenum (Nymphæa advena). Common S. Lvs 1 ft. long, thick; fis. 2-3 in across, more or less globular, not wide open, yellow tinged green or brown, sepals 6. N. Amer.

lùteum (Nymphæa lutea). EUROPEAN YELLOW P. Livs. rising a little above the water or floating: fis. smaller than those of N. advenum, yellow, somewhat fragrant, sepals 5.

polysépalum (Nymphæa polysepala). Lvs. to 1 ft. long and 14 in. wide: fis. 3-5 in. across, yellow, sepals 9-12. Calif. to Ore.

NURSERY, in horticulture, is a place or establishment in which plants are propagated and then grown until such time as they are placed in permanent quarters or sold to the customer. It is naturally concerned mostly with perennial plants.

The nursery establishment may be wholly or partly under glass, or wholly in the open. It may be devoted to the rearing of orchids, begonias, roses, dahlias, lilies, lilacs, hedge plants, forest trees, fruit-trees, or any other class of vegetation. Nursery-growing practically constitutes a business or enterprise quite by itself, requiring special equipment, experience and market, and it has its own literature and traditions.

NUT: an indehiscent 1-celled and 1-seeded hard and bony fruit, even if resulting from a compound ovary. In horticulture an edible hardshelled fruit that can be kept in a dry state; see Filbert, Hickory-Nut, Pecan, Walnut.

NUTLET: a small or diminutive nut; nucule.

NUTMEG. One member, Myristica fragrans, of a large genus, is widely known for the seed which furnishes the nutmeg of commerce and the aril surrounding the seed which is commercial mace. Attractive tree to 70 feet: leaves alternate, oblong-lanceolate, to 5 inches long, brownish: flowers dieccious, without corolla: fruit reddish or yellowish, to 2 inches long, splitting into 2 valves, the scarlet mace forming a network

around the brown seed or nutmeg. Molucca, but somewhat grown in parts of the American

tropics.

The nutmeg thrives in a hot moist climate in well-drained rich soil. The plants are dicecious and one male is sufficient for ten to twelve females, although it is impossible to determine the sex before flowering. For this reason grafting is the best method of propagation although seeds are commonly employed. Seeds may be sown in bamboo pots and transplanted when seedlings are 8-10 inches high. A tree should come into bearing at seven to eight years of age and will remain productive for many vears.

NUTMEG, CALIFORNIA -: Torreya californica.

NIITTALLIA: Osmaronia Mentrelia

NYCTAGINÀCEÆ. Four-o'Clock Family. About 25 genera distributed widely about the world in warm and trop. countries; known to hort. chiefly in Bougainvillea, a genus of woody plants, Pisonia, and the herbaceous genera Abronia, Allionia, Boerhaavia and Mirabilis, grown for ornament. The family is characterized by its fls. subtended by an involucre which is sometimes petal-like and showy (as in Bougainvillea), petals lacking but calyx often or usually corolla-like (as in the four-o'clock), 1-celled 1-seeded ovary, the fr. an achene on which the calyx is persistent. The family is allied to Amaranthaceæ.

NYCTÁNTHES. Oleaceæ. Shrub or tree to 30 ft., native of India and sometimes grown under glass or in the open in warm countries, for its small night-blooming fls. Propagated by cuttings over heat. N. Arbor-tristis. Night-Jasmine. Tree-of-Sadness. Lvs. opposite, ovate-cordate, to 4½ in. long: fls. salverform, white with orange tube, fragrant, in few-fld. heads subtended by involucre-like bracts: fr. an orbicular caps. 34 in. long.

NYCTERINIA: Zaluzianskya.

NYCTOCÈREUS. Cactacex. Slender erect or clambering somewhat branched cereus-like cacti, sts. and branches cylindric and many-ribbed, spiny: fls. nocturnal, large and white, funnelform: species 5, in Mex. and Cent. Amer. See Cacti.

guatemalénsis (Cereus guatemalensis). Usually erect, to 2½ in. diam.; ribs 8-12, obtuse, low; spines about 10, to 1½ in. long, yellowish, not stiff: fls. yellow- to carmine-red outside, white within, to 8 in. long. Guatemala.

Hirschtianus (Cereus Hirschtianus). Sts. to 1 in. diam., prostrate; ribs about 10, acute, low; spines pale yellow, to ½ in. long; fls. pale rose to white, the segms. very narrow. Nicaragua.

serpentinus (Cereus serpentinus). Clustered, at first erect and then clambering or hanging, to 10 ft. long and 2 in. thick; spines about 12: fls. 6-7½ in. long. Mex.—Widely

NYMPHÆA (Castalia). NYMPHEA. WATER-Nymphæaceæ. Showy aquatic herbs with horizontal or erect rootstocks, sometimes tuberous, the lvs. usually floating and often colored on the under surface: fls. mostly showy, floating or standing near the surface, in white, yellow, pink, red or blue, some blooming by day and some by night: fr. under water, a single compound body of many divisions with a depressed saucer-like center; about 40 species and numerous hort. hybrids distributed widely in temp. and trop. regions.

Nympheas are propagated by seed which are rolled up in a ball of clay and dropped into a pond, or sown in pots

which are then submerged in shallow water, indoors or out. which are then submerged in shallow water, indoors or out. The more usual method is to use parts of rootstocks which are sunk in the pond and held by stones, or in the case of the tender species they are placed in pans of water indoors; the species that produce tubers on the rootstocks may be increased by this means.

ádvena: Nuphar advenum.

Aiba (N. venusta). European White W. Robust: lvs. roundish, to 1 ft. across, red when young, crowded on the rhizome: fls. white, 4-5 in. across, open nearly all day. Eu., N. Afr. In var. candidissima the lvs. are yellowish when young, first to bloom in spring till frost. Var. rubra, rosyred. Sweden.

amábilis: hort, form with silver-pink fls, of spreading

ámpla. Tender: lvs. narrowly peltate, to 14 in. diam., margins toothed or nearly entire, green above and redpurple beneath: fls. white, to 5 in. across. Tex. to Brazil.

Andreana. Hybrid between N. alba var. rubra and N.

Arethusa. Hybrid between N. alba var. rubra and N. mexicana: fls. crimson-pink.

Arnoldiana. Hybrid between N. rubra and N. Lotus: fls. rosy-carmine.

atropurpurea: form of N. rubra.

auròra. Hybrid between N. alba var. rubra and N.

Bissetii. Hybrid between N. rubra and N. Lotus: fls. magenta.

cardiea. Blue Lotus of Egypt. Tender, free-blooming but not showy: lvs. 12-16 in. across, green with purple blotches beneath: fls. 3-6 in. across, light blue with white center, opening 3 days in forenoon. N. and Cent. Afr.

candidíssima: N. alba var.

capénsis. Cape Blue W. Tender: lvs. to 16 in. across: fis. 6-8 in. across, sky-blue, whitish at bottom, opening 4 days in forenoon to late afternoon. S. Afr. Var. zanzibariensis (N. zanzibariensis). Lvs. often smaller; fis. larger, to 12 in., deep blue, opening and closing 3-5 days somewhat later, sepals purple-blue within and on margins. Zanzibar. Forms of this are azùrea and rosea.

Carishbrookii: hort. hybrid of undetermined parentage. caroliniana (N. odorata var. superba). Hybrid between N. odorata var. rosea and N. tuberosa: fls. rosy-pink.

castaliflora: a hort, form with mottled lys, and pink fragrant fis. to 10 in. across, day-blooming.

chromatélla: N. Marliacea var.

chrysantha. Hybrid between N. alba var. rubra and N. mexicana.

colossea. Hybrid between N. alba and N. odorata var. rosea: fis. light pink.

columbiana. Hybrid between N. rubra and N. Lotus: fls. carmine.

Daubeniana. Possibly a hybrid of N. micrantha and N. cærulea: tender: fls. pale blue.

Deaniana. Hybrid between N. rubra and N. Lotus: fis. pink.

dentàta: N. Lotus var.

devoniénsis. Hybrid between N. rubra and N. Lotus:

fis. rosy-carmine.

élegans. Lvs. 7 in. across, under surface dark purple:
fis. pale violet, 3-6 in. across, open 3 days in the forenoon.

Mex., Tex.

Ellisiana: hort. hybrid, of which one parent is probably N. alba var. rosea.

flava: N. mexicana.

flavóvirens (N. gracilis). Tender: lvs. 15-17 in. across, reen underneath: fls. 6-8 in. across, white, day-blooming. Mex.

formosa. Hybrid between N. alba var. rubra and N. mexicana.

Froèbelii: a form probably of N. alba var. rubra.

fúlva. Hybrid between N. alba var. rubra and N. mexi-

gigantèa. Australian W. Lvs. 18 in. across, under surface brownish-pink to purple: fis. light blue, petals tipped dark blue, open 7 days 9 A.M. to 6 F.M., 6-12 in. across. Australia. Var. Hudsoniàna does not differ.

Gladstoniana. Hybrid between N. alba and N. odorata var. rosea: fls. white.

gloridsa: a form of N. alba var. rubra.

grácilis: N. flavovirens.

grácilis ròsea and rùbra represent a pink-fid. hybrid between N. flavorirens and N. capensis var. zanzibariensis. hélvola: N. tetragona var.

indica. Hybrid between N. rubra and N. Lotus: fis. of different colors, of many named forms.

kewénsis. Hybrid between N. rubra and N. Lotus: fls. rosy-pink.

lacten: garden form of N. odorata.

Laydékeri. Hybrid between N. alba var. rubra and N. tetragona or N. mexicana; there are many named forms in different colors.

Lôtus. White Lotus of Egypt. Tender: lvs. 12-20 in. across, dark green on top, brownish beneath: fis. 5-10 in. across, white with outer petals pinkish, opening evening till nearly next noon. Egypt. Var. dentata. Fis. white, 8-10 in. across, open till past noon Cent. Afr. Large-fid. forms of this are grandiflora, magnifica and superba.

Luciana: improved form of the hybrid between N. odorata var. rosea and N. tuberosa.

lùcida: form of the hybrid N. Laydekeri with red-crimson fla.

litea: Nuphar luteum.

Marliàcea. A series of hybrids of different parentage raised by M. Latour-Marliac of France. Vars. álbida, cárnea and rôsea are hybrids of N. alba and N. odorata var. rosea. Var chromatella (N. chromatella). Hardy: floating lvs. much blotched with brown, 3-8 in. across, when crowded rise above water: fls. bright yellow, 3-6 in. across. Probably a hybrid between N. mexicana and N. alba or N. tuberosa. Hybrids between N. alba var. rubra and N. tetragona are vars. flámmea, ignea, and rūbra punctāta.

marmorata: hort. name for a tender form said to have lavender-blue fis. and lvs. green, mottled and streaked with chestnut-brown.

mexicana (N. flava). Yellow W. Rootstock erect and tuber-like, spreading by runners: floating lvs. 4-8 in across, blotched brown above, crimson-brown with blackish dots beneath: fls. 4 in. across, standing 4-5 in. above the water, bright yellow, open before midday and early afternoon. Fla., Mex., but hardy N. protected under cult.

Modrei. Hybrid between N. alba and N. mexicana.

Modrei. Hybrid between N. alba and N. mexicana.
odorata. Fragrant W. Hardy: lvs. 3-10 in. across,
rather thick, dull green above, usually purplish beneath;
fls. white, fragrant, 3-5 in. across, opening 3 days in forenoon. Common in E. U. S. In the wild at Cape Cod is a
pink-fld. var. rosea, in the S. and American tropics is a
larger white-fld. var. gigantéa. Var. máxima is N. tuberosa
var. Var. minor, lvs. deep red beneath, sepals purple. Var.
sulphirea (N. sulphurea). Lvs. all floating, 4-6 in. across,
like those of N. odorata but blotched with brown: fls. light
yellow, 4-5 in. across, 2-4 in. above the water, open in
morning. Probably N. mexicana X. N. odorata.

Omarana. Hybrid between N. rubra and N. Lotus:

Ortgiesiana rubra. Hybrid between N. rubra and N. Lotus: fis. magenta.

ovalidia. Tender: lvs. narrowly elliptic, 10 in. long and 6 in. wide, large brown blotches above, under surface plain green: fls. deep blue, closed in dull weather. Trop. Afr.

pennsylvania. Hybrid between N. cærulea and N. capensis var. zanzibariensis: tender: fis. large, medium blue, open 8 A.M. to 5 P.M.

polysépala: Nuphar polysepalum

pulchérrima. Hybrid between N. cærulea and N. capensis: tender: under surface of lvs. green, densely blotched with purplish-black, margin purplish-red, 16 in. across: fis. light blue, 10–22 in. across.

pygmæa: N. tetragona.

Richardsonii: N. tuberosa var.

Rôbinsonii. Hybrid between N. alba var. rubra and N. mexicana.

rubicunda. Hybrid between N. rubra and N. Lotus: fls. reddish-pink.

ribra. RED INDIA W. Tender: lvs. 12–18 in. across, bronzy reddish-brown but becoming greenish, hairy beneath: fls. 6–10 in. across, deep purplish-red, opening 3 or 4 nights till nearly noon. India.—The parent of many hybrids.

Seignorétii. Hybrid between N. alba var. rubra and N. mexicana.

somptuosa. Large-fid. hybrid between N. alba and N. odorata var. rosea.

speciosa. An improved form of the hybrid between N. odorata var. rosca and N. tuberosa.

spléndida: hort, name.

stellata. Blue Lorus of India. Lvs. blue-violet beneath: fis. 3-7 in. across, pale blue, whitish at base (pink and white forms are known), opening 3 days in the forenoon and early afternoon. India.

Stúrtevantii. Hybrid between N. rubra and N. Lotus: fis. reddish-pink.

sulphurea: N. odorata var.

supérba: N. caroliniana.

tetragona (N. pygmæa). Pygmy W. Hardy, smallest species cult., has been used much in hybridization, con-

tributing to the Marliacea, Laydeckeri and other hybrids: lvs. reddish beneath, 3-4 in. across: fis. white, 1½-2½ in. across, open 3 or 4 days from noon to 5 P.M. Siberia to Japan, also in N. Ida. and Ont. Var. fiba is listed, but may not differ from type. Var. hélvola (N. helvola). Probably hybrid between N. mexicana and N. tetragona. Hardy: lvs. floating, 3-4 in. across, blotched all over with brown: fis. floating, small, yellow, 2 in. across, open during the after-

tuberòsa. Magnolia or Tuberous W. Hardy: rootstocks bearing detachable short tuber-like branches: lvs. green beneath: fis. 4-9 in. across, pure white, opening 3 to 4 days till shortly after noon, faint or no fragrance. N. Amer. Var. máxima is a smaller form from N. J. Var. Ríchardsonii, more numerous petals, forming a globe when fl. fully open. The vars. rôsea and ribra are forms of the hybrid between N. odorata var. rosea and N. tuberosa. Var. sulphurea, a pale yellow form.

venústa: N. alba.

virginalis: hort. form of unknown parentage.

zanzibariénsis: N. capensis var.

NYMPHÆÀCEÆ. WATER-LILY FAMILY. Per. aquatic herbs of wide distribution, with usually large floating lys, that commonly arise from a submerged rootstock, bisexual regular showy or sometimes inconspicuous fls. having 4 or more sepals, few or many petals which pass into the numerous stamens, and fr. of separate or united carpels, the seeds sometimes discharged through apical apertures. The genera grown in ponds or aquaria are Brasenia, Cabomba, Euryale, Nelumbium, Nuphar, Nymphæa, Victoria.

NYMPHOIDES (Limnanthemum). ING-HEART. Gentianaceæ (or Menyanthaceæ). Aquatic perennials with broad floating lvs. heart-shaped at base and yellow or white fls.; grown in ponds or tubs.

Tubs should be filled two-thirds full of loam covered with sand and the remainder water. Propagated by pieces

of the leaf containing flower-buds.

findicum. WATER-SNOWFLAKE. Lvs. orbicular, to 8 in. across: fis. white, yellow toward base, borne in umbels at top of petioles. Tropics. Var. aureum is a deep yellow form.

lacundsum. I.vs. ovate-orbicular, 2 in. across, purplish beneath: fls. nearly white, 1/2 in. across. in umbels, accompanied by clusters of tubers. N. Amer.

nymphæoldes: N. peltatum,

1) applications. In penalum, pelitium (N. nymphæoides), Lvs. ovate-orbicular, to 4 in. across, the margins wrvy: fis. bright yellow, 1 in. across, in umbels in axils of lvs. Eu., Asia; sparingly nat. in N. Amer.

NYMPHOZANTHUS: Nuphar.

NÝSSA. TUPELO. Nyssaceæ. Asian and N. American trees with alternate simple deciduous lvs. which turn scarlet in autumn, minute greenish-white unisexual fls., and small but conspicuous drupaceous frs.; sometimes grown for ornament in moist situations, prized also for the crooked brushy branching of some of the

Propagated by seeds sown at once or stratified, and by layers. Trees do not transplant well from the wild.

aquática. Corron or Tupelo Gum. To 100 ft.: lvs. to 7 in. long, entire or angular-toothed: fr. dark purple, 1 in. long, solitary. Swamps, Va. to Fla. and Tex.

bifldra: N. sylvatica var.

multiflòra: N. sylvatica.

sylvática (N. multiflora). Pepperidge. Sour or Black Gum. To 100 ft: lvs. to 4 in. long, entire: fr. dark blue, to 34 in. long, 1-3 together. Me. to Fla. and Tex. Var. biflora (N. biflora) has mostly obtuse rather than acute lvs. and much flattened ribbed stones. N. C. to Fla. and La.

NYSSACEÆ. NYSSA FAMILY. Three genera of trees and shrubs native in N. Amer. and Asia, with alternate simple lvs., bisexual or diœcious fis. having very small calyx, 5 or more petals or lacking, inferior 1- or 6-10-celled ovary, and mostly drupaceous fr. Camptotheca, Davidia and Nyssa are cult.

OAK: Quercus. Jerusalem-: Chenopodium Botrys. Poison: Rhus diversiloba and R. radicans. She: Casuarına. Silk-: Grevillea robusta. Tanbark: Lithocarpus densiflora.

OAKESIA: Uvularia.
OAKESIELLA: Uvularia.
OAT. FALSE: Trisetum.

OATS: Anena

OBELISCARIA: Lepachus columnifera var.

OBLONG: a rather broad leaf or other part, longer than wide and with the sides nearly or quite parallel most of their length.

OBREGÒNIA. Cactaceæ. One species native in Mex. and related to Echinocactus. **O. Denégrii.** Obconic, to 5 in. diam., with numerous densely imbricated keeled tubercles, areoles white-woolly; spines many and soon deciduous: fls. white, 1 in. long.

OBTUSE: blunt, rounded, not pointed.

OCEANORUS: Zigadenus leimanthoides.

ÓCHNA. Ochnaceæ. Trop. trees and shrubs in both hemispheres with alternate toothed leathery lvs., yellow fls., and fr. of sessile drupes surrounding a central receptacle.

One species is grown under glass or out-of-doors in southern California. The best soil in greenhouse culture is fribened would trained. Propagated by cuttings of halfripened wood in summer or fall.

multiflora. Shrub to 5 ft. lvs. oblong, to 5 in. long: fls. yellow, the sepals turning red: fr. with bright red receptacle and black seed-like drupes. Trop. Afr.

OCHNACEÆ. OCHNA FAMILY. About 20 trop. woody genera with alternate simple or pinnate lvs., bisexual polypetalous fls. with mostly 5 sepals and petals, 10 or more stamens, deeply lobed ovary, and fr. a drupe, berry or caps. The family is near Hypericaceæ in the series. Ochna is sometimes planted.

OCHROCODON: Fritillaria pudica.

OCHRÒMA. Balsa. Bombacaceæ. Trop. American trees furnishing very light wood used for commercial purposes: lvs. large, soft, alternate: fls. very large, terminal, petals 5: fr. a caps. with seeds immersed in dense wool.

Lágopus: O. pyramidale.

pyramidàle (O. Lagopus). To 60 ft. with smooth trunk to 16 in. diam.: lvs. nearly orbicular, to 1 ft. across, toothed or lobed: fis. solitary, nearly white, petals 4 in long: caps. linear, to 1 ft. long, having reddish wool. W. Indies, N. S. Amer.

OCHRÒSIA. Apocynaceæ. A small genus of trees from southern hemisphere having milky juice, opposite or whorled lvs., yellow fls. in terminal or subterminal pedunculate cymes, and fr. a 1- or 2-seeded drupe. Propagated by seeds or cuttings.

elliptica. Tree to 20 ft. or less: lvs. obovate-oblong to elliptical, obtuse or very briefly acuminate, to 6 in. long, in whorls of 3 or 4 or occasionally opposite: fls. cream-colored, sessile, in dense corymbose cymes: fr. scarlet, ellipsoid with acuminate apex, to 2 in. long, usually in pairs, with violet-like odor when crushed. New Caledonia.—It has been planted under the name Kopsia arborea.

OCIMUM. Labiatæ. Very aromatic ann. and per. herbs or small shrubs, the basil grown for seasoning and for the pleasing fragrance: fls. mostly small, in terminal or branching racemes.

Basils are sweet herbs tender in the North and should be started indoors or in a hotbed; otherwise they are easily grown The herbage is cut while the plant is growing and dried, and often a second crop is obtained The roots may be lifted for a winter supply of foliage.

Bastlicum (O. bullatum). Bastl. Ann. or grown as such, much branched, to 2 ft.: lvs. ovate, to 2 in. long, often purplish: fls. white or purplish, to 1/2 in. long. Trop. Asia, Afr., Pacific Isls.

bullatum: O. Basilicum.

crispum. Erect per.: lvs. ovate, to 1 in. long, acuminate, serrate to entire, glabrous, petiolate: fis. in lax terminal racemes. Japan.—Best treated as an ann.

minimum. Bush Basil. Probably a small form of O. Basilicum.

sanctum. Ann. to 2 ft, sts. purplish, hairy: lvs. ellipticoblong, to 2 in. long, pubescent on both sides, glandular-dotted: fls. purplish, in racemes to 8 in. long with pedicels longer than calyx. Malaysia, Australia and W. Asia.—Sometimes known as Holy Basil, as it is considered the most sacred plant in the Hindu religion.

suave. Tree Basil. Shrub to 8 ft, much branched: lvs-ovate, densely woolly: fls. whitish or purplish, 1/4 in. long. In dense and much panicled racemes to 9 in. long. India, Afr.

OCONEE-BELLS: Shortia galacifolia.

OCOTILLO: Fouquieria splendens.

OCTADESMIA: Lælia monophylla.

OCTOMÈRIA. Orchidaceæ. American epiphytes with tufted sts., solitary lvs. and small fls. clustered in the axils of lvs., the sepals and petals similar, the small lip 3-lobed. See Orchids for cult.

diáphana. Sts. to 4½ in. tall lf. elliptic-lanceolate, petioled, to 3 in. long: ffs. about 3½ in. long, translucent, yellowish-white. Dec.-Apr. Brazil.

ODONTIÒDA. Orchidaceæ. Group of orchid hybrids between the genera Odontoglossum and Cochlioda.

Brádshawiæ (O. crispum X C. Noezliana).

Brèwii (Odontioda Charlesworthii \times Odontoglossum Harryanum).

Chárlesworthii (O. Harryanum \times C. Noezliana). Coòksoniæ (O. armanvullærense \times C. Noezliana), heatonénsis (O. cirrhosum \times C. sanguinea).

keighleyénsis (O. cirrhosum X C. Noezliana).

Sánderæ (O. percultum \times C. Noezliana).

Thwàitesii (O. Harryanum X C. vulcanica). Vuylstêkeæ (O. nobile X C. Noezliana).

ODONTOGLÓSSUM. Orchidaceæ. Epiphytic trop. American orchids with 1- or 2-lvd. pseudobulbs and fls. in lateral racemes or panicles, the sepals and petals nearly equal, the lip with claw parallel to column and spreading mid-lobe. The cult. species are mostly native in high elevations and are usually difficult to grow in N. Amer. because of the hot summers; they require a cool house. See remarks under Orchids.

Adrianiæ. Hybrid between O. crispum and O. Hunner wellianum

Aireworthii. Hybrid between O. crispum and O. Japonais Aliciæ. Hybrid between O. Edwardii and O. spectabile. altum. Hybrid between O. armainvillerense and O

Hallii.
amabile. Hybrid between O. spectabile and O. crispum.
amandum. Hybrid between O. Denisoniæ and O. nobile.
amanum. Hybrid between O. nobile and O. spectrum.

Andersonianum: O. crispum var.

ardentissimum: O. armainvillierense.

armainvillierénse (O. ardentissimum). Hybrid between O. nobile and O. crispum.

Ashworthianum. Hybrid between O. Edwardii and O. Ossultonii.

bictoniénse. Pseudobulbs surrounded by If.-bearing sheaths, 1-3-lvd.; lvs. to 151/4 in. long and about 1 in. wide: infl. to about 30 in. tall, commonly racemose, many-fld.;

fis. about 1½ in. across; sepals and petals commonly yellow-green blotched with brown or purplish; lip violet or whitish with a pair of erect yellow basal crests. Aug.-Jan. Cent. Amer.

Cervántesii. Pseudobulbs clustered, 1-lvd.: If. petioled, to 6 in. long: infi. longer than If., to 6-fid.; fis. 1½-2½ in. across; sepals and petals white with numerous concentric chocolate streaks near the base; lip white with yellow basal crest. Oct.-May. Mex., Guatemala.

Chárlesworthii. Hybrid between O. Harryanum and O. triumphans.

cirrhosum. Pseudobulbs with 1-2 lvs. to 12 in. long: infl. to 3 ft. long, nodding; fls. to 4 in. across, white spotted with red-brown; lip with yellow side lobes streaked with red. Apr.-July. Ecuador.

citrósmum: O. pendulum.

Cookianum. Hybrid between O. blandum and O. triumphans.

Coradinei. Perhaps a natural hybrid: racemes manyfid.; fis. pale yellow with large brown spots, to about 3 in. across. Colombia.

cordatum. Pseudobulbs with 1 lf. to 8 in, long: infl. to 2 ft. high, to 10-fid.; fis. to about 3 in. across; sepals greenish-yellow barred with brown; petals yellowish spotted with brown; lip white with brown spots. Jan., Apr.-July. Cent. Amer.

Crawshayanum. Hybrid between O. Hallii and O. Harruanum.

crispodinei. Hybrid between O. crispum and O. Cora-

crispum. Pseudobulbs with 2 lvs. to 12 in. long: infl. exceeding the lvs., usually racemose and 5-15-fld., rarely paniculate; fls. to 3½ in. across, variable in size and color, wavy margined, often white and more or less blotched with red; lip with large yellow blotch near base. Feb.-Apr. Colombia. Var. Andersonianum (O. Andersonianum) has yellowish fls. spotted with brown.

Dénisoniæ (O. Wilckeanum). Hybrid between O. crispum and O. luteo-purpureum.

Édwardii. Pseudobulbs 2-lvd.: lvs. 2 ft. long and 1½ in. wide: infl. paniculate, to 4 ft. high, many-fld.; fls. small, about 1 in. across, mauve or puce with yellow callus at base of lip. Jan.—Apr. Ecuador.

Edwardinum. Hybrid between O. Edwardii and O. eximium.

excéllens. Hybrid between O. nobile and O. triumphans. exímium. Hybrid between O. armainvillierense and O. crievum.

Fletcherianum. Hybrid between O. Edwardii and O. cirrhosum.

grande. Pseudobulbs 2-3-lvd.: lvs. to 14 in. long and about 2½ in. wide: infl. longer than lvs., rarely to 7-fld.; sepals yellow barred with cunnamon-brown; petals with basal half reddish-brown and anterior half yellow; lip creamwhite spotted with brown near edges. Aug., Oct.-Mar. Guatemala.

Hállii. Pseudobulbs bearing 1 or 2 lvs. to 15 in. long: infl. to 5 ft. long, racemose, many-fld.; fls. about 3-4 in. across; sepals and petals bright yellow blotched with chest-nut-brown; lip pale yellow or white spotted with red, toothed. Mar.-Apr. Ecuador, Peru.

Harryanum. Pseudobulbs with 2 lvs. to 1 ft. long: infl. to 3 ft. high, many-fld.; fls. variable, 2½-4 in. across; sepals chestnut-brown marked irregularly with yellowish; petals chestnut-brown with basal half traversed by longitudinal white and mauve lines; lip basally violet with white stripes on the sides and with central yellow blotch, white in front. July-Aug. Colombia.

harvengténse (O. loochristiense). Hybrid between O. crispum and O. triumphans.

hastilabium. Pseudobulbs with 2 lvs. to about 1 ft. long: infl. paniculate, to 4 ft. or more long; fls. 3 in. across; sepals and petals pale green to cream-color, barred and spotted with purple; lip white with purple at base. Jan.—Aug. Colombia.

hellemense. Hybrid between O. harvengtense and O. crispum.

Hénryi. Hybrid.

Holmesii. Hybrid between O. spectabile and O. Adrianiæ.

Hunnewellianum. Pseudobulbs 1-lvd.: If. to 8 in. long: infl. longer than If., racemose, several-fld.; fls. 2 in. across; sepals and petals greenish-yellow spotted with brown; lip white or yellowish spotted with brown. Aug., Nov.-Jan. Colombia.

illustrissimum. Hybrid between O. armainvillierense and O. Japonais.

Insleayi. Plant similar to O. grands: pseudobulbs with 2 lvs. about 8 in. long: infl. exceeding the lvs., 5-10-fld.;

fls. to about 3 in. across; sepais and petals greenish-yellow barred with red-brown; lip bright yellow with a border of red spots. Aug.-Sept., Dec., Jan. Mex.

Japonàis (O. Lambeauianum). Hybrid between O. Rolfew and O. crispum.

Keighyelénsii. Hybrid.

læve: Miltonia lævis.

Lambeauianum: O. Japonais.

Lóbbii. Hybrid between O. amabile and O. nobile.

loochristiense: O. harvenutense.

lùteo-purpùreum. Pseudobulbs with 2 lvs. to 1 ft. or more long: infl. about as long as lvs., racemose, many-fld.; fis. 3-4 in. across; sepals chestnut-brown tipped with yellow; petals yellow blotched with brown; lip white or yellowish with large brown spot, fringed. Mar -Aug Colombia. Var. scéptum (O. seeptrum). Fls. smaller, sepals brown with narrow yellow border.

maculatum. Pseudobulbs crowded, with 1 lf. to 10 in. long: infl longer than lvs, commonly many-fid., pendulous; ffs. 2-3 in. across; sepals brown; petals and lip yellow spotted with brown. Jan.-May. Mex.

mirificum. Hybrid between O. crispum and O. luteo-purpureum var. sceptrum.

nebulòsum. Pseudobulbs with 2-3 lvs. to 9 m. long: infl. slightly exceeding lvs., 3-7-fld.; fis 2½-3 in. across, white spotted around the center with red-brown. May-July. Mex.

nítidum. Cross between the hybrids O. spectabile and O. Denisoniæ.

nobile (0. Pescatorei). Pseudobulbs 2-lvd; lvs. to 12 in. long; infl. to 2 ft. high, racemose or paniculate; fls. numerous, 2-3½ in. across, variable, white; lip with yellow crest and often with crimson spots. Mar.—May. Colombia.

Oberthuri. Hybrid between O. Adrianiæ and O. harveng-

Ossultònii. Hybrid between O. spectabile and O. nobile.

péndulum (O. citrosmum). Pseudobulbs with 2 lvs to 1 ft. long: infl. pendulous, longer than lvs, many-fld., commonly racemose; fis about 2 m. across, variable; sepals and petals white or sometimes rose-tinted; lip rose to lilac. Apr.-July. Mex. Var. gigantèum is listed.

Pescatòrei: O. nobile.

pulchéllum. Pseudobulbs 2-3-lvd: lvs. linear, to 13 in. long: infl. to 15½ in. long, to 10-fid; fls. 1-1½ in. across, fragrant, white except base of hp which is yellow dotted with red. Dec.-May. Cent. Amer.

Reichenheimii: Miltonia Reichenheimii.

Rôlfeæ. Hybrid between O. nobile and O. Harryanum.

R6ssii. Pseudobulbs with 1 lf. to about 5½ in long; included it little surpassing the lf., 1–5-fld.; fls. about 2–3 in across; sepals white or pale rosy spotted with brown; petals white or rosy, spotted with brown at base; lip white, rosy or pale yellow with yellow basal crest. Feb.—Apr., Aug., Oct. Mex., Guatemala.

Sánderæ. Hybrid.

scéptrum: O. luteo-purpureum var.

Schlieperianum. Plant similar to O. grande: pseudobulbs 2-lvd.: lvs. to 1 ft. long: racemes surpassing lvs., 3-6-fid.; fls. to 3½ in. across; sepals and petals pale yellow with brown spots in lower part; lip paler yellow spotted with brown at base. May-July. Costa Rica, Panama. Var. album has white fls. Var citrinum is a listed name. Var. xanthinum is listed, with brighter yellow fls.

Thompsonianum. Hybrid between $O.\ Edwardii$ and $O.\ crispum.$

tigrinum. Hybrid between O. Fascinator and O. Harry-anum.

triúmphans. Pseudobulbs with 2 lvs. to 15 in. long; infl. usually racemose, to 3 ft. high, to 10-fld; fls. large, to 3 ½ in. across; sepals and petals golden-yellow blotched with redbrown; lip white or yellowish at base, cinnamon-brown bordered with white or yellow above. Mar.-May. Colombia.

triumphosum. Hybrid between O. triumphans and O. cirrhosum.

Uroskinneri. Pseudobulbs with 1 or 2 lvs. to 1 ft. long: infl. to 36 in. tall, usually racemose, 9-20-fld.; fls. about 2 in. across; sepals and petals green and brown mottled; lip pale rose mottled with white. Mar.-Apr., July-Aug. Guatemals.

Vuylstékei. Hybrid between O. Denisoniæ and O. triumphans.

warnhamense. Hybrid between O. Hallii and O. nobile. Wilckeanum: O. Denisoniæ.

Williamsianum. Natural hybrid between O. grande and O. Schlieperianum.

ODONTONEMA (Thyrsacanthus). Acanthaceæ. Herbs and shrubs of trop. Amer. with opposite entire lvs. and red tubular 5-lobed or 2-lipped fls. in terminal spike-like racemes; three species are grown in S. U. S. and sometimes under glass. Propagated by cuttings.

callistachyum. Shrub to 15 ft.: lvs. oblong to ellipticovate, to 1 ft. long: fis. red or pink, to $1\frac{1}{4}$ in. long, in racemelike panicles. Mex., Cent. Amer.

Schomburgkianum (T. rutilans). Shrub to 6 ft.: lvs. oblong-lanceolate: fls. red, 1½ in. long, in drooping racemes to 3 ft. long. Colombia.

strictum. Shrub to 6 ft.: lvs. oblong, to 6 in. long, often wavy-margined: fls. crimson, to 1 in. long, with short lobes, in erect close long infl. Cent. Amer.—Sometimes grown as Justicia coccinea.

ODONTÒNIA. Orchidaceæ. Group of hybrids between the genera Odontoglossum and Miltonia. Lairéssem (O. cristum × M. Warscewiczu).

ODONTOPHÒRUS. Aizoaceæ. Succulent perennials of S. Afr., bearing opposite lvs. having several slender teeth on keel and edges, dotted, velvety: fls. solitary; stigmas 8–10: segregate from Mesembryanthemum.

Márlothii (M. Marlothn). Much branched: lvs. 3-angled, united at base, 1¼ in. long and ¼ in. wide and thick, white-warted fls. yellow, to 2 in. across.

nanus. Similar to O. primulinus but smaller, with white

primúlinus. Lvs. 3-angled, to $1\frac{1}{4}$ in. long, $\frac{3}{4}$ in. wide, and $\frac{1}{4}$ in. thick, velutinous and warted: fis. pale yellow, to 2 in. across.

ODONTOSÒRIA. Polypodiaceæ. Trop. ferns formerly included with Davallia but differing in characters of the indusium. One is readily grown under glass. See *Ferns*.

chinénsis (Davallia tenuifolia, O. tenuifolia). Fronds to 1½ ft. long and 9 in. wide, 3-4-pinnatifid into fine segms, about ½ in. long. Trop. Asia, Polynesia.

tenuifòlia: O. chinensis.

ODONTOSPÉRMUM. Compositæ. Herbs and shrubs of the Buphthalmum group from the Medit. region and Canaries, with solitary terminal rather large heads of ray- and disk-fls.; pappus of scales. One species grown as a greenhouse or tub-plant, and may be wintered as are hydrangeas. Propagation by cuttings or seeds.

serfceum. Dwarf shrub: lvs. opposite, oblong-spatulate, sılky-hairy: heads golden-yellow, 2-3 m. across, in summer. Canary Isls. Var. grandiflorum is listed.

ODOSTEMON: Mahonia.

ŒNOTHÈRA. Onagraceæ. Herbs of wide distribution but mostly in western hemisphere, including the evening-primroses that open late in the day and close in morning (nocturnal), and the sundrops that remain open in the day (diurnal) and make attractive flowering clumps; some of the evening-primroses have very large fls. and are interesting for the sudden opening of the corolla and the attracting of nocturnal The prevailing color in Enothera is vellow but there are red and pink kinds, and fls. of some species open nearly or quite white and change to rose. The group is separated by some authors into about a dozen genera but it is here kept together, as Anogra, Hartmannia, Kneiffia, Lavauxia, Megapterium, Meriolix, Pachylophus, Raimannia, Sphærostigma. Some of these plants, particularly the *Œ. biennis* group (incl. *Œ. Lamarckiana*), have been the subjects of extensive studies in mutation. The species are ann., bien. and per.

Œnotheras are sun-loving dry-land plants of simple

cultivation, commonly grown from seeds or the clumps of the perennial kinds may be divided. Some of them are tall erect plants to 2 or 3 feet, and others are stemless; a number of them are more or less prostrate. Some of the decumbent and stemless kinds are useful in the rock-garden.

acaùlis (Œ. taraxacifolia). Dandellon-leaved Sundrop. Bien. or per., stemless at first but making prostrate branches: lvs. pinnstifid, with large terminal segm.: fls. to 4 in. across, white to blush, long-tubed, shorter than radical lvs.: fr. short, 4-winged at top, short-stalked or nearly sessile. Chile.—This species is Burbank's "America." A var. lûtea is listed.

albicaulis (Anogra albicaulis. Œ. punnatifida). Ann. or bien. to 15 in., branches decumbent or ascending: basal lvs. spatulate, toothed, obtuse; st.-lvs. deeply pinnatifid: fls. yellow, durnal, about 1½ in. long. Man. to Mont. south to Tex. and New Mex.

alysoides. To nearly 2 ft., mostly glabrous: lvs. narrowly lanceolate to obovate, to 4 in. long: fls. white fading to pink, to ½ in. long, many in dense spikes. Rocky Mts. Var. decorticans has nodding spikes with caps. tapering to apex and very thick-walled. Calif.

argillícola. Glabrous plant to 4½ ft.: st.-lvs. linear-lanceolate, to 3½ in. long: fis. yellow, petals to 1¾ in. long. Va. and W. Va.

Berteriàna (Raimannia Berteriana). Erect to 2 ft., ann. or bien., hairy: lvs. narrow-lanceolate to oblong-lanceolate, more or less crenate and undulate, upper ones nearly or quite sessile: fls. nocturnal, yellow, 1 in. or more across: fr. linear, 1½ in. long. Chile, Argentina.

biénnis (Onagra biennis). Common Evening-Primrose. Tall coarse variable simple or branched erect weedy bient to 6 ft, in old fields and waste places and nat. in Eu. and elsewhere: lvs lance-ovate or narrower: fis. 1-2 in. across, nocturnal, yellow: fr. oblong, to 1½ in. Var. grandiflora is a larger-fid. form, in southern states, sometimes regarded as a distinct species; forms in the trade under this name need special study.

bistorta. Rather showy ann. lightly pubescent sundrop, ascending, 10–16 in.: lvs. narrow-lanceolate to ovate, denticulate: fls. to 1 in. across, yellow, with purple spots in center: fr. about ¾ in. or more long, somewhat 4-sided, not beaked. S. Calif. Known in cult. mostly in the var. Veitchiana (E. Veitchiana, Sphærostigma Veitchianian), which differs in having a longer less angled beaked pod.

brachycárpa (Lavauxia brachycarpa). Stemless pubescent per: lvs. long and narrow, thickish, pinnatifid to entire: fis. yellow, 2 in. or more across, long-tubed: fr. sessule on the crown, short, winged. Kans., northwest and southwest.

cæspitosa (Pachylophus cæspitosa). Nearly or quite stemless bien, or per, with woody root: lvs. pubescent, narrow, sinuate or dentate to pinnatifid: fis. to 3 in. across, white or pink: fr. short, tuberculate and winged. S. D., west and south.

califórnica (Œ. pallida var. Anoyra californica). Ascending per. from a rootstock, 20 in. or less, hoary-pubescent: lvs. narrow-oblanceolate, dentate or pinnatifid: fls. white turning pink, 2 in. more or less across, remaining open in early morning: fr. linear and ribbed, to 2 in. long. Calif.—Another Œ. californica or Eulobus californicas is properly Œ. leptocarpa, apparently not cult.; it is an erect hairy ann. with small yellow or orange fls. that frequently have reddish spots inside.

campylócalyx (sometimes written campylocarpa. E. coccinea. E. versicolor). Ann. or bien., erect to 2½ ft., simple or branched, more or less pubescent: Ivs. linear-lanceolate, nearly or quite sessile, denticulate: fls. 1 in. or more across, nocturnal, red with yellowish margins: fr. short, oblong, sessile, harry. Bolivia, etc.

canadénsis: Œ. fruticosa.

cheiranthifòlia (E. spiralis. Sphærostiqma spirale). Prostrate or somewhat ascending tap-rooted per., with oblong to oblanceolate white-pubescent lvs.: fls. yellow, about 1 in. across: fr. nearly linear, short, coiled. Coasts, Calif.

Childsii: Œ. Kunthiana.

cinnabarina: see Œ. odorata.

Clùtei. Bien. to 5 ft., pubescent: lvs. linear or oblong, entire or slightly toothed: fls. yellow, to 3 in. across: fr. short, about 1 in. long. Ariz.

coccinea: Œ. campylocalyx, Œ. rosea.

Cockerellii. Erect very leafy bien., 2-3 ft., more or less pulescent or hirsute: lvs. lanceolate, entire or somewhat denticulate: fls. light yellow, nocturnal, 1 in. or more across: fr. narrow-oblong, sessile, about 1 in. long. Colo.

consólida: see Œ. odorata.

coronopifolia (Anogra and Raimannia coronopifolia). Erect branched gray-pubescent per. to 2 ft.: lvs. narrow, deeply pinnatifid into narrow lobes: fls. diurnal, white turning pink, 1 in. or more across, buds drooping: fr. oblong, pubescent. Kans., north and west.

cruciata (Œ. biennis var. cruciata). Erect mostly simple glabrous or slightly hairy ann., to 4 ft.: lvs. lanceolate to long-oblong, remotely denticulate or entire: fls. yellow, small, about ¾ in. across, nocturnal, the petals about as narrow as sepals: fr. oblong-angled, sessile, about 1 in. long. New England, N. Y.

densifiòre: Boisduralia densiflora.

dentata (Sphærostigma dentatum). Ann. to 9 in., branched, glabrous or nearly so: lvs. linear, to nearly 2 in. long: fls. yellow changing to reddish, small. Calif. to Chile.

Drimmondii (Raimannia Drummondii). Diffuse hairy-pubescent ann., sts. nsing 1-2 ft.: lvs. mostly lance-oblong, denticulate to entire: fls. yellow to cream-color, 2-3 in. across, delicate and attractive, nocturnal: fr. linear, 1-2 in. across, delicate and attractive, long. Tex. Var. nana is listed.

eximia (Pachylophus eximius). Leafy per. to 1 ft. high: lvs. oblanceolate to spatulate, dentate or lobed, hairy at least on margins: fis. white turning pink, 2 in. or more across, nocturnal: fr. narrow-ovoid, to 1½ in. long. Colo. to New Mex.—Much like Œ. cæspitosa.

floribunda: Œ. riparia. fragrans: listed name.

Fraseri: Œ. glauca var.

fruicòsa (E. serotina. E. canadensis. Kneifia fruicòsa). Per. sundrop, becoming semi-woody at base, 1-3 ft. tall, sts. reddish, nearly glabrous to thinly hairy: Ivs. lanceolate to oval-lanceolate, sparsely denticulate to entire, often short-stalked: fls. to 2 in. across, showy, yellow: fr. short-oblong, winged, about ½ in long, glabrous or with glandular hairs. N. S. south and west, on dry land. Var. major is very floriferous and makes a bushy plant. Var. Youngii (E. Youngi). strong and stocky, profuse bloomer: lvs. mostly large, shiny and slightly glaucous.

glàbra: perhaps Œ. biennis.

glauca (Kneiffia glauca). Sundrop much like Œ. fruticosa but glabrous and somewhat glaucous, fr. longer and broadly winged, lvs. sessile, ovate or oval. Va. and Ky. south. Var. Fråseri (E. Frasert) has rather ovate-lanceolate and mostly slightly stalked lvs.

grandiflora: Œ. biennis var.

grándis: Œ. laciniata var. grandiflora.

heterántha: Œ, subacaulis.

Hookeri. Bien., of the Æ. biennis group, to 4 ft., canescent or hairy: lvs. ovate to oblanceolate, to 9 in. long: fls. yellow, nocturnal, the petals to 2 in. long and as broad. Calif.

imperialis: the plant so grown is probably one of the E. fruticosa group.

Johnsonii. The true E. Johnsonii (properly E. primi-veris), acaulescent and with pinnatifid lvs., of W. N. Amer., is apparently not in cult.; the ornamental large-fid. sweet-Is apparently not in cute, the original arge-ind, sweet-scented plant grown under this name is one of the E. Lamarckuna group: fis. opening in evening and closing next forenoon or midday; calyx reddish; bien. to 4 ft., but mostly blooming first year from seed.

Kunthiàna (E. Childsii. E. tetraptera var. Childsii).

Differs from E. tetraptera in having petals only 1/2-1/2 in.

long and winged fr. about 1/2 in. diam. Tex. to Cent. Mex.

laciniàta (Œ. sinuata. Raimannia laciniata). Diffuse bien. or per., thinly hairy to glabrous, to 2 ft. high: lvs. narrow, sinuate-dentate to pinnatifid: fls. pale yellow, mostly small and not showy, nocturnal: fr. linear, to 1½ in. long. N. J. to S. D., Fla. and Mex. Var. grandiflora (Œ. grandis) has fls. 2 in. or more across. Mo., Kans. to Tex.

Much like a large-fld. Œ. biennis, but Lamarckiana. sts. red-tuberculate, lvs. broad and crinkled, fl.-buds densely pilose and viscid, stigmas longer. Unknown wild; an old garden plant seen in various forms.

lavandulæfðlia (Galpinsia lavandulæfolia). Tufted per. to 8 in., gray-pubescent: lvs. linear, entire: fis. yellow, to 3 in. long, with long funnelform tube: fr. cylindrical, 1 in. long. Wyo. to Tex. and Ariz.

leptocárpa: see Œ. californica.

linearis (Kneifia linearis). Slender bien. or per. sundrop, to 20 in., nearly glabrous to hairy: lvs. variously spatulate to narrow-lanceolate, nearly or quite entire: fis. bright yellow, to 1½ in. across, but usually smaller: fr. club-shaped, pubescent and not glandular. Conn. to Ga.

longiflòra: see Œ. odorata.

lûtes is listed.

macrantha. The plant grown under this name is one of the Œ. Lamarckiana group.

macrocárpa: Œ. missouriensis.

marginata (Pachylophus marginatus). Tufted nearly stemless per., hairy: lvs. oblanceolate, wavy-toothed: fls. white, turning pink, to 3 in. long, with long tube: fr. spindleshaped, with tubercles on angles. Ore. to Colo.

mexicana. Similar to Œ. tetraptera from which it differs

in its slightly smaller dull rose-red fis. and its long narrow non-ridged nearly sessile cylindrical fr. N. Mex. to S. Amer.

micans: see Œ. odorata.

minuta: hort, name.

missouriénsis (Œ. macrocarpa. Megapterium missourmussouriensis (*E. macrocarpa. Megapterium missouriense*). Canescent per. with sts. ascending to about 1 ft.: lvs. narrow-oval to lanceolate to broad-linear, denticulate or entire: fis. yellow, 4-6 in. across, long-tubed, showy: fr. becoming 2-3 in. long and nearly as broad, widely winged. Neb. and Mo. west and south.

mollfssima. Ann. or grown as such in gardens, to 2½ ft., branched, lossely hairy: lvs. linear-lanceolate, to 3 in. long, remotely denticulate to entire: fls. nocturnal, small, yellow, about ¾ in. across. Argentina.—The plant grown under this name is weedy and not very attractive, and some of the stock passing as Œ. Sellown and Œ. villosa are apparently the same.

montana (Pachylophus montanus). Stemless per.: lvs. oblanceolate, to 4 in. long, coarsely wavy-toothed, margins hairy: fls. white, becoming pink, night-blossoming, to 2½ in. across: fr. tubercled on blunt ridges. Neb. to Ida. and Nev.

muricata: Œ. parviflora.

odorata. Ann. or so grown, erect, branched, to 4 ft., glabrous to sparsely hairy: lvs. long-linear-lanceolate, or the upper ones lance-ovate, remotely toothed: fls. nocturnal, yellow fading to reddish, fragrant, 1-2½ in. across. Chile.—Plants sometimes grown as Œ. cinnabarina, consolida, longiflora, micans, prostrata, suaveolens, sulphurea, undulata, apparently belong here.

ovata. Golden-Eogs. Stemless per.: lvs. in basal rosette, oblong to ovate, entire or slightly toothed: fls. yellow, the filiform calyx-tube to 4 in. long, petals orbicular, 22 in. long: fr. linear. Calif.

pallida (Anogra pallida). Per. to 14 in.: lvs. lanceolate, entire, lobed or toothed, glabrous: fls. white turning pink, to 1½ in. long, blooming in evening: fr. narrow-linear, 8-ribbed. Calif. to Rocky Mts.

parviflora (E. murcata). Like E. biennis but usually not as tall and less branched: lvs. rather thick and glabrous or only thinly harry, tip of sepals separated in bud (rather than in contact), upper bracts persistent and equalling or exceeding the pods. Northeastern states to Newf.

perénnis (E. pumila. E. pusilla. Kneiffia pumila). Small or slender finely pubescent per. sundrop, sometimes to 2 ft. but commonly lower and often blooming when 2 in. high: lvs. oblanceolate or oblong, entire: fis. yellow, 1 in. or less across: fr. short, club-shaped, short-stalked or sessile. Newf. to Ga., Man. and Kans.

Pflgrimii: form of Œ. perennis.

ninnatifida: (E. albicaulia.

prateinsis (Knesifia pratensis). Attractive stoloniferous sundrop, per. to 2 and 3 ft., soft-hairy:lvs. oblong-lanceolate or somewhat elliptic, sinuate or entire: fls. yellow, profuse and showy, to 2 in. across, buds purplish: fr. short, clubshaped. Fields, Me. to Ia. and Ark.

prostràta: see Œ. odorata.

pumila: Œ. perennis. pusilla: Œ. perennis.

rhizocárpa: Œ. triloba.

rhombipétala (Raimannia rhombipetala). Bien. to 4 ft., pubescent: lvs. linear-lanceolate, slightly toothed: fis. yellow, to 2 in. across: fr. curved. Ind. to Tex.

ripària (Œ. floribunda. Kneiffia riparia). Like Œ. linearis, but more pubescent and the fis. larger (to about 2 in. across), floriferous. Near the coast, L. I. to Ga.

rosea (Œ. coccinea of lists. Hartmannia rosea). Low diffuse bien or per., blooming first year from seed, finely pubescent, sts. slender and 1-2 ft. long: lvs. ovate-lanceolate or narrower, sparsely denticulate or entire, small: fis. small and not showy, ½ in. or less across, rose-purple, opening at evening and remaining to next day: fr. club-shaped, long-tapering. Tex. and New Mex. to S. Amer.

ròsea mexicana is a form of Œ. mexicana.

rubricalyx. Afterglow Evening-Primrose. Form of E. Lamarchiana or derivative from it, with attractive red calvx-tube.

Sarrazinii: Œ, tetraptera.

Sellòwii: see Œ. mollissima.

serótina: Œ. fruticosa.

serrulata (Meriolix serrulata). Erect mostly finely pubescent per. or bien., more or less woody at base, to 1½ ft. high: lvs. mostly linear, sharply dentate: fs. yellow, diurnal, to 2 in. across, petals crenulate: fr. linear, canescent. Man, to Tex, and New Mex.

sinuata: Œ. laciniata.

speciòsa (Hartmannia speciosa). Erect or ascending finely pubescent per.: lvs. linear to lance-oblong, sinuate, dentate or pinnatifid: fis. diurnal, white or whitish changing

to pink, to 3 in. across: fr. club-shaped, 4-ribbed. Mo. west and south, and nat. eastward; showy. Var. álba, fis. white; var. grandiflòra is listed; var. ròsea, fis. rose; var. rùbra,

spinulosa (Meriolix spinulosa). Similar to Œ. serrulata but with spinulose-toothed lvs. and larger fls. and frs. Ark. to New Mex.

spiralis: Œ. cheiranthifolia. suavèolens: see Œ. odorata.

subacaulis (Œ, heterantha, Taraxia subacaulis), Stemless, pale yellow, ½ in. long. Mont. to Calif. Var. taraxacifolia (E. heterantha var. taraxacifolia), lys. lyrate-pinnatifid.

sulphurea: Œ. odorata.

taraxacifòlia: Œ. acaulis.

taraxacirons: C. acoults.

tetráptera (E. Sarrazini: Hartmannia tetraptera). Decumbent diffuse or erect thinly hairy ann. to 20 in.: lvs. lanceolate to narrow-ovate, coarsely toothed to pinnatifid: fls. whitish becoming rose or rose from the first, diurnal, petals ¾-1½ in. long, showy: fr. swollen, 1 in. or more long and ¼-½ in diam., with long st.-like base, 5-ridged. Tex. to Ariz. to S. Amer. Var. Childsii is E. Kunthuana. Var. rôsea is listed.

trichôcalyx (Anogra trichocalyx). Bien. or per. to 12 in. high, sılky-hairy: lvs. linear or nearly so to lanceolate or ovate, usually sinuate-pinnatifid, to 2 in. long: fis. white, petals to 1½ in long, the buds nodding. Colo. and Wyo. to Calif.—Variable.

trîloba (Œ. rhizocarpa, Lavauxia triloba and flava). triloga (*E. rhizocarpa*. Lawauxia triloga and flawa). Fer., stemless, slightly pubescent or glabrate, with dandelion-like lvs., blooming first year from seed: fls. white or pink, to $2\frac{1}{2}$ in. across, very long and slender-tubed, shorter than lvs.: fr. short, winged, in a cluster at the crown. Ky. and Tenn. to Calif. and Mex.

undulàta: see Œ. odorata. Veitchiana: Œ. bistorta var. versícolor: Œ. campulocalux.

villòsa. S. African, considered to be Œ. biennis nat. there, but plants grown under this name may be Œ. mollissima.

viridéscens (Œ. spiralis var. viridescens. Sphærostigma windescens (E. spirals var. wirdescens. Sphærostyma wirdescens). Tap-rooted bien, or per, green, sts. 13/2-2/g ft. prostrate or ascending: lvs. thickish, round-ovate and cordate, hairy, denticulate: fls. yellow becoming greenish, 1 in. or less across: fr. linear, 4-angled, coiled. Seashore, S. Calif.

Whitneyi: Godeta grandiflora.

Youngii: Œ. fruticosa var.

CENOTHERACE A: Onagrace x.

OKA: Oxalis crenata.

OKRA, GUMBO. The large green erect pods of Hibiscus esculentus. From these pods is made the well-known gumbo soup of the South, where the plant is more extensively grown than in the North. The pods are also employed in their green state for stews, and are dried and used in winter, when they are nutritious and form no little part of the diet in certain sections of the country. The seeds are sensitive to cold and moisture, and should not be sown until the ground has become warm. The seed should be sown in a drill 1 inch deep, the plants thinned to 12 inches in the row for the dwarf varieties and 18-36 inches for the tall varieties; the rows are usually far enough apart to admit of horse tillage. One ounce of seed supplies 50-100 feet of drill, depending on the thickness of sowing. The tall kinds reach 4-7 feet. The culture given corn or cotton is suitable.

OLD MAN: Artemisia Abrotanum. -Man-and-Woman: mpervivum tectorum. -Mans-Beard; Clematis Vitalba. empervivum tectorum. Woman: Artemisia Stelleriana.

ÒLEA. OLIVE. Oleaceæ. Attractive evergreen trees and shrubs native in eastern hemisphere with opposite commonly entire lvs. silvery-scurfy underneath, small white or whitish unisexual or bisexual fls. in panicles, and fr. a drupe, usually 1-seeded. One species is grown widely for the edible fr. and others for ornament in Calif. and other mild climates. See Olive.

Aquifòlium: Osmanthus ilicifolius.

chrysophylla. Small tree: lvs. lanceolate, to 4 in. long, vellow beneath: fr. globose, blackish. Trop. Afr.

communis: see O. europæa.

Cunninghamii. To 70 ft.: lvs. variable, linear to ovate-lanceolate, to 10 in. long: fr. ovoid, about 1/4 in. long, red. New Zeal.

europæa. Common O. To 25 ft.: lvs. oval to lanceolate, to 3 m. long, silvery-scaly beneath: fis. fragrant: fr. oblong, to 1½ in. long, shining black when ripe. Medit. region.—Grown for fr. in Calif. and for ornament and curiosity in Fla. and elsewhere. The wild form has been distinguished as var. Oleáster, with thorny branches, and the cult. olive as var. communis.

fragrans. Osmanthus fragrans

ilicifòlia: Osmanthus rlicifolius.

lanceolata. To 50 ft., diœcious: lvs. linear to ovate-lanceolate, to 6 in. long: fr. ovoid, ½ in. long, red or orange.

montana. To 50 ft., diocious: lvs. linear or linear-lanceolate, to 3½ in. long: fr. ovoid, red, to ½ in. long. New Zeal.

OLEACEAE. OLIVE FAMILY. Widely distributed trees and shrubs in trop, and temp. regions in both hemispheres, of more than 20 genera, grown for ornament and shade, and the olive for the edible fr.: lvs. prevailingly opposite, simple or pinnate: fls. regular, bi-sexual or unisexual, having commonly 4-lobed calyx and corolla, the latter gamopetalous (sometimes apetalous in Fraxinus), 2 stamens, superior 2-celled ovary: fr. a berry, drupe, caps. or samara. Genera herein treated are Abeliophyllum, Chionanthus, Fontanesia, Forestiera, Forsythia, Fraxinus, Jasminum, Ligustrum, Menodora, Nyctanthes, Olea, Osmanthus, Osmarea, Phillyrea, Siphonosmanthus, Syringa.

OLEANDER: Nerium, Yellow: Thevetia nereifolia.

OLEARIA (Shawia). Tree Aster. Daisy-TREE. Compositæ. Many evergreen shrubs and small trees with mostly alternate lvs. tomentose beneath and heads of white, blue or purple ray- and disk-fls. solitary or in corymbs or panicles; pappus of bristles; native in New Zeal. and Australia. Several species are grown out-of-doors in Calif. for ornament. Propagated by cuttings of half-ripened shoots, as well as by

álbida. Tree to 20 ft.: lvs. oblong or ovate-oblong, to 4 in. long, entire, white-tomentose beneath: heads of 3-6 fls., 1/4 in. long, in large panicles. New Zeal.

angulata. Shrub to 12 ft.: lvs. oblong or oval, to 2½ in. long, white-tomentose beneath, undulate: heads of 3-5 fls., ½ in. long, in panicles longer than lvs. New Zeal.

arboréscens (O. nitida). Shrub to 12 ft.: lvs. ovate, to 3½ in. long, sinuate-toothed, satiny-tomentose beneath: heads of 15-20 fts., ½ in. long, in large branched corymbs. New Zeal. Var. angustifolia has lanceolate or linear-lanceolate lvs. Var. capillàris (O. capillaris) has lvs. to 1 in. long.

argophilla. Tree to 25 ft.: lvs. ovate to oblong-lanceo-late, to 5 in. long, toothed or rarely entire, silvery-silky-pubescent beneath, reticulated above: heads few-fld., in large corymbs. Australia.

avicenniæfðlia. Tree to 20 ft.: lvs. oval-lanceolate, to 4 in. long, entire, white- or buff-tomentose beneath: heads of 2 or 3 fs., 1/4 in. long, in long-stalked branched corymbs. New Zeal.

capillàris: O. arborescens var.

Colembia. Shrub to 10 ft.: lvs. obovate to lanceolate, to 6 in. long, mostly acute, sharply toothed: heads discoid, dark brownish-purple, to 1 in. across, 4-10 in hairy racemes to 8 in. long. New Zeal.—Sometimes becomes a small tree to 30 ft. high with larger lvs.

Canninghamii. Shrub or tree to 25 ft.: lvs. ovate to linear-oblong, to 6 in. long, coarsely toothed, white-tomentose beneath: heads of 12-24 fls., 14 in. across, in large branching panicles. New Zeal. Var. colorata has narrower

erubéscens: O. myrsinoides var.

Fórsteri: O. vaniculata.

fragrantssima. Shrub to 15 ft., with dark brown or black bark: lvs. elliptic-lanceolate to -ovate, to 1½ in. long, entire, silky-tomentose beneath: heads of 4-8 yeilowish fragrant fls., ½ in. long, in sessile clusters. New Zeal.

furfuracea. Shrub or tree to 20 ft. lvs. oblong to ovate, to 4 in. long, entire or slightly toothed, silvery-tomentose beneath: heads of 5-12 fis., 1/2 in. long, in branched corymbs New Zeal.

Gunniàna: O. stellulata.

Haastii. Shrub to 8 ft.: lvs. oblong, to 1¼ in. long, entire, shining above, white-tomentose beneath: heads of 8-10 fls., ¼ in. long, in long-stalked corymbs. New Zeal.

ilicifòlia. Shrub or tree to 20 ft., with musky odor: lvs. linear to lanceolate, to 4 in. long, spiny-toothed and undulate, yellowish-tomentose beneath: heads of 8-12 florets, ½ in. long, in large corymbs. New Zeal.

lineata. Shrub with branches often drooping: lvs. clustered, narrow-linear, to 2 in. long, margins revolute, white-tomentose beneath: heads of numerous fis., in clusters. New Zeal.

macrodônta. Resembling O. ilicifolia but with ovate or oblong lys. toothed but not spiny. New Zeal

moschāta. Shrub to 12 ft., with musky odor: lvs. obovate-oblong, to ¾ in. long, entire, white-tomentose beneath: heads of 12-20 florets, ¼ in. long, in small longstalked corymbs. New Zeal.

myrsinoides. Low shrub: lvs. obovate or oblong, to ½ in. long, finely toothed, shining and reticulated above, tomentose beneath: heads of 4-8 fls., in leafy panicles. Australna. Var. erubéscens (O. erubescens) has lvs. to 2 in. long and larger heads.

nitida: O arborescens.

nummularifòlia. Shrub to 10 ft.: lvs. orbicular to obovate, to ½ in. long, margins recurved, very thick, shining and reticulated above, tomentose beneath: heads of 6-12 fls., ½ in. long, solitary. New Zeal.

odorata. Shrub to 12 ft.: lvs. opposite or clustered, linear-obovate, to 1 in. long, entire, white-tomentose beneath: heads of 20-35 fls., in clusters. New Zeal.

oleifòlia. Shrub to 8 ft.: lvs. lanceolate or oblong-lanceolate, to 3 m. long, entire, reticulated above, white-tomentose beneath: heads of 4-8 fls., ½ in. long, in loose corymbs. New Zeal.

pachyphfila. Shrub to 8 ft.: lvs. ovate or oblong-ovate, to 5 in. long, entire or undulate, very thick, silvery-tomentose beneath: heads of 7-10 fls., 3/4 in long, in corymbs to 5 in. across. New Zeal.

paniculàta (O. Forsteri). Shrub or tree to 20 ft.: lvs. oblong or ovate, to 3 in. long, undulate, white-tomentose beneath: heads of 1 ft., ½ in. long, in branched corymbs. New Zeal. Var. ellíptica has narrower lvs.

pannòsa. Shrub: lvs. ovate-cordate to oblong, to 3 in. long, entire, reticulated above, densely tomentose beneath: fls. to 1 in. long, in solitary heads. Australia.

parvifòlia: O. virgata.

Solandri. Shrub to 15 ft.: lvs. opposite or clustered, linear-obovate, to ½ in. long, margins recurved, yellowish-tomentose beneath heads of 8-20 florets, ½ in. long, solitary. New Zeal.

stellulāta (O. Gunniana). Shrub to 5 ft.: lvs. oblong or lanceolate, to 3 in. long, sinuate-toothed, white-tomentose beneath: heads of 20 or more fls., in leafy panicles. Australia.

suavis. Shrub or tree to 18 ft. lvs. linear-oblong to ovate, to 1½ in. long, entire, yellowish-tomentose beneath: heads of 6-10 fls., >5 in. long, in branched panicles New Zeal.

Thómsonii. Tree to 15 ft.: lvs. oblong-obovate, to 6 in. long, entire, reticulated above, silvery-tomentose beneath: heads ¼ in. long, in large corymbs. New Zeal.

Traversii. Tree to 30 ft.: lvs. opposite, oblong or ovate, to 2½ in. long, entire, white-tomentose beneath: heads of 5-15 disk-fls., ¼ in. long, in branching panicles. New Zeal.

virgata (O. parvifolia). Shrub to 10 ft.: lvs. opposite or clustered. Innear-ohovate, to ½ in. long, white-tomentose beneath: heads of 5-12 fts., ¼ in. long, solitary or clustered. New Zeal.

OLEASTER: Elwagnus angustifolia.

OLIVE. The developed fruit of *Olea europæa*, grown extensively in Mediterranean countries, and in North America well adapted to parts of California, Arizona, and often grown for ornament and interest in other southern regions.

Olive is somewhat more tender, or requires more sum total of heat, than the wine grape (Vitis vinifera). The olive attains great size with age, and eventually the trees should stand 40 feet or more apart each way, but plantations are commonly set at 25 to 30 feet, often with the idea of thinning out the trees in time. The crop demands a deep fertile soil but well drained, and a clear fogless atmosphere is desired for the best results. Although drought resistant, the olive thrives well under intelligent irrigation, the requirements being 30 to 40 acre-inches a year, including rainfall.

Propagation of the olive is readily accomplished by means of softwood cuttings 4 or 5 inches long, only the leaves on the tip being retained and those usually cut back somewhat. The cuttings are started in sand under artificial heat and then removed to the nursery. Much larger and heavier cuttings of old wood are sometimes employed, the lower part being variously cut or wounded to stimulate root and stem production. The suckers about the base of the tree, taken with a heel from the trunk, are also employed. Seeds are also used in propagation, but the seedlings must be grafted to the desired variety. Cutting off the end of the stone or pit will hasten germination. When one year in the nursery the seedlings may be whip-grafted or side-grafted.

For best results the olive orchard should be given clean tillage. On neglected trees without good moisture supply, the fruit is small or it may not set freely. Attention is given to pruning, and insects and diseases must be

promptly met.

For making the ordinary pickled olive, the fruits are gathered when they have reached practically full size but while still good green in color. Ripe pickles rich in eupeptic oil and high in food value are also in demand, and the fruit is taken from the tree when it is black. In any case the fruit is picked by hand to avoid bruising; this is true even when the crop is designed for oil, to prevent rot and mold. The fruit is mechanically graded for pickles, producing different lines or quotations of the product. It is then cleaned, the bitterness removed by lye, and the pickling process completed by hardening and preserving in salt. It requires about 6 pounds of olives to make 1 gallons of oil. The average production of fruit is perhaps 1½ tons to the acre, but greater yields are obtained on the best plantations.

OLIVE, BLACK: Bucida Buceras. False: Elwodendron orientale. Russian: Elwagnus angustifolia. Spurge-: Cneorum tricoccon. -Wood Bark, Bermuda: Elwodendron Laneanum.

OLIVERANTHUS: Echeveria Harmsii.

OLNÈYA. Leguminosæ. A spiny tree to 25 ft., native in the deserts of Ariz. to Lower Calif. O. Tesòta. Desert Ironwood. Lys. pinnate, the lfts. to ¾ in. long, grayish: fls. papilionaceous, violet-purple, in racemes about 1 in. long: pods oblong, to 3 in. or more long, slightly constricted between seeds.—The seeds or beans have been utilized as food by the Indians.

OLSYNIUM: Sisyrinchium.

OMPHALÒDES. NAVELWORT. NAVEL-SEED. Boraginaceæ. Ann. and per. low herbs much like Myosotis but differing in technical characters, mostly in Eu. and Asia, with alternate simple

lvs. and white or blue fls. in loose racemes resembling forget-me-nots.

A few species are grown in the flower-garden. They succeed in moist partially shady or sunny situations. Propagated by seeds sown in spring or by division.

cappadócica (O. cornifolia). Per. to 10 in.: lvs. ovate, heart-shaped at base: fis. rich blue with white in center, ½ in. across, in spring. Asia Minor.

cornifòlia: O. cappadocica.

japónica. Probably per., to 6 in.: lvs. spatulate-oblong to oblanceolate, sessile, acute, base somewhat wedge-shaped, margins entire or remotely wavy: fis. to ½ in. across, calyx ciliate and pilose with lanceolate lobes. Japan.

linifòlia (Cynoglossum linifolium). Ann. to 1 ft.: lvs. spatulate to linear-lanceolate: fls. white, to ½ in. across, in summer and autumn. Spain, Portugal. Var. cæruléscens has bluish fls. sometimes tinged rose.

Lucflize. Per. to 8 in.: lvs. ovate or oblong: fls. rose turning to blue, ½ in. across, in spring. Greece, Asia Minor.

lusitánica (O. nutda). Per. to 2 ft.: lvs. oblong-lanceolate, shining above: fis. blue with white center, 1/2 in. across, in spring. Portugal.

nitida: O. lusitanica.

vérna. Creeping Forger-Me-Nor. Per. to 8 in., bearing stolons: lvs. ovate to ovate-lanceolate: fls. blue, ½ in. across, in spring. Eu. Var. álba has white fls.

OMPHALOGRÁMMA. Primulaceæ. Small Asiatic genus closely allied to Primula, differing in fls. solitary, before the lvs., calyx-lobes 5–8, seeds much compressed and attached by a narrow linear hilum on the ventral side.

vinciflorum (Primula vinciflora). To 9 in.: lvs. oblong or oval, erect and overlapping, ciliate, papery: fis. purpleviolet or blue, 1½ in. across. China.

ONAGRA: Enothera.

ONAGRÀCEÆ ((Enotheraceæ). EVENING-PRIMROSE FAMILY. Herbs or only rarely shrubs, of various habit, terrestrial or aquatic, ann., bien., per., yielding ornamental subjects in several genera. The ovary, mostly elongated, is inferior and prominent, crowned with the calyx and polypetalous corolla, and commonly with projecting or conspicuous essential organs. The species are several hundred in many parts of the world, in about 40 genera. Most of them are of easy cult. The genera treated in this book are Boisduvalia, Circæa, Clarkia, Epilobium, Eucharidium, Fuchsia, Gaura, Godetia, Jussiæa, Lopezia, Ludwigia, Œnothera, Trapa (sometimes referred to Trapaceæ or Hydrocaryaceæ), Zauschneria.

ONCIDIODA. Orchidacex. A group comprising a few hybrids between the genera Oncidium and Cochlioda.

Chárlesworthii (O. incurvum X C. Noezliana).

ONCÍDIUM. Orchidaceæ. Epiphytic orchids of trop. Amer. with commonly 1-2-lvd. pseudobulbs and fls. in lateral racemes or panicles, the sepals and petals often nearly equal, the lip usually 3-lobed and crested or tubercled at base. They are plants both of cool mts. and hot regions, of various requirements in cult. from coolhouse to warmhouse, depending on the species; they usually require considerable sun and air; see Orchids for cult.

alàtum. Pseudobulbs ovoid, to ¾ in. long, 1-lvd. at the apex, flattened: If. oblong, to about 3 in. long, acute: scape to 10 in. long, flattened, winged; fls. yellow; sepals and petals with dark markings. W. Indies.

altissimum. Pseudobulbs with 1 or 2 lvs. to 16 in long; fis. in nodding racemes to about 4 ft. long, yellow barred with brown. W. Indies.

ampliatum. Pseudobulbs with 1-2 lvs. to 15½ in. long

ampliatum. Pseudobulbs with 1-2 lvs. to 15½ in. long and 3½ in. wide: nnfl. a many-fid. raceme or panicle to about 3 ft. long; fis. bright yellow with red-brown blotches near center, white on the back. Dec.-May. Cent. Amer., Trinidad. Colombia. Var. mājus has larger fis.

anthocrène. Pseudobulbs with 2 lvs. to 1 ft. long and 2 in. wide: infl. arching, racemes or panicles many-fld., to 4 ft. long; fls. brown banded and edged with yellow. Colombia.

aurdsum: O. excavatum.

barbatum. Pseudobulbs with 1 lf. to 416 in. long: infl. racemose or paniculate, loosely few-fld., to 2 ft. long; sepals and petals yellow blotched with brown; lip 3-lobed, yellow, having crest dotted with red. Jan.—June. Brazil.

carthaginense. Pseudobulbs much reduced, 1-lvd.: If oblong to elliptic, fleshy, to 19½ in. long: infl. loosely paniculate, many-fld., to 5 ft. long; fls. white spotted with purplish-rose, to 1 in. across, segms. crisped. Blooms all year. Cent. Amer., W. Indies, N. S. Amer. Var. rôseum, fls. smaller, yellowsh with deep red spots.

Cavendishianum. Pseudobulbs much reduced, with 1 oblong-elliptic If. to about 1 ft. long; infl. usually paniculate and many-fld., to nearly 4 ft. long; fls. rather large, yellow; sepals and petals commonly spotted with brown. Oct.—May. Mex., Guatemala.

Cebollèta. Pseudobulbs very small, with 1 slender cylindrical If. to about 23 in. long; infl. commonly paniculate and many-fld, to 32 in. long; fis. dull yellow; sepals and petals spotted with red-brown. Jan.—May. Cent. Amer., W. Indies, S. Amer.

cóncolor (O. unguiculatum). Pseudobulbs with 2 lvs. to 6 in. long; fls. citron-yellow, in 6-12-fld. drooping racemes to 1 ft. long. Oct -May. Brazil.

cornigerum. Pseudobulbs with 1 lf. to 6 in. long: infl. paniculate, many-fld., to 2 ft. long; fls. small, about ¾ in. across, yellow spotted with dark red. Nov.-Feb. Brazil, Paragulay.

crispum. Pseudobulbs with 2-3 lvs. to 8 in. long: infl. loosely panieulate, to 45 in. long, many-fld.; fls. to 3 in. across, very wavy, chestnut-brown sometimes spotted with yellow. May-Aug., Nov.-Dec. Brazil.

cartum. Pseudobulbs with 2 lvs. to 1 ft. long; infl. loosely paniculate, many-fld, to about 3 ft. long; fls. to 2 in. across; sepals chestnut-brown barred with yellow, petals brown with yellow margin; lip yellow with broad brown margin. Spring and summer. Brazil.

divaricatum. Pseudobulbs with 1 lf. to 1 ft. long: fls. brown tipped with yellow, about 1 in. across, in much branched panicles to about 6 ft. high. Aug.—Oct. Brazil.

excavatum (O. aurosum). Pseudobulbs with 1-2 lvs. to 20 in. long: fis. yellow spotted with brown, 1½ in. across, in many-fid. panieles to 3 ft. long. Oct.-Mar. Peru, Ecuador.

flexuosum. Pseudobulbs with 1-2 lvs. to 91% in. long: infl. paniculate, many-fld., to 3 ft. high; fls. yellow spotted near base of each segm. with brown, \$\frac{3}{4}-1\%\$ in. across. Oct.—Mar., June-Aug. Brazil, Paraguay.

Fórbesii. Pseudobulbs with 1-2 lvs. to 10 in. long: infl. usually paniculate, many-fld., to 3 ft. high; fls. chestnutbrown edged with yellow, 2-2½ in. across. Mar.-Apr., Oct.-Nov. Brazil.

fuscătum: Miltonia Warscewiczii.

Gårdneri. Pseudobulbs with 2 lvs. to 1 ft. long: infl. paniculate, many-fld., to 3 ft. long; fls. about 2 in. across; sepals brown barred with yellow; petals brown margined with yellow; lip yellow with marginal band of red-brown spots. Aug.- Dec. Brazil.

Harrisonianum. Pseudobulbs with 1 lf. to 6 in. long: infl. paniculate, many-fid., to about 1 ft. long; fls. about ¾ in. across, yellow spotted with red. Oct.-May. Brazil.

hastatum. Pseudobulbs with 1-2 lvs. to 9 in. long: infl. loosely paniculate, to 5 ft. long; fls. about 1½ in. across; sepals and petals marked with yellow-green; lip with white or yellow side lobes and red mid-lobe tipped with green. Mex.

incurvum. Pseudobulbs with 2-3 lvs. to 16 in. long; infl. loosely paniculate, many-fid., to about 5 ft. long; fis. to 1½ in. across, rose-lilac spotted with white. July-Jan. Mex.

intermèdium. Pseudobulbs lacking: lvs. clustered at the base, distichous, equitant, oblong-lanceolate, falcate, to 4 in. long, margins denticulate: fls. in racemes or panicles, golden-yellow. W. Indies.

Jonesianum. Pseudobulbs very small, with 1 almost cylindrical If. to 16 in. long and ½ in. wide: infl. racemose, loosely 3-10-fid., to 20 in. long; fls. about 2 in. across; sepals and petals whitsh-yellow or greenish spotted with brown; lip white with yellow base spotted with red. Aug.-Feb., May. Paraguay, Bolivia.

Kramerianum. Pseudobulbs flattened-orbicular, 1-lvd.: If. to 9 in. long: infl. to 30 in. long, with swollen nodes, several-fid. in succession; fls. very large, about 5 in. in vertical diam.; dorsal sepal and petals chocolate-brown, lateral sepals orange-red mottled with yellow; lip wavy, citron-yellow bordered by reddish-brown. Mar.-May, Nov.-Dec. Ecuador, Colombia.

Lanceanum. Pseudobulbs minute, 1-lvd.: lvs. to 20 in. long and 5 in. wide, spotted with violet: infl. exceeding the lvs, racemose or paniculate, few-to many-fld; fls. to 2½ in. across; sepals and petals yellow or green thickly spotted with brown; lip violet-purple at base and rose above. May-Aug. British and Dutch Guiana, Trinidad. Var. Louvrexianum has the apical half of lip white.

leucochilum. Pseudobulbs with 2 lvs. to over 2 ft. long: infl. paniculate, loosely many-fid., to 7 ft. high; sepals and petals greenish barred and spotted with dark brown; lip white with lavender dots at base. Mar.-Aug., Nov. Mex. to Hondurgs.

lùridum. Differs from O. carthaginense in its larger fls., and dull red to yellowish-brown sepals and petals which are sometimes tinged with violet. Fla., W. Indies, Cent. Amer., S. Amer.

macránthum. Pseudobulbs with 2 lvs. to almost 2 ft. long: infl. an elongate climbing panicle to 10 ft. long; fls. very large, to 4 in. across; sepals olive- or brown-yellow; petals golden-yellow; lip yellow with central white crest and dark red or purplish basal lobes. Blooms nearly all year. Colombia, Ecuador, Peru.

Marshallianum. Pseudobulbs with 2-3 lvs. to about 1 ft. long: infl. a lax many-fld. panicle to about 5 ft. high; fls. to 2½ in. across; sepals greenish-yellow barred with brown; petals golden-yellow with brown spots, wavy; lip yellow with red spots at base. Apr.-June. Brazil.

microchilum. Pseudobulbs with 1 lf. to 1 ft. long; infl. loosely paniculate, to 4 ft. long, many-fid.; fis. 1½ in. across; sepals brownish edged with yellow; petals similar, chestnut-brown or brown-purple; lip white spotted with reddish-purple. Aug. Guatemala.

oblongatum. Pseudobulbs with 2 lvs. to 18 in. long: infl. paniculate, many-fid:, fis. sulfur-yellow with reddsh-brown spots at base of segms. July-Aug. Mex., Guatemala.

ornithorhynchum. Pseudobulbs with 2 lvs. to 10 in. long: infl. a drooping many-fld. panicle to 1½ ft. long; fis. rose-llac with yellow crest on lip, about ¾ in. across. Aug.-Dec. Mex. to Salvador. Var. albiflorum has whitish fis.

Papflio. BUTTERFLY ORCHID. Pseudobulbs with 1 If. to 9 in. long and 2% in. wide, mottled with purplish-brown: infl. to 4 ft. long; fis. 1-several, successive, very large, to about 4 in. across; dorsal sepal and petals linear, reddish-brown sparingly marked with yellow; lateral sepals oblong, wavy, chestnut-brown with yellow markings; lip yellow with broad brown marginal band. Blooms all year. Trinidad, Venezuela, Brazil, Peiu.

phymatochilum. Pseudobulbs with 1 lf. to 14 in. long: infl. loosely paniculate, many-fid., to 5 ft. long; fls. 2 in. across; sepals and petals greenish-yellow spotted with brown (sometimes yellowish-white spotted with orange); lip white with red spots around the basal yellow crest. Apr.-May. Brazil.

Pùbes. Pseudobulbs with 1-2 lvs. to 5 in. long; infl. paniculate, to 2 ft. high, many-fld.; fls. about 1 in. across; sepals and petals brown barred with yellow, lateral sepals united; lip red-brown or purplish bordered with yellow. Dec.-Mar. Brazil, Paraguay.

pulvinātum. Pseudobulbs with 1-2 lvs. to 1 ft. long: infl. loosely paniculate, many-fld., to 9 ft. long; fls. to 1 in. across; sepals and petals with basal half brown and apical half yellow; lip yellow spotted with red. June-Dec. Brazil, Paraguay, Argentina.

rupestre. Pseudobulbs with 1 lf. to 15 in. long: infl. paniculate, few-fld.; sepals and petals bright yellow spotted with reddsh-brown at base; lip golden-yellow with reddish-brown blotch. Apr.-Sept. Colombia, Ecuador.

sarcòdes. Pseudobulbs with 2-3 lvs. to 10 in. long: infl. loosely paniculate, many-fld., to 6 ft. long; sepals and petals chestnut-brown bordered with yellow; lip bright yellow with red-brown spots around the crest. Apr.-July. Brazil.

sphacelatum. Pseudobulbs with 2-3 lvs. to about 2 ft. long: infl. loosely paniculate, many-fld., to 5 ft. long; fls. 1 in. across; sepals and petals yellow spotted with brown; lip golden-yellow with red-brown band in front of crest. Feb.-Sept. Mex. to Honduras.

spléndidum: O. tigrinum var.

tigrinum. Pseudobulbs with 2-3 lvs. to 12 in. long: infl. usually loosely paniculate, to about 48 in. high; fis. large, to nearly 3 in. across; sepals and petals greenish-yellow blotched with red-brown; lip large, yellow. Oct.—Feb. Mex. Var. spléndidum (O. splendidum). Pseudobulbs 1-2-lvd.: claw of lip broader than in O. togrinum with smaller lateral lobes. Dec.—Feb. Guatemala.

unguiculatum: O. concolor.

uniflorum. Plant small: pseudobulbs with 1 lf. to about 6 in. long: infl. racemose, 1-2-fld., about length of lvs.; sepals and petals greensh-yellow spotted with brown; lip bright yellow spotted with tawny-purple below. Apr., July-Aug., Dec. Brazil.

varicosum. Pseudobulbs with 2-3 lvs. to 12 in. long: infl. a many-fid. nodding panicle to 5 ft. long; fls. about 1 in. across; sepals and petals dull yellow or greenish barred with red-brown; lip large, golden-yellow. Sept.-July. Brazil, Paraguay, Bolivia. Var. Rogersii has larger fls. to 2 in. across.

Wentworthiànum. Pseudobulbs with 1-2 lvs. to 12 in. long infl. loosely paniculate, to 12 ft. long; fis. about 1 in. across, yellow spotted with brown. Apr.-June. Guatemala.

ÓNCOBA. Flacourtiaceæ. Trop. polygamous shrubs or small trees with alternate lvs., white, reddish or yellow fls. in clusters or solitary, and fr. a leathery berry; one species is planted in Calif.

Routledgei. Spiny shrub to 20 ft.: lvs. oblong, wavy-toothed: fis, white, 2 in. across, fragrant. Trop. Afr.

ONION (species of Allium). Well-known hardy cool-season biennials and perennials, cultivated in the vegetable-garden for the edible bulbs and sometimes for the leaves that are used in seasoning. Others of the genus are grown for the ornamental flowers, for which see Allium.

The common onion is Allium Cepa, native in western Asia, ordinarily biennial, with fistulose or hollow leaves and a prominent bulb. The Welsh onion is A. fistulosum, also Asian, a more leafy plant and with bulb soft and little thicker than the neck. The shallot is A. ascalonicum, probably Asian but not identified as an indigen; it differs from the onion in small stature, slender awl-like leaves and small more or less angular bulbs that part into several bulbs cohering by the base; the usual shallot of cultivation, however, is a small cluster onion, a form of Allium Cepa.

Another fistulose species is the perennial tufted A. Schænoprasum, chive, native in Europe and Asia. It does not produce distinct bulbs. The leaves are used for seasoning, being cut as needed. It is a durable plant and makes an attractive border; the rosepurple flower-heads are ornamental when allowed to develop. The chive (or cive) is readily raised from seeds and propagates well by division. It is hardy and requires no special care, although it is well to divide and reset the stools when they become weak from overcutting or crowding.

Flat-leaved alliums grown for eating are leek and garlic, which see in their alphabetic order. The leek has a simple bulb, not much thicker than the crown. Garlic is a much smaller plant with the thin-skinned bulb breaking into several integral parts or cloves. Rocambole is a larger plant than garlic (Allium Scorodoprasum), grown the same but little seen in North America.

The common field onion is propagated directly from seeds. Other races of the same species are propagated asexually, as by (a) sets, (b) multipliers, (c) "tops" or "acons"; these races are grown for small green early bunch onions. (a) Sets are small onions, the size of a hazelnut more or less, that were arrested in their development by being grown very thickly (from seed) and ripened off early in the season; when planted the next spring they resume their growth. (b) Multipliers or potato onions are a form in which the bulb divides into separable parts; each part is planted the following spring (or autumn far South) as are the sets. (c) Top onions are little bulbels that appear in the flower-cluster in the place of blossoms; they are handled the same as sets.

Being hardy, onions are started as early in the spring as the ground is dry and settled and can be made fit. The land should be in good tilth, fine and mellow. In the far South,

they may be sown in autumn.

Rows stand 12 to 18 inches apart. Seed is sown thickly, covered ½-1 inch deep, and the seedlings or young plants thinned to 2 inches or more apart, depending on the variety. In the home garden, these young onions may be used on the table. Good tillage must be provided until the onions are nearly grown. Soil should hold moisture well as the plants are not deep-rooted; it should be liberally supplied with available plant-food. Soils that bake and become very dry are not adapted to onion growing. For these reasons, well-drained swamp lands are popular for onion culture, but good crops can be grown in the ordinary garden if the earth is deeply prepared, fertile, well supplied with humus, and in superior tilth. Tillage is usually by means of hand tools. Raw rough stable-manure is not used for onions.

After being pulled or lifted, the mature bulbs are allowed to cure a day or two before placed in storage; sometimes they are cured under cover so that they become dry and free from earth. After curing the tops are cut off, about a half inch above the bulb. For home use, onions are stored in the cellar, much

as are potatoes.

There are many varietics, differing in season, size, shape, color, flavor. Danvers, Wethersfield, Southport, are standard kinds or races. The large Bermuda, Spanish, and Italian onions require a long season and are usually mild in flavor. A good crop of field onions is 300–500 bushels to the acre, but greater yields are frequently obtained.

Onions are sometimes transplanted when very young, the seeds having been sown in a seed-bed usually under glass, as in a hotbed. Early onions of uniform size, for table use green and for sale as "bunch onions," may be

produced by this method.

The onion is subject to serious diseases and pests. The most recent advice should be available from the experiment stations. Smut is treated by applying formaldehyde solution in the drill at seeding time.

The Welsh onion or ciboule is grown for its leaves, employed as seasoning; raised from seeds sown in spring, the foliage being ready in autumn or following spring.

ONION, SEA -: Urginea maritima.

ONÓBRYCHIS. Leguminosæ. Per. herbs or spiny shrubs with pinnate lvs., papilionaceous fls. in axillary racemes or spikes, and flattened often spiny or crested pods; O. viciæfolia is grown for forage and others occasionally for ornament. Seeds should be sown in spring or fall where the plants are to grow. Sainfoin is adapted to dry soil.

Cáput-gálli. Ann. to 18 in., white-pubescent: Ifts. 10-14: fis. purple, very small, usually 3-6 in compact racemes, the peduncle nearly as long as lvs. Medit. region.

Cristagálli. To 1 ft.: lfts. less than ½ in. long: fis. flesh-colored: pods with deeply lobed crest on back, to ¾ in. long. Medit. region.

sativa: O. viciæfolia.

viciæfòlia (O. saisva). Sainfoin or Sainfoin. Holy Clover. Esparcer. To 2 ft.: lfts. 1 in. long: fls. pale pink: pods toothed on back, ¼ in. long. Eu., N. Asia. ONOCLÈA. Polypodiaceæ. One coarse and not very attractive fern with creeping rhizomes and two knds of fronds, native of north temp. regions, sometimes transferred to grounds. See Ferns. O. sensíbilis. Sensitive-Fern. Sterile fronds to 4½ ft. long, deeply pinnatifid, pinnæ wavy-toothed; fertile fronds to 2½ ft. long, 2-pinnate, the segms. rolled up into bead-like bodies forming panicles. Newf. west and south to Gulf states, in moist pastures and similar places. For O. Struthiopteris and nodulosa see Pieretis.

ONONIS. REST-HARROW. Leguminosæ. Herbs and shrubs native to Eu., N. Afr. and W. Asia, with lvs. mostly of 3 lfts., papilionaceous fls. solitary or in racemes, and cylindrical or swollen pods; grown in borders and rock-gardens. Of easy cult.; propagated by seeds or division.

aragonénsis. Subshrub to 10 in., branches contorted, very pubescent: lfts. orbicular, glabrous, leathery, margins dentate: fis. yellow, in terminal non-leafy racemes. Meditregion.

arvénsis: O. spinosa, but material so listed may be O. hircina.

censia. Per. to 10 in., slightly woody at base: Ifts. oboval, denticulate: fis. rose, solitary on naked axillary peduncles, in summer. S. Eu.

Colúmnæ: O. pusilla.

fruticòsa. Shrub to 2 ft.: lfts. oblong-ovate, coarsely serrate: fls. pink or whitish, 2-3 together. June-Aug. S. Eu., N. Afr.

hircina. Shrubby, to 2 ft.: lfts. oblong-lanceolate: fis. rose and white, usually 2 together, in summer. Eu.

minutíssima. Per. to 18 in., somewhat woody at base: lfts. obovate, denticulate, terminal lft. sessile: fls. yellow, in leafy spikes, May-Sept.: pod glabrous. S. Eu., N. Afr.

Natrix. Per. to $1\frac{1}{2}$ ft.; lfts. oblong: fls. yellow, solitary. June–July. S. Eu.

pusfila (O. Columnæ). Per. to 10 in.: Ifts. oval, terminal lft. petioled: fls. yellow, in leafy spikes, May-June: pod pubescent. S. Eu.

rèpens. Prostrate or ascending: lfts. ovate or obovate: fls. pink, soiitary. June-July. S. Eu.

rotundifòlia. Shrubby, to 1½ ft.: lfts. round to ovate: fls. bright rose, 2-3 together, in summer. S. Eu.

spinosa (O. arvensis). Per. to 2 ft., sometimes thorny: lfts. oblong: fls. pink, 1-2 together. June-July. Eu.

ONOPÓRDUM. Compositæ. Coarse ann. and bien. woolly thistle-like herbs with large alternate prickly-toothed or -lobed lvs. and solitary or clustered heads of purple or white disk-fls., the bracts of involucre often spiny-tipped; pappus of bristles; native of the Old World, a few planted for ornament. Propagated by seed.

Acanthium. Scorch Thistle. Bien. to 9 ft., white-tomentose all over: lvs. oblong, prickly, lobed and toothed, the lower often 1 ft. long: heads to 2 in. across, usually solitary, pale purple, spiny. Eu., Asia; nat. in E. N. Amer. Var. 41bum has white fis.—The plant, or a form of it, is sometimes listed as "Robert Bruce."

acaule. Bien., st. very short and seemingly absent: lvs. oblong, pinnatifid, woolly on both sides, lobes spiny: heads cushioned in basal rosette of lvs., very large, solitary, white. Medit. region.

alexandrinum: O. Sibthorpianum var.

anatólicum; O. Sibthorpianum,

arábicum. Bien. with swollen deeply winged sts.: lvs. ovate-lanceolate, sinuate, spiny: heads solitary, purplishred. Medit. region.

bracteatum. Bien., tall, tomentose: lvs. oblong-lanceolate, shallowly lobed, spiny: heads large, globose, the involucial bracts recurved. E. Medit. region.

illfricum. Bien., sts. with spiny wings: lvs. oblong-lanceolate, pinnate into spiny lobes, white-tomentose: heads purple. S. Eu.

polycéphalum. Bien., densely tomentose, tall, sts. grooved: lvs. lanceolate, lobed, spiny: heads in corymbs, rose, spiny. E. Eu.

Salteri: a hort. plant of unknown origin, to 5 ft., pyramidal, shining and silvery.

Sibthorpianum (O. anatolicum). Bien. to 3 ft., white-tomentose: lvs. oblong-lanceolate, punnate into spiny segms, sts. with spiny wings: heads to 3 in. across, purple, spiny. Medit. region. Var. alexandrinum (O. alexandrinum) is less woolly

tauricum. To 6 ft.: lvs. elliptic-oblong, lobed, spiny: infl. many-headed. S. Eu.

ONÓSMA. Boraginaceæ. Hairy ann., bien. and per. herbs of the Medit. region and Himalayas, sometimes undershrubs, with alternate simple lvs. and yellow, purple or white fls. in one-sided racemes; corolla tubular or urn-shaped, stamens commonly included. Sometimes grown in borders and rock-gardens. Propagated by seeds and cuttings in summer.

álbo-ròseum. Per to 6 in., densely tomentose: lvs. ohlong: fls. white changing to rose or violet, velvety, about 1 in. long. Asia Minor.

cássium. Per. to 1½ ft.: lvs. oblong: fls. yellow, about ¾ in. long. Syria.

decipiens: O. nanum.

echioides. Bien. or per. to 1½ ft.: lvs. spatulate or linear-lanceolate: fis. cylindrical, pale yellow or whitish, drooping S. Eu. to W. Asia.

emòdi. To 11/2 ft., hairy: lvs. oblanceolate: fls. purple, 1 in. long. Himalayas.

helvéticum: a Swiss form of O. stellulatum.

nanum (O. deceptens). Probably per., to 5 in.: lvs. linear-lanceolate, bristly: fls. white, glabrous. Asia Minor.

rupéstre. Per. to 6 in.: lvs. linear-lanceolate, to 1 in. long, soft-hairy, acute or obtuse, sessile: fis. pale yellow in bud becoming ivory-white, narrowly urn-shaped, to 34 in. long on short red pedicels. Caucasus.

stellaris: listed name.

stellulàtum. Per. to 8 in : lvs. linear-oblong: fls. tubular, yellow, 1 in. long. S. Eu. Var. taùricum $(O.\ tauricum)$ has revolute lvs. and fls. to $1\frac{1}{2}$ in. long.

tauricum: O. stellulatum var.

tubiflorum. Lvs. linear, stellate-hairy: fls. to 11/2 in. long, in lax elongate racenies. Bulgaria.

venústum: listed name.

Visiànii. Bien., sts. setose, violaceous: lvs. linear, white-hairy beneath, sessile: fls white becoming yellowish, calyx softly setose. N. E. Medit. region.

ONOSMODIUM. FALSE GROMWELL. Boraginacex. Hairy per. herbs of N. Amer. and Mex., with alternate lvs. and white, yellowish or greenish tubular fls. in scorpioid spikes or racemes; may be transplanted but of little ornamental value.

occidentale. To $3\frac{1}{2}$ ft.: lvs. lanceolate or ovate-lanceolate, to 3 m. long: fis. to $\frac{3}{4}$ in. long, pubescent outside. Ill. to New Mex.

ONÝCHIUM. CLAW-FERN. Polypodiacex. Small graceful ferns with 3-4-pinnate fronds of two kinds and sori borne at tips of segms.; native in Asia, Afr. and trop. Amer. Grown as pot and pan plants in conservatories and similar places. See Ferns.

japónicum. Fronds to 1½ ft. long, thin, light green, 2-4-pinnate into very small segms. Himalayas to Java and

OOPHYTUM. Aizoacex. Two species of tufted per. succulents of the S. African Mesembryanthemum group: plant-bodies ovoid, the solitary fls. borne in the small fissure; petals many, in 2-3 series; stamens many; stigmas usually 6, filiform.

nanum (M. nanum). Growths to about $\frac{1}{2}$ in. high and thick, glabrous, with minute dots: fis. rose, $\frac{1}{2}$ in. across.

OPHIOGLOSSACEÆ. ADDERS-TONGUE FAM-ILY. Three genera, in both hemispheres, of more or less fleshy ferns with simple or compound lvs. from a short rootstock, and with yellow spores in sporangia borne in separate fertile spikes or panicles. Some of the species are very small and commonly overlooked when in grass or other herbage. The species of this family are planted sparingly as wild-garden or perhaps rock-garden subjects. Genera herein treated are Botrychium and Ophioglossum.

OPHIOGLÓSSUM. ADDERS-TONGUE-FERN. Ophioglossaceæ. Small ferns with solitary or few succulent lvs., consisting of a sterile usually entire blade and a contracted long-stalked fertile spike bearing 2 rows of fleshy spore-clusters; of wide distribution, but not often seen by the casual observer and little planted. See Ferns.

Éngelmannii. Lvs. usually 2-5, to 9 in. long, the steule lf.-blade to 3½ in. long and 2 in. wide, sessile: fertile spikes to 1 in. long, on stalks to 4 in. long. Va. to Ariz. and Mex.

vulgatum. Hardy: If. usually solitary, to 16 in. long including the stalk, If.-blade to 5 in. long and 2 in. wide, sessile: fertile spikes about 2 in. long, on stalks to 10 in. long. N. S. to Fla., Eu., Asia, mostly in moist meadows and woods.

OPHIOPÒGON (Mondo). LILY-TURF. Liliacex. Evergreen sod-forming stemless per. narrow-lvd. herbs of E. Asia, not many species, valuable as ground-cover and as pot and porch plants, sometimes seen in the conservatory. The following species are adaptable in parts of N. Y.: fls. small, bluish or white, drooping, borne in racemes among the foliage, the ovary inferior, the filaments very short and anthers pointed: fr. berry-like and 1-seeded, blue.

The culture is simple in sun or shade. Propagated by division. The oldest name for this genus is Mondo, and combinations have been made under it, but Ophiopogon has been long in use and is now officially conserved.

Jaburan (M. Jaburan). Jaburan or White L. Roots stout and cord-like, tubers none: lvs. long and grass-like, to 2 ft. or more, and about ½ in. broad: fils. white, ½ in. or more long, in a short terminal raceme. fr. oblong, violetblue. Japan. Var. vittatus has lighter-striped lvs. Leaf color forms are known as vars. aureus and variegatus.-Liriope Muscari often passes as O. Jaburan.

japónicus (M. japonicum). Dwarf L. Low, with long underground stolons and the roots tuber-bearing lvs. many, to 10 or 12 in. long, dark green, commonly curved: fis. small, light liae, in a short loose raceme: fr. blue, size of pea. Japan, Korea.—An excellent sod-forming plant.

ÒPHRYS. Orchidacex. Terrestrial orchids bearing basal and cauline lvs. and fls. in terminal racemes, the petals smaller than sepals, lip entire or 3-lobed. For cult, see Orchids.

apffera. Plant to 20 in. high: lvs. oblong to lanceolate-elliptic: racemes loose, few-fld.; sepals pink; petals reddish-green or dark green; hp dark purple or velvety-brown with yellow-green markings. Eu., N. Afr.—Sometimes planted in lock-gardens or similar places.

cordata: Listera cordata.

OPHTHALMOPH YLLUM. Aizoaceæ. Stemless dwarf succulents from S. Afr., allied to Conophytum and a segregate of the Mesembryanthemum group: lvs. united into a plantbody with small fissure at top, pubescent, transparent at tips: fls. white or rose, shortstalked.

Friedrichiæ (M. Friedrichiæ). Plant-body cylindrical, to 1½ m. high and ¾ in, thick, reddish: fis. purplish or white, ¼ in. across.

Hérrei. Plant-body to 1½ in. high and ¾ in. thick, ve-green, velutinous: fis. white or pale rose, to 1 in. olive-green, across, slightly fragrant.

Maughanii (Conophylum Maughanii). Plant-body 1 in. high and ½ in. wide and thick, smooth and light or yellow-ish-green: fis. ½ in. across.

Schléchteri. Similar to O. Friedrichiæ but smaller,

shout ½ in. high.

Schfildtil. Plant-body to 1 in. high and ¾ in. wide and thick, cylindrical or somewhat obconical, fissure to ¼ in. wide: fls. creamy-white, 1 in. long, nocturnal.

Trièbneri. Distinguished from O. Friedrichiæ by the flattened rather than rounded lobes, thickly dotted and less transparent.

OPIUMA: Pithecellobium dulce.

OPLÍSMENUS. Graminex. Per. grasses weak or decumbent at base, lvs. broad and flat, spikelets in interrupted spikes; native in tropics and subtropics and planted in greenhouses for hanging-baskets and edgings of beds; propagated by rooting sts. See Grasses.

compositus. BASKET-GRASS. Sts. to 3 ft. or more long, somewhat trailing: lvs. to 4 in. long and 1 in. wide: spikes to 4 in. long, awned. Afr., trop. Amer.—Has been cult. under the erroneous name of O. Burmannii. Var. vittātus has lvs. striped with white and pink.

hirtéllus. Sts. to 2½ ft., usually about 14 in., creeping with fruiting culms generally erect or ascending: purple awned spikes in panicles to 4 in. long. Mex., W. Indies, S. Amer.—A variegated-lyd, form is known to florists as Panicum variegatum.

OPLÓPANAX (Echinopanax). Araliaceæ. A few prickly deciduous shrubs native in W. N. Amer. and E. Asia, with alternate palmately 5–7-lobed lvs. and greenish-white fls. in panicled umbels. Propagated by seeds, suckers, and root-cuttings.

horridum. Devils-Club. To 12 ft.: lvs. orbicularovate, to 10 in. across, toothed, prickly on both sides, bright green: fr. scarlet, ½ in. long. Alaska to Calif.

OPOPANAX: Acacia Farnesiana.

OPULASTER: Physocarpus.

OPÚNTIA. PRICKLY-PEAR. TUNA. CHOLLA. Cactaceæ. Many species, 250 or more, although more than three times this number of names are known in the genus, native from Canada to the straits of Magellan. For the most part they are coarse and awkward plants from the cultivator's point of view and do not lend themselves well to pot or tub culture, and relatively few of them are well known to hort. although any number may be transferred to grounds. The frs. of some of them, as the tunas and Indianfig, are edible, and some of the spineless forms are recommended for forage; in times of need, spines are burned off wild plants to provide forage for cattle. Some kinds of opuntia have run wild extensively in Australia, S. Afr. and elsewhere. The opuntias are of various habit, from small tree-like plants or spreading or prostrate, sometimes more or less clambering, areoles mostly carrying spines and also glochids or fine barbed bristles, but some species are naturally spincless or nearly so: fis. commonly
1 at an arcole, yellow, red, greenish or white,
opening wide: fr. a dry or juicy berry. Two
main groups may be recognized by the nonbotanist,—the species with flat and mostly broad pads or joints (or at least some of them flat) as the prickly-pears and tunas; those with cylindrical or terete joints or branches as the chollas and tasajos; in the following account the species belonging to the first group are marked 1, and those to the second or cylindric group are indicated as 2. The first group or Subgenus (1) is Platyopuntia, the second (2) Cylindropuntia. There is a third subgenus, Tephrocactus, with short usually clustered joints, not much represented in hort. For cult., see Cacti.

The odd or even grotesque form of the opuntias and their ability to withstand hardship make them adaptable, as ornamental subjects, to exposed and rocky banks, to rock-gardens and to waste corners where little attention can be given them. A good number of them are hardy practically all over the country. They may be propagated from the joints, and they grow very readily from seeds. The flowers are showy and interesting although of short duration. The spines and glochids, however, restrict their

use. O. Ficus-indica and O. Tuna are grown in tropical and subtropical countries for the abundant edible fruits.

aciculata. 1: to 3 ft. high and 9 ft. across, lower branches decumbent; joints obovate, to 8 in. long and glaucous, areoles with several slender spines and numerous glochids: fis. golden-yellow, to 4 in. across. Tex.

albifidra: O. Salmiana.

Alcahes. 2: to 3 ft., much branched, very spiny; spines about 12 and covered with white sheaths: fis, greenish-yellow, brownish outside. Lower Calif.

amm6phila. 1: erect and branched, to 8 ft. or more tall and st. 10 in. diam. at base, somewhat tree-like, with unjointed trunk; joints elongate to oval, usually 2-8 in. long; spines about 2½ in. long, reddish to gray: fls. bright yellow, about 3 in. across. Fla.

Amyclæa. 1: joints oblong or elliptic, to 16 in. long and twice as wide and somewhat glaucous, areoles with 1-2 short bristles and 1-4 stiff spines: fls. yellow. Probably Mex.

Andeada: listed name.

andicola. Tephrocactus: low, much branched and spreading; joints ovate, somewhat acute, to 3½ in. long, dark green to blackish, glochids pale yellow, abundant; central spines 3-5, to 2½ in. long, somewhat flattened: fls. pale yellow. W. Argentina.

angustata. 1: sts. ascending; joints narrow, to 10 in, long, tapering basally, glaucous green; spines to 1½ in. long, sharply angled, whitish with brown base: fls. not known. Ariz.

antillana. 1: prostrate, forming clumps 3 ft. across; joints obovate, to 8 in. long; spines 3-6 and unequal, glochids yellow: fls. yellow turning reddish, to 3 in. long. W. Indies.

aoracántha. Of the Tephrocactus group: forming clumps to 20 ft. across and 8 in. high; joints globular, to 3 in. diam, and strongly tuberculate; spines 1-7, to 5 in. long, brown: fls. white. Argentina.

arboréscens: O. imbricata.

arbúscula (O. neoarbuscula). 2: much branched bush to 10 ft. with short trunk; joints to 3 in. long and ½ in. thick; spines 1 or several to 1½ in. long: fls. greenish-yellow tinged red, 1½ in. long. Ariz., Mex.

arenaria. 1: st. prostrate, to 1 ft. long; joints somewhat turgid in growing season but becoming thinner, to 3 m. long and half as broad; spines 5-8: fls. red, about 3% m. broad. Tex., New Mex.

arizónica: O. Engelmannii.

atrispina. 1: low spreading plant forming clusters to 6 ft. dam. or more; joints somewhat orbicular, to 6 in. dam.; spines from upper arcoles only, flattened, dark brown, base black: fls. yellow to orange. Tex.

atroviridis. 2: low; joints globose or ovoid, to 1½ in. diam., olive-green, areoles with white wool and yellow bristles; spines 3-5, 1 in. long: fls. yellow. Peru.

Aùberi: Nopalea Auberi.

aurantiaca. 1: low and much branched; joints fragile and linear, about 3 in. long, to 1 in broad; spines 2 or 3; fis. yellow, 1 in. broad. Uruguay, Argentina.

aurea. 1: prostrate; joints oval to obovate, to 4½ in. long and 1 in. thick, light green; spines usually absent, but solitary and yellow when present, glochda golden-brown: fls. yellow to apricot-pink. Ariz.

austrina. 1: roots tuberous, to 6 in. long and 2½ in. diam., sts. somewhat erect; joints narrowly to broadly ovate or suborbicular, to 4½ in. long, bright green; spines 1-6, about 1 in. long, twisted or wanting, white to pink: fls. bright yellow, to 3 in. across. Fla.

arirea. 1: creet, branching from base or with single trunk; joints orbicular to obovate, to 6 in. diam., glaucous blue-green; spines to 1½ in. long, unequal, nearly black, glochids brown: fis. deep yellow becoming reddish-pink: fr. spineless, dull crimson, edible. Mex.

bàla: listed name.

basilaris. 1: in clumps, sts. prostrate or erect, sometimes to 4 ft.; joints broad-obovate, to 8 in. long; spines mostly none: fls. purple or white, to 3 in. long. S. Utah, Nev., W. Artz., S. Calif., Mex. Listed vars. include alba, humistrata, intricata and ramosa.

bellapérone: listed name.

Bergeriana. 1: often making thickets, to 10 ft. and trunk to 16 in. thick, top spreading or clambering; joints narrow-olong and becoming somewhat glaucous; spines 2 or 3 or 5, unequal: fls. deep red and many, petals 1 in. long. Unknown native; now spread on Riviera and N. Italy.

Bigelovii. 2: usually with an erect trunk to 3 ft. with short branches conspicuous near the top and beset with pale yellow spines; joints 2-6 in. long: fls. magenta to crimson, about 1½ in. long. Characteristic in S. Nev., Ariz., S. Calif., N. Mex.

Blakeana: O. phwacantha.

Bóldinghii. 1: plant bushy, to 7 ft. tall; joints obovate, to 3 in. long, usually spineless: fls. rose-pink, to 2 in. long.

bondata: listed name.

borinquénsis. 1: forming clumps to 6 ft. across and $1\frac{1}{2}$ ft. high; joints oblong, to 3 in. long, $1\frac{1}{2}$ in. wide and $\frac{1}{2}$ in. thick; spines 2-3, to $2\frac{1}{2}$ in. long. Puerto Rico.

brachyárthra; O. fragilis.

brachyclada. Similar to O. basilaris, but differing in having some joints flattened and others cylindrical.

Bradtiana: Grusonia Bradtiana.

brasiliénsis. 1: to 12 ft., with cylindric naked or spiny trunk and small top; terminal joints flat and leaf-like: fls. yellow, about 2 in. long. S. Brazil to Argentina, Bohvia; nat. in S. Fla.

Bravoana. 1: erect, branching from base, to 7 ft. tall; joints oblong to obovate, to 15 in long and half as wide, thin; spines none to 5, to 2 in long, flattened, glochids yellow surrounded by white wool: fls. yellow, shading to red with age. Lower Calif.

bulbispina. 2: prostrate, forming clumps to 4 ft. across; joints ovoid, 1 in. long and ½ in. diam. with prominent tubercles; radial spines 8-12; central spines 4½ in. long and bulbose at base. Mex.

Burrageana. 2: to 3 ft. or less, densely spiny; joints cylindric, to 6 in. long; spines numerous and covered with thin yellow sheaths: fls. brownish-red with green base, 1½ in. across. Lower Calif.

cacanàpa: O. Lindheimeri.

Calmalliana. 2: joints cylindrical, to ¾ in. diam., tubercles present, linear-oblong, to 1 in. long; spines about 4, unequal, to 1 in. long: fis. said to be purple. Lower Calif.

camánchica: O. phæacantha.

camuéssa: (). robusta.

canina. 1: erect becoming decumbent, plant to 14 ft. across; joints marrowly oblong, to 14 in. long and about 2 in. wide, glossy green; spines 1-3, to 1½ in. long, grayish tipped yellow; fls. yellow. Argentina.

cantabrigiénsis. 1: to 6 ft., bushy; joints orbicular or obovate, to 8 in. long, arcoles with brown wool and yellowish glochids; spines 3-6 or more, to $1\frac{1}{2}$ in. long: fls. yellowish with reddish center, 2 in. long. Mex.

Cardénche. 2: described as intermediate between O. Kleinæ and O. imbricada: to 8 ft., with trunk to 4 in. diam.; joints tuberculate; spines usually 4, to 1 in. long, translucent: fls. pale purple, 1½ in. across. Mex.

catacántha: O. rubescens.

cenèsa: listed name.

chlorótica: 1: to 6 ft. or more with definite trunk; joints ovate or orbicular, to 8 in long and glaucous; spines several, 1½ in. long, yellow, glochids numerous and yellow: fls. yellow, 3 in. across. Calif., Nev., New Mex., Ariz., Utah, Mex.

Ch6lla. 2: mostly tree-like, to 10 ft, with trunk to 6 in. diam., in age spineless; joints often in whorls, with large compressed tubercles; spines commonly numerous: fls. deep purple, about 1 in. or more broad. Lower Calif.

ciribe. 2: to 3 ft. tall; joints to 2 in. long and 3 in. diam., strongly tuberculate; larger spines 4-6, to $1\frac{1}{4}$ in. long: fls. yellow: fr globose, spineless. Lower Calif.

clavaroides. 2: low, straggling; joints cylindrical to conical, terminal ones often cristate; spines 4–10, radiating, hair-like; fls. pale greenish-brown, to 2 in. across. Chile.—Usually best grafted on other species of Opuntia or on Cereus. Requires half-shade.

clavata. 2: spreading, patch-forming, to 6 in. high and 7 ft. across; joints clavate, to 3 in. long; radial spines 6–12, to $\frac{5}{4}$ in. long; centrals 4–7, to $\frac{1}{4}$ in. long: fls. yellow, to $\frac{1}{4}$ in. long. New Mex.

clavellina. 2; loosely branched erect shrub, to 3 ft. tall; ultimate joints spreading or ascending, club-shaped, to 4 in. long and ½ in. diam., with conspicuous elongated tubercles; spines 3-6, to 3 in. long or more with loose sheaths: fls. yellow. Lower Calif.

cochenillifera: Nopalea cochenillifera.

comonduénsis. 1: low, spreading, to 8 in. high; joints obovate to orbiculate, about 6 in. long, soft-pubescent; spines 1-3, to 2 in. long or more, yellow: fis. yellow: fr. purple. Lower Calif.

compressa (O. Opuntia, humifusa, mesacantha, nana, Rafinesquei). 1: low and spreading or sometimes ascending; joints orbicular to oblong, to about 5 in. long; spines 1 or 2 from an areole or wholly wanting; fls. yellow, 2-3 in. across. Ont. and Mass to Ala. and Mo; nat. in Eu.—There are several cult. forms. This low N. American plant had been improperly known as O. vulgaris.

congésta: said probably to represent a race of O. ar-buscula.

corallicola (Consolea corallicola). 1: to 6 ft. or more, tree-like; joints elliptic, to 12 in. long; spines 5-9 and to 7 in. long: fls. bright red, to ¾ in. across. Fla.

cordobénsis. 1: trce-like, the very spiny trunk to 7 ft. high and 8 in. diam.; joints oblong-obovate, to 1 ft. long; spines 1-6, about 1 in. long, white: fls. yellow: fr. yellowish, pear-shaped. Argentina.

Covillei (0. megacarpa). 1. thicket-forming; joints nearly orbicular, to 8 in. long or more; spines 3-6, to 2½ in. long, unequal, white to brown; fls. yellow. S. Calif.

crássa. 1: to 6 ft., somewhat branched; joints ovate to oblong, to 5 in. long and glaucous; spines 1 or 2 or wanting, the areoles with brown wool: fis. not described. Unknown wild, probably Mex.

crinifera: O. orbiculata.

514

cumulicola. 1: erect, to 5 ft., branched, tuberous; joints obovate to nearly orbicular, to 12 in. long, thick, bught green; spines 1-2, light yellow to gray or brownsh: fis. deep yellow, to 4½ in. across. S. Fla.

curassávica. 1: sts. prostrate or hanging; joints usually 5, oblong-ovate, to 2 in. long, thick; spines 4 or more about 1 nn. long, yellow to white, needle-like: fls. not known. Curacao.

cylindrica. 2: to 12 ft., more or less branched; joints cylindric and obtuse at apex; spines short and white and sometimes wanting: fls. searlet, about 1 in. broad. Ecuador, Peru. Var. cristata is listed.

Davisii. 2: to 1½ ft. and densely covered with pale yellow spines; joints to 3 in. long and ½ in. diam., strongly tuberculate; spines 6-12, to 2 in. long, glochids numerous and yellow: fls. ohve-green or yellow, 1½ in. long. W. Tex., New Mex.

decumana: O. maxima.

decûmbens. 1: to 1 ft., often creeping or trailing; joints oval or oblong, to 8 in. long, pubescent, areoles with yellow glochds and wool; spines normally solitary, to $1\frac{1}{2}$ in. long, yellow: fis. deep yellow, $1\frac{1}{2}$ in. long. Mex., Guatemala.

dejécta: Nopalea dejecta.

delicata. 1: procumbent; joints ovate, to 3 in. diam., areoles with brown glochids; spines 1-2, to $1\frac{1}{2}$ in. long: fis. yellow, 2 in. long. Ariz.

diademata. Tephrocactus: plant spreading; joints ovate, to 3½ in. long, brown- to gray-green; spines 1-4, reddish-brown, 1-4 in. long; fls. pale yellow, to 1½ in. across. W. Argentina.—Erect forms are known.

Diguètii: Pereskiopsis Diquetii.

Dillenii (O. horrada). 1: low and spreading or tall and branching to 10 ft. high; joints obovate or oblong, to 16 in, long; spines sometimes few or none but on young areoles often as many as 10 and usually not exceeding 2½ in. long: fls. lemon-yellow but sometimes red, about 3 in. long. Near coast S. C. to S. Amer.—It has been erroneously known as O. Tuna.

discâta. 1 spreading, shrub-like, to 5 ft. tall; joints orbicular or nearly so, to 10 in. across, glaucous blue-green; spines 2-4, rarely to 9, about 1 in. long; fls. light yellow with darker center, to 4 in. across. Ariz.

distans. 1: to 12 ft. with short trunk and many branches; joints obovate, to 10 in. long, 6 in. wide and ¾ in. thick, areoles few with many glochids and no spines: fis. orangered, ¾ in. long. Argentina.

Dobbieàna. 2: thicket-forming, usually only to 3 ft, high but occasionally to 12 ft. or more; joints orbicular to obovate, to 10 m. long, very spiny; spines 5–12, white, to 12 in. long, areoles usually with 2–4 reflexed hairs: fis. chocolate-brown, to 1 in. long, filaments and style pinkish: fr. red, to 2 in. long, spiny becoming smooth. Ecuador.

Drammondii (O. frustulenta. O. pes-corvii). 1: prostrate or spreading, 8 in. or less high; joints narrow-linear to broad-oblong, to 4½ in. long and half as broad; spines 1, 2 or 4 or wanting: fis. yellow, about 2½ in. broad. N. C. to Fla. in sand.

durangénsis. 1: probably of bushy habit; joints broadly obovate, to 8 in, long and nearly as wide, pale green; spines 3-5, to $\frac{5}{8}$ in, long, yellow to brown: fis. yellow, to 2 in, long. Mex.

echinocárpa. 2: mostly low but sometimes to 4 ft. or more high, much branched; joints short and strongly tubercled; spines many: fis. yellowish, often tipped red outside, ovary densely spiny. Utah, Nev., Ariz., Calif., Lower Calif.

Eichlamii. 1: tree-like to 40 ft. tall; joints broadly obovate, to 8 in. long; spines 4-6, unequal, to ¾ in. long, rosepink to white: fts. carmine-red. Guatemala.

elàta. 1: to 3 ft.; joints oblong, to 10 in. long and half as broad, areoles white-woolly and usually spineless: fis. orange-yellow, 2 in. across. Brazil, Paraguay. Var. obovàta,

joints obovate, spines on upper areoles and 2 in. long. Var. elonzata is listed.

elatior (O. nigricans). 1: much branched, to 15 ft.; joints obovate to oblong to nearly orbicular, to 1 ft. or more long; spines 2-8: fis. dark yellow striped red or sometimes salmon-rose, about 2 in. across. N. S. Amer.

Ellisiana. 1: to 6 in. high and 6 ft. across, loosely branched; joints obovate or ovate, to 3/4 in. long and glaucous, spineless: fis. deep yellow or orange, 21/2 in. across. Tex.

Émoryi: O. Stanlyi.

Engelmannii (O. Wootonii, O. arizonica), 1: wide-spreading; joints oblong to orbicular, to 1 ft. long; spines mostly 3 or 4 but sometimes only 1 or even wanting or more numerous on old joints: fls. yellow, large. Tex. to Ariz., Mex.

erinacea (O. ursina). 1: small low clump with branches

erinacea (O. ursuna). 1: small low clump with branches ascending or erect; joints ovate to oblong, to 4 in. or more long; spines many: fis. red or yellow, about 2½ in. long. Utah, Ariz., Nev., Calif.

Ficus-indica. Indian-Fig. 1: large and bush-like or sometimes tree-like and to 15 ft.; joints oblong to spatulate, to 15 or 20 in. or more long, commonly spineless: fis. yellow, to 4 in. across. Nativity undetermined; widely spread to 4 in. across. over the world.

filipéndula: O. Pottsii.

Fisheri: listed name

flavéscens. 1: to 3 ft. high, forming clumps to 5 ft. across; joints obovate, to 10 in. long, areoles about 1½ in. apart; spines usually 1-3, to 1½ in. long, stout. Ariz.

flocobsa (O. sendis of some authors). One of the Tephrocacti with short oblong or globular joints: in clumps or low mounds sometimes 6 ft. diam. with very many erect branches hidden in a mass of long white hairs; spines 1–3 from an areole. fls. yellow, about 1 in. long. Andes, Peru, Bolivia.

flórida: listed name.

frágilis (O. brachyarthra). 1: small and mostly not conspicuous but sometimes making mounds a few in. high; joints fragile, from nearly globular to flattened; spines 5-7. fls. pale yellow, about 2 in. across. Wis. to B. C. and south to Tex. and Ariz.

frustulenta: O. Drummondii.

frutéscens: O. leptocaulis.

fülgida (O mamillata), 2; to 10 ft. with woody trunk 8 in. diam.; joints to 8 in. long and 2 in. diam. strongly tuberculate and breaking off easily; spines 2-12 and 1½ in. long and yellowish, glochida light yellow: fls. pink, 1 in. across. Ariz., Mex.

fulvispìna: O. leucotricha.

fuscoátra. 1: prostrate; joints orbicular or obovate, to 3 in. long; spines 1-3, 1 in. long, yellow or dark brown, glochids numerous: fls yellow, 3 in. across. E. Tex.

glomeràta: seemingly a confused name; plants so listed may be O. diademata or O. Turpinii.

Gosseliniana. 1: 3 ft. or more, the old trunk with long spines; joints to 8 m. long and broad, red or purplish; spines 1-2 or lacking, to 4 m. long, brown, glochids numerous. Mex.

grácilis: O. leptocaulis.

Gråhamii. 2: much branched, forming low mounds; joints club-shaped, to 2 in. long, with oblong tubercles; spines 8-15, to 2½ in long, glochids numerous: fls. yellow, 2 in. across. Tex., New Mex., Mex.

grandiflora. 1: low with ascending branches; joints to 6 in. long; spines usually none; fis. yellow with red center, to 5 in. across. E. Tex.

Greenei: O. tortispina.

haitiénsis: O. moniliformis.

Hámiltoniæ: listed name.

Hanburyana. 1: shrub-like, to 7 ft. high; joints narrowly ohlong, to 12 in. long, bright green; spines usually 3-7, to 1¼ in. long, slightly flattened and twisted, yellow-brown: fls. yellow. Not known from wild.

Hildemannii. Similar to O. sulphurea in habit and fls., differing in smaller joints, longer glossy deep yellow spines and glossy fr. S. Amer., probably Bolivia.

hórrida: O. Dillenii.

humifùsa: O. compressa.

hùmilis: O. Tuna.

humistrata. 1: prostrate or ascending, forming clumps to 1 ft. high and 3 ft. across; joints obovate, to 6 in. long and 21/2 in. diam., glaucous, areoles without spin numerous brown glochids: fls. purplish. Calif.

hyps 6phila. 2: cespitose, to 4 in. high; joints globose or cylindric, to 1 in. long, spines 3-5 and weak. Argentina.

hyptiacantha. 1: to 3 ft., much branched; joints oblong or obovate, to 1 ft. long; young spines 1 and with 2-3 white

hairs, spines on older plants 4-6 and 3/2 in, long: fis. red. Mex

hystricina. 1: joints ovate or orbicular, to 8 in. long; spines numerous and to 4 in. long, glochids yellow: fis. yellow, 2 in. long. New Mex., Ariz., Nev.

ignéscens. Of the Tephrocactus section; forming clumps to 8 in. high; joints to 4 in. long and very fleshy; spines 6-15, 2 in. long, yellow: fls. deep red. Peru, Chile.

imbricata (O. arborescens). 2: tree-like, to 10 ft. and more; ultimate joints about 1 in. diam. and strongly tubercled, spines 8-30 and sheathed: fls. purple, 2 in. more or less long. Colo., Tex., New Mex., Mex.

inamona (O. quipa). 1: often prostrate, forming clumps to 4 ft. across; joints orbicular or oblong, to 6 in. long and 1 in. thick, bluish-green; spines usually none, glochids numerous and yellowish-brown: fls. brick-red. Brazil.

inérmis: O. structa.

invícta. 2: forming clumps to 1½ ft. high and 6 ft. across; joints obovoid or club-shaped, to 4 m. long and strongly tuberculate; radial spines 6-10; centrals 10-12 and flattened: fls. yellow, 2 in. across. Lower Calif.

iocoguilla: listed name.

keyénsis. 1: erect, clump-forming and freely branched; joints broadly oval to spatulate, to 12 in. long, bright green; spines 4-13, very short and stout, usually concealed by the bristles: fls. salmon-colored, to 1½ in. across. Fla. Keys.

Kleiniæ. 2: to 8 ft, glaucous, areoles with white wool and bristle-like spines; spines usually 1 and covered with yellow sheaths: fis. purplish, 1 in. long. Tex., Mex.

Labouretiana: O. maxima.

lèvis. 1: low, bush-like, to 5 ft. or more; joints oblong-obovate, to 12 in. long; spines 1-3, often absent: fls. pale yellow, tinged red, to 3 in. across. Ariz.

lagunæ: thought to be inseparable from O. robusta.

lanígera: O. orbiculata.

lasiacántha. 1: somewhat tree-like with definite trunk; joints obovate-oblong, to 12 in long; spines about 1-3, to 13/4 in. long; fls. yellow to dark orange, about 3 in. across. Mex

leptocaulis (O. frutescens. O. gracells). 2: commonly bush-like but sometimes with trunk 3 m. diam. and several thing, branches cylindric and slender; spines very slender and mostly solitary at young areoles but 2 or 3 on older ones; fis. greenish or yellowish, about 34 in. long. S. W. U. S., Mex.

leucótricha (O. fulvispina). 1: to 12 or 15 ft., covered with long white bristles; joints oblong to orbicular, pubescent: fls yellow, about 2 in. long. Mex.

Lindheimeri (O. cacanapa). 1: commonly erect, to 12 ft. sometimes only spreading; joints orbicular to obovate and somewhat glaucous; spines mostly 1-6: fis. yellow to dark red, to 3½ in. across. La., Tex., Mex.

linguifórmis. 1: bushy, 3-4 ft; joints oblong to lanceolate, to 20 in. or more; spines yellow: fls. yellow, about 3 in. across. S. Tex.

littoralis. 1: spreading; joints orbicular or oblong and to 6 in. long, areoles with brown wool; spines numerous and yellow; fls. yellow, to 5 in. across. Coast, S. Calif.

Llóydii. 2: to 10 ft. high and across, much branched; joints cylindrical and 34 in. diam, tubercles prominent; spines few, 14 in long: fis. dull purple, 1 in. long. Mex.

longispina: an uncertain species. S. Amer.

Loòmisii. 1: to 1½ ft. high; joints obovate-orbicular, to 6 in. long, areoles 1 in. apart; spines 1-4, to 1½ in. long; fls. yellow fading to salmon-pink. Ariz.

lùbrica. 1: low spreading plant; joints obovate to o bicular, about 7 in. long, glossy green; spines often absent, but sometimes abundant and to 1 in. long: fls. yellow, to 1 in. long. Mex.

lùrida: name of no botanical standing.

Macateèi. 1: prostrate; joints orbicular or obovate, to $2\frac{1}{2}$ in. long; spines 1-3, to 1 in. long; fls. yellow with red center, to 3 in. across. Tex.

Macdougaliana. 1: tree-like, to 25 ft. tall; joints oblong, to 2 ft. long, soft-pubescent; spines about 4, one to 1% in. long, yellow to white, flattish. Mex.

Máckensenii. 1: low, spreading, with some branches erect; joints ovate-orbicular, to 8 in. long, pale to dark green with age; upper areoles with 1-4 white or brown spines: fls. yellow, to 3 in. long: fr. rose-purple. Tex.

macrócalyx. 1: to 3 ft. high and broad, much branched; joints obovate, to 8 in. long and 3 in. diam. velvety-pubescent, areoles with yellowish wool and reddish-brown glochids, spineless: fls. yellow, green outside. Probably Mex.

macrocentra. 1: more or less bushy, to 3 ft.; joints mostly orbicular to oblong, to 8 in. long; commonly with 1 or 2 spines at upper areoles but sometimes spineless: fis. yellow drying red, 3 in. across. W. Tex. to Ariz., Mex.

macrorhiza. 1: commonly nearly prostrate and making a clump; joints orbicular to obovate, to 6 in. long; spines 1-4 and to 1 in. long or wanting; fis. yellow with reddish center, about 3 in. across. Mo. and Kans. to Tex.—Has tuber-like roots.

mamillata: O. fulgida.

margaritha (O. pucnantha var.). 1: much branched bush-like form to 4 ft. tall; joints oblong to orbicular, to 10 in. long, rather thick; spines about 4-9, to ½ in. long, needle-like, reddish-brown: fls. pale yellow, becoming deep maroon with age. Lower Calif.

máxima (O. decumana. O. Labouretiana). 1: plants large and much branched; joints long-spatulate, to 1 ft. or more; spines 1 or 2 and white or wanting: fls. orange-red, 3 in. across. Known only in cult.

megacántha. 1: to 15 ft. or more, often with trunk; joints obovate to oblong, to 2 ft. or more long; spines 1-5 and white: fls. yellow to orange, about 3 in. across. Mex.; escaped in some regions.

megacárpa: O. Covillei.

mesacántha: O. compressa.

micrócalvx: listed name.

micródasys. 1: crecping to nearly erect, to 2 ft.; joints oblong to orbicular, to 6 in. long, spineless: fls. yellow or tinged red, to 2 in. long. N. Mex.

Milispaughii. 1: trunk cylindrical, to 2 ft. high and 3 in. diam., branches ascending from top; joints narrowly oblong to lanceolate, to 18 in. long; spines on trunk dense, to 6 in. long, purple to gray, those on branches and joints shorter: fls. crimson-lake, to ½ in. across: fr. spiny. Bahama Isla

mínima: probably O. curassavica.

missouriénsis: O. polyacantha.

Mdelleri. 1: somewhat spreading; joints erect, maceneri. 1: somewnat spreading; joints erect, somewhat club-shaped, to 3 in. long; spines setose or needle-like, about ½ in. long; fls. salmon-colored. Mex.

mojavénsis. 1: prostrate; joints nearly orbicular; spines 2-6 and to 2½ in. long, angular and compressed, bristles yellow. Mojave Desert, Calif.

molésta. 2; to 7 ft. tall; joints cylindric, tapering basally. molesta. 2: to 1 it. tair; joints cylindric, tapering basally, to 16 in. long and to 2 in. dam. at top, tubercles low, somewhat clongate, to 1½ in. long; spines 6-10, unequal, to 2 in. long, pale yellow, sheaths papery, loose: fls. purple, 2 in. long. Lower Calif.

monacántha. 1: erect shrub or tree-like, to 7 ft. with thick st.; joints ovate becoming elongated, to 1 ft. long; areoles usually with single brown spine to 1½ in. long; ffs. yellow, to 3½ in. across fr. red, pyriform, spineless, to 3 in. long. S. Brazil to Argentina.

moniliformis (O. haitiensis), 1: trunk to 12 ft, high and armed with spines to 5 in, long and with yellowish-white armed with spines to 5 in long and with yellowish-white wool at their bases, branching at top; joints to 1 ft. long 5 in. wide and ½ in. thick, arcoles of older joints with 5-8 yellowish spines and brown glochids; fls. yellow or orange, 1 in. across. W. Indies.

multifldra: O. Tuna.

nàna: O. compressa.

neoarbúscula: O. arbuscula.

nigricans: O. elatior

nigrisans. O. etath.

nigrispina. Of the Tephrocactus group: much branched shrub to 8 in.; joints cylindrical, to 1½ in. long and ¾ in. diam., bearing spirally arranged tubercles, areoles with wool and glochids; spines 3-5, 1 in. long, purplish-black; fis. purple, 1 in. long. Argentina, Bolivia.

occidentalis. 1; erect or ascending, to 4 ft. tall, forming dense ceputose clumps; joints oblong-obovate, to 12 in. long; spines 2-7, to 2 in. long, unequal and occasionally absent: fls. yellow: fr. purple. S. Calif.

Opúntia: O. compressa,

orbiculata (O. crinifera. O. lanigera. O. senilis of some authors). 1. to 3 ft. or so, often broader than high; joints orbicular to obovate or spatulate, to 6 in. long; spines several and yellow: fls. yellow. N. Mex.

Orpetii: listed name.

ovata. 1: cespitose, low; joints ovate to occasionally club-shaped, to 1½ in. long, rarely to 3 in., yellowish-green to purplish; spines 5-9, about ½ in. long, brown becoming white with age. Argentina, Chile.

pállida. 2: sts. to 3 ft. high and 2 in. diam., branching; spines 20 or more and to 1½ in. long with white papery sheaths fls. pale rose. Mex.

papyracántha: a confused name; plants so listed may be O. diademata or O. platyacantha.

Parishii. 2: sts. creeping, forming dense clusters, very spiny; joints club-shaped; radial spines numerous; central spines 4 and to 1½ in. long, glochids numerous. S. Calif., Nev.

Párryi. 2: shrub-like to 18 in. tall; joints cylindrical, to

12 in. long and ¾ in. diam; tuberculate; spines about 10, to 1¼ in. long, unequal, dark brown: fis. yellow. S. Calif.

Péntlandii. Tephrocactus section: much branched, forming clusters to 3 ft. across; joints obovoid, to 4 in. long and tubercled, arcoles with wool and yellow glochids; spines when present 2-10 and bright yellow; fls. lemonyellow to deep red, 1 in. long. Peru, Bolivia, Argentina.

pés-córvii; O. Drummondii.

pheacantha (O. camanchica. O. Blakeana). 1; commonly prostrate, some of the branches ascending; joints mostly longer than broad, 4-6 in. long; spines 1-4; fls. yellow, 2 in. across. Tex. to Anz., N. Mex.

pilifera. 1: to 15 ft. with woody trunk and broad top; joints oblong or orbicular and to 1 ft. long; spines 2-9 and white, areoles with white hairs: fls. red. Mex.

piscata: probably O. discata.

Pittièri. 1: trec-like, to 20 ft. tall, trunk terete, spiny; joints narrowly oblong, to 20 in. long, areoles about 1½ in. apart; spines 3-6, to 1 in. long, unequal, white. fls. dark orange becoming scarlet. Colombia.

platyacántha. Tephrocactus: plant low, prostrate; joints ovate, to 2½ in. long; spines 5-7, whitish, to 1¾ in. long: fis. yellow, to 1¼ in. across. S. Chile to Patagonia,

Pollardii. 1: prostrate, resembling O. compressa in habit: joints oblong, to 6 in. long and ¾ in. thick; spines usually solitary when present, to 1¾ in. long, stiff and sharp: fls. yellow, to 3½ in. across. N. C. to N. Fla., Ala. and Miss.

polyacántha (O. missouriensis). 1: low and spreading and commonly making small clumps; joints orbicular and usually less than 4 in. across; spines 9 or fewer: fis. lemonyellow, tinged red outside, to 2 in. long. N. D. to Alta., Wash., Tex. and Ariz. Var. borealis does not differ from the type.

polyántha: O. Tuna.

polycárpa. 1: erect, much branched, to 3 ft. tall, thicket-forming; joints somewhat elliptic, to 15 in. long; spines 1-3, often absent, to 1½ in. long: fls. bright yellow, to 3 in. across. Fla.

Pôttsii (0. filipendula). 1: to 1 ft. high, spreading; joints broad-obovate and to 5 m. long; spines 1-2, to 1½ m. long and white or purplsh, glochids yellow: fls. deep purple, 3 m. across. Tex., New Mex., Mex.

prolifer. 2: somewhat tree-like, to 8 ft. tall, trunk and older branches woody, cylindrical; upper joints to 5 in long, therefed, fragile; spines 6-12, to ½ in. long, brown: fls. dark red, small. S. Calif.

pubéscens. 1: to 16 in , much branched; joints nearly cylindrical and to 3 in. long; spines numerous and short: fls. lemon-yellow. Mex. to Guatemala.

pùmila. 1: low, thicket-forming; joints terete or somewhat flattened, to 8 in. long, soft-pubescent, tubercled, fragile to touch; spines 2-8, to 1½ in. long, unequal: fls. yellow, tinged red, about ½ in. long. Cent. and S. Mex.

pycnántha. 1: low, somewhat respitose, to 10 in. tall; joints oblong to orbicular, to 8 in. long, areoles close together; spines 8-12, to 1½ in. long, yellow to brown: fis. bright yellow. Lower Calif.

Quimilo. 1: to 12 ft high, much branched; joints elliptic or obovate, to 1½ ft. long and 1 in. broad and thick; spines usually 1, to 6 in. long and twisted: fis. red, 3 in. across. Argentina.

quipa: O. inamæna.

quiscalòra: listed name.

Rafinésquei: O. compressa; see O. tortispina.

ramosissima. 2: shrubby, to 6 ft. high, branches 3 in. long and covered with low diamond-shaped tubercles, areoles with wool and glochids; spines usually 1 or none and covered with yellow papery sheaths: fils, greenish-yellow tinged red, 1½ in. long. Nev., Ariz, Cahf., Mex.

rastrèra. 1: creeping; joints circular or obovate and to 8 in. diam.; spines several, to $1\frac{1}{2}$ in. long, white, glochids yellow: fls. yellow. Mex.

rèpens. 1: forming dense clusters to 1½ ft. high and 12 ft. across; joints oblong to linear, to 6 in. long and 1½ in. diam, areoles with brown wool and white hairs and yellow glochids; spines numerous and to 1½ in. long: fls. yellow, 1½ in. across. W. Indies.

retrorsa. 1: sts. prostrate and creeping; joints linear-lanceolate; spines 1-3 and reflexed: fls. yellowish, 2 in. across. Argentina.

rhodántha (O. xanthostemma). 1: joints obovate to oblong and to 5 in. long; spines 3-4, to 1 in. long and 2-3 shorter ones, glochids brown: fls. red or pink, 3 in. across. Neb., Colo., Utah.

robústa (O camuessa). 1: often erect to 15 ft., mostly much branched; joints orbicular to oblong, to 10 in. long and glaucous; spines in the wild 8-12: fis. yellow, 2 in. across. Cent. Mex. Var. måjor is listed.

rosàrica: listed name.

rotundifòlia: Pereskiopsis rotundifolia.

rubéscens (O. catacantha). 1: tree-like to about 30 ft., trunk sometimes 6 in. diam.; joints oblong to oblong-obovate, to 10 in. long; spines several to many or sometimes wanting: fls. yellow, orange or red, about ¾ in. across. W. Indies.

růfida (O. microdasys rufida). 1: to 5 ft., with definite trunk; joints nearly orbicular, to 10 in. diam., velvetytomentose, areoles with many brown glochids: fls. yellow or orange, to 2 in. long. Tex., Mex.

Salmiana (O. albifora). 2: bushy, to 6 ft., branches terete and to about ½ in diam, and not tubercled; spines usually several but sometimes wanting: fis, pale yellow to white, I in more or less across. S. Brazil to Argentina.

santamaria: see Grusonia santamaria.

santa-rita. 1: to $4\frac{1}{2}$ ft, with short trunk; joints orbicular and bluish-green, are oles with numerous brown glochids and sometimes brown spines: fls. deep yellow, 3 in across.

Scheèri. 1: to about 3 ft., lower branches sprawling; joints oblong to orbicular, to 1 ft. longest way; spines 10-12 and yellow: fls. pale yellow becoming salmon, large. Mex.

Schickendántzii. 1: much branched and shrub-like, to 7 ft. tall; joints cylindric or flattened, warty, gray-green; spines 1-2, to ¾ in. long, awl-shaped: fls. yellow, to nearly 2 in. across: fr. green. N. Argentina.

Schöttii. 2: prostrate, rooting from areoles, forming clusters to 10 ft. across; joints club-shaped, to 3 in. long and 34 in. diam. and strongly tubercled; spines several and to 2½ in. long, wool and glochids white turning brown: fls. yellow, 1½ in. long. Tex., Mex.

Schweriniana. Similar to O. polyacantha, differing in joints to 2 m. long, glochids red not yellow, and spines weak not rigid. Colo.

senilis: O. floccosa, O. orbiculata.

serpentina. 2: sts. slender to 1 in. diam. and sometimes prostrate, strongly tubercled; spines 7-20 and covered with yellowish-brown papery sheaths: fls. greenish-yellow, 13/4 in. across S. Calif. and Lower Calif.

serràna is listed.

silvéstris: listed name.

Sæderstromiana. 1: usually erect, to 4 ft. tall; joints obovate, to 15 in. long, bright green to gray-green; spines 2-10, about 1½ in. long, unequal, reddish to gray, very conspicuous: fls. yellow to orange and brick-red, to 2½ in. long. Ecuador.

Schrénsii. 1: prostrate, in clusters to 3 in. across; joints orbicular, to 2½ in. diam. and very spiny; spines several and to 2 in. long; fls. pale yellow, 1 in. long. Peru, Bolivia, Argentina

spathulata: Pereskiopsis spathulata.

sphærica. Of the Tephrocactus section: low; joints globular and to 1 ft diam, areoles with brown wool; spines few to many and to 1½ in. long: fls. deep orange, 1½ in. long. Peru, Chile. Var. violaciflora is said to have violet fls.

spinosior. 2: to 12 ft., tree-like; joints to 1 ft. long and 1 in. diam. and strongly tubercled; spines 6-12 or more and ½ in long, glochids yellowish-white: fls. purple, pink, yellow or white, 2 in. across. Ariz., New Mex., Mex.

spinosíssima. 1: to 15 ft. with spiny trunk 3 in. diam.; joints oblong; spines 1-3, to 3 in. long, yellowish or whitish, glochids brown: fls. yellow turning red. Jamaica.

spinulifera. 1: tall and much branched; joints orbicular or oblong or obovate, to 1 ft. long, with white bristle-like spines or none: fis. purple. Mex.

Stánlyi (O. Emoryi). 2: sts. commonly less than 1 ft. high and creeping, much branched and making broad masses; joints 4-6 in. long and strongly tubercled; spines many and stout: fis. yellow, about 2 in. across. New Mex., Ariz., Mex.

stenárthra. 1: shrubby, creeping; joints oblong to lanceolate and yellowish-green; spines 1-3 or none: fis. yellow. Paraguay.

stenopétala. 1: thicket-forming bush-like plant; joints obovate to orbicular, to 8 in. long, purplish- to gray-green, areoles to 1½ in. apart; spines 2-4, to 2 in. long, reddishbrown to black: fls. orange-red, inner segms. very narrow. Cent. Mex.

streptacantha. 1: to 15 ft. with trunk to 1½ ft. diam, and many branches; joints obovate or orbicular and to 1 ft. long; spines numerous and white: fls. yellow or orange, to 3½ in. across. Mex.

stricta (O. inermis). 1: bushy and spreading and making large clumps 2½ ft. high; joints obovate to oblong, 3-6 in. long, spineless or sometimes 1 or 2 or more spines to a joint: fls. yellow, about 2½ in. long. Cuba, Fla. to S. Tex.

strigil. 1: ascending to 2 ft. tall; joints orbicular to obovate, to 5 in. long, areoles about ½ in. apart; spines 5-8, to 1 in. long, reddish. Tex.

subterranea. Of the Tephrocactus section: nearly buried in sand, with thick root; joints cylindrical and to 1½ m. long; spines 1-7, short and recurved: fis. brownish. Argentina, Bolivia.

subulata (Pereskia and Pereskiopsus subulata). 2: to 12 fix, sometimes with a single trunk to 4 in. diam., branches many and clustered, tubercles large and depressed; spines usually few and yellow but sometimes none: fis. orange or greenish-yellow, reddish outside. Probably Argentina.

sulphurea. 1: forming clumps to 8 ft. across and 1 ft. high; joints oblong to obovate, about 10 in. long, green or purplish-green, tubercled; spines 2-8, to ½ in. long, curved, twisted or straight; ffs. yellow, to 1½ in. across. Argentina, Chile, and possibly Bolivia.

tapôna. 1: clump-forming, to 2 ft. high; joints orbicular to oboyate, to 10 in. across, pale green; spines 2-4, one to nearly 3 in. long, yellow: fr. purple outside, red within, spineless. Lower Calif.

tardospina. 1: semi-prostrate, spreading, to about 1½ ft. high; joints orbicular to obovate, to 10 in. long; spines often present at top only, usually 1-3, to 2 in. long, brown: fls. yellow: fr. red. E. Tex.

tenuiflora. 1: to 3 ft. or decumbent and much branched; joints spatulate, to 16 in. long; spines 3-6 and 1 in. long; fts. salmor-colored. 1 in. across. Fls. Keys.

tères: O. vestita.

Tesajo. 2: to 1 ft. high and broad; joints to 2 in. long; spense 2 and small, central spine 1 and 2 in. long; fls. yellow, 1/2 in. long. Lower Calif.

tetracántha. 2: much branched and bush-like, to 5 ft. tall; joints cylindrical, to 12 in. long and ½ in. diam., purplish-green, tubercles becoming less prominent with age; spines 3-6, to 1½ in. long: fis. greenish-purple, to ¾ in.

Thurberi. 2: bush-like, to 14 it. tall; joints elongated, to 10 in. long and ½ in. diam.; spines 3-5, to ½ in. long, brown: fls. yellowish-brown, to 1½ in. across. W. Mex.

tomentòsa. 1; to 20 ft. with smooth trunk to 1 ft. diam.; joints oblong to narrow-obovate, to 8 in. long, soft-pubescent; spines none or very few: fls. orange, about 2 in. long. Cent. Mex.; escaped elsewhere.

tortispina (O. Greenes). 1: prostrate and creeping, with ascending orbicular to obovate joints 6-8 in. long; spines about 6-8 and white, yellow or brown: fls. sulfur-yellow, to about 3 in. across. Wis. and S. D. to Tex. and New Mex.—Some of the plants known as O. Rafinesques may belong here, but the spines in O. tortispina are 2 or more to each areole rather than 1 or 2 or none.

Trâceyi. 1: low, much branched, to 8 in. high; joints oblong, to 3½ in. long and 1 in. wide, young ones nearly terete; spines 1-4, to 1½ in. long, needle-like, gray with dark tips: fls. yellow, to 1¾ in. across. Miss.

Trelèasei. 1: spreading, to 1 ft. high; joints often erect, obovate, to 6 in. long, pale blue-green; spines present or absent, glochids dull yellow: fis. rose-pink. S. Calif.

triacántha. 1: semi-procumbent or clambering or even erect but low; joints thick and oblong, to 3 m long; spines mostly 3: fls. brownish-yellow to cream-color, 2 m. long. W. Indies.

trichóphora. 1: forming clumps to 3 ft. across; joints orbicular or obovate and to 4 in. diam.; spines numerous, to 1½ in. long: fls. yellow. New Mex., Tex., Okla.

Tuna (O. humilis. O. multiflora. O. polyantha). 1: to 3 ft. or less; joints to 6 in. long but mostly smaller, obovate to oblong; spines 2-6, light yellow and slightly spreading: fts. yellow and slightly tinged red, about 2 in. across: fr. red, 1 in. or more long. Jamaica. Var. amarfila is listed.—See also O. Dillenii. Tuna is the Mexican name for opuntias.

tunicata. 2: to 2 ft. or forming low clumps; joints globular or oblong, to 6 in. long and strongly tuberculate; spines 6-10, to 2 in. long and covered with white papery sheaths: fls. yellow, 1 in. long. Mex. to Chile.

Túrpinii. Tephrocactus: plant low and spreading; joints spherical to ovoid, smooth, to 1½ in. long; spines 1-3, flat and papery, to 1½ in. long; fls. white or cream-colored, to 1½ in. across. Argentina.

ursina: O. erinacea.

Våseyi. 1: spreading, branches low, a few erect; joints ovate, to 5 in. long, thick, pale glaucous green; spines 1-3, about ½ in. long, brownish to gray, tipped yellow: fis. reddish-salmon-colored. S. Calif.

velùtina. 1: to 12 ft.; joints oblong or pear-shaped, to 8 in. long and 6 in. across, pubescent; spines 2-6, to 1½ in. long, bristles yellow or brownish: fis. yellow, 2 in. across.

Verschafféltii. 2: much branched, dense clumps; joints

globose to short-cylindric, to 10 in. long and % in. diam., tubercled; spines absent, glochids white: fis. orange to blood-red. Bolivia.

versicolor. 2: to 12 ft., with woody trunk and open top to 15 ft. across; joints to 8 in. long and 1 in. diam. and variously colored; spines 5–11 and to 1 in. long, glochids reddish-brown: fls. yellow, greenish, reddish or brown, to 2 in. across. Ariz., Mex.

vesitia (0. teres). 2: clump-forming, with weak much branched st; joints oblong to cylindric, to 8 in. long and $\frac{1}{2}$ in diam., fragile; spines about 6, to 1 in. long, brownish: fis. dark red, about $\frac{3}{2}$ in. across. Bolvia.

vivipara. 2: to 10 ft., much branched; joints to ¾ in. long and ½ in. diam., areoles with yellow wool; spines 1-4 and ¾ in. long: fls. purplish. Ariz.

vulgaris. 1: to 20 ft., often with cylindric trunk 6 in. diam.; joints ovate to oblong, to 1 ft long; spines 1 or 2 or sometimes 10 or more on the trunk: fls. yellow or reddish, about 3 in. broad. Brazil, Paraguay, Uruguay, Argentina. Var. variegāta is listed.—See O. compressa.

Wéberi. Of the Tephrocactus section: forming clumps to 7 in. high and 1 ft. across; joints cylindric, to 2½ in. long and ½ in. diam., strongly tubercled and spiny; spines 5-7, to 2 in. long; fls. yellow. Argentina.

Wentiana. 1: erect, branched, to 7 ft. tall; joints obovate to elliptic, to 10 in. long and ½ in. thick, pale glaucous green; spines 3-5, pale yellow to white: fls. pale yellow; fr. red, small. Venezuela, Curacao.

Whipplei. 2: much branched and low; joints usually 6 in. long or less and ½ in. duam.; spines about 12, to ¾ in. long, glochids pale yellow: fls. yellow, to ¾ in. across. N. New Mex, Ariz., S. Colo. and S. Utah.

Whitneyi. 1: prostrate; joints obovate to orbicular, to 6 in. long, nearly as wide and about 1½ in. thick, reddish; spines absent, glochids very short: fis. red, to 3 in. across, margins of segms. wavy. Calif. Var. albiflora has green joints to 3 in. wide and white fis.

Winteriana. 1: similar to O. Lindheimeri from which it differs in its dark brown spines and by some authors the two are not considered distinct.

Wodtonii: O. Engelmannii.

xanthóstemma: O. rhodantha.

zebrina. 1: to 3 ft., much branched; joints oval or obovate and to 8 in. long; spines 1-4 and red-brown finely banded: fls. yellow, 3 in. across. S. Fla. and Keys.

ORACH: Atriplex hortensis.

ORANGE: Citrus; see Citrus Fruits (page 182). African Cherry-: Cutropses. Mexican-: Chorsya ternata. Mock-: Philadelphus, Prunus carolunana. Natal-: Strychnos spinosa. Osage-: Maclura pomifera. -Root: Hydrastis candensis. Trifoliate-: Poncirus trifoliata. Wild-: Prunus caroluniana.

ORBEXILUM: Psoralea Onobrychis.

ORCHID: see Orchids Butterfly: Epidendrum venosum, Onculrum Papilio. Crane-fly: Tipularia discolor. Grass-Pink: Calopogon pulchellus. Spider: Renanthera Maingayi. Swan: Cycnoches. -Tree: Bauhina variegata. Windmill: Bulbophyllum refractum.

ORCHIDS, ORCHIDACEÆ. ORCHID FAMILY. An extensive family of terrestrial and epiphytic monocotyledonous herbs of more than 500 widely distributed genera, of various habit but mostly with bulbous or thickened sts. often with thickened internodes or pseudobulbs: the group is characterized by the very irregular fls. having 3 sepals, 3 petals, of which the 2 lateral ones are alike and the third modified into a lip which is often spurred and saccate, the stamens and pistil united to form a column or gynandrium on which the pollen is borne in masses or pollinia, inferior ovary, and capsular frs. containing many minute seeds.

Many genera are grown by florists for cutflowers, by fanciers, and some of the terrestrial kinds in gardens; there are many artificial hybrids in the greenhouse, often between genera. Any number of genera are to be found in the special collections of fanciers, but those most generally cultivated or known within the scope of this book are Acampe, Acineta, Ada, Aërangis, Aérides, Aëridovanda, Angræcum, Anguloa, Anota, Ansellia, Aplectrum, Arachnis, Arethusa,

Arpophyllum, Ascocentrum, Ascotainia, sia, Batemannia, Bifrenaria, Bletia. Bletilla. Brassavola, Brassia, Brassocattleya, Brassocattlelia, Brassolelia, Brassolelio cattleya. Broughtonia, Bulbophyllum, Calanthe, Calopogon, Calypso, Camarotis, Catasetum, Cattleya, Cephalanthera, Chysis, Cleistes, Cochlioda, Cœlia, Cœlogyne, Comparettia, Corallorrhiza, Coryanthes, Cycnoches, Cymbidium, Cyper-orchis, Cypripedium, Cyrtopodium, Dendro-bium, Dendrochilum, Diacrium, Disa, Doritis, Dossinia, Epicattleya, Epidendrum, Epipactis, Epiphronitis, Eria, Eriopsis, Eulophia, Galeandra, Galeola, Gastrochilus, Gomesa, Gongora, Goodyera, Grammatophyllum, Habenaria, Hæmaria, Hartwegia, Houlletia, Huntleya, Ionopsis, Isotria, Lælia, Læliocattleya, Leptotes, Liparis, Lissochilus, Listera, Lockhartia, Ly-caste, Macradenia, Malaxis, Masdevallia, Maxil-laria, Miltonia, Mormodes, Mystacidium, Neobenthamia, Octomeria, Odontioda. Odontoglossum, Odontonia, Oncidioda, Oncidium, Ophrys, Orchis, Ornithidium, Ornithochilus, Paphiopedilum, Peristeria, Pescatorea, Phaius, Phalænopsis, Pholidota, Phragmipedium, Physosiphon, Pleione, Pleurothallis, Pogonia, Polystachya, Promenæa, Renanthera, Restrepia, Rhyncho-stylis, Rodriguezia, Saccolabium, Sarcanthus, Sarcochilus, Sarcoglottis, Schomburgkia, Scuticaria, Selenipedium, Sigmatostalix, Sobralia, Sophrolæliocattleya, Sophronitis, Spathoglottis, Spiranthes, Stanhopea, Stenoglottis, Thrix-spermum, Thunia, Tipularia, Trichopilia, Vanda, Vandopsis, Vanilla, Warseewiczella, Xylobium, Zygocolax, Zygopetalum. The literature of Zygocolax, Zygopetalum. The literature of orchids is extensive and the intending grower should be in touch with it.

The native terrestrial orchids of the United States and Canada are many. They usually inhabit cool bogs and some of them are represented on sandy plains and in moist grass-lands. Many of them are not showy, as in the genera Aplectrum, Epipactis, Habenaria, Liparis, Listera, Malaxis, Spiranthes; others have showy or very prominent flowers, as in Arethusa, Calopogon, Calypso, Cypripedium, Orchis, Pogonia. Any of these orchids may be transferred to grounds and some of them are offered by dealers in native plants. The conditions under which they grow naturally are diverse; one must know these conditions and endeavor to reproduce them in order to make a success of the cultivation. The little native orchids add a particularly interesting touch to rock-gardens, bogs, and to wild places under control of the gardener.

The commercial orchids of house culture are from regions within the tropics, although many of them come from high elevations. Most of them are forest or shade-loving plants. These orchids are principally in the genera Brassavola, Calanthe, Cattleya, Cœlogyne, Cymbidium, Dendrobium, Lælia, Lycaste, Miltonia, Odontoglossum, Oncidium, Paphiopedilum, Phalænopsis, Phragmipedium, Vanda. One undertaking the culture of these and other exotic orchids should know whether they are epiphytes, and the approximate elevations and conditions as to moisture, shade and sunlight under which they grow in nature. The culture of the main orchid groups is now so well learned that many of the species are grown for the cut-flower trade.

The culture of orchids requires close observation and adaptability on the part of the grower, and he should not start out independently until he has had good experience under a competent man. The niceties of orchid growing are the result of much devotion to the subject. A difference of two or three degrees in temperature, or a slight variation in watering or shading, may make the distinction between success and failure. The resting period of the different kinds must be carefully understood and ad-justed. Nearness to the glass or remoteness from it are important. If one is growing the usual run of common and commercial orchids. one kind of greenhouse may be sufficient, but if a wide assortment of fanciers' species is to be grown, there should be houses of different temperature and moisture conditions. For the warmest species, the winter temperature should not go below 65° to 70° at night; in such conditions one may raise the more tropical Cypripediums (Paphiopedilum, Phragmipedium), Angræcums, Aërides, Calanthes, Dendrobiums, Phalænopsis, Vanda. A cooler range, with minimum night winter temperature of 60-65° should grow the more tropical Epidendrums and Lælias, the Cattleyas, some of the Miltonias, Stanhopeas. A range running a few degrees lower may be employed for the cooler or Mexican Lælias, many Maxillarias, Lycastes, Oncidiums, some of the Cœlogynes (as *C. cristata*), Phaius. The Odontoglossums usually require special treatment to reduce the sun's heat in summer; they are plants of high altitudes; houses should be moist, well ventilated, and in hot weather the roof may be sprayed outside with cold water; shading in summer is also necessary to reduce the temperature.

The two cultural groups of exotic orchids are the terrestrials and the epiphytes, although these divisions are not absolute; some growers make one cultural group to comprise the deciduous kinds and another the evergreen. As classes, the terrestrials and epiphytes do not differ in temperature and moisture requirements but the terrestrial kinds are grown in pots of soil and the true epiphytic kinds mostly on blocks or in baskets or cribs. In general, terrestrial orchids thrive in a soil comprised of about one-half fibrous loam to which is added approximately equal parts of leaf-mold and sharp sand. Some growers make a mixture of one-third good chopped sod with part of the fine silty soil removed, one-third live chopped sphagnum, one-third leaf-mold; ground bone may be added for vigorous plants. The purpose is to provide a medium containing sufficient plant-food at the same time that it is thoroughly well drained and aerated and yet retains the necessary moisture. The observing grower soon develops mixtures to suit his needs.

The epiphytic orchids require much fibrous or peaty material in which to grow. This material is usually obtained from the roots of wild ferns, particularly of the osmundas, which are chopped and rubbed on a sieve to remove the fine earth. This osmundine or orchid peat is now a standard base for potting mixture as it does not soon decay, permits abundant ventilation about the roots, and supplies the necessary physical properties. With the osmundine or similar material are combined chopped sod and leaf-mold for the semi-terrestrial

orchids, but it may be used alone for the true epiphytes. Live sphagnum is sometimes added to it.

Propagation of orchids has undergone a radical revolution in recent years consequent on the federal restrictions of the importing of fresh plants from the tropies and the closer study of germination requirements. The old methods still are practiced of propagating by separation or offsets as in Dendrobium, by division and by cuttings. Just before active growth begins, well established plants of the Cypripediums and some others may be divided. Cuttings may be made of the stems of species that do not produce pseudobulbs; on some orchids, as Vandas, aerial roots develop along the continuing stem and the cutting may be made below this point; other shoots are likely to arise near the severed area and these may also be employed for cuttings.

A special kind of cutting or division obtains in the pseudobulbous species, as in Cattleyas, Cœlogynes, Odontoglossums and some of the Dendrobiums. Behind the active growing shoots are the old pseudobulbs attached to the rhizome; part of this rhizome bearing usually 5 or more pseudobulbs may be partially severed and allowed to remain until new growth begins on it, or completely severed and potted at once.

Propagation by means of seeds has been a difficult and dubious process, but recent investigation has put the practice on an assured successful basis. The difficulty was due in part to the minute size of the seeds which makes them especially susceptible to injury by various micro-organisms and insects. According to certain European investigators the orchid embryo must become infected by that particular fungus which is found in the root of orchid plants, and the fungus method has been put into practical use abroad. The investigations of Knudson in the United States reveal, however. that the fungus plays no direct part in the germinating process and that successful germination of orchid seed depends on a supply of available organic matter which constitutes food for the embryos. On this latter principle Knudson has devised a method that insures successful ger-mination of orchid seeds and is now widely employed under commercial conditions.

The Knudson method of germinating seedlings under aseptic conditions is similar to those employed in culturing bacteria. For this purpose a nutrient solution is made up, consisting of calcium nitrate 1 gram, monobasic or primary potassium phosphate 0.25 gram, magnesium sulfate 0.25 gram, ferric phosphate (insoluble) 0.05 gram, ammonium sulfate 0.50 gram, agar 15 grams, cane-sugar 20 grams and distilled water one liter. The salts supply nutrients, the sugar supplies organic food, and the agar is to make the medium gel. The solution should be acid in reaction. Due to the variability in agar and salts the amount of acid to be added cannot be specified but the reaction should be in chemical terms pH 5.0 or 5.2. This culture medium is heated until the agar dissolves and then poured into culture tubes (Fig. 9). These tubes are then plugged with cotton and sterilized. After sterilization and when still hot, the tubes are placed in an inclined position to give a slope to the culture medium. The seeds are then sterilized by use

of a solution of chloride of lime and transferred to the tubes by means of a looped platinum wire. The technique used in bacteriology must be followed. After the seeds have germinated they may be transferred to flasks (Fig. 9) containing the same medium but only $\frac{1}{10}$ per

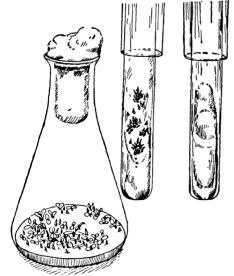

Fig. 9. Seed-propagation in orchids. Flask contains three-months-old seedlings, reduced; middle tube, good germination; right-hand tube, no germination because of absence of sugar.

cent sugar. There they may be kept for a year or so until large enough to transplant in the open. The seedlings may also be transplanted from the tubes to the open, although greater care must be given the seedlings. From this point, the plantlets are given the same attentive care that is familiar to orchidists who are acquainted with propagation. The transplanting of any orchid seedlings requires great pains

of any orchid seedlings requires great pains.

Transplanting of the seedlings takes place when two or three leaves have appeared or when the rootlets become readily visible to the naked eye. This may be anywhere from two to eight months after sowing. They are placed in 2½-inch pots, with drainage and charcoal in the bottom. The pots should be sterilized. The soil should be fine peat or similar substance. As many as 100 seedlings may be set in one pot. The pots are placed in a moist warm glass frame or case free from drafts. In six months or so the seedlings may be transplanted again into 2½-inch pots, only 25 being set therein; at the third transplanting only 5 or 10 seedlings occupy a pot. In three to eight months from the first shift the plantlets of most kinds should be ready for separate or individual pots; about two years are usually allowed from the seed sowing to the individual potting; thereafter some four to six years are required to bring the plants into bloom, depending on the species and the general growing conditions.

If seeds are germinated in the Knudson or other nutritive solutions, the plantlets will be larger when removed and first transplanted, and only a few need be placed in a 2½-inch pot and fewer transfers are necessary, but otherwise the treatment is the same.

While the Knudson method is advisable for commercial establishments where loss and failure must be reduced to the minimum and also for the germination of very choice and rare seeds, the amateur and some large growers may nevertheless prefer sowing the seeds on soil or other stratum. The seeds are sown as soon as ripe. Early spring is a preferable time. Sometimes the seeds are dusted on the pots or baskets of the parent plant or of related species and then imbedded in the potting material by very careful watering. It may require three months or two years for the seed to germinate under this method, and in the meantime the material should not be disturbed. In another method osmunda fiber alone or mixed with dead or live sphagnum is used. This material is compacted in a 4-inch pot. A piece of burlap or Turkish toweling is stretched over the surface and secured by forcing the edges of the cloth between the pot and potting material. The seed is sown on the cloth and the pots then placed in a germinating case.

Germination by the fungus method consists of inoculating a sterilized peat mixture with a pure culture of the rhizoctonia or root fungus. When the mixture is permeated with the fungus, the seed is sown essentially as in other methods, and the young plants go through a similar course of transplanting.

ÓRCHIS. Orchidaceæ. Orchids of woods, swamps and moist places, with tuberous roots and growing on the ground, mostly basal lvs. and rather small fls. in terminal racemes or spikes, the sepals similar and either connivent or spreading, the petals usually smaller, lip entire or 3-lobed and spurred at base. Planted in moist situations in rock-gardens and elsewhere out-of-doors; see Orchids; also Habenaria.

maculata. To about 20 in. high: lvs. cauline, elliptic to narrowly oblong or oblanceolate, often dark-spotted: fls. in dense spikes to 3½ in. long, pink with lip marked with purple. May-Aug. Eu., Asia.

militaris. To about 2 ft. high: lvs oval to lanceolateoblong, to 8 in. long: spike dense, oblong-cylindrical; fls. short-bracted; sepals and petals converging and arching over the lip, pale rose, white or grayish-white; lip rose with lilac-purple spots, 3-lobed with the large mid-lobe bilobed. Eur. Asia.

rotundifòlia. To 11 in. high; lf. single, basal, oval to nearly orbicular: spike short, few-fld; fls. magenta; lip 3-lobed, white spotted with magenta. Que. to Yukon south to N. New England and Mont.

spectábilis (Galeorchis spectabilis). Showy Orchis. To 1 ft. high: lvs. 2, to 8 in. long and 4 in. wide: fls. about 1 in. long, in 2-7-fld. spikes; sepals and petals purple, united into a hood; lip white. May-June. N. B. to Ga. and Mo.

ORCHYLLIUM: see Utricularia.

OREOBATUS: Rubus deliciosus and relatives.

OREOBROMA: Lewisia.

OREOCARYA. Boraginaceæ. Bien. or per. herbs of the Cryptantha kind, native in W. N. Amer., having alternate hairy lvs. and white or yellowish salverform forget-me-not-like fls. borne in a panicle or thyrse.

glomerata. To 1½ ft.: lvs. spatulate to linear, to 2½ in. long: fls. white, ½ in. across. Man. to Utah.

OREOCÈREUS. MOUNTAIN CACTUS. Cactaceæ. Cacti native in the Andes, forming large clumps, areoles with long white hairs, ribs strongly spined: fls. diurnal, with cylindrical tube.

aureispinus: probably Parodia aureispina.

Bruénnowii: O. Celsianus var.

Bruénnowii: O. Celsianus var.

Celsiànus (Cereus and Pulocereus Celsianus). To 3 ft. high, branches 3 in. thick; ribs 9-17, areoles ½-½ in. apart, hairs of tubercles matted; spines to 2 in. long and yellow: fts. dark red, to 7 in. long. Bolivia, Peru, Chile. Var. Bruénnowii (O. Bruennowa) has more slender sts., ribs 9-10, densely woolly. Var. foveolàtus (O. foveolatus. O. and Pulocereus fossulatus). Sts. more deeply notched with areoles ¾-1¼ in. ap.rt, hairs not matted. Var. lanuginðsior has hairs woolly, abundant, short and matted. Var. robústior is of larger habit and has stouter spines.

Doelzianus (Morawetzia Doelziana). Sts. club-shaped, clump-forming, to 3½ ft. high and 4 in. diam., terminated by a cephalium; ribs 11, about ¼ in. high, rounded; spines yellow to dark brown, about 20, to 1¾ in. long, centrals 4 and scarcely distinguishable from the slightly shorter radials: fls. carmine, to 4½ in. long, zygomorphic: fr. ovoid, yellow-green. Cent. Peru.

fossulatus: O. Celsianus var. foveolatus.

foveolatus: O. Celsianus var.

gigantèus: probably O. Celsianus var. robustior.

Hendricksenianus. Differs from O. Trollii in its long golden-yellow silky and glossy hairs and in its larger size. Bolivia and Peru.

lanuginòsior: O. Celsianus var.

Ianugmosior: O. Ceisianus var.

Tröllii (Cereus Irigoyenii. Pilocereus Trollii). Cespitose, unbranched, to about 3 ft. high and 4 in. diam.; ribs usually 9, becoming indistinct with age; radial spines about 7, to ¾ in. long, reddish to white; centrals 1-3, to 2 in long; hairs abundant from areoles, glossy and cream-colored, becoming grayish, to 2 in. long: fls. pale brownish-red, to 4 in. long. Bolivia and Peru.

OREÓCHARIS. Gesneriaceæ. Stemless per. E. Asiatic herbs. One species, O. primuloides, is offered. To 15 in or more: lvs. oblong-cuneate, in basal rosettes, coarsely crenate-dentate: fls. blue, to 1 in. long, in many-fld. umbels or cymes: fr. a narrowly linear caps. Japan.—Propagated by seeds and adapted to the rockery.

OREODOXA (as to Florida and West Indian species): Roystonea

OREÓPANAX. Araliacex. Shrubs or trees with entire, lobed or digitate lvs, and directous or polygamous fls. in heads borne in panicles or racemes, and berry-like fr.; native in trop. Amer. and grown under glass, in the open only in the warm parts of the country. Propagated by cuttings and seeds.

Thibaùtii: O. xalapense.

Talapénse (O. Thibautu). Shrub or small tree: lvs. of 5-9 oblong or obovate lfts. to 1 ft. long, nearly entire: heads ½ in. across, in racemes 1 ft. long; fr. black. Mex., Cent. Amer.

OREÓXIS. Umbelliferæ. Dwarf stemless alpine perennials from W. N. Amer., having pinnatisect lys. and yellow fls. in small umbels: fr. globose-oblong and only slightly flattened laterally. Propagated by division or seed; adapted to the rockery.

aipina. To 3 in.: lfts. 1-7, linear, to ½ in. long, pale green: fls. pink, yellow to whitish, in umbels to nearly ¾ in. across: fr. to ½ in. long. High elevations, Colo., Utah.

ORIGANUM. MARJORAM. Labiata. Per. herbs of the Old World, cult. for the aromatic foliage and attractive small purple-pinkish fls. borne in spikes.

Origanum is easily grown in all warm garden soils; the plants should stand 10 inches in rows 15 inches apart. Propagated by seed or usually by division in spring or early

Dictamnus. CRETE DITTANY. Procumbent, white-woolly, sts. often ascending: lvs. broadly ovate, entire, thick, to ¾ in. long, somewhat mottled: fis. pink to purplish, subtended by large bracts, in hop-like heads. Greece.—Probably not hardy N.

hirtum: O. vulgare

Majorana: Majorana hortensis. Onites: Majorana Onites.

pulchéllum. To 1 ft. or less, gray-hairy, sts. ascending, woody at base: lvs. ovate, entire, obtuse: fls. rose-pink, in nodding head-like spikes. S. E. Eu.

virens: O. vulgare.

vulgare (O. hritum and virens). Hardy sweet herb to 2½ ft, rootstocks nearly horizontal: lvs. broad-ovate, 1½ in. long: fls. in clusters to 2 in. across. Eu.; nat. in N. Amer. Var. aureum has golden or yellow lvs.

Rutaceæ. Deciduous shrub to 10 ft. native in Japan and hardy in S. New England.
O. japonica (Celastrus Orixa). Lvs. alternate, obovate, to 5 in. long: fls. diœcious, small, greenish, the staminate in racemes, pistillate solitary: fr. of 4 carpels.—Propagated by greenwood cuttings, root-cuttings, layers and seeds.

ORMÒSIA. NECKLACE-TREE. Leguminosæ. Trop. trees with pinnate leathery lvs., papilionaceous fls. usually in terminal panicles and compressed mostly thick and leathery pods; the ornamental seeds of several species are made into necklaces; sometimes planted in the tropics and subtropics.

dasycárpa: O. monosperma.

monospérma (O. dasycarpa). Large timber tree: fls. blue, the panicles rusty-tomentose: pods 1½ in. long, rusty-tomentose, with 1 large scarlet seed with a black patch. W. Indies,

ORNITHÍDIUM. Orchidacex. Epiphytes of trop. Amer. with elongate sts. usually concealed by distichously imbricating sheaths and bearing at intervals 1-lvd. pseudobulbs and clusters of axillary rather small fls.; sepals and petals often similar; lip 3-lobed. Grown in warm greenhouse; see Orchids.

densum (Maxillaria densa). Lvs. to about 15 in. long: fls. borne in dense clusters on peduncles about 1 in. long; sepals and petals white often tinted with rose or green; lip white or rosy with purple on disk. Dec.—May, July, Sept. Mex. to Honduras.

ORNITHOCHÎLUS. Orchidaceæ. Asiatic epiphytic orchids with fls. in pendulous racemes or panicles, the sepals and petals similar, the lip 3-lobed, clawed, and spurred at base. See Orchids for cult.

fúscus. Lvs. to 6 in. long and 2 in. wide; infl. a pendulous many-fld. raceme or paniele about 12 in. long; sepals and petals golden-yellow or greenish streaked with red; lip with a dark red fimbriate limb. May-Aug. Burma to

ORNITHÓGALUM. Liliaceæ. Bulbous herbs with either narrow or rather broad basallys. and white, yellow or reddish fls. in bracted racemes or corymbs at top of scape, the perianthsegms. distinct.

The hardy kinds may be planted out-of-doors and left undisturbed. The tender species, from Africa and Mediterranean region, may be grown in pots in the greenhouse or in frames, sometimes in window-gardens. Propagated by

arábicum. To 2 ft.: lvs. to 2 ft. long and 1 in. broad: fis. white with black pistil, 1 in. long, fragrant, in racemes. Medit. region.—Useful in conservatory.

arianum. To 10 in.: lvs. 4-6, strap-shaped, to 8 in. long and about ½ in. wide, all basal: fis. to ¾ in. across, white, outer segms, greenish with white margins, in corymbs of 8-12. E. Russia.

aureum: O. thyrsoides var.

Boucheanum: O. nutans var.

caudatum. To 3 ft.: lvs. to 2 ft. long and 1½ in. across: fls. white with green center, 1 in. across, in long racemes. S. Afr.—Sometimes seen in windows.

Férgusonii: listed name of plant said to be 9 in. high with bright yellow star-like fis.: probably of hort. origin.

graminifolium. Lvs. to 1 ft long, cylindrical: fis. white. 1/3 in. long, in racemes to 3 in. long. S. Afr.

kewense. Hybrid between O. thyrsoides and its var. aureum: fls. buff-yellow.

lacteum. To 2 ft.: lvs. to 1½ ft. long and 1 in. broad: fis. milk-white, ¾ in. long, in dense racemes. S. Afr.

maculàtum: O. Thunbergianum.

mauritánicum: listed name.

narbonénse. To 1½ ft.: lvs. to 1½ ft. long and ½ in. wide: fls. white keeled with green on outside, to 2 in. across, in racemes. S. Eu.

nttans. To 2 ft.: lvs. to 1½ ft. long and ½ in. wide: fls. white inside, green with white margins outside, to 2 in. across, nodding, in racemes. Eu., S. W. Asia; run wild in Pa. and elsewhere. Var. Boucheanum (O. Boucheanum) has larger fls. with more prominent anthers and in denser racemes Asia Minor; nat. in Germany.

oligophýllum (O. plutyphyllum). To 6 in., bulb compressed-ovoid, to 134 in. diam.: lvs. lanceolate, falcate, to 6 in. long, glabrous: fis. pale creamy-white with narrow pure white margin, to 1 in. across, in short corymbose racemes with pedicels becoming shorter toward top, lanceolate bracts about half as long as pedicels. Greece to Asia Minor.

platyphýllum: O. oligophyllum.

pyramidàle. To 2 ft.: lvs to 1½ ft. long and ½ in. across: fls. white keeled with green outside, I in. across, in long narrow racemes. S. Eu.

refléxum. To 4 in., bulb about ¾ in. diam.: lvs. 2-3, linear-oblong, obtuse, to 5 in. long: fis. with abruptly recurved segms., in racemes to 1¾ in. long. Asia Minor.

Sandersiæ. To 3 ft. or more: lvs. limp and strap-shaped, to 1 ft. long, many: fls. white, to 1 in. across, on pedicels to 2 in. long, pistil prominent, shining, greenish-black. S. Afr.

speciosum. To 1 ft., rarely 1½ ft.: lvs. linear, short, thick, usually 4: fls. 3-5 in raceme having flexuous rachis, white with distinct purplish-black spot at tip of each perianth-segm., to 1 in long, segms. not keeled, style very short and stout. S. Afr.

spléndens. To 15 in.: lvs. sword-shaped, to 4 in. long, glaucous, usually only 4: fls. satiny vermiliton, to 1 in. long, cup-shaped, about 12 in raceme, anthers and style yellow. S. Afr.

suaveolens. To 1½ ft.: lvs. to 12 in. long, linear, glabrous, straight: fis. pale yellow, ½-½ in. long, fragrant, few or many on lax racemes to 6 in. long on a stiff peduncle, segms. distinctly keeled, style ½ in. long or less. S. Afr.

Thunbergianum (O. maculatum). To 1½ ft. lvs. linear or lanceolate, shorter than st., usually 3 or 4: fls. yellowish, the 3 outer segms. with distinct black spot at tip, segms. not keeled, 1-6 on very short pedicels, style very short and stout. S. Afr.

thyrsoides. To 1½ ft.: lvs. to 1 ft. long and 2 in. wide: fls. white or yellow, ¾ in. long, in dense racemes. S. Afr. Var. álbum with white fls. represents the typical form. Var. aùreum (O. aureum), fls. golden-yellow.

umbellatum. STAR-OF-BETHLEHEM. To 1 ft.: lvs. to 1 ft. long and ½ in. broad: fls. white, green margined with white outside, 1 in. across, in umbel-like corymbs. Medit, region; run wild in northern states.

ORNÍTHOPUS. Leguminosæ. Herbs with pinnate lvs., small papilionaceous fls. in axillary heads or umbels, and linear pods separating into 1-seeded joints; one species is grown to some extent as a forage and green-manure crop. Seed should be sown in spring in light or sandy soil

sativus. Serradella. Ann. to 1½ ft.: Ifts. small and numerous: fls. rose-colored, in few-fld. umbels. Spain, Morocco.

ORNUS EUROPÆA: Fraxinus Ornus.

OROBUS: Lathyrus and Vicia.

ORÓNTIUM. Aracex. Aquatic herb native in E. N. Amer., sometimes transferred to bogs and pond-margins where it roots deeply. O. aquáticum. Golden-Club. Lvs. oblong-elliptic, to 1 ft. long and 5 in. wide, floating or ascending, dark green above and paler beneath, on petioles to 20 in. long: spadices 2 in. long, yellow, borne on white scapes to 2 ft. long; spathes soon deciduous.

ORÓPHACA: plants listed under this name are here treated as belonging to the genus Astragalus. The names in the trade are as follows: cæspitosa: A. gilviflorus.
sericea: A. sericoleucus.
tridactylica: A. tridactylicus.
OROSTACHYS: Sedum

ORÓXYLON. Bignoniacex. One tree to 40 ft., native from India to Malaya, and grown in the open in S. U. S. It prefers rich soil and is propagated by seeds and cuttings over heat. O. indicum (Pyroslegia indica). Lvs. 2-3-pinnate, the ovate entire lfts. to 5 in. long: fls. white or purplish, bell-shaped with 5 crisped lobes, to $2\frac{1}{2}$ in. long and $3\frac{1}{2}$ in. across, in terminal panicles: fr. linear, to 3 ft. long. For O. flavum see Radermachia pentandra.

ORÒYA. Cactacex. Two depressed-globose solitary cacti native in the Andes of Peru. See Cacti for cult.

neoperuviana. To 8 in. diam., bright green; ribs about 24, sometimes more, to ½ in. wide; radial spines 23-28, to ½ in long, pectinate, white to yellowish; centrals 1-2, indistinct from radials: fls. yellow within, rose outside.

peruviàna (Echinocactus peruviànus). To 5 in. across; ribs usually 21 and low and tubercled; radial spines 18-20, 34 in. long, yellowish tipped with red; central spines often lacking: fis. pink with yellow base, reddish outside, 1/2 in. long

ORPINE: Telephium. Family: Crassulaceæ.

ORTHOCÁRPUS. OWLS CLOVER. Scrophulariaceæ. Ann. and per. herbs in W. N. and S. Amer., allied to Castilleja, with alternate entire or cut lvs., those in the infl. often colored, and 2-lipped tubular white, yellow or cream-colored fls. in spikes; sometimes grown in the flower-garden.

purpuráscens. Ann, 1 ft.: lvs. cut into linear or threadlike segms: fls crimson or purple, to 1½ in long, the lower lip tipped white and with yellow or purple markings, in dense spikes to 4 in. long, fl.-bracts tipped with red. Calif.

tenuifòlius. Ann. to 8 in., sts. hairy and purphsh: lvs. cut into linear-filiform segms: fls yellow, or sometimes tipped purphsh, to 34 in. long. Ida. to Wash. and B. C.

ORTHOSTEMON: Feijoa.

ORŸZA. Gramineæ. Ann. and per. marsh grasses, one much grown for the grain: lvs. flat: spikelets large, flattened, in terminal panicles. See Grasses.

sativa. Rice. Ann. to 4 ft.: lvs. to 2 ft. long and ½ in. wide: panicles to 1 ft long, curved or nodding, branches ascending: grains yellow or straw-colored, white when polished (as in the commercial article). E. Indies, but escaped in trop. regions.—Widely cult. in trop and warm-temp. regions for the grain, requiring water conditions for part of its development.

ORYZÓPSIS. RICE-GRASS. Graminew. Slender per. grasses with flat or involute lvs. and terminal narrow or open panicles, native in W. Amer. One species, O. hymenoides (O. cuspidata), Indian R., is used for forage purposes. To 2 ft., densely tufted: lvs. narrow, to 6 in. long: spikelets with awn to ¼ in. long, the glumes nearly black when mature and densely white-pilose. Man. to B. C. south to Tex., N. Mex. and Calif.

OSAGE-ORANGE: Maclura.

OSCULĀRIA. Aizoaceæ. Separated from Mesembryanthemum: small shrubby perennials with spreading branches, 3-angled lvs. slightly united at base, and small short-stalked fls. in 3's: S. Afr.

cauléscens (M. caulescens). To 1½ ft.: lvs. to ¾ in. long and ½ in. broad, somewhat curved, glaucous, toothed on edges but not on keel: fis. rose, fragrant, to about ¾ in. across.

deltoides (M. deltoides). Erect or nearly so: lvs. incurved, to ½ in. long and more than half as broad, glaucous and toothed: fis. rose, ½ in. across. Var. muricata (M. muricatum), smaller and blue-green, lvs. smaller with sharper teeth, pedicels shorter.

paardebergénsis; probably Mesembryanthemum paardehergense.

OSIER: Salix.

OSMÁNTHUS. Oleaceæ. Shrubs and trees with opposite entire or toothed persistent lvs. green and glabrous underneath, bisexual or unisexual fls. in clusters or racemes, and fr. a 1-seeded drupe: grown under glass or in the open in mild or warm regions. Propagated in late summer by cuttings of half-ripe wood under glass: seeds do not germinate until the second year, and are not often obtainable.

americanus. Devil-Wood. To 45 ft.; lvs. elliptic to lanceolate, to 7½ in. long, entire, shining above: fis. greenish, fragrant, corolla-tube about length of lobes. N. C. to Fla. and Miss.

Aquifòlium: O. ilicifolius.

armàtus. To 15 ft: lvs. oblong-lanceolate or lanceolate, to 5½ in. long, spiny-toothed, reticulate: fls. fragrant. Sept.-Oct. China.

aurantiacus. Similar to O. fragrans, differing in the lanceolate lvs 3-7 in. long, the fis. orange-colored and very fragrant. China and possibly Japan.

Delavayi: Siphonosmanthus Delavayi.

Fortunei. Hybrid between O. fragrans and O. ilicifolius: to 6 ft.: lvs. ovate, to 4 m. long, spiny-toothed: fls. fragrant.

fragrans (Olea fragrans). To 30 ft.: lvs. oval to oblong-lanceolate, to 4 in. long, entire or fine-toothed: fls. white, fragrant, corolla divided nearly to base, early spring. Asia.

—An old greenhouse plant.

—An old greenhouse plant.

ilicifòlius (O. Aquufolum. Olea ilicifolia and Aquifolum) To 20 ft.: lvs oval to oblong, to 2½ in. long, with few large spiny teeth, shining: fls. white, fragrant, corolla divided nearly to base. June-July. Japan. Var. argénteomarginàtus, lvs. marked with white. Var. aûreo-marginàtus (var. aureus), lvs. vanegated with yellow. Var. myrtifòlius, lvs. sinaller, entire. Var. purpuráscens (var. purpureus), lvs. dark purple when young. Var. rotundifòlius, dwarf, lvs. 1 in long, entire or with short teeth. Var. variegated with white.

purpureus: O ilicifolius var. purpurascens.

serrulatus. Differs from O. fragrans in its usually entire more leathery lvs. with midrib deeply impressed above, and in its smaller fls. W. China.

OSMAREA. Oleacex. A generic group comprising crosses between Osmanthus and Phillyrea. O. Búrkwoodii having as parents Siphonosmanthus Delavayi and P. decora. Evergreen shrub: lvs. 11/2 in. long, dark green and shining: fls. ivory-white, fragrant, in Apr.

OSMARÒNIA (Nuttallia). Rosaceæ. Deciduous shrub native from B. C. to Calif. and planted for ornament, hardy in north central states. O. cerasiformis. Osoberry. To 15 ft.: lvs. oblong-lanceolate, to 4 in. long, entire: fls. dioccious, greenish-white, fragrant, 1/3 in. across, in drooping racemes in Apr.-May: fr. a bluishblack drupe to ½ in. long.—It does best in shady places in moist soil. Propagated by seeds sown when ripe or stratified, and by suckers.

OSMIA: Eupatorium odoratum.

OSMORHÌZA (Washingtonia). Umbelliferæ. Per. herbs with fleshy roots, ternately compound lvs., very small white fls. in few-rayed umbels, and linear frs.; native in N. and S. Amer. and E. Asia; interesting in the wild garden.

brevistylis: O. Claytonii.

Claytonii (O. brevistylis). To 3 ft., hairy: lvs. to 1 ft. across, the segms. ovate, deeply toothed. N. S. to N. C. and Ala.

longistylis. Differs from O. Claytonii in its less coarsely and irregularly toothed lvs. and style to 1/8 in. long; glabrous and pubescent forms occur. Que. to Sask. south to Ala. and Colo.

OSMÚNDA. Osmundaceæ. Rather coarse but attractive deep-rooted ferns with 2-pinnate or -pinnatifid fronds in large crowns, the fertile segms. much contracted and forming separate panicles, or in O. Claytoniana some of the pinnæ only transformed and spore-bearing; native in Asia, N. and S. Amer. See Ferns.

cinnamòmea. Cinnamon-Fern. Hardy: sterile fronds to 5 ft. long, on stipes 1 ft. long, rusty-tomentose when young, 2-pinnatifid, margins usually entire; fertule fronds in the center, 2-pinnate, becoming ennamon-brown as spores mature. N. Amer., W. Indies, S. Amer., E. Asia.

Claytoniana. Interrupted-Fern. Fronds to 4 ft long on stipes to 2 ft. long, 2-pinnatifid, margins usually entire, the spores confined to a few of the central pinnæ. N. Amer.,

grácilis: probably a S. American form of O. regalis.

regalis. Royal-Fern. Fronds to 6 ft. long, 2-pinnate, margins finely toothed, the fertile pinnæ forming terminal panicles. N. Amer., trop. Amer., Eu, Afr.

OSMUNDACEÆ. OSMUNDA FAMILY. Three genera in both Old and New Worlds, of large ferns with 1-3-pinnate or -pinnatifid fronds and naked sporangia borne on modified pinnæ or in clusters on lower surface of fronds. Leptopteris and Osmunda are grown in the open.

OSOBERRY: Osmaronia cerasiformis.

OSTEOMÈLES. Rosaceæ. Shrubs with alternate pinnate lvs., white fls. in terminal corymbs, and fr. a small pome; native in Asia and Polynesia.

Grown for ornament mostly in mild regions (as southern states) where they prefer well-drained soil and a sunny position. Propagated by seeds which germinate slowly, by cuttings under glass, or grafting on cotoneaster.

anthyllidifòlia. To 6 ft, evergreen: lfts. 13-19, to ½ in. long, silky-pubescent beneath: fls. ½ in. across: fr. pubescent. Hawaii south.—Stands in parts of N. Y.

Schweriniæ. To 10 ft., deciduous or semi-evergreen: lfts. 15-31, to 1/4 in. long, gray-pubescent beneath: fis. 1/4 in. across: fr. glabrous. China.

OSTERDAMIA: Zousia.

OSTRÒWSKIA. Campanulaceæ. One striking per. herb from Cent. Asía, hardy in the N. with winter protection but not very durable. It should have a sunny exposure on well-drained ground. Propagated by cuttings of young growth or roots: also by seeds but these may require years to germinate and fls. may not be obtained in less than three or four years. O. magnifica. GIANT BELLFLOWER. To 5 ft. or more: lvs. whorled, ovate, to 6 in. long, toothed: fls. pale lilac, to 4 in. across.

ÓSTRYA. HOP-HORNBEAM. Betulaceæ. Deciduous monœcious small trees with alternate toothed lvs., staminate fls. in slender drooping catkins, pistillate in erect catkins, and fr. a nutlet inclosed by a bladder-like light green involucre; native in the northern hemisphere where it may be cult. for ornament. Propagated by seeds sown in fall or stratified.

virginiana. American H. Ironwood. To 60 ft.: lvs. to 5 in. long: fruiting catkins to 2½ in. long, drooping. Ont. to Fla. and Tex.

OTHAKE: Polypteris Hookeriana.

OTHONNA. Compositæ. Shrubs or herbs in S. Afr., often with tuberous roots: lvs. basal or st.-lys. alternate or clustered at ends of branches: heads yellow, solitary or clustered, of ray- and disk-fls.; pappus of bristles.

Othonnas are grown in conservatories or hanging-baskets.

They thrive in any soil with good drainage. Propagated by pieces of the stem treated as cuttings, or by portions of the stem that have rooted where they rested on the soil.

capénsis: O. crassifolia.

carnosa. Subshrub, 9 in. high: lvs. linear-terete, fleshy, to 2 in. long: heads few, in corymbose panicles.

crassifolia (O. capensis). Per. with slender or trailing sts., becoming shrubby at base: Ivs. scattered or in clusters, fleshy, cylindric-obovoid, to 1 in. long: heads ½ in. across, solitary on sts. to 4 in. long, opening in sun.—Frequent under glass.

OURÍSIA. Scrophulariaceæ. Erect, decumbent or prostrate per. herbs of the Andean region of S. Amer., New Zeal. and Tasmania: lvs. mostly radical, opposite, entire or crenate: fls. mostly white but running into purplish shades and yellow centers, sometimes scarlet, clustered on a scape-like st. or sometimes axillary and solitary; stamens 4. Sometimes grown in rockeries and shady places.

coccinea. To 1 ft.: lvs. oval or oblong, dentate-lobed: fls. scarlet, drooping above the foliage, stamens exserted. Chile; more or less hardy N.

macrocárpa. Sts. stout, to 2 ft., but usually lower: lvs. persistent, oblong or orbicular, to 8 in long, ciliate: fls. whorled, white with more or less yellow center, to 1 in diam. New Zeal.; hardy N. in cool woods or rock-garden.

macrophylla. Differs from O. macrocarpa in more slender habit, pubescent rather than glabrous, and less leathery lvs. New Zeal.

OUVIRANDRA: Aponogeton fenestralis.

OVARY: ovule-bearing part of a pistil, becoming (sometimes with attachments) the fruit.

OVATE: with an outline like that of a hen's egg cut in two lengthwise, the broader end downward.

OVOID: a solid that is oval (less correctly ovate) in flat outline.

OVULE: the body which, after fertilization, becomes the seed; it is contained, perhaps with others, in the ovary.

OXALIDACEÆ. OXALIS or WOOD-SORREL FAMILY. About 10 widely distributed genera of herbs, shrubs and trees, with usually compound lvs., regular fls. with 5 sepals and petals, 10 stamens and superior 5-celled ovary, and fr. a dehiscent caps. or fleshy berry. It is allied to Geraniaceæ. Only the genera Averrhoa, grown for its edible fr. as well as for the ornamental tree, and Oxalis, planted for ornament, are known in cult.

ÓXALIS. Wood-Sorrel. Oxalidaceæ. Small herbs, often producing tubers or bulbs, with clover-like digitate lvs. which close at night, white, pink, red or yellow axillary often long-stalked fls. and capsular quickly dehiscent fr.; about 300 widely distributed species, grown for ornament or a few for the edible roots. Some of the species have somewhat branching It-bearing sts., sometimes more or less woody, and others are scapose with the peduncles arising directly from the crown of the plant or the bulb.

Propagated by bulbs or division of the roots and by seeds. For bloom in late winter or early spring in window-garden and conservatory, bulbs should be divided in September. After blooming the bulbous kinds should be placed in a cool cellar for a resting period. The flowers are showy in sunshine.

Acetosélla. EUROPEAN W. Low early-blooming scapose per: Ifts. 3, obcordate: fls. white with purple or rose-purple veins, the petals oval, obtuse, not emarginate. Eu.—See O. montana.

adenophfila. Scapose per., roots tuberous: Ifts. 12-22, obcordate, ½ in. long, glaucous: fis. pink with deeper veins, solitary or in few-fid. umbels. Chile.

americana: O. montana.

Bowieana (O. Bowies. O. purpurea. Caudoxalis Bowieana). Scapose per. with thickened roots and scaly bulbs: lfts. 3, large, obcordate: fls. rose-purple, to 2 in. across, in summer. S. Afr.

brasiliénsis. Scapose per. to 6 in.: lvs. retuse, lfts. 3: fis. magenta with darker throat and veins, to 1 in. across.

bupleurifòlia. Somewhat shrubby: petioles flattened and leaf-like, bearing 3 small deciduous lits. at tips: fls. yellow, among the lvs. Brazil.

californica (Xanthoxalis californica). Tufted per. with prostrate sts. to 8 in. or more long: lits. 3, oval, to 36 in. long: fls. yellow, 1/3 in. across, 1-3 together. S. Casif.

carnosa. Scapose per with spindle-shaped roots: Ifts somewhat fleshy, obcordate: fis. yellow, in autumn, 2, 3 or several to a scape, the petals emarginate or denticulate. Chile.

cérnua (Bolboxalis cernua). BUTTERCUP O. BERMUDA BUTTERCUP. Scapose per. with thickened roots and deep scaly bulbs: Ifts. 3, deeply obcordate: fls. bright yellow, to 1½ in. across, nodding, in spring. S. Afr.; nat. in Bermuda and Fla.

corniculata (O. lutea. Xanthoxalis corniculata). Creeping per. but blooming first year: lfts. 3, small, obcordate: fls. light yellow. Eu.; escaped in N. and trop. Amer.—Frequent on the floor of greenhouses. Var. atropurparea (O. tropæoloides) has purple lvs. and is used for bedding.

crenata. Oka. Per. but grown as ann. from underground tubers, which are eaten in S. Amer.: lfts. 3, obovate: fls. yellow striped with purple, axillary. Peru.

decaphýlla. Scapose, from solitary bulb: lvs. digitate, circular in outline, of 8-10 narrow bifid lfts.: fls. violet, small, many in an umbel. Mex.

Déppei (Ionoxalis Deppei). Scapose per. with simple scaly bulbs: Its. mcstly 4, truncate, not notched: fis. red, in umbels. Mex. Var. álba has white fis.

Drummondii (Ionoxalis Drummondii). Scapose per. to 1 ft., bulbous: Ifts. 3, 2-lobed, ovate or oblong: fis. violet, to ¾ in. long, in 4-7-fid. umbels on scapes longer than lvs. Tex. New Mex.

enneaphýlla. Scapose per. with tuberous roots: lfts. 9-20, obcordate, glaucous: fis. white with lavender veins, solitary. Falkland Isls. Var. rôsea has rose-pink fis.

floribunda. Fls. rose with darker veins, or white. Botanical position uncertain but probably a form of O. rosea or O. lassandra.

grandis. Per. to 3½ ft.: lfts. to 1½ in. across, brown-margined: fls. yellow, petals to ¾ in. long, in dichotomous cymes. N. B. to Ga., Ind. and Ala

heterophýlla. Bulbous per. with weak leafy sts. 1 ft. or more long: lfts. 3, 2-lobed: fls. with yellowish tube and purple limb, to 34 in. long, solitary. S. Afr.

hirta. Erect or decumbent, st. branched and leafy, pubescent: lits. 3, mostly spatulate or narrow-cuneate: fis violet or purple, single on long axillary peduncles. S. Afr

lasiandra. Scapose per. with simple scaly bulbs: Ifts. 5-10, 3 in. long, entire: fis. crimson, in crowded umbels. Mex.

latifòlia. Stemless bulbous per. to 8 in.: Ifts. 3, very broadly wedge-shaped, to 1½ in. wide at truncate-emarginate apex and ¾ in. long, glaucous, ciliate, petiole to 6 in. long: fis. dull lilac-purple, to ½ in. across, 5-8 in umbels, pedicels to ¾ in. long and peduncle to 7 in. Mex.

lobata. Stemless per. to 4 in., tuberous: Ifts, obovate, deeply ema ginate to retuse, occasionally almost bilobed: fis. yellow, lined and dotted red. Chile.

lùtea: O. corniculata.

magellánica. Per. to 2½ in., stoloniferous: Ifts. 3, obcordate, very small: fis. white, ½ in. long, solitary. S' S. Amer., S. Australia, New Zeal.

Martiana. Scapose per. with rather shallow loosely scaly compound bulb: Ifts. 3, obcordate: fis. to ¾ in. long, rosy, in loose mostly compound umbels. Trop. Amer.

montana (O. americana). American W. The American representative of O. Acctosella: scapose, summer-blooming in cool northern woods: Its. 3, obcordate: petals oblong, emarginate, pale pink or white and purple-veined.

oregana. Lvs. and scapes from creeping rootstock: Ifts. 3, obcordate, to 2 in. wide: fis. white or rose veined with purple. Wash. to Calif.

Ortgièsii. Per. to 1½ ft., leafy-stemmed: lfts. 3, fishtailed at end, very broad: fls. yellow with darker veins, in cymes on long axillary peduncles. Andes of Peru.—Seen in greenhouses.

purpurea: O. Bowieana.

rosea. Erect tall per: lfts. 3, obcordate, petioles 1 in. or less long: fis. rosy with darker veins, in spring, long-stalked in open cymes. Chile. Var. delicata is listed.—Probably much of the cult. material under this name is 0. rubra.

rubra. Scapose per. with thick stock: Ifts. 3, obcordate: fis. pink or rose with darker veins, varying to lilae or white, in compound umbels above the foliage. Brazil.—Frequent window-garden plant, and in the open in mild regions.

stricta (Xanthoxalis stricta). Per., erect: lfts. 3, obcordate: fis. small, yellow, pedicels reflexed in fr. Old World; scarcely cult.; common weedy plant in N. Amer., Bernuda and elsewhere.

tetraphýlla (Ionoxalis tetraphylla). Scapose per. with simple scaly bulbs: Its usually 4, obcordate: fis. lilac or rosy, in simple umbels. Mex.

tropæoloides: O. corniculata var. atropurpurea.

valdiviénsis. St. short, per. but grown as ann.: lfts. 3, obcordate: fis. bright yellow striped with brown inside, in umbels on long peduncles. Chile.

variábilis. Scapose bulbous per.: Ifts. 3, ciliate, not notched: fls. showy, white, rose or violet, to 2 in. across, yellow at base. Cape of Good Hope; persists in S. Calif.

violacea (Ionozalis violacea). Scapose per. with scaly brown bulbs: lfts. 3, broadly notched: fls. violet or rose-purple (seldom white), several on peduncles usually exceeding lvs. Mass. to Fla. west to Rocky Mts.—Rarely cult. but useful in borders and rock-gardens.

OXALIS, BLUE: Parochetus communis,

OXÈRA. Verbenacex. Shrubs, often climbing, with opposite entire lvs. and white or yellowish fls. in clusters; one sometimes grown in greenhouses or out-of-doors in S. Calif. Requires a winter temperature of 55-60°. Propagated by cuttings and seeds.

pulchélla. Climbing: lvs. oblong-lanceolate, to 5 in. long: fis. trumpet-shaped, white, 2 in. and more long, with conspicuous calyx and long-exserted stamens. New Caledonia.

OX-EYE: Buphthalmum.

OXLIP: Primula elation.

OXYANTHUS ISTHMIA: Posoqueria latifolia.

OXYBAPHUS: Allionia.
OXYCOCCUS: Vaccinium.

OXYDÉNDRUM (sometimes but not originally spelled Oxydendron). Ericaceæ. Deciduous tree to 60 ft., planted for ornament and hardy N. but of slow growth. Propagated by seeds. O. arbòreum (Andromeda arborea). SOTR-WOOD. SORREL-TREE. Lvs. oblong-lanceolate, to 8 in. long, turning scarlet in autumn: fls. white, ½ in. long, in terminal drooping panicles to 10 in. long, July-Aug.: fr. a small gray-pubescent caps. Pa. to Fla. and La.

OXYLÒBIUM. Leguminosæ. Shrubs from Australia with simple entire usually whorled or opposite lvs., yellow or purple papilionaceous fls. in racemes, and swollen pods; one species sometimes planted in Calif.

Callistachys (Callistachys ovata). Tall shrub: Ivs. ovateoblong to lanceolate, to 5 in. long, leathery: fis. yellow, in dense terminal racemes to 6 in. long: pods leathery, ½ in. or more long.

lanceolatum: probably a synonym of O. Callistachys.

OXYPÉTALUM (Tweedia). Asclepiadaceæ. S. American herbs or subshrubs with opposite lvs. and fls. in umbels or heads, corolla deeply 5-parted, the corona of 5 scales; one species intro. into S. U. S.

cærûleum. Twining, herbaceous: lvs. oblong, cordate at base; fis. blue with darker blue fleshy corona, about 1 in. across, in axillary 3-4-fid. clusters. Argentina.

OXÝRIA. Polygonaceæ. Low erect perennials of nearly circumboreal distribution in northern hemisphere, with basal palmately veined lvs. and small greenish perfect fls. in terminal panicled racemes: fr. a broadly winged achene. Adapted to the rockery and propagated by division or seeds. Two species known, of which one, O. dígyna, is cult. To 1 ft.: lvs. reniform to somewhat orbicular, to 1½ in across, long-petioled: fls. many, slender-pedicelled.

OXÝTROPIS (Aragallus). Leguminosæ. Low per. herbs or subshrubs somewhat like Astragalus, with pinnate lvs., papilionaceous fls. in racemes or spikes, and cylindrical pods; sometimes grown in rock-gardens. Propagated by seeds or division.

argentata (O. sulphurea). Nearly stemless, silky-pubescent fis. yellow or whitish, in dense spikes on scapes longer than lvs. Siberia.

campéstris. To 1 ft.: fls. pale yellow tinged with purple, in short spikes. N. Eu., Asia and Amer.

Hálleri: O. uralensis.

Lámbertii. To 1½ ft., silky-pubescent: fls. bluish-purple, in racemes to 4 in. long. Minn. to Mont.

montana. To 6 in.: fls. purple, in short racemes. Eu.

ochroleùca. Sts. short, glaucous: fls. yellowish-white, drooping, in short racemes. Asia.

sericea. To 6 in., sılky-pubescent: fis. light purple, in racemes to 4 in. long on scapes longer than lvs. Neb., Colo., Wyo.

spléndens. To 1½ ft., densely silky-pubescent: fls. deep purple, in dense spikes to 4 in. long. Minn. to Sask. and New Mex.

sulphurea: O. argentata.

tenélla. To 1½ ft., sts. procumbent, hairy: lfts. elliptic to oblong-linear, acutish, ¾ in. long or more, appressed-silky. fls. blush-purple to reddish, small: pod terete, 1-celled. Turkestan.—A forage plant offered as Astragalus Rubyı probably belongs here.

uralénsis (O. Halleri). To 6 in., covered with silky hairs: fls. bright purple, in short spikes. N. Eu. and Asia.

villòsus. To 6 in., silky-pubescent: fis. creamy, in dense spikes 2 in. long. Mont., S. D.

OXYURA: Layia chrysanthemoides.

OYSTER-PLANT: Tragopogon porrifolius. Spanish: Scolymus hispanicus.

OYSTER, VEGETABLE: Tragopogon porrifolius.

OZOMELIS: Mitella stauropetala.

OZOTHAMNUS: Helichrysum.

PACHTRA. Bombacaceæ. Trop. trees with digitately compound lvs., large pink, white or brownish fls. with abundant long showy stamens, and capsular frs., the seeds sometimes eaten; ornamental subjects in the far S. Propagated by seeds or cuttings.

aquática (Carolinea princeps). GUINEA-CHESTNUT. Large tree: Ifts. 5-7, oblong-lanceolate, to 1 ft. long: fls. solitary, pinkish or purplish, to 14 m. long, with numerous slender stamens: fr. 1 ft. or more long and to 5 in. diam. S. Amer.

fastudsa: P. macrocarpa.

macrocárpa (*P. fastuosa*). Small tree: lfts. 5-7, oblong to obovate, to 8 in. long: fls. pale pink to straw-colored within, to 9 in. long: caps. to 9 in. long and 8 in. diam. Mex. to Costa Rica.—Differs from *P. aquatica* in its ovate rotund caps.

PACHISTIMA. Celastracew. Evergreen small shrubs of N. Amer. bearing opposite simple leathery lvs., small reddish bisexual fls., and capsular frs.

Pachistimas may be transferred into the border, wild-garden or rock-garden where they thrive in any well-drained soil. Propagated by seeds, layers, cuttings under glass, and P. Canbyi also by division. They are hardy in southern New England.

Cánbyi. To 1 ft., trailing: lvs. narrowly oblong, to 1 in, long and less than 14 in. broad, sides nearly parallel, the margins revolute, minutely serrulate toward apex. Mts. of Va. and W. Va.

Myrsinites. To 3 ft.: lvs. ovate, oval to lance-elliptic, to 1¼ in. long, broad, toothed, often acute. B. C. to Calif. Var. variegata is listed.

PACHYCÁRPUS. Asclepiadaceæ. Erect per. S. African herbs having tuberous or fleshy roots, allied to Asclepias and differing in technical characters of the fls. One species is doubtfully cult., P. grandiflorus (Asclepias grandiflora). To 20 in., pubescent: lvs. oblong to lanceolate, to 4½ in. long, petioled, margins usually undulate: fls. yellowish-green spotted purple-brown, on pedicels to 1 in. long in 2-4-fld. umbels.

PACHYCÈREUS. Cactaceæ. Columnar and ribbed tree-like Mexican spiny cacti of 10 species differing from Cereus in bearing scales on ovary and fl.-tube with felt and bristles in their axils and fr. bur-like and dry: fls. diurnal, stamens included: plants usually bearing dense wool or felt. See Cacti.

chrysomállus (Cereus and Cephalocereus chrysomallus). Much branched with age, the erect branches making a compact top to 15 ft. through and to more than 50 ft. high, glaucous; ribs 11-14; radial spines about 12; centrals 3: fis. cream-color, about 2½ in. long, concealed in long brownish wool.

Colúmna-Trajani (Cercus and Cephalocereus Columna-Trajani). Trajans Column. St. often simple (at least below), to 20 in. diam. and 40-50 ft. high; ribs many and green, areoles with brown felt; radials 8-10; centrals longer: fis. purple.

marginatus: Lemaireocereus marginatus.

Pálmeri: perhaps Cephalocereus Palmeri.

pecten-aboriginum (Cereus pecten-aboriginum), HAIR-BRUSH CACTUS. To 30 ft., trunk to 6 ft. and 1 ft. diam., with many erect branches; ribs 10 or 11 and tomentose; spines 8-12, 1-3 central: fls. white inside and purple outside, 2 in. or more long.—The large frs. are sometimes used by Indians as hair-brushes, whence the Latin name.

polýlophus: Cephalocereus polylophus.

Pringlei (Cereus Pringles). To 30 ft. and more, trunk 3-6 ft. and 2 ft. or more diam., sometimes nearly simple but often with many upright branches; ribs 11-17, areoles brown-felted; spines 20 or more on young parts but often absent in old plants: fls. white, to 3 in. long.

ruficeps. St. columnar, to 50 ft. tall and 18 in. diam., somewhat branched above; ribs about 26; spines reddish when young, radials 8-10, to ½ in. long, becoming gray, centrals 1-3, to 2 in. long.

Tetétzo (Cereus and Pilocereus Tetetzo). To 45 ft., branching: fis. greenish-white, 2/2 in. long, in clusters of 10-20.

PACHYLOPHUS: (Enothera.

PACHÝPHYTUM. Crassulaceæ. Succulent herbs of Mex. with very thick lvs. and fls. solitary or in one-sided racemes, differing from Cotyledon in having the petals appendaged at the insertion of the stamens; sometimes grown in greenhouses and perhaps in the open in warm regions.

adúncum: P. Hookeri.

amethýstinum: Graptopetalum amethystinum.

bractedsum (Cotyledon Pachyphytum). About 1 ft. tall, glaucous-blue: lvs. mostly in rosettes on st., obovate: fis. red, in racemes to 6 in. long.

brevifolium. Sts. short, to 2 in.: lvs. to ¾ in. long, very fleshy, blunt: fls. few, in a raceme; lobes of calyx broad and blunt, nearly hiding the petals.

compactum. Sts. to 4 in.: lvs. very fleshy, but somewhat flattened, to 1 in. long, closely set at right angles to st.: fl-st. to 16 in. high, with 7 to 10 reddish fls. in a racemose cluster.

glutinosum: listed name.

Hookeri (P. aduncum). Sts. to 2 ft.: lvs. oblong, very thick and turgid, to 2 in. long: fls. yellowish, tinged with red, 6 to 18 in a racemose cluster.

hùmile: listed name.

oviferum. Lvs. ovate, terete, hoary, to 1½ in. long and 1 in. wide. fis. red; sepals unequal, to ¾ in. long.

uniflorum. Sts. to 2 ft., simple or branched at base: lvs. turgid, to 2 m. long, pale green, not glaucous. fls. solitary, reddish.

PACHYRHÌZUS. YAM BEAN. Leguminosæ. Twining herbaceous vines having large tuberous roots, trifoliolate lvs., papilionaceous fls. in clusters on long axillary racemes, and flattened pods.

Yam beans are grown in warm countries for the edible roots and pods. Propagated by seeds. Vines should be supported by sticks or otherwise.

eròsus. At least the terminal lft. lobed: fls. violet: pods 4-6 in. long. Tropics.

palmatilobus. Strong high climber: lvs. of 3 large odd irregular lfts. cuneate at base and with pointed notches on the broad top: fls. purple, in long racemes. Trop. Amer.—Planted in S. Fla.

tuberdsus. Lfts. entire: fls. white: pods 8-12 in. long. Tropics.

PACHYSÁNDRA. Buxacex. Deciduous or evergreen procumbent per. hardy herbs or subshrubs, with simple lvs., monœcious apetalous fls. in spikes, and capsular frs.; planted as ground-cover in shady locations. Propagated by cuttings in summer.

procúmbens. Alleghany P. or Spurge. To 1 ft.: lvs. mostly deciduous, entire or toothed above middle: fls. greenish or purplish, in spikes from the base of the sts. Apr.-May. W. Va. to Fla. and La.

terminalis. JAPANESE P. or Spurge. To 12 in.: lvs. persistent, toothed above middle: fls. white, in terminal spikes, in May. Japan. Var. variegata has lvs. bordered and variegated with white.—This species is now much employed for ground-cover.

PACHÝSTACHYS. Acanthaceæ. Shrubs of trop. Amer. distinguished from Jacobinia by technical differences in the pollen and stamens, and of the same cultural requirements.

coccinea (Jacobinia and Justicia coccinea). To 7 ft.: lvs. ovate or oval, to 8 in. long, entire: fls. scarlet, 2 in. long, deeply 2-lipped, in dense terminal heads. Trinidad, S. Amer.

PACHYSTÈGIA. Compositæ. New Zealand shrub distinguished from Olearia by technical

characters of involucre and pappus. P. insígnis. To 6 ft.: lvs. crowded at ends of branches, to 7 in. long and 4 in. across, entire, very thick and leathery, shining above, densely tomentose beneath: heads to 3 in. across, of white ray-fls. and yellow disk-fls. Planted in Calif.

PACHYVÈRIA. Crassulacex. A name proposed to include hybrids between the genera Pachyphytum and Echeveria.

clavata. Hybrid between P. bracteosum and a species of Echeveria: lvs. gray, broadest near middle: raceme mostly bifid with the fls. crowded.

Clèvelandii. Hybrid between P. bracteosum and E. secunda: lvs. narrow, tinged purple: petals without appendages; sepals narrow, somewhat spreading or ascending.

glauca. Hybrid between P. Hookeri and a species of Echeveria: lvs. closely crowded, to 2 in. long, subterete, slightly flattened above, gray: sepals shorter than corolla; petal-tips recurved.

Orpetti. Listed name applied to hybrid between P. bracleosum and a species of Echeveria: st. short: rosette lvs. oblanceolate, acute, to 7 in. long, glaucous, tinged with purple: flowering-shoot to 1 ft. tall; fls. pink, in a paniculate inf.

Scheideckeri. Hybrid between P. bracteosum and E. secunda: cespitose, st. short: lvs. many, glaucous: sepals shorter than and appressed to corolla.

sobrina. Hybrid between P. Hookeri and a species of Echeveria: lvs. narrow, to 5 times as long as broad, glaucous: corolla and sepals both to about ½ in. long.

PADUS RACEMOSA: Prunus Padus.

PÆÒNIA. PEONY. Ranunculaceæ. Strong per. herbs or low shrubs with tuberous or thickened rootstocks, large alternate compound lvs., usually large solitary red, purple, white or yellow fls., and dehiscent follicular frs.; mostly native in Eu. and Asia.—The commonly cult. peonies are mostly the issue of P. albiflora and P. suffruticosa.

Peonies are amongst the most popular flower-garden subjects and are very hardy, blooming in spring and early summer. They thrive in any soil, but fertile loam is best and as they are gross feeders they should be given a top dressing in late fall which is worked into the soil in spring. Propagated by division of clumps in late summer or autumn, layers and cuttings; also by seeds which will not produce bloom for about three years and are not expected to reproduce the parent exactly. Varieties may be propagated by grafting on a piece of tuber with eyes removed in late summer or early autumn, stored over winter, and planted out in spring. Peonies may also be forced in the greenhouse.

Many of the horticultural forms have been given Latinized names and are not recognized botanically. Some of these are: alba, amabilis, alrosinguines, bicolor, Buckri,

Many of the horticultural forms have been given Latinized names and are not recognized botanically. Some of these are: alba, amabilis, atrosangumea, bicolor, Buckit, candidissima, chrysanthemifolia, delicatissima, formosa, fragrantissima, upantea, grandyfora, liquidat, magnifica, nutabilis, nigricans, nivea, nobilissima, odorata, prolifera, pulcherrima, purpurea, sulphurea, superbissima, tricolor, umbellata, violacea.

albiflora (P. edulis. P. fragrans. P. Reevesiana). To 3½ ft., with spindle-shaped tuberous roots: Ivs. biternate, the lfts. oblong to lanceolate, entire, long-acuminate, usually veined with red: fls. originally white or pink but now in many colors as most of the named garden forms belong here, to 6 in. across. fr. of 3-5 commonly glabrous follicles. Siberia, China, Japan. Var. festiva has double white fls. marked in center with carmine. Var. sinénsis (P. chinensis) has large double crimson fls.

anemonæflora: garden name for form of P. officinalis.

anomala. To 3 ft., with tuberous roots: lvs. biternate, the lfts. lanceolate or linear-lanceolate, acuminate, often lobed: fis. bright crimson, about 4 in. across: fr. of 3-5 glabrous or tomentose follicles. N. Eu., Asia. Var. insignis has magenta fis. with crimson stigmas.

arbòrea: P. suffruticosa.

arietina: P. peregrina.

Bánksii: a var. of P. suffruticosa with much doubled larger rose fls.

Brownii. To 16 in.: lvs. ternate or biternate, the lobes obovate, glaucous: fls. brownish-red, to 1½ in. across: fr. of 3-5 glabrous follicles. B. C. to Calif. and Utah.

cárnea: probably a hort. form of P. albiflora.

chinénsis: P. albiflora var. sinensis.

corállina (P. corsica. P. flavescens). To 4 ft., with tuberous roots: lvs. mostly biternate, lfts. elliptic-lanceolate,

entire, acute: fis. purple to whitish, about 4 in. across: fr. of usually 5 tomentose follicles becoming glabrous. S. Eu. córsica: P. corallina.

decora. To 3 ft., with oblong tuberous roots: lvs. pale green, lfts. oblong, entire, obtuse: fis. deep purple, about 4 in. across: fr. of 2-3 tomentose follicles, S. Eu. Var. Pállasii has narrower lfts. and crimson fis.

Deláchei: a violet-crimson late-blooming plant.

Delavayi. Stoloniferous subshrub to 3 ft.: Ivs. bipinnate, the lfts. ovate-lanceolate to lanceolate, entire or toothed: fts. dark crimson, 2 in. across: fr. of 5 glabrous follicles. W. China.

edùlis: P. albiflora.

élegans: P. officinalis.

emòdi. To 2 ft.: lvs. usually biternate, lfts. oblong or lanceolate, entire or cut: fis. white or red: fr. mostly of 1 rough or glabrous follicle. Himalayas.

festiva: plants so named are probably P. albiflora or P. afficinalis.

flavéscens: P. corallina.

fragrans: P. albiflora.

fulgida: P. officinalis.

Hùmei: P. suffruticosa var.

hùmilis: probably referable to P. peregrina or P. para-

laciniàta: probably P. anomala although sometimes applied to P. tenutolia.

lobàta: P. officinalis var.

litea. Substrub to 3 ft.: lvs. pinnate into obovateoblong cut or lobed lfts.: fls. golden-yellow, to 4 in. across: fr. of 3 glabrous follicles. China.

macrophýlla of cult.: probably P. tomentosa.

microcarpa. To 1½ ft.: lvs. bipinnate into oblong acute lfts. very pubescent beneath fls. bright crimson, to 5 in. across: fr. of 2 glabrous follicles. Mts. of Spain.

Mlokosewitschii. To 21/4 ft.: lvs. biternate, lfts. oblong or elliptic, bluish-green above, glaucous beneath, nerves and margins red: fls. yellow, to 5 in. across: fr. of 3 white-to-mentose follicles. Caucasus.

Moùtan: P. suffruticosa.

officinalis (P. elegans. P. fulgida. P. pubens). To 3 ft.: lvs. mostly biternate, lfts. oblong-lanceolate, lobed, obtuse or short-acute: fls. dark crimson varying to white or yellowish, about 4 in. across: fr. of 2-3 white-tomentose follicles. S. Eu., W. Asia. Double forms are vars. álbo-plèna, rôseoplèna, rûbro-plèna. Var. festiva has white fls. with red centers. Other Latin-named forms are atro-rûbra, lobata, sanguínea, supérba.

paradóxa. Probably only a form of P. peregrina, differing in the smaller lvs. glaucous and whitish beneath. S. Eu.

peregrina (P. arictina). To 2 ft.: lfts. oblong, acute, pilose beneath: fls bright crimson, to 4 in. across: fr. of 2-3 tomentose follicles. Eu.

Póttsii: listed as an early form with fragrant dark crimson fls.

pùbens: P. officinalis.

Reevesiana: P. albiflora.

Rússii: a form of P. corallina with lvs. densely pubescent beneath.

sinénsis: P. albiflora var.

Smouthii: a form of P. anomala.

suffruticosa (P. arborea. P. Moutan). Tree P. Much branched shrub to 6 ft.: lvs. biternate, the lfts. ovate, 3-5-lobed, glaucous beneath: fls. red, rose or white, to 1 ft. across: fr. of numerous densely pubescent follieles China. Var. Hůmei, fls. whitish with dark center, partially double. Var. papaveràcea, fls. white with purple blotch at base of petals, nearly single. Var. rôsea, fls. bright rose.

tenuifòlia. To 1½ ft., with creeping rootstocks: lvs. ternate, the lfts. narrow-linear: fls. dark crimson or purple, 3-4 in. across: fr. of 3-4 pubescent follecles. S. E. Eu., W. Asia. Var. laciniàta has more finely dissected lvs. and var. latifòlia is said to have less finely cut lvs.

tomentòsa. Much like $P.\ Wittmanniana$ but with densely tomentose carpels and darker more strongly veined foliage. Orient.

Veitchii. To 2½ ft.: lvs. narrowly divided into 12-15 segms, light green, glossy above and below, veins markedly depressed: fls. purplish-crimson, to 4 in. across, several on each peduncle. China.

Whitleyi: a form of P. albiflora with large white single fls.

Wittmanniàna. To 3 ft.: lvs. biternate, the lfts. ovate, pubescent beneath: fls. yellow to whitish, 4 in. across: fr. of 2-3 glabrous follicles. Caucasus.

Woodwardiana: listed name.

PAGODA-TREE, JAPANESE: Sophora japonica.

PAINT-BRUSH, DEVILS: Hieracium aurantiacum. Indian: Castilleja californica.

PAINTED-CUP: Castilleia. -Tongue: Salviglossis sinunta

PAK-CHOI: Brassica chinensis and parachinensis.

PALAFOXIA: Polypteria Hookeriana.

PALAOUIUM. Sapotacex. Large trees with milky juice from which gutta-percha is obtained, alternate leathery lys., small 6-lobed fls. in clusters, and fr. a fleshy berry; native in E. Indies and Malaya.

Gútta (Isonandra Gutta). To 40 ft.: lvs. oval, 4 in. long, rusty-tomentose beneath. Malaya.—Sometimes planted in warm countries for ornament and interest.

Rubiacex. Shrubs or trees PALICOTREA. of trop. Amer., with opposite lvs., small tubular fls. in terminal panicles, and fr. a small drupe. Sometimes planted for ornament far S.

barbinérvia. Shrub or tree to 25 ft.: lvs. elliptic, to 10 in. long, shining above: fls. white, corolla tomentose. W. Indies. cròcea. Shrub to 10 ft.: lvs. ovate or elliptic, to 8 in. ng: fls. red, corolla glabrous: fr. dark brown or black. long: fls. red, coro W. Indies, S. Amer.

PALI-MARA: Alstonia scholaris.

PALISÒTA. Commelinaceæ. Trop. African per. herbs having parallel-veined lvs. edged with reddish hairs, white, rose or bluish fls. in panicles that are sometimes nearly hidden at base of foliage, and fr. a purple or red berry; rarely grown in greenhouse collections. Propagated by cuttings over heat, or by seeds.

Barteri. Lvs to 2 ft. long and 41/2 in. wide, mostly basal: fls dark purplish.

Pynaértii. Sts short: lvs. to 1½ ft. long and 6 in. wide, gray-pubescent: fls. white, in dense infl. to 3 in. long.

Rhamnaceæ. Trees or shrubs with spines and alternate simple lvs., small fls. in cymes, and spherical small fr. with a broad wing or rim surrounding it, making a dry disklike object with raised center; grown for ornament but not hardy north of Washington.

The one species commonly grown (P. Spina-Christi) needs a sunny position and well-drained soil. Propagated by seeds sown in autumn or stratified, by layers and root-

aculeàtus: P. Spina-Christi.

Hemsleyanus (P. orientalis). Tree to 40 ft. or more, often spineless, with lvs. much larger than the following species and fr. broader. China.

orientàlis: P. Hemsleyanus.

Spina-Christi (P. aculeatus). Christ-Thorn. Jerusalem-Thorn. To 20 ft., with straight and hooked spines: lvs. ovate, to 1½ in. long, mostly finely toothed, 3-ribbed: fts. greenish-yellow: fr. brownish-yellow, to 1 in. across. S. Eu. to N. China.

PALM, PALMACEÆ. Highly ornamental and decorative evergreen and mostly evergrowing woody plants, much prized in the juvenile state under glass and extensively planted for full stature in tropical and warm-temperate regions around the globe, many of them yielding economic products of great importance, probably 200 genera and perhaps 4,000 species. In general, the palms are not well understood botanically as to species and varieties.

Palms are mostly tree-like, but some of them are extensive climbers and others are bushes. The trunk or caudex is various in character, although of endogenous internal structure. In some kinds the caudex is wholly subterranean. In most cases the trunk is unbranched, but in Hyphæne and a few others it may be naturally

forked, sometimes extensively. Multiple heads now and then occur in various palms following injury. The flowers of palms are small but commonly numerous, bisexual or unisexual, borne on a simple or usually branching spadix or inflorescence that is mostly contained in or subtended by a simple or multiple spathe, the plant often monœcious or sometimes diœcious; the spadix is borne among the leaves in some genera, below them in others, and sometimes above the crown the fruit is exceedingly various, from nuts small or large, drupes berry-like, and dry seed-like bodies.

To the general observer and the horticulturist the palms fall into two groups, (1) the fan-leaved or palmate kinds, (2) the feather-leaved or plumose in which the veining or the division is pinnate on either side a continuing rachis; these distinctions, however, do not hold strictly, for there are intermediate types and a botanical classification might not give them primary importance. For careful discrimination the flowers and flowering habit, and the fruits, must be known. Under glass, the palms are seen mostly in the juvenile or virgin state and their exact identification may be difficult or impossible.

The number of palms planted in the continental United States is far greater than is commonly supposed. Genera here entered are: Acanthophœnix, Acrocomia, Actinophlœus, Adonidia, Aiphanes, Archontophonix, Areca, Arecastrum, Arenga, Arikuryroba, Astrocaryum, Attalea, Bactris, Balaka, Bismarckia, Borassus, Brahea, Butia, Calamus, Caryota, Ceroxylon, Chamædorea, Chamærops, Chambeyronia, Chrysalidocarpus, Coccothrinax, Cocos, Collinia, Colopthrinax, Copernicia, Corozo, Corypha, Cryosophila, Cyrostachys, Dæmonorops, Deckenia, Desmoncus, Dictyosperma, Elæis, Erythea, Eupritchardia, Euterpe, Gaussia, Geonoma, Guilielma, Hedy-scepe, Heterospathe, Howea, Hydriastele, Hyophorbe, Hyphæne, Juania, Jubæa, Kentia, Kentiopsis, Korthalsia, Latania, Licuala, Linospadix, Livistona, Lodoicea, Nannorrhops, Nipa, Normanbya, Paurotis, Phœnix, Phytelephas, Pinanga, Polyandrococos, Pseudophœnix, Ptychoraphis, ga, Foryandrococos, rectudophyllum, Rhapis, Ptychosperma, Raphia, Rhapidophyllum, Rhapis, Rhopalostylis, Rhyticocos, Roscheria, Roystonea, Sabal, Scheelea, Serenoa, Stevensonia, Syagrus, Synechanthus, Thrinax, Trachycarpus, Trithrinax, Veitchia, Verschaffeltia, Wallichia, Washingtonia, Zombia. Studies in recent years have made important changes in palm nomenclature, and further elucidation is to be expected.

Other groups than these are undoubtedly in test grounds within the confines of the continental United States, but probably the present genera comprise the kinds that have attained currency or have been represented in trade-lists or American horticultural literature. Some of these palms are known only as under-cover subjects, although most of them (if not all) are now planted somewhere within our limits in the open or under lath (the lath providing protection from sun and wind as well as from cold). In some cases they are yet known only as small seedlings, with their adaptabilities still to be determined. The number in cultivation will increase as the capabilities are better known in southern Florida, southern California, and on the Gulf coasts between, and as the interest in palms expands.

The above genera represent most palm regions

of the world. In the United States, 10 genera are native, with nearly or quite 20 species, most of them Floridian. California has one species of Washingtonia, Texas two or three species of Sabal. No palms are known to be native in Arizona and New Mexico except one station for Washingtonia in the former. In the middle Gulf coast country, Sabal and Serenoa are represented; and the palmetto extends as far, on the Atlantic coast, as North Carolina.

Formerly many kinds of palms were grown in greenhouses and for decoration in residences but the number is now reduced mostly to those that can be grown in large quantity and striking uniformity, as the Howeas, Chrysalidocarpus lutescens, Syagrus Weddelliana, Phænix Roebelenii and P. canariensis, all feather-palms; but in very mild climates for patio and lathhouse use a larger range of pot and tub subjects is available; and many of the species are adaptable for house use in the hands of the amateur.

In general, palms are easy to manage as pot subjects, and when they become too large or begin to fail they may be discarded for younger plants, these plants being purchased from dealers. They thrive mostly in partial shade. Transplanting to other pots should be undertaken preferably only when the roots are active, as in spring and summer. A common fault is to shift too frequently into too large pots, as this may check growth and orderly development and may result in over-watering. Although the growing young palm requires constant moisture, it suffers quickly from an excess and from poor drainage. Well-rotted sod is a good basis for palm soil with which may be mixed a little old manure or leaf-mold and sufficient sand or peat to keep it rather light, sweet and open. Most palms grow readily from good seed, in a mild heat under glass. The young seedlings of most kinds thrive in a night temperature of about 60° F. or a little under, and 10 to 20° higher in the day. In summer, potted palms may be plunged in the open in partial shade well protected from wind. Only very few of the house palms can be propagated from suckers, although this is the only way of procuring named varieties of dates in orchard planting for fruit; but for house decoration, young date palms may be readily raised from seeds of the commercial fruits.

The palms have large uses in landscape planting in climates adapted to them, but they are commonly very poorly placed for the best effect; the subject needs careful study by competent artists. A palm, as any other plant, is not pleasing unless thrifty and exhibiting the characteristics of its kind. Often the plants are neglected or carelessly grown; and if placed where they must be constantly trimmed of their leaves they soon lose character and become valueless. For permanent planting, palms should be moved only when roots are active and may reëstablish themselves; yet persons think that because they are evergreen they may be moved with impunity at any time. Palms require good soil and, at least in the growing season, plenty of water, to produce their full verdure. When the ground is naturally thin and poor, abundant stable-manure or other fertilizer may be thoroughly mixed with the soil, and an annual topdressing added. In other words, palms require as good treatment as other plants if they are to come to their best; and the intending grower

should understand something of the countries from which they come as an index to their requirements in temperature and moisture.

PALM, ALEXANDRA: Archontophænix Alexandræ. Arikury: Arikuyroba. Barrel: Colpothrinax Wrightii. Barrigona: Colpothrinax Wrightii. Betel: Area Cathecu. Black: Normanbya Normanbya. Blue, Mexican: Erythea armata. Bottle: Colpothrinax Wryghtii, Hyophorbe amaricaulis. Cane: Calamus. Carnauba: Copernicia cerifera. Cherry: Peeudophænix. Cluster: Actinophænis. Boum, Egyptian: Hyphæne thebaica. Everglade: Paurotis Wrightii. Fan, Chinese: Livistoma chinensis. Gingerbread: Hyphæne thebaica. Guadalupe: Erythea edulis. Ivory-Nut: Phytelephas mucrocarpa. King: Archontophænix. Lady: Rhapis. Manila: Adonidia. Mazari: Nannorhops Ritchieana. Needle: Rhapidophyllum. Nikau: Rhopalostylis sapida. Nut, Australian: Cycas media. Oil, African: Elexs guinensis. Oil, American: Corozo oleifera. Overtop: Rhytrocos. Palmyra: Borassus flabellifer. Peabetry: Thrinax. Peach: Guitlelma Gaspiaes. Piccabeen: Archontophænix Cunninghamuna. Pignut: Hyophorbe. Princess: Dictyosperma. Queen: Arecastrum Romanozoffanum. Rattan: Calamus. Rock: Brahea. Royal: Roystonea. Sago-: Cycas revoluta. Saw-Cabbage: Paurotis Wrightii. Seamberry: Coccohrinax. Silver-Saw: Paurotis. Spindle: Hyophorbe Verschaffeltii. Step: Archontophænix Alexandræ var. Beutricæ. Sugar: Arenga pınnata. Syrup: Jubæa spectabits. Talipot: Corypha umbraculifera. Wax: Cerozylam andicola. Windmill: Trachycarpus Fortunei. Wax: Cerozylam andicola. Windmill: Trachycarpus Fortunei.

PALMA CHRISTI: Ricinus communis. de vino: Acro-

PALMATE: lobed or divided or ribbed in a palm-like or hand-like fashion; digitate, although this word is usually restricted to leaves compound rather than merely ribbed or

PALMATIFID: cut about half way down in a palmate form.

PALMERÉLLA. Lobeliaceæ. Per. lobelialike herbs native in Mex. and Calif., with alternate simple lvs., fls. in terminal racemes, the corolla with long straight tube and spreading 2-lipped limb, and fr. a caps.

débilis. To 2 ft., glabrous: lvs. linear-lanceolate, to 3 in. long, entire: fls. whitish with light blue limb, ¾ in. long. Var. serrata has sharp-toothed lvs.

PALMETTO: Sabal, Saw -: Serenoa, Scrub -: Serenoa,

PALO VERDE: Cercidium Torreyanum.

GINSENG. Araliaceæ. Low per. herbs native in N. Amer. and E. Asia, having digitately compound lvs. borne in whorls, small greenish polygamous fls. in terminal umbels, and berry-like frs.; grown for the roots which are employed in medicine. The species of Polyscias are sometimes known as Panax.

Ginseng seed should be sown in drills or broadcast in beds in light well-drained loam. Seedlings should be transplanted the first or second year. Seeds should be stratified until ready for use.

anomalum: Nothopanax anomalum.

aureum: a form of Polyscias Guilfoylei.

caryotaefòlium: listed name of unknown botanical standing; apparently an error.

crassifolium: Pseudopanax crassifolium.

excélsum: referable to Polyscias fruticosa var. plumata.

fèrox: Pseudopanax ferox.

fruticosum: Polyscias fruticosa.

Ginseng: P. Schinseng.

Léssonii: Pseudopanax Lessonii.

quinquefòlium (Aralıa quinquefolia). American G. To 1½ ft.: lvs. of 5 somewhat obovate abruptly acuminate coarsely toothed lifts. to 5 in. long. Que. to Mo.—The common species in cult. in N. Amer.

Schinseng (P. Ginseng). ASIATIC G. Lvs. of 5 oblong-ovate gradually acuminate finely double-serrate lfts. to 4 in. long, having conspicuous white bristles on veins above. Manchuria, Korea.

trifolium (Aralia trifolia). DWARF G. GROUNDNUT. To 8 in.: lvs. of 3-5 toothed lits. to 1½ in. long. N. S. to Ga. and Wis.

PANCRÀTIUM. A maryllidace x.Mostly summer-flowering bulbs of the Old World with basal lvs. and white fls. in umbels terminating the solid scapes, the perianth with long tube and narrow segms., the stamens united at base into a cup or crown. Plants grown under this name are likely to be Hymenocallis, which differs in technical botanical characters.

Pancratiums should be kept in a night temperature of 60-70° and well watered. Bulbs should be rested and kept dry through the winter. In late winter they may be repotted or given a top diessing. Propagated by offsets or seeds.

calathinum: Humenocallis calathina.

canariènse. To 2 ft.: lvs. sword-shaped, glaucous, to 2 ft. long: fis. white, to 2½ in. long, in umbels of 6-10, tube about 1½ in. long, on very long pedicels. Canary Isls.

illfricum. Lvs. strap-shaped, to 2 in. wide: fls. on scapes 1 ft. or more long, with green tube 1 in. long and segms. 1½ in. long, crown toothed, ¼ in. long, filaments of stamens to ¾ in. long, pedicels short. Medit, region.

marftimum. Lvs. to 2½ ft. long, linear, evergreen: fls. very fragrant, with tube to 3 in. long and linear segms. 1½ in. long, crown with short teeth, 1 in. long, the filaments of stamens and pedicels short. Medit. region.

PANDANÀCEÆ, SCREW-PINE FAMILY, Rather woody plants, related to palms, usually shrublike or trees, with simple mostly stiff sword-like lvs. borne at tips of branches, and sometimes producing aerial roots; stamens and pistils separate and not in definite fls., and fr. a cone- or ball-like body; 4 genera in Old World tropics and warm regions, of which Freycinetia and Pandanus are known to hort. in N. Amer.

PANDÀNUS. SCREW-PINE. Pandanacex. Trop, shrubs and trees with stiff usually pricklymargined lvs., fls. in spikes, naked, and fr. a mass of woody drupes or nuts: the lvs. are arranged in a spiral way, whence the name screwpine. Lvs. used for bags and the like in some Cases.

Screw-pines may be planted out-of-doors in tropical or semi-tropical regions, and are grown in greenhouses and window-gardens in the juvenile state, in pots and tubs, for house and tuble decoration. They require abundant moisture and heat, and will thrive in conditions suitable for palms. Propagation is by suckers that arise about the base, placed in pots over bottom heat, or by seeds when procurable; the latter should be soaked for twenty-four hours abunted in pots and given water and shade hours, planted in pots and given water and shade.

Baptístii. St. short lys. 1 in. wide, unarmed, striped with white or yellow. New Britain Isls. Var. aureus is listed with lvs. yellow striped.

boniensis. Tree about 21 ft. high, st. with many aërial supporting roots: lvs. about 2 in. wide, long-pointed. Pacific Isls.—Distinguished from *P. tectorius* by drupes trilocular, not multilocular.

caricosus. Low, tufted: lvs. to 2 in. wide, glaucous beneath, margins finely spiny-toothed. Java.

furcatus. Tree to 40 ft. with large aerial roots forming about base, sparingly forked: lvs. to 20 ft. long and 4 in. wide, glaucous beneath, marginal spines flattened and curved, to 14 in. long; spathes golden-yellow, to 2 ft. long; fr. reddish-brown, to 9 in. long, fleshy. S. Asia.—Sometimes confused with *P. ceylanicus*, a plant not known to be in cult. here, but which is more slender, and lvs. narrower with more strongly recurved spines.

grácilis. Shrub: lvs. imbricated, keeled, margins and midrib above with incurved prickles. Philippines.

graminifolius. Lvs. about 35 in. wide, glaucous beneath. Burma.—The plant commonly cult. under this name is P. pygmæus.

javánicus: a name of no botanical standing; possibly P. variegatus.

pacificus. Lvs. broad, glossy dark green, with tail-like tip. Pacific Isls.

pygmèus. St. to 2 ft.: lvs. about 1/3 in. wide, glaucous beneath, long-pointed. Madagascar.

Sánderi. St. short: lvs. 2 in. or more wide, banded lengthwise with golden-yellow. Timor. Var. Roehrsianus has lvs. striped yellow.

stenophýllus. Lvs. linear, to 21/2 ft. long, acute, spines short, ascending and more remote and smaller along middle

than at base or tip: drupes several on peduncle, to 1/4 in. long. Java. Sumatra.

tectorius. Tree to 20 ft., with brace-roots: lvs. to 2 in. wide, glaucous-green, long-pointed. Asia, Australia, Pacific

ûtilis. Branching tree to 60 ft., with brace-roots: lvs. 3 in. wide, glaucous-green with reddish spines. Madagascar, where it is used for making baskets and other articles.—The species is usually planted in frostless countries.

variegatus. St. with brace-roots: lvs. striped or variegated with white or young lvs. entirely white. Polynesia.

Veitchii. Lvs. to 3 m. wide, banded lengthwise near the margins with silvery-white. Polynesia.—The most popular house and florists' pandanus.

PANDÒREA. Bignoniaccæ. Evergreen shrubs climbing or clambering by tendrils and petioles, or otherwise, native in Old World tropics, with pinnate lys., funnelform white or pink fls. in panicles, and fr. an oblong pod.

Pandoreas are grown out-of-doors in southern United States, but may withstand a little frost. They require rich soil and sunny exposure. Propagated by seeds, and by cuttings of green wood under glass.

australis: P. pandorana.

Brycei: Podranea Brycei.

jasminoides (Bignonia and Tecoma jasminoides). BOWER-PLANT. Lvs. of 5-9 ovate to lanceolate entire lits. to 2 in. long: fis. white with pink throat, to 2 in. long, in few-fid. panieles. Australia. Var. álba, has pure white fis. and ròsea pink.

pandorana (P., Bignonia, and Tecoma australis). Wongapandorana (r., Bignonia, and 1 ecoma australis). Wonda-Wonga Vine. I.vs. of 3-9 ovate to ovate-lanceolate nearly entire lfts. to 2½ in. long; fls. yellowish-white spotted with purple, ¾ in. long, in many-fld. panicles. Malaysia, Austra-lia. Var. rosea has pale rose fls.

Ricasoliàna: Podranea Ricasoliana

PANICLE: flower-cluster in which the branches are racemose, the flowers being pedicellate: a branching raceme.

PANICULARIA: Gluceria.

PÁNICUM. Graminex. Large widely distributed group of ann. and per. grasses, the spikelets borne in panicles or rarely racemes; a few species are grown for grain and forage and others for ornament. See Grasses.

altissimum. confused name

americanum: Pennisetum glaucum,

barbindde: P. purpurascens.

capillare. Wirth-Grass. Ann. to 2 ft.: lvs. to 1 ft. long and ½ in. wide: panieles to 14 in. long, the branches exceedingly slender and spreading. N. S. to Fla. and Tex., Bernuda.—Sometimes prized for its large capillary infl. and in dry bouquets.

Crus-córvi: Echinochloa Cius-galli.

Crús-gálli: Echinochloa Crus-galli.

excúrrens: Setaria plicata.

frumentàceum: Echinochloa Crus-galli var.

germánicum: Setaria italica.

hungariénsis: this name presumably applies to the Hungarian-grass, Setaria italica var. nigrofructa.

maximum. Guinea-Grass. Tufted per. to 10 ft.: lvs. to 2 ft. long and ½ in. wide, midrib whitish: panicles to 2 ft. long, branches spreading. Afr.—Grown for forage in the S.

miliaceum. MILLET. BROOM-CORN MILLET. Ann. to 4 ft.: lvs. to 1 ft. long and 1 m. wide: panieles to 1 ft. long, drooping, the branches slender and crowded: grain smooth and shining, white or straw-colored. E. Indies.—Grown for grain and forage.

palmifòlium: Setaria palmifolia.

plicatum: Setaria plicata.

purpuráscens (P. barbinode). Para-Grass. Per. to 10 ft., stolomíterous and rooting at nodes: Ivs. to 1½ ft. long and ½ in. wide, rough on edges: panieles to 1 ft. long, the branches ascending. Brazil, but escaped in trop. Amer. Grown for forage.

sulcătum: Setaria sulcata.

texanum. Colorado-Grass. Texas Millet. Ann. to 3 ft., soft-pubescent: lvs. to 8 in. long and ¾ in. wide: panicles of one-sided racemes. Tex.

tonsum; Tricholæna rosea.

variegatum: the plant intended is probably Oplismenus hirtellus.

virgatum. Switch-Grass. Per. to 6 ft.: lvs. to 1 ft. or more long and ½ in. wide, rough on edges: panieles to 1½ ft. long, the branches spreading or ascending. Me. to Fla. and Ariz., W. Indies, Cent. Amer.—Sometimes raised for omamont

PANSY: see Viola.

PAPÀVER. Poppy. Papaveracex. Herbs or rarely subshrubs with milky colored juice, lobed or dissected lvs., showy red, violet, yellow or white fls. and nodding buds solitary on long stalks, and fr. a caps.

Poppies are popular flower-garden subjects grown as annuals, and others perennial in borders and rock-gardens. Seeds should be sown where plants are to grow, as poppies do not transplant well.

aculeatum. Ann. to 4 ft., st. branched or nearly simple, covered with stiff spreading bristles: lvs. green, pinnatifid, pinnæ spine-tipped; fis clear scarlet-orange, to 2 in. across: caps. glabrous. S. Afr., Australia.

alpinum (P. Burseri). Alpine P. Nearly stemless per appuum (r. Burseri). ALPINE F. Nearly stemiess per. to 10 in. high: Ivs. 2-3-pinnate, glaucous: fls. white or yellow, fragrant: caps. oblong. Alps. Hort. color forms listed are: álbum, aùreum and rôseum. Var. laciniàtum is listed with pinnæ more narrowly linear. Var. pyrenàicum is P. purenaicum.

altaicum; an unidentified trade name of which some of the material so listed is P. atlanticum.

amurénse: P. nudicaule var.

apùlum. Ann.: lvs bipinnate: fls. spotted with purple: caps. elhpsoidal. Italv.

árcticum: catalogue name.

Argemone. Ann. to 1 ft.: lvs. bipinnate: fls. pale scarlet with dark spot at buse of petals: caps, oblong-cylindric. Eu., N. Afr.

armeniacum. Bien. to 1½ ft, spiny at base, glabrous above: lvs. ovate, rarely to 4 in. long, pinnatifid, pinnæ spine-tipped: fls. pink, to ¾ in. across: caps. glabrous. E. Medit region.

atlánticum. Hairy per to 2 ft.: lvs. toothed or pinnate: fls. orange-red or scarlet, to 3 in. across: caps. club-shaped, glabrous except on ridges of its top. Morocco.

atrosanguineum: probably a hort, form of P. orientale.

bracteatum. Hairy per. to 3 ft.: lvs. pinnate, the lobes coarsely toothed: fls. blood-red, to 4 in. across, with bracts near them: caps obovate. Medit. region to Persia.

Búrseri: P. alpinum.

californicum. Western P. Ann. to 2 ft.: lvs. pinnate: fis. red spotted with green at base, to 2 in. across: caps. top-shaped. Calif.

caucásicum (P. fugax). Glaucous bien, to 2 ft.: lvs. bipinnate: fls scarlet, yellowish at base: caps. oblong. Caucasus.

dùbium. Ann. to 2 ft.: lvs. pinnate: fls. rose or white with darker center: caps. oblong or club-shaped. Eu.; escaped in N. Amer. Var. lævigåtum is glabrous and has purple usually spotted fls. The plant under this varietal name may be P. Rhæas.

floribúndum. Bien. to 2 ft., sts. and lvs. yellowish-glaucous, hispid: lf.-segms. usually dentate: fls. brilliant vermilion, stamens yellowish: caps. glabrous. Caucasus.

fugax: P. caucasicum

gigantèum: a form of P. somniferum.

glaucum. Tulip P. Ann. to 2 ft.: lvs. pinnately lobed or cut, glaucous: fls. scarlet spotted at base, to 4 in. across. Syria to Persia.

Heldreichii. Hairy per. to 20 in. high, st. erect, not much branched, leafy: lvs. oblong, to 8 in. long, apex broadly cuneate, cauline lvs. sessile, uppermost ones bract-like, margins of all crenate-serrate: fls. many in long racemes. Medit. region.—The plant cult. under this name may be P. Schinzianum.

hyoszpanifolium. Bien. to 2 ft., sparsely setose: lvs. broadly oblong-lanceolate, pinnatifid, to 3 in long, segms. oblong, terminated by setæ to ¼ in. long: fls. pink, suffused with orange. N. Medit. region to Syria.—Sometimes confused with *P. caucascum*, differing in its more rigid setatipped lf.-segms. and caps. hispid on ridges, not glabrous.

involucratum: an unidentified trade name.

laterstium. Hairy branched per to 2 ft.: lvs. lanceolate, pinnatifid at base, outer half irregularly serrate, pinnæ and serrations spine-tipped, to 10 in. long: fls. brick-red, petals broad. Armenia.

macróstomum. Ann. to 1½ ft.: basal lvs. pinnate, oblong-lanceolate, cauline lvs. linear-lanceolate, entire or somewhat acutely dentate: fis. purplish-red, to 2 in. across,

base rarely without black spots, petals sometimes with white margins; caps. usually glaucous. E. Medit, region.

magnificum: a form of P. somniferum.

Marei. Differs from P. dubium in anthers black before anthesis, pollen vellow. Morocco.

monanthum. Per. to 11/2 ft.: lvs basal, linear or oblong, cut-toothed or pinnatifid: fls. solitary, brick-red, 11/2 in.

monstrdsum: a form of P. somniferum.

Murséllii: a strain of P. somniferum with double fringed fls.

nudicaule. ICELAND P. Nearly stemless hairy per. to I ft. high; ivs. pinnately lobed or cut; fls. white with yellow at base, yellow with green at base, orange or reddish, to 3 in. across, fragrant, sometimes double. Arctic regions, in N. Amer. south to Colo. Color forms are grown under such names as álbum, amurénse, aurantiacum, aureum, coccineum, croceum, delicatum, luteum, roseum and rubro-aurantiacum.—The American variations have been treated by some botanists as Productum nudicaule. ICELAND P. Nearly stemless hairy per by some botanists as P. radicatum.

olýmpicum: P. pilosum.

olimpicum: P. pilosum.
orientale. Onental P. Hairy per to 4 ft: lvs. pinnate, the lobes sharply toothed: fis. scarlet with black spot at base ranging to orange and pale pink, 6 in. and more across, sometimes double. Medit. region to Persia. Hort. forms include dibum, atrosanguineum, crineum, delicatum, luminosum, magnificum, pygmæum. Var. bracteatum is P. bracteatum. Var. Párkmannii (P. Parkmanni) is a double-fid. form.—Many of these forms may be hort hybrids of P. orientale and P. bracteatum. Oriental poppies are easily propagated by division or root-cuttings made after flowering. They are among the longest-lived members of the group and do best when left undisturbed.

pæoniflorum: a peony-fld, strain of P. somniferum.

Párkmannii: P. orientale var.

paucifoliàtum. Short-stemmed per. to 1 ft.: lvs. oblong-lanceolate, pinnately lobed to irregularly crenate-serrate, to 8 in. long, usually only one or two cauline lvs.: fis. orangered, to 112 in. across. Armenia.

pavoninum. Peacock P. Hairy ann. to 1 ft.: lvs. pinnate, the lobes sharply toothed: fis scarlet spotted with dark color, 1 in. across. Turkestan, Afghanistan.

pilosum (P. olympicum). OLYMPIC P. Hairy per. to 3 ft.: lvs. irregularly toothed: fls. brick-red, 2 in. across, Mt. Olympus in Bithynia.

pinnatifidum. Ann. to 2 ft, much branched, sts. setose: lvs. pinnatifid to simple and toothed, somewhat pilose: fls. rose-pink to reddish, stamens yellow. S. Eu.

pvgmæum: P. orientale var.

pyrenaicum (P. rhæticum). Tufted nearly stemless per. to 4 in. tall: lvs. pinnately parted: fis. yellow or orange, to 1 in. long: caps. oblong. Pyrenees.

radicatum: see under P. nudicaule.

rhæticum: P. purenaicum.

Rhœas. Corn P. Ann. to 3 ft.: lvs. irregularly pinnate or rarely entire: fls. cinnabar-red, deep purple, scarlet, or sometimes white, 2 in. across. Eu., Asai, nat. in N. Amer.; this is the common field poppy of Eu. Var. umbrosum has dark red fls. with blackish spots. Shirley poppies are a strain of this species. Var. coccineum airreum is a color

rupifragum. Nearly stemless per. to 1½ ft.: lvs. pinnately cut: fls. pale red, to 3 in. across. Spain. Var. atlanticum is P. atlanticum.

Schinzianum. Gray-hairy per. to 11/4 ft.: lvs. obovate-lanceolate, irregularly pinnately lobed: fls. brick-red, 11/4 in. long: caps. obovoid. Habitat unknown.

setigerum. Sometimes treated as a form of P. somni-rum, but it is hairy, lvs. more deeply cut, and has violet fls. Medit. region.

somniferum. Opium P. Ann. to 4 ft.: lvs. coarsely toothed or lobed: fis. white, pink, red or purple, to 4 in. across, sometimes double or with fringed petals Greece, Orient.—Opium is obtained from the milky juice of the fr.

spicatum. Densely white-hairy per to 2½ ft.: lvs. oblong, basal ones long-petioled, densely pilose, margins crenate-serrate: fls. arranged in spike-like racemes on short peduncles: caps. glabrous. Asia Minor.

thibéticum. Similar to P. nudicaule but with larger fis. in yellow and orange. Tibet.

triniæfòlium. Bien. similar to P. caucasicum but with more compound lys. and smaller fls. Asia Minor.

umbrosum: P. Rhæas var.

PAPAVERACEÆ. POPPY FAMILY. Herbs or rarely shrubs, of about 25 widely distributed genera, often showy in bloom, having colored juice, regular bisexual polypetalous fls. with 2-3

caducous sepals, 4–8 or 8–12 free deciduous petals, numerous stamens, superior 1-celled ovary, and fr. a caps. opening by valves or pores. Several genera are grown in the flower-garden, as Argemone, Bocconia, Chelidonium, Dendromecon, Dicranostigma, Eomecon, Eschscholzia, Glaucium, Hunnemannia, Macleaya, Meconella, Meconopsis, Papaver, Platystemon, Pteridophyllum, Roemeria, Romneya, Sanguinaria, Stylomecon, Stylophorum.

PAPAW: Asimina triloba; see Pawpaw.

PAPAYA: see Carica.

PAPER-BUSH: Edgeworthia papyrifera. -Flower: Bougainvillea glabra var. Sanderiana.

PAPHIOPÈDILUM (Cordula). Lady-Slipper. Orchiduceæ. Trop. Asiatic terrestrial or epiphytic orchids without pseudobulbs, leathery conduplicate lvs., and fis either solitary or in racemes, having the lateral sepals united, lipsac-like often with involute margins, and 1-celled ovary. The name Paphiopedilum has been conserved over the older genus Cordula under the International Rules; species names formerly listed under Paphiopedilum may be found in Phragmipedium; see also Selenipedium. Grown in the hothouse and some of them at intermediate temperatures; they require good moisture supply; see Orchids for cult.

Actaus: P. Siemonii.

Albertianum: a form of P. Leeanum.

Alexandræ. Hybrid between P. Godefroyæ and P. nitens.

Allanianum. Hybrid between P. Curtisii and P. Spencerianum

amandum. Hybrid between P. insigne and P. venustum. anglise. Hybrid between P. callosum and P. Leeanum.

Appletonianum. Lvs. to 6 in. long and 1½ in. wide, green: fls. solitary or 2, on stalks to 20 in. high, about 3½ in. across; sepals yellow-green streaked with wine-purple; petals green at base and rose at tip; lip greenish-brown. Winter and spring. Slam.

Argus. Lvs. to 8 in. long and 1½ in. wide, light green tesselated with dark green spots: fls. solitary (rarely 2), on stalks to 16 in. high; sepals white veined with green or green and purple; petals white veined with green and closely spotted with brownish-black, red at tip; lip brownish-purple marked with light green. Mar.-June, Aug. Philippines.

Arthurianum. Hybrid between P. insigne and P. Faireanum.

Ashburtoniæ. Hybrid between P. barbatum and P. insigne.

augústum. Hybrid between P. Haynaldianum and P. villosum.

aureum. Hybrid between P. nitens and P. Spicerianum. There are many named forms of this hybrid.

barbatum. I.vs. to 6 in. long and about 1 in. wide: fls. 3-4 in. across, solitary (rarely 2), on stalks to 12 in. high; sepals white and pale green vened with brown-purple; petals greenish at base and purple at tip with black warts; lip brown-purple. Jan.-Aug. Malaya. Var. Warneri has deep maroon lip and dorsal sepal white spotted with rosemagenta.

Bartetii. Hybrid between P. barbatum and P. insigne.

Bédfordiæ. Hybrid between P. Actæus var. revolutum and P. Shogun.

Beeckmannii. Hybrid between P. bellatulum and P. villosum var. Boxallii.

Behrensianum. Hybrid between P. villosum var. Boxallıı and P. Io var. grande.

bellåtulum. Lvs. to 10 in. long, elliptic-oblong, obtuse, dark green above with pale green mottling, dull purple beneath: fls. solitary on short peduncle, 2-3 in. across, white or cream with brown-purple specks; sepals and petals very broad; lip with smaller spots. Apr.-May, Aug.-Sept. Burma.

bingleyense. Hybrid between P. Charlesworthii and P. Harrisanum.

birkdalense. Hybrid between P. insigne var. Harefield Hall and P. Thalia Mrs. Wellesley.

Bóxallii: P. villosum var.

Bragaianum: P. Godseffianum.

Brandtise. A cross between two hybrids, P. Iva and P. Youngianum.

Brunnianum. Hybrid between P. Leeanum and P. ananthum.

burbagénse. Hybrid between P. insigne and P. selligerum.

Búrtonii supérbum is listed.

cállo-Rothschildianum: P. Fowleri.

callòsum. Lvs. to 9 in. long and 2 in. wide, green tesselated with blackish-green: fls. large, 3½-4 in. across. solitary (sometimes 2) on stalks to 15 in. high; sepals white lined with purple and green veins; petals greenish, purple at tip, with several black warts; lip brown-purple outside. Jan.-Apr., July-Dec. Siam, Cochin-China. Var. gigantèum has dorsal sepal white shaded with emerald-green and striped with dark green. Var. Sánderæ has white fls., dorsal sepal lined with green.

calophilium. Hybrid between P. barbatum and P.

Cal \hat{p} pso. Hybrid between P. villosum var. Boxallii and P. Spicerianum.

Cánhamii. Hybrid between P. superbiens and P.

Chamberlainianum. Lvs. to 8 in. long and nearly 2 in. wide: racemes to 2 ft. long, many-fld.; fls. 3-5 in. across; sepals greenish heavily marked with purplish-brown; petals greenish marked with small purple and brown spots in lines, twisted and wavy; lip green at base shading to deep rose and covered with purplish dots. Blooms all year. Sumatra.

Charlesianum. Hybrid between P. nitens and P. Leeanum.

Chárlesworthii. Lvs. to 10 in. long and 1 in. wide: fls. 2½-3½ in. across, solitary on stalks about as long as lvs.; dorsal sepal rounded, rose veined with purple; petals and lip greenish veined with brown. Aug.—Dec., Apr. India.

ciliolare. Lvs. to about 12 in. long and 2½ in. wide: fls. to 4 in. across, solitary on stalks to 32½ in. high; sepals white striped with green, purplish at base; petals drooping, green at base, purplish above densely marked with dark purple spots; lip greenish-purple. Feb.-June. Philippines.

Clárkii. Hybrid between P. Charlesworthis and P. Swanianum.

concinnum. Hybrid between P. villosum and P. pur-puratum.

cóncolor. Lvs. to 6 in. long and 1½ in. wide; fl.-stalks very short; fls. 2-3 in. across, solitary or 2, pale yellow finely spotted with violet. Apr, Sept. Burma, Indo-China, China.

Crossianum. Hybrid between P. insigne and P. venus-

Cúrtisii. Lvs. to 8 in. long and 3 in. wide: fls. to more than 4 in. across, solttary on stalks to 12 in. or more high; dorsal sepal green edged with white and lined with purple; petals greenish-rose toward base, finely spotted with dark purple; lip greenish-brown. Apr.—Sept. Sumatra.

Curtmannii. A cross between two hybrids, P. Schlesingerianum and P. Beeckmannii.

Cymatòdes. Hybrid between P. Curtisii and P. superbiens.

Dauthièri: P. Harrisianum.

Dayanum. Lvs. to about 8 in. long and 2½ in. wide: fls. to 6½ in. across, solitary on stalks to 12 in. high; sepals white lined with green; petals greenish at base, purplish or reddish-white near apex; lip greenish-violet. May-Aug., Nov. Borneo.

Deedmannianum. Hybrid between P. Chamberlainianum and P. Spicerianum.

Dicksoniànum. Cross between P. Hera (hybrid) and P. villosum.

Druryi. Lvs. to 10 in. long and 2 in. wide: fls. about 3 in. across, solitary on stalks to 12 in. high; sepals and petals greenish-yellow with a blackish stripe through the middle; lip yellow. Jan.-May. India.

Édwardii. Hybrid between P. Fairieanum and P. superbiens.
